

Why are we wasting time and money continually monitoring control valves in manual mode? We need control valves that control automatically!

**YOU CAN DO THAT**

**FISHER**

**You can expect better control from the Fisher® Control-Disk™ valve from Emerson.**

Process control loops containing rotary valves often end up being placed in manual mode due to poor control performance. This forces operators to constantly monitor and adjust the control signal which can significantly reduce efficiency. With double the control range, Control-Disk allows control closer to the target set point, regardless of process disturbances. So, you can keep your loop in automatic. With low maintenance requirements and quick delivery, it's time to put Control-Disk in your loop. Visit [www.Fisher.com/bettercontrol](http://www.Fisher.com/bettercontrol) to watch an animation video or download a brochure.
