Optimize production and boost profitability while keeping your people safe.

Refining Solutions
Leverage Emerson’s valves, actuators, regulators, and services to reduce emissions and improve the safety, production, and reliability of your refinery.
Operating more efficiently is difficult with changing environmental responsibilities.

Refineries, more than most process facilities today, are tasked with environmental, safety, and social responsibilities that make it harder than ever to stay profitable. It’s critical to keep personnel safe in hazardous environments, but it is becoming more difficult to hire and retain qualified local personnel as the experienced workforce continues to retire.

On top of this, meeting production volume targets is essential to staying afloat in a competitive market. But, fleet inefficiencies create operating constraints that put production at risk, and unscheduled shutdowns and slowdowns make meeting those targets and contract commitments virtually impossible.

“We’re staffed to run, not staffed to change.”
–Refinery Operations Manager, North America

Refining is much more than just a technical operation. It’s subject to a strong business constraint: meeting market demand.
–Independent Refiner

Many refiners believe that regulatory changes, like IMO, will present a medium to major disruption to the industry.
–OilandGas360.com, 2019
Stay ahead of the competition by responding to market conditions with greater flexibility.

In today’s changing energy market, refiners are under increasing pressure to implement operational flexibility. Emerson’s solutions make it easier for operators to safely meet demand while lowering operating costs, reduce unplanned slowdowns and shutdowns, and adapt to new clean fuels regulations.

Produce cleaner fuels to reduce emissions and energy use.
- Access comprehensive consulting expertise to identify and correct all energy-related issues
- Implement pre-packaged energy-saving solutions quickly with global support

“Fisher™ Control-Disk™ valves have enabled our compressors and chillers to run smoothly, with less loading and unloading energy required.”
– Process Engineer, CAMECO

Train and equip personnel to be more efficient and decrease overall operating costs.
- Utilize proven solutions to improve awareness of and response to imminent asset failures
- Run units at capacity and adapt to changing process conditions with maximum yields

In 2017 alone, more than 19,900 students participated in relevant product or industry training through Emerson’s Educational Services team—offered from 80+ global service locations and taught by 300+ certified instructors.

Better prioritize maintenance requirements to operate more reliably and increase availability.
- Digital installed base asset recording and tracking creates turnaround execution efficiency
- Valve Condition Monitoring and diagnostic analysis allows for data-driven maintenance planning

With wireless THUM adapters, previously stranded diagnostic information was made available to the refinery’s information database and distributed to the staff responsible for maintaining the assets, enabling them to act before a process interruption.
– Refinery in California, USA
Refining Solutions

Crude Distillation
• Meet product specifications, minimize energy use, and improve throughput. ► p5

Hydroprocessing
• Increase product yield and prolong the life of your catalyst. ► p7
• Improve yield, extend catalyst life, and mitigate reactor temperature excursions. ► p7

Fluidized Catalytic Cracking
• Reduce steam usage while maintaining quality with improved distillation control. ► p9

Catalytic Reformer
• Ensure reformer availability for hydrogen generation and high-octane gasoline component. ► p11

Hydrogen Generation
• Optimize hydrogen production and improve the reliability of your hydrogen purification process. ► p13

Delayed Coker
• Maximize higher-value cut points and improve safety by streamlining your coke removal process. ► p15

Sulfur Recovery
• Maintain refinery throughput while ensuring availability and safe operation. ► p17

Tanks
• Improve inventory insight, quality tracking, and safety. ► p19
Fluidized Catalytic Cracking Solutions
Reduce Fluidized Catalytic Cracking (FCC) complexity to convert low value heavy oils to higher value products. ► p9

Hydroprocessing Solutions
Address low and ultra-low sulfur diesel requirements while adding product yield flexibility. ► p7

Crude Distillation Solutions
Minimize product quality variation, off-spec production, and energy-consumption per unit of feed to increase column throughput. ► p5

Hydrogen Generation Solutions
Meet increasing hydrogen demand and purity requirements to fulfill downstream requirements. ► p13

Delayed Coker Solutions
Maximize higher value cut points and improve safety by streamlining coke removal process. ► p15

Sulfur Recovery Solutions
Maintain reliable and safe combustion control and reduce the effects of corrosion. ► p17

Catalytic Reformer Solutions
Maintain optimum naphtha reformer performance and consistent intermediates for downstream petrochemical availability. ► p11

Tank Solutions
Manage tanks and terminals more efficiently to achieve better inventory insight, quality control, and safety. ► p19
Crude Distillation Solutions

The atmospheric crude distillation unit (CDU) is the first processing unit in a refinery downstream of the desalter. The unit is a complex column that fractionates crude oil into the basic product streams. These intermediate product streams from the crude distillation unit can vary widely depending on the refinery operating objectives.

What’s your opportunity?

- Consistently meet sidecut specifications, minimize energy use, and improve throughput
- Reduce product quality variation and off-spec production
- Increase recovery of more valuable products
- Maximize feed rate upon demand
- Increase column throughput

Ensure on-spec quality and throughput.
With Emerson’s advanced control solutions for crude distillation units, combined with best-in-class measurement capabilities, you’ll consistently save energy costs while minimizing disturbances and reducing quality giveaway.

Crude Unit Application Solutions Guide

Services offered...
- Valve Condition Monitoring time series analysis
- Control valve calibration
- Regulator configuration and repair
- Pressure relief valve configuration and repair
- Technology upgrades and retrofit
- Product and system training
- Pressure relief valve spare pool management
- Valve sizing and selection
Featured Crude Distillation Solutions

**Fisher Feed Valve to Furnace**
Obtain tight shutoff and precise flow of heavy gas oil feed into the furnace with a valve designed for streamlining flow passages.
- An eccentric plug minimizes contact with the seat ring when opening, reducing friction and elongating the life of the valve
Fisher V500 product webpage ►

**Fisher Pump-Around Valve**
Extract heat from the column efficiently for pump-around applications.
- This valve will provide optimal performance and separation between product draws, reducing the variability in quality specifications
Fisher easy-e ED product webpage ►

**Fisher Fuel Gas Valve**
Precisely control the flow of fuel to heat the charge heaters with a valve solution designed to reduce process variability.
- Designed to provide excellent shutoff to help avoid temperature swings in the heater and efficiently process feed further downstream
Fisher Control-Disk product webpage ►

**Anderson Greenwood™ Desalter Overpressure Protection**
Achieve stable relief regardless of flashing liquids or where they occur, optimize operations to prevent unnecessary releases to the flare, and improve the safety system lifecycle.
- Dampening feature provides additional protection from water hammer
Anderson Greenwood Series 200/400 webpage ►

**Vanessa™ Triple Offset Valve**
Isolate fuel and feed stock lines with ultimate dependability. These valves provide reliable, repeatable, zero leakage shutoff.
- The metal-seated, triple-offset geometry provides excellent shut-off and rapid stroke times
Vanessa 30,000 Series product webpage ►

**Fisher Burner and Pilot Gas Regulator**
Ensure efficient and steady fuel gas supply pressure during start-up and continuous operation from the fuel gas header.
- Pilot-operated burner regulator
- Self-operated pilot gas regulator
- Fast speed of response
Fisher 1098 Series product webpage ►

**Fisher Digital Isolation™ Solutions**
Reduce systematic failures and operational costs of crude distillation with a fully integrated and verified SIL 3 valve solution.
- Applied diagnostic coverage
- Standardized solution decreases engineering and execution time
Fisher Digital Isolation TOV webpage ►

**Fisher Fuel Gas Header Regulator**
Maintain constant fuel gas header pressure throughout the process unit with precise pressure control.
- Pilot-operated and fast speed of response
- Noise-attenuation technology

Hydroprocessing Solutions

Hydroprocessing refers to two separate but similar processes: hydrotreating and hydrocracking. The hydrocracker unit is important to meet low sulfur diesel while taking advantage of opportunistic market conditions between gasoline and diesel, so keeping this unit operating reliably and effectively is imperative. Safety is also a challenge with this unit due to high pressures, hydrogen, hydrogen sulfide, fired heaters, and potential reactor temperature excursion. Hydrotreaters are critical in protecting downstream process catalysts, as poor performance can significantly affect product yield and efficiency and potentially require an earlier shutdown for catalyst replacement.

What’s your opportunity?

• Increase quality and yields with better regulatory controls that improve temperature control of the fired heater and hydrogen quench controls
• Improve functioning safety and operate within increasingly stringent environmental regulations with automation solutions that deliver better measurement, control, and diagnostic information
• Meet low sulfur fuel requirements

Maximize uptime with tight reactor bed temperature control and improved downstream catalyst performance.

Emerson’s advanced hydrocracker solutions provide tighter control in the field, more accurate temperature measurements, detection of potential problems, and enhanced insight into the hydrocracker’s performance. Hydrocracker Unit Application Solutions Guide

Using our hydrotreating solutions, you’ll gain the tight control, accurate measurements, and real-time compositional data needed to maximize the yield of higher-value products while reducing the typical operator intervention needed to keep your process running well.

Services offered...

• Startup optimization and performance testing
• Valve Condition Monitoring and analysis
• Control valve online and offline diagnostics
• Regulator configuration and repair
• Pressure relief valve configuration and repair
• Technology upgrades and retrofit
• Product and system training
• Leak detection
• Pressure relief valve spare pool management
• Outgassing valve sizing and selection

Minimize outgassing issues that lead to severe vibration and poor controllability and accelerated trim wear. This trim is ideal for critical, high-pressure letdown applications where long valve and trim life is crucial to keeping the unit running smoothly.

- Staged pressure drops help prevent cavitation and a lower cage separates the flow steam into smaller jets to help avoid erosion
- Pressure profile helps avoid premature outgassing within the valve trim while splitting the flow steam into smaller jets at the valve outlet to prevent vibration

Fluidized Catalytic Cracking Solutions

The Fluid Catalytic Cracking (FCC) is a dynamic and complex process, operating in severe conditions where plugging and catalyst reversal are always a risk. With a significant portion of the refinery’s heavy petroleum being processed in the FCC unit, a slowdown or shutdown can directly impact the refinery’s profitability.

The FCC unit is also an important source of butene and pentene olefins used in refinery processes such as the alkylation unit. As a critical unit in the refinery, the alkylation unit’s optimum operation is essential.

What’s your opportunity?

• Reduce steam usage while maintaining quality with improved distillation control in the gas concentration section
• Reduce FCC complexity to convert low value heavy oils to higher value products
• Size and select the right control valve to prevent catalyst erosion and avoid process interruptions
• Keep assets running reliably in spite of severe reactor and regenerator temperatures

Detect line plugging and catalyst reversal in real time.

Using Emerson solutions for FCC, you’ll have the tight control over your process and real-time measurement accuracy needed to ensure smooth and efficient operation.

Services offered...

• Valve Condition Monitoring and analysis
• Control valve calibration
• Regulator configuration and repair
• Pressure relief valve configuration and repair
• Technology upgrades and retrofit
• Product and system training
• Pressure relief valve spare pool management
• Valve sizing and selection
## Featured Fluidized Catalytic Cracking Solutions

### Fisher Charge Oil Flow Valve

Ensure precise flow control of feedstock into the charge heater, which helps avoid excessive buildup on the heater tubes, maintains outlet temperature, and optimizes reaction performance and efficiency.

- Designed for forward or reverse flow with tight shutoff in either flow direction
- Oversized shaft and rugged trim parts allow for high pressure drops

Fisher CV500 product webpage [►]

### Fisher Charge Pump Spillback Valve Trim

Prevent cavitation in the charge pump with valve trim designed to handle high pressure drops. Reducing cavitation damage means less unscheduled maintenance and longer asset life.

- Valve trim uses a series of flow restrictions and expansions to eliminate cavitation
- Hardened metal seats provide tight shutoff to minimize seat erosion

Fisher anti-cavitation trim solutions webpage [►]

### Anderson Greenwood FCCU Regenerator Protection

Reduce the number of spring valves and associated piping systems by implementing pilot valves with full bore orifices.

- Dual outlets reduce or eliminate the effects of excessive reaction forces to avoid special pipe support structure
- Maximum capacity with non-API standard size
- Pilot purge or ISO-DOME options to isolate catalyst media

Anderson Greenwood Series 400 webpage [►]

### Anderson Greenwood Flowing Pilot Relief Valve

Ensure stability of the Pilot for Steam application by keeping the internal critical pilot evenly warmed.

- Pilot warming consistency prevents steam from condensing within the pilot while the main valve is open, which could result in significant pressure decreases and main valve instability.

Anderson Greenwood Series 500 webpage [►]

### Fisher Main Column Bottoms Valve

Circulate flow from the bottom of the column to the reboiler and back to the column to facilitate separation and ensure proper product specification.

- Streamlined flow passages, rugged components, and a wide choice of erosion-resistant trim materials all promote long, dependable service life in high-viscosity slurry applications

Fisher V500 product webpage [►]

### Fisher Charge Oil Heater Fuel Gas Valve

Maintain discharge temperature of the charge oil as it is injected into the reactor.

- Designed to control non-lubricating, viscous, or other hard-to-handle fluids
- Post guiding stabilizes the valve plug at all points in its travel range to reduce vibration, mechanical noise, and trim wear

Fisher easy-e EZ product webpage [►]

### Vanessa Triple Offset Valve

Handle the fluidized catalyst around the reactor and regenerator with a valve that can manage the lighter end of the cycle oils on the upper parts of the fractionator.

- Inherent zero leakage characteristics preserve costly catalyst and prevent waste of unspent catalyst affecting the performance of the units and associated piping

Catalytic Reformer Solutions

As a primary process unit, the catalytic reformer is essential to providing high-octane gasoline component, petrochemical intermediate feedstock, and hydrogen for the rest of the refinery, and any upset in the reformer can easily cause a slowdown or shutdown in these processes.

What’s your opportunity?

- Maintain optimum catalytic reformer performance and consistent hydrogen availability
- Ensure reformer availability for hydrogen generation and high octane gasoline component

Ensure reliable high-octane component, petrochem intermediates, and hydrogen supply with precise heater control.

With Emerson’s catalytic reformer solutions, you’ll gain precise control of heater outlet temperature to ensure product quality and the accurate asset health measurements needed to ensure your reformer consistently supplies the hydrogen needed.

Services offered...

- Valve Condition Monitoring and analysis
- Control valve calibration
- Regulator configuration and repair
- Pressure relief valve configuration and repair
- Technology upgrades and retrofit
- Product and system training
- Pressure relief valve spare pool management
- Valve sizing and selection
Featured Catalytic Reformer Solutions

**Fisher Catalyst Handling Valve**
Reduce crushing of the catalyst and pressure build up downstream by controlling gravity feed of the catalyst through the valve.
- Specially-designed flow passages eliminate solids accumulation that can hinder valve operation, which can extend the life of the catalyst spheres, reduce maintenance cost, and improve regeneration efficiency
  - Fisher SS 1388 product bulletin ►
  - Fisher SS 2528 product bulletin ►

**Fisher Overtravel Valve Trim**
Reliably control and purge the hydrogen and nitrogen transfer gases.
- Rugged guiding provides high valve plug stability, which reduces vibration and noise
- Unique plug deflector and dual-seat design helps prolong life span and protect against catalyst fines
  - Fisher EZ-OVT product webpage ►

**Fisher Optimized Compressor Antisurge Valve and Accessories**
Protect the compressor from damaging surge events with quick and accurate valve response to immediately recycle the discharge flow.
- The proper valve, actuator, and accessories can help increase compressor throughput, reliability, and efficiency as well as plant uptime
  - Proper Anti-Surge Valve Selection white paper ►

**Fisher Separator Liquid Valve**
Prevent cavitation damage while controlling the separator level and feed of the stabilizer to help ensure products meet their purity targets.
- Hardened trim materials provide excellent wear resistance for longer trim life
  - Fisher NotchFlo™ product webpage ►

**Crosby Blocked Discharge Overpressure Protection**
Meet fugitive emissions requirements for gas and steam applications, like API 526 and 527, with spring-loaded pressure relief valves.
- Styles available for liquid service and two-phase applications
- Metal or soft seats and conventional or balanced bellows options available for more application flexibility
  - Crosby J Series product webpage ►

**Fisher Burner and Pilot Gas Regulator**
Ensure efficient and steady fuel gas supply pressure during start-up and continuous operation from the fuel gas header.
- Pilot-operated burner regulator
- Self-operated pilot gas regulator
- Fast speed of response
  - Fisher MR 95 product webpage ►

**Tartarini Fuel Gas Header Regulator**
Achieve pressure control to maintain a constant fuel gas header pressure throughout the process unit with this pilot-operated regulator.
- Fast speed of response
- Noise-attenuation technology
  - Tartarini FL product webpage ►

Hydrogen Generation Solutions

The hydrocracker, hydrotreaters, and isomerization units rely on a consistent supply of pure hydrogen to avoid slowdowns and shutdowns. Coupled with the need to process heavier and higher sulfur crude slates, generating and managing hydrogen production is more critical than ever.

What’s your opportunity?

• Ensure reliable hydrogen generation and distribution
• Meet increasing hydrogen demand and purity requirements to fulfill downstream requirements
• Increase availability for on-spec hydrogen to maximize constant refinery utilization
• Improve hydrogen purity control, leading to a longer catalyst lifespan

Ensure reliable hydrogen generation and distribution.
Using Emerson hydrogen generation solutions, you can ensure the supply and purity of hydrogen created will enable you to improve hydrocracking, minimize coke laydown, and increase catalyst life and throughput.

Services offered...
• Valve Condition Monitoring and analysis
• Control valve calibration
• Regulator configuration and repair
• Pressure relief valve configuration and repair
• Technology upgrades and retrofit
• Product and system training
• Valve sizing and selection

Delayed Coker Solutions

The coker is an important processing unit for extracting high-value fuel products from the bottom of the oil barrel, but unmonitored disturbances during coke drum switchovers can often lead to process slowdowns or even shutdowns.

Because it is typically one of the “dirtiest” and most high maintenance processes in the refinery, maintaining a safe, healthy environment around the coker is critical. Anything that can be done to increase reliability, lower maintenance costs, and enable higher on-stream time is valuable.

What’s your opportunity?

• Consistently meet side-cut specifications and improve safety by streamlining your coke removal process
• Minimize the cycle time between drum switching
• Achieve an accurate and reliable material balance around the coker, optimizing the unit’s efficiency

Operate your coker safely and efficiently.
Our advanced process control solutions for delayed cokers and fired process heaters can minimize disturbances, optimize temperature control, reduce buildup, and provide a faster transition back to normal operating conditions.

Services offered...
• Valve Condition Monitoring and analysis
• Control valve calibration
• Regulator configuration and repair
• Pressure relief valve configuration and repair
• Technology upgrades and retrofit
• Product and system training
• Valve sizing and selection
## Featured Delayed Coker Solutions

### Fisher Fractionator Reflux Valve

Reduce product variability and maintain safe operating conditions for your coker unit.
- Achieve tight emissions control with excellent shutoff capability
- Reduce vibration and mechanical noise with high valve plug stability
- Prolong asset life with increased wear resistance of hardened stainless steel trim

Visit Fisher easy-e ET product webpage [►](#)

### Fisher Furnace Feed Valve

Achieve precise flow of heavy gas oil feed into the furnace and avoid temperature swings that can lead to excessive coke build up in the furnace tubes.
- Specially selected trim materials and body coatings help to withstand oil sands, furnace feed, and other highly erosive applications

Visit Fisher V500 FFD product webpage [►](#)

### Bettis™ High-Temperature Electric Actuator

Automate valve performance and improve coker Mean Time Between Failure (MTBF) with an actuator proven to execute a valve’s sequential event consistently and reliably.
- Plug-in, printed circuit board technology minimizes wiring
- Easily serviced, modified, or removed using a common screwdriver

Sulfur Recovery Solutions

An imbalance of combustion air in sulfur recovery units could result in too much hydrogen sulfide or sulfur dioxide in the tail gas and possibly cause a shutdown of the entire refinery—and corrosion is an ongoing challenge. Overall refinery throughput can also be negatively impacted if the sulfur being removed is not able to be fully processed.

What’s your opportunity?

• Maintain reliable and safe combustion control and reduce the effects of corrosion
• Avoid limited throughput due to sulfur content

Safely recover sulfur and ensure regulatory compliance.

With Emerson final element solutions, you can help ensure the combustion air ratio is properly controlled to maintain safe and reliable sulfur recovery.

Tank Solutions

Tanks contain large quantities of materials with significant commercial value so it’s important to safeguard quality and control operations related to storage and movements. The rise in the number of products and the increasing customer and market demands have resulted in logistical, environmental, and inventory challenges that can be solved with additional insight from appropriate instrumentation and control systems.

What’s your opportunity?

- Improve the way tanks and terminals are managed by integrating tank gauging systems with the site’s automatic control system
- Enhance visibility of tank status and movements to avoid cross-contaminating product or improper valve alignment
- Expand your process monitoring and automation capabilities
- Improve safety with better alarm management

Improve inventory insight, quality tracking, and safety.

With Emerson’s tank solutions, you can gain better insight into your tank inventory, and detect potential safety and environmental incidents early enough to avoid any product loss.

Services offered...

- Valve Condition Monitoring and analysis
- Regulator configuration and repair
- Pressure relief valve configuration and repair
- Technology upgrades and retrofit
- Product and system training
- Tank walkdown to understand stranded diagnostics
## Featured Tank & Storage Solutions

### Fisher
**Tank Blanketing Regulators**

- Prevent outside air from entering the tank, reducing the possibility of explosion and oxidation.
  - Low set point technology
  - Pilot-operated models provide higher accuracy and capacity
  - Direct-operated models provide fast response

Continuous support in the face of changing market and operating conditions

Emerson leads the way with industry-defining end-to-end digital service experiences, enabling you achieve superior outcomes through our maintenance, reliability, and performance offerings. The tools we’ve developed support the digital transformation of the refining industry, providing the confidence to extract the maximum value from your service and technology investments. Our teams partner with you across the globe to help you maintain safe operation, improve reliability, and optimize plant performance.

With over 100 regional service centers and 60+ mobile service centers worldwide, local experts are available to work with you to understand your unique challenges and enable you to find a solution. Our broad portfolio of service offerings allows us to tailor our support to align with your specific business goals.
