Smart Wireless Gateway
NOTICE

Read this manual before working with the product. For personal and system safety, and for optimum product performance, make sure you thoroughly understand the contents before installing, using, or maintaining this product.

Within the United States, Emerson Process Management has two toll-free assistance numbers:

Global Service Center
Software and Integration Support
1-800-833-8314 (United States)
+63-2-702-1111 (International)

Customer Central
Technical support, quoting, and order-related questions.
1-800-999-9307 (7:00 am to 7:00 pm CST)

North American Response Center
Equipment service needs.
1-800-654-7768 (24 hours—includes Canada)
Outside of the United States, contact your local Emerson Process Management representative.

WARNING

The products described in this document are NOT designed for nuclear-qualified applications. Using non-nuclear qualified products in applications that require nuclear-qualified hardware or products may cause inaccurate readings.

For information on Rosemount nuclear-qualified products, contact your local Emerson Process Management Sales Representative.

SAFETY MESSAGES

Instructions and procedures in this manual may require special precautions to ensure the safety of the personnel performing the operations. Information that potentially raises safety issues is indicated by a warning symbol (⚠). Please refer to these safety messages before performing an operation preceded by this symbol.

**WARNING**

Failure to follow these installation guidelines could result in death or serious injury.

- Make sure only qualified personnel perform the installation.

Explosions could result in death or serious injury.

- Verify that the operating atmosphere of the device is consistent with the appropriate hazardous locations certifications.

Electrical shock could cause death or serious injury.

- Use extreme caution when making contact with the leads and terminals.

INTRODUCTION

The Smart Wireless Gateway connects WirelessHART™ self-organizing networks with host systems and data applications. Modbus communications over RS-485 or Ethernet provide universal integration and system interoperability. The optional OPC functionality from the Gateway offers a means to connect to newer systems and applications while providing a richer set of data.

The Smart Wireless Gateway provides industry leading security, scalability, and data reliability. Layered security ensures that the network stays protected. Additional devices can be added at anytime. There is no need to configure communication paths because the Gateway manages the network automatically. This feature also ensures that WirelessHART field devices have the most reliable path to send data.
What is Included?
The box containing the Smart Wireless Gateway will contain several items essential to the complete installation and operation of the Gateway.

- Smart Wireless Gateway
- Quick Installation Guide
- Software pack, 2 disk set
- Crossover cable, Ethernet
- Mounting hardware
- Conduit plugs, 4
- Conduit adapters (optional)

If an optional remote antenna has been ordered, it will be in a separate box containing:

- Remote mount antenna
- Mounting hardware
- Lightning arrestor
- Cable (1 or 2 pieces that total 50 ft, [15,2 m] in length)
- Weatherproof tape

MANUAL

This manual will help to install, configure, operate, and maintain the Gateway.

Section 1 – Overview
This section introduces the product and describes what components may be found in the box. It also includes details for services and support as well as return and disposal of the product.

Section 2 – Initial Connection
This section describes how to connect to the Gateway for the first time and what settings should be configured before placing it on a live control network. It is important to note that some Gateways are used in stand-alone applications and do not reside on a network. In these cases it is still important to configure the items outlined in this section.

Section 3 – Mounting and Connection
This section describes how to properly mount the Gateway and make electrical connections, including electrical wiring, grounding, and host system connections. This section also describes how to mount the optional remote antenna.

Section 4 – Software Setup
This section describes the installation and setup of the optional software included with the Smart Wireless Gateway. This software will aid in secure host integration as well as wireless field device configuration.

Section 5 – Host Integration
This section describes how to connect the Gateway to a host system and integrate data gathered from the field device network. It covers network architectures, security, and data mapping.

Section 6 – Troubleshooting
This section provides troubleshooting tips as well as information to contact technical support over the phone or through email.

Section 7 – Glossary
The glossary defines terms used throughout this manual or that appear in the web interface of the Smart Wireless Gateway.
Appendices

The appendices provide additional and more specific information on a variety of subjects including Product Specifications and Product Certifications.

SERVICE SUPPORT

Global Service Center
Software and Integration Support
- United States: 1 800 833 8314
- International: 63 2 702 1111

Customer Central
Technical Support, quoting, and order related questions
- United States: 1 800 999 9307 (7:00 a.m. to 7:00 p.m. CST)
- Asia Pacific: 65 6777 8211
- Europe/Middle East/Africa: 49 8153 9390

RETURN OF MATERIALS

To expedite the return process outside of North America, contact your Emerson Process Management representative.

Within the United States, call the Emerson Process Management Response Center toll-free number 1 800 654 7768. The center, which is available 24 hours a day, will assist you with any needed information or materials.

The center will ask for product model and serial numbers, and will provide a Return Material Authorization (RMA) number. The center will also ask for the process material to which the product was last exposed.

WARNING

Individuals who handle products exposed to a hazardous substance can avoid injury if they are informed of, and understand, the hazard. If the product being returned was exposed to a hazardous substance as defined by OSHA, a copy of the required Material Safety Data Sheet (MSDS) for each hazardous substance identified must be included with the returned goods.

PRODUCT RECYCLING/DISPOSAL

Recycling of equipment and packaging should be taken into consideration and disposed of in accordance with local and national legislation/regulations.
Section 2  Initial Connection

OVERVIEW

This section describes how to connect to the Gateway for the first time and what settings should be configured before placing it on a live control network. It is important to note that some Gateways are used in stand-alone applications and do not reside on a network. In these cases it is still important to configure the items outlined in this section.

Before the Gateway can be permanently mounted and connected to a live control network, it needs to be configured with an IP address. This is done by forming a private network between the gateway and a PC/Laptop. The following items are needed to complete this section:

- Gateway
- PC/Laptop
- Crossover Cable (supplied with the Gateway)
- 24 Vdc power supply

NOTE

If the Gateway was ordered with the DeltaV™ Ready option, it has been configured to operate on a DeltaV control network, and the Initial Configuration Section does not need to be completed. Only setting the password is required.
SYSTEM REQUIREMENTS

The following requirements apply to the PC/Laptop used to configure the Gateway. Additional requirements may apply if using the optional Security Setup Utility or AMS® Wireless Configurator. See Section 4: Software Setup on page 4-1 for more information.

Web Browser Applications

• Mozilla® Firefox® 1.5 or higher
• Microsoft Internet Explorer® 6.0 or higher

Ethernet

• 10/100base-TX Ethernet communication protocol

INITIAL SETUP

Prepare PC/Laptop

The PC/Laptop will need to be configured to form a private network before communicating to the Gateway. The network settings can be found in the control panel of the PC/Laptop. To configure these settings:

1. Find and open the Control Panel. (It is generally found from the Start Menu.)
2. Open Network Connections.
3. Select Local Area Connection.
4. Right click the mouse and select Properties from the list.
5. Select Internet Protocol (TCP/IP), and choose the Properties button.
6. From the General tab, select Use the following IP address button.
7. Set the IP Address to 192.168.1.12 and press the Tab button.
8. A Subnet mask of 255.255.255.0 should fill in automatically.
9. Click OK to close the Internet Protocol (TCP/IP) window.
10. Click Close on the Local Area Connection window.

Internet proxies will need to be disabled through the PC/Laptop’s default internet browser.

1. Find and open the default internet browser (typically Microsoft Internet Explorer).
2. Find the Tools menu and select Internet Options.
3. From the Connections tab, click the LAN Settings button.
4. Under Proxy Server the boxes for Automatically Detect Settings and Use a proxy server for your LAN should be unchecked.
5. Click OK to close the Local Area Network (LAN) Settings window.
6. Click OK to close the Internet Options window.

The PC/Laptop is now set up to form a private network and to communicate with the Gateway.

NOTE:
Connecting to the Gateway’s secondary Ethernet port will require different network settings. Please see Table 2-1 for additional network settings.
Table 2-1. Default IP Addresses

<td>10.5.255.254</td>
</tr>
<tr>
<td>Ethernet 2 (DeltaV Ready)</td>
<td>10.9.255.254</td>
</tr>
</tbody>
</table>

Connections and Power

Physically connect the PC/Laptop to the Gateway with the supplied crossover cable by connecting one end to the Ethernet port on the back of the PC/Laptop. Connect the other end to the Ethernet 1 port on the Gateway. Figure 2-1 shows the standard terminal block diagram. Once the Gateway and PC/Laptop are connected wire a 24 Vdc power supply with a capacity of at least 250 mA to the Gateway power input terminals.

When making physical connections to the Gateway it is important to use the electrical conduit entries located on the bottom of the housing. Connecting through the open terminal block cover (the lower cover) may stress the connections and damage the Gateway.
Configure the Gateway

It is now possible to log into the Gateway for the first time and begin configuration for placement on a live control network. The following items need to be configured:

- Security Passwords
- Time Settings
- TCP/IP Network Settings

Use the following procedure to log in to the Gateway:

1. Open a standard web browser (typically Microsoft Internet Explorer).
2. Enter 192.168.1.10 in the address bar
3. Acknowledge the security to proceed.
4. Enter admin for User Name.
5. Enter default for the Password.

The web browser will now be directed to the Gateway’s default home page. There is a navigation menu located on the left hand side with four main areas.

- Diagnostics: View status of communications, client server parameters, and more
- Monitor: Screens created by the user to view data from field devices
- Explorer: Basic view of values from field devices
- Setup: Configure the Gateway for operations, security, and host system integration

Security Passwords

There are four role based user accounts for the gateway with varying levels of access. The table below describes this access.

<table>
<thead>
<tr>
<th>Role</th>
<th>User Name</th>
<th>Web Interface Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executive</td>
<td>exec</td>

<td></td>
<td>Set home page options</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Configure custom point pages</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Restart applications</td>
</tr>
</tbody>
</table>

Each of the initial passwords for the user accounts is default. It is recommended, for security purposes, that these passwords are changed. The administrator password should be appropriately noted when changed, if it is lost, please contact Emerson Process Management for technical support.
To change the User Accounts Passwords:

1. Navigate to Setup>Security>User accounts.
2. Set the new password for each role based user account, and confirm.
3. Click Submit.

Figure 2-2. User Accounts

Time Settings

The Gateway is the timekeeper for the WirelessHART network, so it is imperative that the Gateway’s time is accurate for timestamp data to be meaningful. Time settings can be found by navigating to Setup>Time.

There are three ways to set the Gateway time:

1. Network Time Protocol (recommended). This option uses a Network Time Protocol (NTP) server to slowly adjust the Gateway’s time in order to match the time of the control network. Enter the IP address for the NTP server and select the packet version (1, 2, 3, or 4).
2. Set with PC Time. This option will match the Gateway’s time to that of the PC/Laptop.
3. Manual Entry. This option allows the user to enter a specific date (MM:DD:YY) and time (HH:MM:SS).

NOTE
Network Time Protocol (NTP) is recommended for the best network performance because it always adjusts time to match the network time server.
Prior to the gateway being installed and connected to a live control network, it should be configured with an IP address, as well as other TCP/IP network settings.

Request the following configuration items from the network administrator:

- Specify an IP address, or use a DHCP server
- Hostname
- Domain Name
- IP address
- Netmask
- Gateway

Obtaining an IP address from a DHCP server is not recommended, since the Gateway operation will be dependant on the availability of the DHCP server. For maximum gateway availability it is best practice to specify an IP address.
To change the TCP/IP Network Settings:

1. Navigate to **Setup>Internet protocol**.
2. Select **Specify an IP address** (recommended).
3. Enter the following:
   - Hostname
   - Domain Name
   - IP Address
   - Netmask
   - Gateway
4. Click **Submit**.
5. When prompted, click **Restart apps**.
6. Click **Yes** to confirm restart.
7. Close the web browser.

**NOTE**
Once the IP Address of the Gateway has been changed, communications to the web interface will be lost. The web browser should be restarted, and then log back into the Gateway using the new IP address and other TCP/IP network settings. The PC/Laptop TCP/IP network settings may need to be changed.

Figure 2-4. Ethernet Settings
System Backup

The Gateway has a System Backup and Restore feature that saves all user-configured data. It is best practice that a System Backup be performed periodically throughout the installation and configuration process.

1. Navigate to **Setup>System Backup>Save.**
2. Click **Save Configuration.**
3. The Gateway collects configuration date and when the file download pop up appears, click **Save.**
4. Enter a save location and file name.
5. Enter **Save.**
6. Click **Return to form.**

**NOTE**
System backup contain user passwords and keys used for encrypting communication. Store downloaded system backups in a secure location.
Section 3  Mounting and Connection

OVERVIEW

This section describes how to properly mount the Gateway and make electrical connections, including electrical wiring, grounding, and host system connections. This section also describes how to mount the optional remote antenna.

General Considerations

The Smart Wireless Gateway may be mounted in any General Purpose location. Be sure the covers are secured tightly to prevent exposure of any electronics to moisture and contamination.

The Gateway should be mounted in a location that allows convenient access to the host system network (process control network) as well as the wireless field device network.
Physical Description

For dimensional drawing information refer to Appendix A: Product Specifications. The cast aluminum housing encloses the electronics circuitry of the Gateway. The front of the enclosure has an upper cover and a junction box cover. The upper cover provides access to the electronics and radio. The junction box cover provides access to the terminal block.

To open either cover, use a ¼-in. bladed screwdriver to remove the appropriate screw on the unhinged side of the enclosure.

Mounting

Find a location where the Gateway has optimal wireless performance. Ideally this will be 15-25 ft. (4.6 - 7.6 m) above the ground or 6 ft. (2 m) above obstructions or major infrastructure. Figure 3-1 show an example gateway installation.

Figure 3-1. Gateway Installation

Pipe Mount

The following hardware and tools are needed to mount the Gateway to a 2-in. pipe:

- Two 5/16-in. u-bolts (supplied with Gateway)
- 2-in. mounting pipe
- ½-in. socket-head wrench

Mount the Gateway using the following procedure:

1. Insert one u-bolt around the pipe, through the top mounting holes of the Gateway enclosure, and through the washer plate.
2. Use a ½-in. socket-head wrench to fasten the nuts to the u-bolt.
3. Repeat for the second u-bolt and the lower mounting holes.
The following hardware and tools are needed to mount the Gateway to a support bracket:

- Four $\frac{15}{16}$-in. bolts
- Mounting support bracket
- $\frac{3}{8}$-in. drill
- $\frac{1}{2}$-in. socket-head wrench

Mount the Gateway using the following procedure:

1. Drill four $\frac{3}{8}$-in. (9.525 mm) holes spaced 3.06-in. (77 mm) apart horizontally and 11.15-in. (283 mm) apart vertically in the support bracket, corresponding with the holes on the Gateway enclosure.
2. Using a $\frac{1}{2}$-in. socket-head wrench, attach the Gateway to the support bracket with four $\frac{15}{16}$-in. bolts.
The Remote Mount Antenna options provide flexibility for mounting the Gateway based on wireless connectivity, lightning protection, and current work practices.

**WARNING**

When installing Remote Mount Antennas for the Smart Wireless Gateway, always use established safety procedures to avoid falling or contact with high-power electrical lines. Install Remote Antenna components for the Smart Wireless Gateway in compliance with local and national electrical codes and use best practices for lightning protection. Before installing, consult with the local area electrical inspector, electrical officer, and work area supervisor.

The Smart Wireless Gateway Remote Antenna options are specifically engineered to provide installation flexibility while optimizing wireless performance and local spectrum approvals. To maintain wireless performance and avoid non-compliance with spectrum regulations, do not change the length of cable or the antenna type.

If the supplied Remote Mount Antenna kit is not installed per these instructions, Emerson Process Management is not responsible for wireless performance or non-compliance with spectrum regulations.

All Remote Mount Antenna kits include weatherproof tape for the cable connections as well as mounting kits for the lightning arrestor and antenna. See Table 3-1 for specifications for each remote antenna kit option.

<table>
<thead>

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Find a location where the remote antenna has optimal wireless performance. Ideally this will be 15-25 ft. (4.6 - 7.6 m) above the ground or 6 ft. (2 m) above obstructions or major infrastructure. To install the remote antenna use one of the following procedures:

**WL2 option**

1. Mount the antenna on a 2-in. pipe mast using the supplied mounting equipment.
2. Connect the lightning arrestor directly to the top of the Gateway.
3. Connect the antenna to the lightning arrestor using the LMR-400 coaxial cable.
4. Use the weatherproofing tape to seal each connection between the Gateway, lightning arrestor, cable, and antenna.
WL3 / WL4 option

1. Mount the antenna on a 2-in. pipe mast using the supplied mounting equipment.
2. Mount the lightning arrester using the supplied mounting equipment. Minimize the distance between the arrester and the egress into the building for optimal lightning protection.
3. Connect the Gateway, lightning arrester, and antenna using the LMR-400 coaxial cables.
4. Use the weatherproofing tape to seal each connection between the Gateway, lightning arrester, cables, and antenna.

Any spare lengths of coaxial cable should be placed in 12-in. (0.3 m) coils. Also ensure that the mounting mast and lightning arrester are grounded according to local/national electrical code. See the following mounting example:

**Figure 3-3. Remote Antenna Installation**

![Remote Antenna Installation Diagram]

**NOTE**
Be sure to apply weatherproof tape to all remote antenna connections. The tape provided is self-fusing silicon tape which must be stretched during application in order to form a proper seal. This tape is intended for single use, do not reuse.

**CONNECTING**

All connections to the Gateway can be made at the terminal block, which is located in the lower junction box section of the enclosure. The terminal block label is located on the inside of the lower cover. See Figure 3-4 for the standard terminal block label and Figure 3-5 for the fiber optic terminal block label.

The junction box portion of the enclosure has four conduit entries for power and communications wiring. Do not run communication wiring in conduit or open trays with power wiring, or near heavy electrical equipment.
Install the included conduit plugs in any unused conduit openings. For NEMA 4X and IP65 requirements, use thread seal (PTFE) tape or paste on male threads to provide a watertight seal.

**Grounding**

The Gateway enclosure case should always be grounded in accordance with national and local electrical codes. The most effective grounding method is a direct connection to earth ground with minimal impedance. Ground the Gateway by connecting the external grounding lug to earth ground. The connection should be 1 Ω or less. The external ground lug is located below the Gateway enclosure and is identified by the following symbol:

![Grounding Symbol]

**Ethernet**

The Gateway is equipped with two 10/100 Based-TX Ethernet communications ports (see Figure 3-4). These connections can be used to access the Gateway’s web interface and to communicate Modbus TCP and OPC protocols.

The primary Ethernet port (Ethernet 1) is used to connect to the host system or other application systems. The secondary Ethernet port (Ethernet 2) can be used as a back up connection or a maintenance port for local access to the Gateway.

**Figure 3-4. Terminal Block Diagram**

![Terminal Block Diagram]

Ethernet connections should use Cat5E shielded cable to connect to an Ethernet hub, switch, or router. The maximum cable length should not exceed 328 ft. (100 m).

**NOTE**

Unless dual Ethernet ports were specified at the time of order, the secondary Ethernet port (Ethernet 2) will not be active.

**Fiber Optic Connection (optional)**

The Gateway may be ordered with an optional fiber optic connection (Figure 3-5). This interface can use the same communications protocols as the Ethernet interface. The fiber optic connection is the primary interface and Ethernet 2 is the secondary interface.
The fiber optic connection uses SC type connectors with a push-pull latching mechanism for quick connection and removal. It requires 1300 nm wavelength multi-mode cable. The maximum cable length should not exceed 2.48 miles (4.0 km).

**RS-485**

The Gateway may be ordered with an optional RS-485 (serial) connection (Figure 3-4). It is referenced by the A and B Serial Modbus terminals. This connection is used to communicate Modbus RTU on an RS-485 data bus.

Use 18 AWG single twisted shielded pair wiring to connect the Gateway to the RS-485 data bus. The total bus length should not exceed 4000 ft. (1220 m). Connect the Tx + (positive, transmit) wire to terminal A and the Rx - (negative, receive) wire to terminal B. The wiring shield should be trimmed close and insulated from touching the Gateway enclosure or other terminations.

If the existing data bus uses a 4 wire Full Duplex configuration, see Figure 3-6 to convert to a 2-wire Half Duplex configuration.
Terminating Resistors

Three DIP switches are provided to enable various terminating resistors to the RS-485 data bus. The switches are found inside the electronics housing near the top center of the main circuit board (Figure 3-7).

Switches 1 and 3 are connected to pull-up and pull down resistors. Switch 1 is for the Tx + (A) line and Switch 3 is for the Rx – (B) line. These 470 Ω resistors are used to prevent noise from being interpreted as valid communications during periods when no actual communications are occurring. Only one set of pull-up and pull-down resistors should be active on the RS-485 data bus at time.

Switch 2 is connected to a 120 Ω terminating resistor. This resistor is used to dampen signal reflections on long cable runs. RS-485 specifications indicate that the data bus should be terminated at both ends (Figure 3-8). However termination should only be used with high data rates (above 115 kbps) and long cable runs.

Figure 3-8. Typical Half Duplex (2-wire) Network
Power

The Gateway is designed to be powered by 24 Vdc (nominal) and requires 250 mA of current. The positive and negative connections are found on the left side of the terminal block (Figure 3-4). An additional case ground is found on the left side of the junction box enclosure.

Connect supply power to the positive + and negative – power terminals found on the left side of the terminal block (Figure 3-4). An additional internal case ground can be found on the left side of the enclosure. The wiring should include an external power shut-off switch or circuit breaker that is located near the Gateway.

NOTE
Using an uninterruptible power supply (UPS) is recommended to ensure availability should there be a loss of power.
Section 4  Software Setup

OVERVIEW

This section discusses the installation and setup of the optional software included with the Smart Wireless Gateway. This software is not required for the wireless field network to operate; however, it will aid in secure host integration as well as wireless field device configuration. The following table describes what items are installed and on which disk they can be found.

Table 4-1. Software Applications

<td>Business, Service Pack 1 or 2</td>
</tr>
<tr>
<td>Windows Server 2008</td>
<td>Standard, Service Pack 1 or 2</td>
</tr>
</tbody>
</table>

Note: Only 32-bit versions of the operating systems are supported.

SOFTWARE INSTALLATION

The software can be found on the 2 disk pack, included with the Gateway. Depending on the PC system configuration, installation may take 30-35 minutes. Installing both disks in order is recommended. The Security Setup Utility is located on Disk 1. To install the software:

1. Exit/close all Windows programs, including any running in the background, such as virus scan software.
2. Insert Disk 1 into the CD/DVD drive of the PC.
3. Follow the prompts.

AMS Wireless Configurator is located on Disk 2. To install the software:

1. Exit/close all Windows programs, including any running in the background, such as virus scan software.
2. Insert Disk 2 into the CD/DVD drive of the PC.
3. Click **Install** from the menu when the AMS Wireless Configurator setup begins.
4. Follow the prompts.
5. Allow AMS Wireless Configurator to reboot PC.
6. Do not remove the disk from the CD/DVD drive.
7. Installation will resume automatically after login.
8. Follow the prompts.

**NOTE:**
If the autorun function is disabled on the PC, or installation does not begin automatically, double click D:\SETUP.EXE (where D is the CD/DVD drive on the PC) and click OK.

SECURITY SETUP UTILITY

The Security Setup Utility enables secure communications between the Gateway and host system, asset management software, data historians, or other applications. This is done by encrypting the standard data protocols (AMS, Modbus TCP, and OPC) used by the Gateway and making them available through various proxies within the Security Setup Utility. These proxies can function as a data server for other applications on the control network. The Security Setup Utility can support multiple Gateways at once and each proxy can support multiple client application connects. Figure 4-1 shows a typical system architecture using the Security Setup Utility.
NOTE:
OPC communications requires the use of the Security Setup Utility regardless of whether encryption is required.

Setup

In the Security Setup Utility add a new proxy for each Gateway based on the communication protocol is being used. For example, add an OPC proxy for each Gateway that is communicating OPC.

Use the following procedure to add a new proxy in the Security Setup Utility:

1. Open the Security Setup Utility.
2. Click EDIT>NEW, then select the type of new proxy to be added.
3. Right click on the new proxy entry and select Properties.
4. Enter the target Gateway’s Hostname and IP Address.
5. Click OK.
6. Click FILE>SAVE.
7. When prompted for authentication, enter the admin password for the target Gateway.
8. Click OK.
9. Repeat steps 2-8 to added additional proxies.
10. Click FILE>EXIT to close the Security Setup Utility.
During this process the Gateway will exchange security certificates (digital signatures) with the proxy.

Figure 4-2. Security Setup Utility

AMS WIRELESS CONFIGURATOR

AMS Wireless Configurator helps deploy and configure wireless field devices. It provides an integrated operating environment that leverages the full capabilities of WirelessHART, including embedded data trending, charting, and graphical display capabilities provided by enhanced EDDL technology.

- Display and modify device configuration
- View device diagnostics
- View process variables
- Provision a wireless device using the drag-and-drop operation so it can join a Gateway’s self-organizing network
- Enhance AMS Wireless Configurator functionality with the AMS Wireless SNAP-ON Application
- Restrict access to AMS Wireless Configurator functions through the use of security permissions

See the release notes for information specific to the current release of AMS Wireless Configurator. To display the release notes, select START>PROGRAMS>AMS WIRELESS CONFIGURATOR>HELP.

Setup

AMS Wireless Configurator supports connectivity to a Wireless Network and a HART Modem. Both of these interfaces must be configured through the Network Configuration application. To run this application, select START>PROGRAMS>AMS DEVICE MANAGER>NETWORK CONFIGURATION.

NOTE:
Do not have the Security Setup Utility running at the same time as the Network Configuration application or else a configuration error might occur.
Use the following procedure to configure a wireless network for AMS Wireless Configurator:

1. Open the Network Configuration application.
2. Click Add…
3. Select Wireless Network and click Install…
4. Click Next.
5. Enter a name for the wireless network and click Next.
6. Enter the HostName or IP Address for the Gateway and click Add.
7. Repeat step 6 if multiple Gateways need to be added.
8. Check the box to Enable Secure Communications with the Smart Wireless Gateway.
9. Click Finish to close the configuration window.
10. Click Close to exit the Network Configuration application.

Figure 4-3. Wireless Network in the Network Configuration

Use the following procedure to configure a HART modem for AMS Wireless Configurator:

1. Open the Network Configuration application.
2. Click Add…
3. Select HART modem and click Install…
4. Click Next.
5. Enter a name for the HART modem and click Next.
6. Select the Hart master type (default is AMS will be Primary HART master) and click Next.
7. Select the COM port for the HART modem and click Next.
8. Check the box to Check to support Multi Drop devices.
9. Check the box to Include WirelessHART Adapter.
10. Click Finish to close the configuration window.
11. Click Close to exit the Network Configuration application.
LICENSING AND CREDITS

The latest licensing agreements are included on each disk of the software pack.

Section 5  Host Integration

Overview ................................................................. page 5-1
Network Architecture ............................................. page 5-1
Internal Firewall ....................................................... page 5-3
Modbus ................................................................. page 5-4

OVERVIEW

This section describes how to connect the Gateway to a host system and integrate data gathered from the field device network. It covers network architectures, security, and data mapping.

NETWORK ARCHITECTURE

Physical connection types are important when determining the network architecture and what protocols can be used for integration. Ethernet is the primary physical connection type. Fiber Optic and RS485 are available as optional connection types. The following network architecture diagrams will help when integrating data from the Gateway into the host system.

Ethernet

An Ethernet connection supports Modbus TCP, OPC, AMS, and HART TCP protocols. Using this connection type, the Gateway is wired directly to a control network (see Figure 5-1) using a network switch, router, or hub. Often there are two networks for redundancy purposes.

Figure 5-1. Ethernet Architecture
Fiber Optic (Optional)

A Fiber Optic connection supports Modbus TCP, OPC, AMS, and HART TCP protocols. Using this connection type, the Gateway is wired to a fiber optic switch (see Figure 5-2). Please note that a redundant fiber optic connection is not available.

RS485 (serial)

An RS485 connection supports Modbus RTU protocol. Using this connection type, the Gateway is wired to an RS485 bus which typically leads to a serial I/O card or Modbus I/O card (see Figure 5-3). Up to 31 Gateways can be connected to a single I/O card in this manner.
Figure 5-3. RS485 Architecture

INTERNAL FIREWALL

The Gateway supports an internal firewall that inspects both incoming and outgoing data packets. TCP ports for communication protocols are user configurable, including user specified port numbers and the ability to disable ports.

The Gateway’s internal firewall settings can be found by navigating to Setup>Security>Protocols.
MODBUS

The Gateway supports both Modbus RTU over the RS-485 serial port and Modbus TCP over Ethernet. It functions as a sub device on the Modbus network and must be polled by a Modbus master or client (host system).

Communication Settings

It is important that the Modbus communication settings in the Gateway match the setting in the Modbus master or client. Please refer to host system documentation for more information on how to configure these settings. The Modbus communication settings can be found by navigating to Setup>Modbus>Communications.

Figure 5-5. Modbus Communications Page

One Modbus Address: When this option is selected, this address is used by the Gateway for Modbus RTU communications.

Multiple Modbus Addresses: When this option is selected, a new column for address will appear on the Modbus mapping page.

Modbus TCP Port: This is the TCP/IP port the Gateway uses for Modbus TCP (Ethernet). To change TCP/IP port settings, see the Internal Firewall section for more details.

Baud Rate: The data rate or speed of serial communications. This setting is only required for Modbus RTU.

Parity: This setting determines parity (none, even, or odd) to use for error checking purposes. This setting is only required for Modbus RTU.

Stop Bits: This setting determines the number (1 or 2) of stop bits to use when ending a message. This setting is only required for Modbus RTU.

Response delay time (ms): This setting determines how long (ms) the Gateway waits before responding to a Modbus request. This setting is only required for Modbus RTU.
Unmapped register read response?: This is the value returned by the Gateway if the Modbus master requests a register with no data assigned to it (empty register). It is recommended this be set to zero fill to prevent errors.

Floating point representation: This setting determines if the Gateway uses floating point values or integer values. There are three options for this setting.

- Float: This option uses 32 bit floating point values.
- Round: This option rounds the data value to the nearest whole number.
- Scaled: This option uses scaled integers to offset negative values or increase decimal point resolution. The equation for scaled integers is:

  \[ y = Ax - (B - 32768) \]

Where:

- \( y \) = Scaled integer returned by the Gateway
- \( A \) = Gain for scaled integer value
- \( x \) = Measured valued from wireless field device
- \( B \) = Offset for scaled integer value

Use swapped floating point format?: This setting switches which register is sent first for a floating point value. This setting is only used for floating point values.

Incorporate value’s associated status as error?: This setting will cause the Gateway to report a predetermined value when a communications or critical diagnostic error is received from the wireless field device. The value is user configurable depending on which floating point representation is chosen. See Value reported for error below.

Value reported for error (floating point): This setting determines what value is reported if the wireless field device reports a failure or stops communicating to the Gateway. This setting is used for floating point values. The choices are NaN (not a number), +Inf (positive infinity), -Inf (negative infinity), or Other (user specified).

Value reported for error (rounded and native integer): This setting determines what value is reported if the wireless field device reports a failure or stops communicating to the Gateway. This setting is used for rounded or scaled integers. The choice is a user specified value between -32768 and 65535.

Scaled floating point maximum integer value: This determines the maximum integer value for the purpose scaling integers. 999-65534

Use global scale gain and offset?: This setting determines if a global gain and offset is applied for scaled integers or if each value has a unique gain and offset. Unique gain and offsets are found on the Modbus Mapping page.

Global scale gain: This value is multiplied to the data values for the purpose of scaling integers. If global scaling is not selected, a gain value will be available for each separate data value on the Modbus Mapping page.

Global scale offset: This value is added to the data values for the purpose of scaling integers. If global scaling is not selected, an offset value will be available for each separate data value on the Modbus Mapping page.
Register Mapping

Register Mapping is the process of assigning data points from wireless field devices to Modbus registers. These registers can then be read by a Modbus master or client. Modbus register mapping can be found by navigating to Setup>Modbus>Mapping.

To add a new data point to the Modbus register map:

1. Click New entry.
2. Complete all of the table entries for the new data point (note that the entry columns may vary based on the Modbus communications settings).
3. Repeat for each new data point.
4. Click Submit.
5. When changes have been accepted, click Return to form.

**Address:** This is the Modbus RTU address used by the Gateway for this data point. It is possible to group data points assigning them the same address (i.e. all data points from the same process unit can have the same address). This column only appears if Multiple Modbus Addresses is selected on the Modbus Communications page.

**Register:** This is the Modbus register number used for this data value. Modbus registers hold two bytes (16 bits) of information; therefore 32 bit floats and integers require two Modbus registers. Each data point needs a unique Modbus register number, unless they are assigned different addresses. Register numbers 0-19999 are reserved for Boolean (bit, coil, binary, etc…) values. Register numbers 20000+ are reserved for floating point or integer values.

**Point Name:** This is a two part name for the data point. The first part is the HART Tag of the wireless field device which is producing the data. The second part is the parameter of the wireless field device.

Point Name is entered as <HART Tag>.PARAEMTER>. Point Name can be entered using the list of values (…) or manual entered. The following table gives a list of standard device parameter which may be considered for Modbus register mapping.
Table 5-1. Device parameters available via Modbus

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>PV</td>
<td>Primary Variable</td>
<td>32 bit float</td>
</tr>
<tr>
<td>SV</td>
<td>Secondary Variable</td>
<td>32 bit float</td>
</tr>
<tr>
<td>TV</td>
<td>Tertiary Variable</td>
<td>32 bit float</td>
</tr>
<tr>
<td>QV</td>
<td>Quaternary Variable</td>
<td>32 bit float</td>
</tr>
<tr>
<td>RELIABILITY</td>
<td>A measure of connectivity to the Gateway</td>
<td>32 bit float</td>
</tr>
<tr>
<td>ONLINE</td>
<td>Wireless communications status</td>
<td>Boolean</td>
</tr>
<tr>
<td>PV_HEALTHY</td>
<td>Health status for PV</td>
<td>Boolean</td>
</tr>
<tr>
<td>SV_HEALTHY</td>
<td>Health status for SV</td>
<td>Boolean</td>
</tr>
<tr>
<td>TV_HEALTHY</td>
<td>Health status for TV</td>
<td>Boolean</td>
</tr>
<tr>
<td>QV_HEALTHY</td>
<td>Health status for QV</td>
<td>Boolean</td>
</tr>
</tbody>
</table>

PV, SV, TV, and QV (dynamic variables) will vary by device type. Please refer to the device’s documentation for more information on for what value is represented by each dynamic variable.

RELIABILITY and ONLINE relate to wireless communications. RELIABILITY is the percentage of messages received from the wireless field device. ONLINE is a true/false indication of whether the device is communicating on the wireless network.

**_HEALTHY parameters are a true/false indication of the health of a particular variable (** = dynamic variable – PV, SV, etc…). These parameters incorporate critical diagnostics from the wireless field device as well as communication status.

**NOTE:**
The **_HEALTHY parameters are a great indication of the health and communications status of the data values.

**State (state value):** The value of a data point which drives a Modbus output of 1. For example if a data point is reported as either True or False, a state value of True will report a 1 for True and 0 for False. A state of False will report a 0 for True and a 1 for False. State is only required for register numbers 0-19999 (Boolean, bit, coil, binary, etc…).

**Invert:** This check box will invert the Modbus output from a 1 to a 0 or a 0 to a 1. Invert is only used for Boolean values using register numbers 0-19999.

**Gain:** This value is multiplied to the data value for the purpose of scaling integers. Gain is only required if scaled is chosen on the Modbus communications page and globe gain and offset is not chosen.

**Offset:** This value is added to the data value for the purpose of scaling integers. Offset is only required if scaled is chosen on the Modbus communications page and globe gain and offset is not chosen.

**Predefined Modbus Registers**

In addition to user configurable parameters, the Gateway also supports a list of predefined Modbus registers with diagnostics and test parameters. The following table is a list of the predefined Modbus registers.
Table 5-2. Predefined Modbus Registers

### AMS Wireless Configurator

<table>
<thead>
<tr>
<th>Issue</th>
<th>Solution</th>
</tr>
</thead>
</table>
| Gateway does not appear in AMS Wireless Configurator | 1. Verify the Security Setup Utility is installed on the same PC as AMS Wireless Configurator.  
2. Setup a wireless network interface using the Network Configuration application. See Section 4 Software Setup.  
3. Verify if the wireless network interface is configured for Secure Gateway Communications.  
4. Verify secure/unsecure AMS protocol settings in the Gateway. Log on to the Gateway and navigate to SETUP > SECURITY > PROTOCOLS.  
5. Restart AMS data server. Right click on AMS server icon in the Windows system tray (lower right corner) and select stop server. |
| Wireless devices do not appear under the Gateway | 1. Verify wireless devices are connected to the Gateway. Log on to the Gateway and navigate to EXPLORER.  
2. Right click on wireless network and select rebuild hierarchy. |
| Wireless device appears with red HART symbol | 1. Install latest device support files from AMS. Go to www.emersonprocess.com > BRANDS > AMS SUITE > AMS DEVICE MANAGER > DEVICE DESCRIPTION (DDs). |
| Device configuration items are grayed out | 1. Verify whether current or historical information is being displayed. This setting is displayed at the bottom of each device configuration screen. Configuration requires the Current setting.  
2. For security purposes a configuration timeout is applied to sessions that have been idle for more than 30 minutes. Log back into AMS Wireless Configurator. |

### Wireless Field Devices

<table>
<thead>
<tr>
<th>Issue</th>
<th>Solution</th>
</tr>
</thead>
</table>
| Wireless device does not appear on the network | 1. Verify the device has power.  
2. Verify the device is within effect communications range.  
3. Verify the proper Network ID has been entered into the device |
| Wireless device appears in the join failure list | 1. Re-enter the Network ID and Join Key into the device. |
| Wireless device appears with service denied | 1. Verify the total number of devices on the network (100 max).  
2. Go to SETUP > NETWORK > BANDWIDTH and click analyze bandwidth (Note: any changes will require the network to reform)  
3. Reduce the update rate for the device. |

### Modbus Communications

<table>
<thead>
<tr>
<th>Issue</th>
<th>Solution</th>
</tr>
</thead>
</table>
| Can not communicate using Modbus RTU | 1. Verify the use of RS-485  
2. Verify wiring connections. See Section 3 Mounting and Connections.  
3. Verify if termination is required.  
4. Verify that Modbus serial communications setting in the Gateway match the Modbus Host settings. Log on to the Gateway and navigate to SETUP > MODBUS > COMMUNICATIONS.  
5. Verify the Modbus address for the Gateway  
6. Verify Modbus register mapping in the Gateway. Log on to the Gateway and navigate to SETUP > MODBUS > MAPPING. |
| Can not communicate using Modbus TCP | 1. Verify secure / unsecure Modbus protocol settings in the Gateway. Log on to the Gateway and navigate to SETUP > SECURITY > PROTOCOLS.  
2. Verify the Modbus TCP communications settings in the Gateway. Log on to the Gateway and navigate to SETUP > MODBUS > COMMUNICATIONS.  
3. Verify Modbus register mapping in the Gateway. Log on to the Gateway and navigate to SETUP > MODBUS > MAPPING. |
| Can not communicate using secure Modbus TCP | 1. Verify the Security Setup Utility has been installed.  
2. Configure a Secure Modbus Proxy for the Gateway. See Section 4 Software Setup.  
3. Verify secure / unsecure Modbus protocol settings in the Gateway. Log on to the Gateway and navigate to SETUP > SECURITY > PROTOCOLS.  
4. Verify the Modbus TCP communications settings in the Gateway. Log on to the Gateway and navigate to SETUP > MODBUS > COMMUNICATIONS.  
5. Verify Modbus register mapping in the Gateway. Log on to the Gateway and navigate to SETUP > MODBUS > MAPPING. |
### OPC Communications

<table>
<thead>
<tr>
<th>Issue</th>
<th>Solution</th>
</tr>
</thead>
</table>
| OPC application can not find a Gateway                                  | 1. Verify the Security Setup Utility has been installed on the same PC as the OPC application.  
2. Configure an OPC proxy for the Gateway. See Section 4 Software Setup. |
| Gateway OPC server does not show any Gateways                          | 1. Configure an OPC proxy for the Gateway. See Section 4 Software Setup. |
| Gateway OPC server does not show any data tags                          | 1. Configure the Gateway OPC Browse Tree. Log on to the Gateway and navigate to SETUP > OPC > OPC BROWSE TREE.  
2. Verify the connection status for the OPC proxy in the Security Setup Utility.  
3. Verify if the OPC proxy is configured for secure or unsecure communications.  
4. Verify secure / unsecure OPC protocol settings in the Gateway. Log on to the Gateway and navigate to SETUP > SECURITY > PROTOCOLS.  
5. Verify network firewall and port settings. |
# Section 7  Glossary

This glossary defines terms used throughout this manual or that appear in the web interface of the Smart Wireless Gateway.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Control List</td>
<td>A list of all devices that are approved to join the network. Each device will also have a unique join key. Also referred to as a white list.</td>
</tr>
<tr>
<td>Active Advertising</td>
<td>An operational state of the network manager that causes the entire wireless field network to send messages looking for new or unreachable devices to join the network.</td>
</tr>
<tr>
<td>Baud Rate</td>
<td>Communication speed for Modbus RTU</td>
</tr>
<tr>
<td>Burst Rate</td>
<td>The interval in which a wireless field device transmits measurement and status data to the Gateway. Same as Update Rate.</td>
</tr>
<tr>
<td>Certificate</td>
<td>A digital signature used to authenticate a client/server while using encrypted communications.</td>
</tr>
<tr>
<td>Connectivity</td>
<td>Typically refers to a combination of communication statistics and link reliability of a wireless field device. May also refer to the connection between the Gateway and the Host System.</td>
</tr>
<tr>
<td>Device ID</td>
<td>A hexadecimal number that provides unique device identification.</td>
</tr>
<tr>
<td>DHCP</td>
<td>Dynamic Host Configuration Protocol: Used to automatically configure the TCP/IP parameters of a device.</td>
</tr>
<tr>
<td>Domain</td>
<td>A unique designator on the internet comprised of symbols separated by dots such as: this.domain.com</td>
</tr>
<tr>
<td>Gateway</td>
<td>Refers to the Smart Wireless Gateway.</td>
</tr>
<tr>
<td>HART Tag</td>
<td>The device’s electronic tag that the Gateway uses for all host integration mapping. Refers to the HART long tag (32 characters, used for HART 6 or 7 devices) or the HART message (32 characters, only used for HART 5 wired devices connected via a WirelessHART adapter)</td>
</tr>
<tr>
<td>Host Name</td>
<td>A unique designator in a domain associated with the IP address of a device such as: device.this.domain.com. In that example the hostname is device</td>
</tr>
<tr>
<td>HTML</td>
<td>Hyper Text Markup Language: The file format used to define pages viewed with a web browser.</td>
</tr>
<tr>
<td>HTTP</td>
<td>Hyper Text Transfer Protocol: The protocol that defines how a web server sends and receives data to and from a web browser.</td>
</tr>
<tr>
<td>HTTPS</td>
<td>HTTP over an encrypted Secure Sockets Layer (SSL)</td>
</tr>
<tr>
<td>Join Failure</td>
<td>When a wireless field device fails to join the WirelessHART network. Most join failures are due to security reasons (missing or incorrect join key, not on access control list, etc.)</td>
</tr>
<tr>
<td>Join Key</td>
<td>Hexadecimal security code that allows wireless field devices to join the wireless field network. This code must be identical in the device and the Gateway.</td>
</tr>
<tr>
<td>Latency</td>
<td>The time from when a message leaves a wireless field device until it reaches the Gateway.</td>
</tr>
<tr>
<td>Netmask</td>
<td>A string of 1's and 0's that mask out or hide the network portion of an IP address leaving only the host component.</td>
</tr>
<tr>
<td>Network I.D.</td>
<td>Numeric code that associates wireless field devices to the Gateway. This code must be identical in the device and the gateway.</td>

Appendix A  Product Specifications

---

**FUNCTIONAL SPECIFICATIONS**

**Input Power**
- 19.2-28.8 VDC
- 150 milliamps for continuous operation. 250 milliamps required to power the Smart Wireless Gateway.

**Environmental**
- Operating Temperature Range: -40 to 158 °F (-40 to 70 °C)
- Operating Humidity Range: 10-90% relative humidity

**EMC Performance**
- Complies with EN61326-1:2006.

**Antenna Options**
- Integrated Omnidirectional Antenna
- Optional remote mount Omnidirectional Antenna

---

**PHYSICAL SPECIFICATIONS**

**Weight**
- 10 lbs. (4,54 kg)

**Material of Construction**
**Housing**
- Low-copper aluminum, NEMA 4X

**Paint**
- Polyurethane

**Cover Gasket**
- Silicone Rubber

**Antenna**
- PBT/PC integrated Omnidirectional Antenna

**Certifications**
- Class I Division 2 (U.S.)
- Equivalent Worldwide
COMMUNICATION SPECIFICATIONS

Isolated RS485
2-wire communication link for Modbus RTU multidrop connections
Baud rate: 57600, 38400, 19200, or 9600
Protocol: Modbus RTU
Wiring: Single twisted shielded pair, 18 AWG. Wiring distance is approximately 4000 ft. (1,524 m)

Ethernet
10/100base-TX Ethernet communication port
Protocols: Modbus TCP, OPC, HART-IP, https (for Web Interface)
Wiring: Cat5E shielded cable. Wiring distance 328 ft. (100 m).

Fiber Optic Ethernet (optional)
100BaseFx optical Ethernet communication port
Wavelength: 1300 nm center
Multimode
SC connectors
Protocols: Modbus, TCP, OPC, HART-IP, https (for Web Interface)
Wiring: 50/125 um or 62.5/125 um fiber, 2.48 miles (4.0 km) maximum distance.

Modbus
Supports Modbus RTU and Modbus TCP with 32-bit floating point values, integers, and scaled integers.
Modbus Registers are user-specified.

OPC
OPC server supports OPC DA v2, v3

SELF-ORGANIZING NETWORK SPECIFICATIONS

Protocol
WirelessHART, 2.4 - 2.5 GHz DSSS.
Maximum Network Size
100 devices @ 8 sec.
50 devices @ 4 sec.

Supported Device Update Rates
4 sec. to 60 min.

Network Size/Latency
100 Devices: less than 10 sec.
50 Devices: less than 5 sec.

Data Reliability
>99%
**SYSTEM SECURITY SPECIFICATIONS**

<table>

<tr>
<th><strong>Ethernet</strong></th>
<th>Secure Sockets Layer (SSL) enabled (default) TCP/IP communications</th>
</tr>
</thead>
</table>

**Smart Wireless Gateway Access**
Role-based Access Control (RBAC) including Administrator, Maintenance, Operator, and Executive. Administrator has complete control of the Gateway and connections to host systems and the self-organizing network.

**Self-Organizing Network**
AES-128 Encrypted WirelessHART, including individual session keys. Drag and Drop device provisioning, including unique join keys and white listing.

**Internal Firewall**
User Configurable TCP ports for communications protocols, including Enable/Disable and user specified port numbers. Inspects both incoming and outgoing packets.

- Lower Cover
  - Remove for Electrical Connections
  - Dimensions: 3.51 (89), 2.96 (75)

- Ground Lug
  - Dimensions: 3.08 (78), 1.59 (40)

- 1/2 inch NPT Conduit Connection
  - Dimensions: 4.78 (121), 6.72 (171)

- Dimensions in millimeters:
  - Lower Cover: 75, 71.4
  - Ground Lug: 78, 40
  - 1/2 inch NPT Conduit Connection: 121, 171
Remote Omni-Antenna Kit

The Remote Omni-Antenna kit includes sealant tape for remote antenna connection, as well as mounting brackets for the antenna, Lightning Arrestor, and the Smart Wireless Gateway.

*Lightning protection is included on all the options. WL3 and WL4 provide lightning protection along with the ability to have the gateway mounted indoors, the antenna mounted outdoors, and the lightning arrestor mounted at the building egress.*

*Note that the coaxial cables on the remote antenna options WL3 and WL4 are interchangeable for installation convenience.*

**Typical Model Number:** 1420 A 2 A3 A 2 N5
(1) Single active 10/100 baseT Ethernet port with RJ45 connector.
(2) Additional ports disabled.
(3) Dual active 10/100 baseT Ethernet ports with RJ45 connectors.
(4) Multiple active ports have separate IP addresses, firewall isolation, and no packet forwarding.
(5) 1300nm Multimode Optical fiber connection with separate SC connectors for Rx and Tx.
(6) Includes features of Option 1.
(7) Convertible to RS232 via adaptor, not included with Gateway.
(8) Includes Webserver, Modbus TCP, AMS Ready, and OPC.
(9) Includes Webserver, Modbus TCP, and AMS Ready.
(10) The WL2 - WL4 options require minor assembly.

Appendix B  Product Certifications

Approved Manufacturing Locations ........................... page B-1
Telecommunication Compliance .............................. page B-1
FCC and IC .......................................................... page B-1
Ordinary Location Certification for FM ....................... page B-1
European Union Directive Information ....................... page B-2

APPROVED MANUFACTURING LOCATIONS

Rosemount Inc. – Chanhassen, Minnesota, USA
Emerson Process Management GmbH & Co. - Karlstein, Germany
Emerson Process Management Asia Pacific Private Limited - Singapore
Beijing Rosemount Far East Instrument Co., Limited - Beijing, China

TELECOMMUNICATION COMPLIANCE

All wireless devices require certification to ensure that they adhere to regulations regarding the use of the RF spectrum. Nearly every country requires this type of product certification. Emerson is working with governmental agencies around the world to supply fully compliant products and remove the risk of violating country directives or laws governing wireless device usage.

FCC AND IC

This device complies with Part 15 of the FCC Rules. Operation is subject to the following conditions. This device may not cause harmful interference. This device must accept any interference received, including interference that may cause undesired operation. This device must be installed to ensure a minimum antenna separation distance of 20 cm from all persons.

ORDINARY LOCATION CERTIFICATION FOR FM

As standard, the Gateway has been examined and tested to determine that the design meets basic electrical, mechanical, and fire protection requirements by FM, a nationally recognized testing laboratory (NRTL) as accredited by the Federal Occupational Safety and Health Administration (OSHA).

North American Certifications

N5  FM Division 2, Non-Incendive
    Certificate Number: 3028321
    Nonincendive for Class I, Division 2, Groups A, B, C, and D.
    Suitable for Class II, III, Division 2,
    Groups E, F, and G; Indoors/outdoor locations;
    Type 4X
    Temperature Code: T4 (-40 °C < Ta < 60 °C)

Canadian Standards Association (CSA)

N6  CSA Division 2, Non-Incendive
    Certificate Number: 1849337
    Suitable for Class I, Division 2, Groups A, B, C, and D.
    Install per Rosemount drawing 01420-1011.
    Temperature Code: T4 (-40 °C < Ta < 60 °C)
    CSA Enclosure Type 4X
EUROPEAN UNION DIRECTIVE INFORMATION

The EC declaration of conformity for all applicable European directives for this product can be found on the Rosemount website at www.rosemount.com. A hard copy may be obtained by contacting your local sales representative.

ATEX Directive (94/9/EC)
Emerson Process Management complies with the ATEX Directive.

Electro Magnetic Compatibility (EMC) (2004/108/EC)
Emerson Process Management complies with the EMC Directive.

Emerson Process Management complies with the R&TTE Directive

European Certification

N1 ATEX Type n
Certificate Number: Baseefa 07ATEX0056X
ATEX Marking: Ⓡ II 3 G
Ex nA nL IIC T4 (-40 °C < T_a < 60 °C)

Special condition for safe use (X):
The surface resistivity of the antenna is greater than one gigaohm. To avoid electrostatic charge build-up, it must not be rubbed or cleaned with solvents or a dry cloth.

The Apparatus is not capable of withstanding the 500V insulation test required by Clause 9.4 of EN 60079-15: 2005. This must be taken into account when installing the apparatus.

ND ATEX Dust
Certificate Number: Baseefa 07ATEX0057
ATEX Marking: Ⓡ II 3 D
Ex tD A 22 IP66 T135 (-40 °C < T_a < 60 °C)
Maximum working voltage = 28 V
N7  IECEx Type n
Certificate Number: IECEx BAS 07.0012X
Ex nA nL IIC T4 (-40 °C <= T_a <= 60 °C)
Maximum working voltage = 28 V

**Special condition for safe use (X):**

The surface resistivity of the antenna is greater than one gigaohm. To avoid electrostatic charge build-up, it must not be rubbed or cleaned with solvents or a dry cloth.

The Apparatus is not capable of withstanding the 500V insulation test required by Clause 9.4 of EN 60079-15: 2005. This must be taken into account when installing the apparatus.

NF  IECEx Dust
Certificate Number: IECEx BAS 07.0013
Ex tD A22 IP66 T135 (-40 °C < T_a < 60 °C)
Maximum working voltage = 28 V

**Combinations of Certifications**

**KD**  Combination of N5, N6, and N1.
Appendix C  Delta V Ready

OVERVIEW
Native integration with DeltaV enables the Smart Wireless Gateway to be autosensed and easily commissioned for seamless integration with all DeltaV applications: Explorer, Diagnostics, and Control Studio. WirelessHART devices can be easily added to the wireless field network and then reconciled through DeltaV Explorer and assigned to analog channels through drag and drop assignment.

REQUIREMENTS
DeltaV:
Version 10.3 or newer.

Smart Wireless Gateway:
DeltaV Ready option (Data Protocol option 5). Appendix A: Ordering Information

MOUNTING AND CONNECTING
Mount the DeltaV Ready Gateway in the same manner as a standard Gateway. (Section 3: Mounting and Connection on page 3-1). The Gateway should be mounted in a location that allows convenient access to the DeltaV control network as well as the wireless field network.

Connect the Gateway’s primary Ethernet port (Ethernet 1) into the DeltaV primary control network. If the dual Ethernet option (Physical Connection code 2) was ordered with the Gateway, connect the secondary Ethernet port (Ethernet 2) into the DeltaV secondary control network.
Out of the box the Smart Wireless Gateway is pre-configured for use on the DeltaV control network. In the DeltaV Explore application, the Gateway will automatically appear in the Decommissioned Nodes folder.

To setup a wireless network will require 3 steps:

1. Commission the Gateway
2. Assign wireless device tags
3. Assign Gateway to controller and download
Commission the Gateway using the following procedure:

1. Click **START>PROGRAMS>DELTAV>ENGINEERING> DELTAV EXPLORE** to launch the DeltaV Explorer application.
2. Expand the folder **SYSTEM CONFIGURATION >PHYSICAL NETWORK>DECOMMISSIONED NODES**.
3. Right click on the Smart Wireless Gateway and select **Commission**.
4. Enter a name for the Gateway and click **OK**.
5. Click **YES** when prompted to Auto-Sense Wireless Gateway.

At this time the Reconcile I/O window will appear. The purpose of this screen is to assign WirelessHART devices to DeltaV I/O channel. This allows the wireless device to be referenced in other DeltaV applications like Control Studio.

Assign wireless device tags using the following procedure:

1. Drag and Drop WirelessHART device from the **Unassigned Wireless HART Devices**: list to the **Channels**: list.
2. Repeat this process for each wireless device until all have been assigned.
3. Click **OK** to continue.

Next the Gateway will need to be assigned to a DeltaV Controller and download all. Assign and download the Gateway using the following procedure:

1. Right click on the Gateway and select **Assign**…
2. Use the browse window and select the desired controller
3. Click **OK** to close the assignment window
4. Right click on the Gateway and select **Download**
5. Follow the download dialog
6. Click **OK** to close the down load window
Now the Gateway and wireless devices are fully commissioned and available to use in other DeltaV applications. When new devices are added to the wireless network they will need to be assigned to DeltaV channels through the reconcile process (right click on Gateway and select configure IO).

**NOTE:**
Logging in to the Gateway is not possible using the default TCP/IP network setting. If the Gateway is decommissioned, use an IP address 10.5.255.254. If the Gateway is commissioned right click on the Gateway in DeltaV Explore and select Wireless Gateway Web Interface.
