Clean-In-Place (CIP) Applications in the Pharmaceutical and Food and Beverage Industries

Results
- Eliminate Cross-Batch Contamination
- Maintain Hygienic Standards
- Asset Protection
- Water Use Optimization

Background
Process piping and vessels used in the pharmaceutical and food and beverage industries require periodic cleaning without disassembly to remove residue from previous batches and to sanitize both the process piping and vessels. Depending upon the industry and the particular products involved, the cleaning can involve alternately flushing with water, caustic solutions, acid solutions, sanitizing (bleach) solutions, and steaming to kill microorganisms.

The 245 Sanitary Flow-Through Toroidal Conductivity Sensor mounts directly into the cleaning lines via tri-clamp flanges. Toroidal sensor technology seldom requires cleaning and features smooth surfaces, unlike contacting conductivity sensors. Therefore, toroidal sensors are the ideal choice for CIP installations.

The Measurement
One of the major requirements for equipment and sensors used in CIP applications is that they be sanitary in design. This means that the surface of a sensor should not contain contours or crevices that could trap residue from the product, that could then decay or harbor microorganisms.

In the high flow, low pressure system, a cascading action serves to clean the lower portions of the process vessels. A typical CIP program entails the following:

1. A pre-rinse with RO-treated water, consisting of three bursts, each of a one-minute duration to remove the bulk of the soil load
2. A continuous 30-minute wash of from 0.5 % to 1.0 % alkaline detergent at 180 °F (82 °C)
3. A one-minute rinse with RO-treated water
4. A 30-second rinse (sometimes ten minutes or more is requisite) of from 0.5 % to 1.0 % nitric or phosphoric acid solution at 150 °F – 180 °F (65 °C – 82 °C)
5. A two-minute rinse with RO-treated water to remove the phosphoric acid residues
6. A final one-minute rinse with deionized water
Instrumentation

1056 Conductivity Analyzer
- Single or dual input
- NEMA 4X (IP65) weatherproof, corrosion-resistant enclosure
- Two isolated current outputs
- Easy to use menu structure
- USP alarm available

245 Clean-in-Place Toroidal Conductivity Sensor
- Toroidal (inductive) principle measurement of construction
- Meets 3-A sanitary standards
- GRAS List wetted materials (PEEK, EP, and 316L stainless steel)

1066 Conductivity Analyzer
- Large easy-to-read process measurements, user-definable display of measurement diagnostic parameters
- Digital Communications – HART® version 7 and FOUNDATION® fieldbus communication protocols available for host monitoring and configuration
- Intuitive menu screens with advanced diagnostics and help screens
- Two 4–20 mA current outputs are standard on the 1066 HART
