Filling & Packaging is the sixth unit in this seven step overview of beverage (carbonated drinks)

Filling & Packaging Process Description

Carbonated beverages are packaged in a wide variety of formats and pack sizes, depending on target markets, product characteristics and geographical or cultural preferences.

From disposable or returnable plastic or glass bottles of various shapes and sizes to aluminium cans, each requires a different filling technology, using mechanical, volumetric or electronic filling systems to ensure accurate and consistent filling quality.

The specific process requirements and critical control points will vary for each type of filler.
