

Design Enhancements to Daniel 6" Senior® Orifice Fitting (ANSI 150 to 600#)

The Daniel Senior® Orifice Fitting remains the world's most widely used device for natural gas flow measurement with a dual-chamber design that continues to deliver an outstanding return on investment. To ensure we meet tighter delivery deadlines for the popular 6" Senior Orifice Fitting (ANSI 150 to 600#), we recently implemented a few minor design enhancements to help streamline the casting process. These enhancements include a slight change to the fitting body which resulted in a minor modification to the stuffing box sleeves used on the gear shafts. In addition, the ¾" drain plug has been replaced with a larger 1" NPT opening. Overall fitting dimensions are unchanged. Also, it is important to note that these enhancements do not affect installation or operation of the fitting.

When ordering, please be aware there are new part numbers for our enhanced 6" Senior Orifice Fitting and the affected spare parts, including the stuffing box sleeve and the drain plugs. Refer to the New Ordering Information chart below for additional information.

We anticipate these minor design changes will have a major impact on delivery and overall customer satisfaction. In fact, the increased production capacity will help reduce lead times while the improved casting process will ensure the highest quality fittings. Contact your local Daniel sales representative today to learn more about this new 6" Senior Orifice Fitting (ANSI 150 to 600#) program.
