

Looking at valve performance from ground level has its advantages.

Especially when you need to check repeatedly on a valve's ability to control.

Emerson's FIELDVUE® Digital Valve Controller with its AMS® ValveLink performance diagnostics software gives you a real-time update on a valve's condition. Any time you want. Without having to leave the convenience and safety of your control room or maintenance shop.

With your PC you can identify air supply leaks, failing transducers or faulty electronics. You can check valve assembly friction and deadband levels with the valve onstream and in control. And then look at long-term trend lines to spot emerging valve repair needs.

Today, with the unmatched diagnostic data given by FIELDVUE AMS ValveLink software you can base valve maintenance decisions on facts rather than guesswork. Which lets you schedule valve maintenance when it's needed. And where it delivers maximum return.

Perhaps best of all, with FIELDVUE AMS ValveLink you can avoid those repeated trips up a long ladder.
