Fisher™ 377 Trip Valve

Fisher 377 pressure-sensing trip valves are for control applications where a specific valve/actuator action is required when supply pressure falls below a specific point. When supply pressure falls below the trip point (see figure 1), the trip valve causes the actuator to fail up, lock in the last position, or fail down. When the supply pressure rises above the trip point, the 377 trip valve automatically resets, allowing the system to return to normal operation. The trip valve can be top-mounted on a manifold, yoke-mounted, or bracket-mounted to match the application requirements. 377 trip valves can be used with Fisher 480, 585C, 685, 1061, 1066, 1069, and Bettis™ G Series piston actuators.

Features

- **Cost Effective**—Single trip valve construction reduces costs and spare part requirements of those systems using three separate switching valves to perform the failure functions. A single trip valve greatly simplifies piping requirements.

- **Ease of Mode Conversion**—Conversion to any of the fail modes requires only minor hookup changes.

- **Adjustable Trip Valve**—The trip point is adjustable for specific supply pressure requirements.

- **Reliable Operation**—The trip valve design includes large diaphragm areas and few moving parts for efficient performance, minimum maintenance, and long service life.
Specifications

Available Configurations
When supply pressure falls below the trip point, 377D Trip Valve: Fails actuator piston down. Includes check valve and volume tank.
377L Trip Valve: Locks actuator piston in the last position.
377U Trip Valve: Fails actuator piston up. Includes check valve and volume tank.
377CW Trip Valve: Fails fully clockwise to close the valve. Requires check valve and volume tank. Trip valve moves piston to either up/down position and requires actuator configuration for actual clockwise movement.
377CCW Trip Valve: Fails fully counterclockwise to close the valve. Requires check valve and volume tank. Trip valve moves piston to either up/down position and requires actuator configuration for actual counterclockwise movement.
All 377 trip valves can be converted to any of the above fail modes with minor hookup changes

Allowable Supply Pressure for Trip Valve
Maximum: 10.3 bar (150 psig)
Minimum: 3.8 bar (55 psig)

Outlet Pressure
Normal Operation: Pressure from control device
Fail-Up or Fail-Down Mode: Maximum volume tank pressure
Lock-In-Last-Position: Respective cylinder pressure

Trip Point
Adjustable from a minimum of 2.8 bar (40 psig) to a maximum of 72 percent of supply pressure; see figure 1
Reset: 12.5 to 33 percent above adjusted trip point

Flow Coefficients (Cv)
Depends on flow path (shown in figure 3) as follows:
Port A to Port B and Port D to Port E: 0.5
Port B to Port C and Port E to Port F: 0.6

Body Connections
1/4 NPT internal

Temperature Capabilities
Nitrile Diaphragms and O-Rings: -40 to 82°C (-40 to 180°F)
Fluorocarbon Diaphragms and O-Rings: -18 to 104°C (0 to 220°F)

Volume Tank Maximum Internal Working Pressure
(for 377D, 377U, 377CW and 377CCW trip valves)
Standard: 10.3 bar (150 psig) for non-ASME approved applications
ASME Approved Applications: Rated 10.3 bar (150 psig), maximum; 9.3 bar (135 psig), recommended

Volume Tank Sizing
See sizing section
Note: Volume tank capacity values are nominal values only. Actual volume may vary slightly due to tolerances within the volume tank and supplier variability.

Hazardous Area Classification
Complies with the requirements of ATEX Group II Category 2 Gas and Dust

Ex h IIC Tx Gb
Ex h IIIC Tx Db

Maximum surface temperature (Tx) depends on operating conditions
Gas: T4, T5, T6
Dust: T85...T104

377 SST
Safety Instrumented System Classification
SIL 3 capable - certified by exida Consulting LLC

Mounting
Top-Mounted: Manifold-mounted between a 3570 positioner and a 480 actuator (manifolds cannot be supplied with 585C, 685, 1061, 1066, and 1069 piston actuators)
Side-Mounted: Yoke-mounted or bracket-mounted for use with a FIELDVUE™ DVC6200, DVC6200f, DVC6200p, DVC6000, or DVC6000f digital valve controller

Approximate Weight
Trip Valve
Aluminum: 0.95 kg (2.1 pounds)
Stainless Steel: 2.31 kg (5.1 pounds)
Mounting Manifold: 0.5 kg (1.2 pounds)
Volume Tank: Varies between 5.4 and 363 kg (12 and 800 pounds) depending on size

1. The pressure/temperature limits in this document and any applicable standard or code limitation should not be exceeded.
2. If the trip point is not specified, the trip point is factory-set at 72 percent of supply pressure or 2.8 bar (40 psig), whichever is higher.
3. Values represent nominal Cv measures for each port pair using a trip valve/actuator combination.
4. This tank is rated at 14.5 bar (240 psig) in LP service. When used with air, the rating should be considered to be 10.3 bar (150 psig), consistent with the maximum pressure allowed for the 377 trip valve.

Figure 1. Maximum Trip Point Settings

Safety Certification

The 377 SST is certified for use in Safety Instrumented System (SIS) applications. Certification is by exida Consulting LLC, a global provider of functional safety and control system security (see figure 2). SIS certification is identified on the product by a label affixed to the pilot body.

The functional safety assessment was performed to the requirements of IEC 61508: ed2, 2010, SIL3 for mechanical components.

Figure 2. exida Certificate
Principle of Operation

377D Trip Valve

In normal operation, supply pressure loads the upper diaphragm (see figure 3) of the unit. The valve plug spring keeps the exhaust port closed. Supply pressure also loads the lower diaphragm through the restriction, causing the plug assemblies to move down and isolate ports C and F while connecting port A to B and port D to E.

Normal actuator control pressure flows from the control device to the top of the cylinder through ports A and B and to the bottom of the cylinder through ports D and E. A volume tank is charged to maximum supply pressure through a check valve in order to retain maximum supply pressure in the volume tank if supply pressure drops.

When supply pressure falls below the trip point pressure in the fail-down mode (see figure 4), the exhaust port opens, venting the supply pressure that is loading the lower diaphragm. This causes the upper ports of the plug assemblies to close and shut off normal pressure flow from the control device to the actuator.

Volume tank pressure then flows through ports C and B to the top of the actuator cylinder, while pressure in the bottom of the actuator cylinder is vented through ports E and F. The pressure imbalance created forces the actuator piston down.

When supply pressure is restored, it loads the upper and lower diaphragms, causing the trip valve to reset. The exhaust port closes. The upper ports of the plug assemblies open, and the lower ports close. Normal actuator control pressure flow from the control device is restored through ports A and B and ports D and E. The check valve opens and recharges the volume tank to the maximum supply pressure.
Figure 4. Fisher 377D Trip Valve Shown Tripped
377L Trip Valve

When supply pressure falls below the trip point in the lock-in-last-position mode (see figure 5), the exhaust port opens, venting supply pressure from the lower diaphragm. This causes the upper ports of the plug assemblies to close and the lower ports to open. Since ports C and F are plugged, no pressure change occurs on either side of the actuator piston, and the piston is pressure-locked in position upon loss of supply pressure. No volume tank is necessary in this mode. When supply pressure is restored, the plug assemblies move back into the normal operating position, and supply pressure flows from the control device through ports A and B to the actuator.
Figure 6. Fisher 377U Trip Valve Shown Tripped

**377U Trip Valve**

The fail-up mode of operation (figure 6) is similar to the fail-down mode of operation except that connections to port C and F are reversed. When supply pressure falls below the trip point, the top of the actuator cylinder vents, and volume tank pressure loads the bottom of the actuator cylinder. The pressure imbalance created forces the actuator piston up.

**377CW and 377CCW Trip Valves**

Makes use of the 377D or 377U trip valve configurations, a piston actuator, and volume tank with check valve to move the piston actuator to either the up or down position. Requires the actuator and valve configuration for actual clockwise or counterclockwise movement.
Volume Tank Sizing

Notes

State and local regulations may require the use of ASME-approved volume tanks. It is the user’s responsibility to determine requirements and applicable regulations for proper volume tank selection.

Volume tank capacity values are nominal values only. Actual volume may vary slightly due to tolerances within the volume tank and supplier variability.

Several different tanks of varying capacities are available. The volume tank must be selected so that its pressure at any time is greater than the minimum percentage of maximum supply pressure required to stroke the actuator (see figure 7).

Figure 7. Volume Tank Sizing Graph

1. Size the volume tank as indicated below:

   For Actuators on Sliding Stem Valves, Determine:  
   \[
   Y = \frac{F}{AP} \times 100
   \]

   For Actuators on Rotary-Shaft Valves, Determine:  
   \[
   Y = \frac{P_r}{P} \times 100
   \]

   Where:

   \( Y \) = Minimum failure positioning percentage
   \( F \) = Actuator thrust required in normal operation to position the valve at the desired limit of travel
   \( A \) = Effective piston area (from the appropriate actuator bulletin)
   \( P \) = Maximum supply pressure available
   \( P_r \) = Highest pressure required by the actuator to stroke the valve (from the appropriate actuator sizing technique)

2. With the minimum failure positioning percentage obtained in step 1, enter the value on the abscissa of the graph in figure 7. Locate the corresponding point on the curve, and read across to find the volume ratio, \( R \).

3. Determine:

   \[
   V_T = \frac{(XA)}{R}
   \]

   Where:

   \( X \) = Maximum actuator travel from the appropriate actuator bulletin. For rotary actuators, substitute total displacement (XA). Actuator displacement can be found in the product bulletin, or contact your Emerson sales office.
   \( V_T \) = Minimum volume tank size required
   \( R \) = Volume ratio from step 2

Note

Volume tank capacity values are nominal values only. Actual volume may vary slightly due to tolerances within the volume tank and supplier variability.
Installation

The 377 trip valve may be mounted in any position without affecting normal operation. Dimensions are shown in figure 8 and tables 1 and 2.

Ordering Information

When ordering specify:

Application

1. Available supply pressure
2. Actuator type number and size
3. Aluminum or stainless steel construction
4. Input signal range
5. Operating ambient temperature
6. Trip point (If the trip point is not specified, the unit is factory-set to trip at 72 percent of supply pressure or 2.8 bar (40 psig), whichever is higher.)
7. Volume tank size

Trip Valve

Refer to the specifications. Review the information under each specification and in the referenced figures. Specify the desired choice wherever there is a selection to be made. Be sure to specify the type number as described in the Available Configurations specification.

Refer to table 3 for guidelines on specifying the correct trip valve.
