

Where's your process taking your profits?

Producing cleaner, lower sulfur gasoline means increased capital spending. With Emerson, you can get more out of your process control investment.

For instance, Fisher digital control valves deliver flow control accuracy as tight as 0.25%, which can boost your plant's overall performance. You can also monitor valve operation in critical processes, such as those in your alkylation unit, with FIELDVUE® Digital Valve Controllers to gain real-time diagnostic data that helps reduce your maintenance expense.

Depend upon FIELDVUE Digital Level Controllers to improve management of your feedstock and fuel inventories. And get a higher return on your control valve investment with the industry-leading easy-e® globe and Vee-Ball® rotary valves.

To reduce operating problems rely on innovative valve designs, such as the multi-stage Dirty Service Trim (DST) that resists plugging and erosion as it helps prevent cavitation. And turn to Fisher's Special Products Group for engineered solutions to your most challenging control valve applications.

Fisher's technology and innovation—including an unmatched service and representative network—can help you realize a greater return on your process control investment. To find out more, visit www.Fisher.com
