Measurement principle

The MSP900SH and the MSP900FH are based on ultrasonic technology. Ultrasonic pulse signals are transmitted and reflected from the liquid surface. The transmitter ‘listens’ for reflected signals (echoes) and measures the time-delay between transmitting and receiving.

The distance to the liquid surface is automatically calculated using the computed time-delay.

The MSP900SH has an integrated sensor for automatically compensating the Distance for temperature effects.

The MSP900FH has a factory fitted remote temperature sensor to continuously measure the air temperature around the transmitter. It then computes the speed of sound in air, automatically compensating Distance for temperature effects.

The level measurement (Bottom Reference minus Distance) is sent through the 4–20 mA and HART output.

Special features

Advanced software features

- Learn routine (false echo registration)

The transmitter can learn to ignore up to four false echoes caused by the pulse signal reflecting off obstructions, until the actual level is seen.
- Empty tank mapping

When a tank is empty, the transmitter can learn to ignore up to four false echoes, without the need for user interaction.
- Present depth

The bottom reference can be automatically set using a known user-entered depth.
- Set as empty

When the tank is empty, the bottom reference can be automatically reset to the measured distance.
- Distance offset

The distance to the surface can be adjusted by a user-entered positive or negative offset value.
- Level offset

The level can be adjusted by a user-entered positive or negative offset value
- Bottom blanking

The transmitter can be set to ignore an area of the tank bottom to avoid false echoes from obstructions.
