Optimize production and boost profitability while keeping your people safe.

Refining Solutions
Leverage Emerson’s valves, actuators, regulators, and services to reduce emissions and improve the safety, production, and reliability of your refinery.
Operating more efficiently is difficult with changing environmental responsibilities.

Refineries, more than most process facilities today, are tasked with environmental, safety, and social responsibilities that make it harder than ever to stay profitable. It’s critical to keep personnel safe in hazardous environments, but it is becoming more difficult to hire and retain qualified local personnel as the experienced workforce continues to retire.

On top of this, meeting production volume targets is essential to staying afloat in a competitive market. But, fleet inefficiencies create operating constraints that put production at risk, and unscheduled shutdowns and slowdowns make meeting those targets and contract commitments virtually impossible.

“We’re staffed to run, not staffed to change.”
–Refinery Operations Manager, North America

Refining is much more than just a technical operation. It’s subject to a strong business constraint: meeting market demand.
–Independent Refiner

Many refiners believe that regulatory changes, like IMO, will present a medium to major disruption to the industry.
–OilandGas360.com, 2019

Environmental regulations are changing frequently—and becoming more and more restrictive.
Stay ahead of the competition by responding to market conditions with greater flexibility.

In today’s changing energy market, refiners are under increasing pressure to implement operational flexibility. Emerson’s solutions make it easier for operators to safely meet demand while lowering operating costs, reduce unplanned slowdowns and shutdowns, and adapt to new clean fuels regulations.

**Produce cleaner fuels to reduce emissions and energy use.**
- Access comprehensive consulting expertise to identify and correct all energy-related issues
- Implement pre-packaged energy-saving solutions quickly with global support

> “Fisher™ Control-Disk™ valves have enabled our compressors and chillers to run smoothly, with less loading and unloading energy required.”
> – Process Engineer, CAMECO

**Train and equip personnel to be more efficient and decrease overall operating costs.**
- Utilize proven solutions to improve awareness of and response to imminent asset failures
- Run units at capacity and adapt to changing process conditions with maximum yields

> In 2017 alone, more than 19,900 students participated in relevant product or industry training through Emerson’s Educational Services team—offered from 80+ global service locations and taught by 300+ certified instructors.

**Better prioritize maintenance requirements to operate more reliably and increase availability.**
- Digital installed base asset recording and tracking creates turnaround execution efficiency
- Valve Condition Monitoring and diagnostic analysis allows for data-driven maintenance planning

> With wireless THUM adapters, previously stranded diagnostic information was made available to the refinery’s information database and distributed to the staff responsible for maintaining the assets, enabling them to act before a process interruption.
> – Refinery in California, USA
**Refining Solutions**

**Crude Distillation**
- Meet product specifications, minimize energy use, and improve throughput. ► p5

**Hydroprocessing**

Maintain optimum naphtha reformer performance and consistent intermediates for downstream petrochemical availability. ► p11
Crude Distillation Solutions

The atmospheric crude distillation unit (CDU) is the first processing unit in a refinery downstream of the desalter. The unit is a complex column that fractionates crude oil into the basic product streams. These intermediate product streams from the crude distillation unit can vary widely depending on the refinery operating objectives.

What’s your opportunity?

• Consistently meet sidecut specifications, minimize energy use, and improve throughput
• Reduce product quality variation and off-spec production
• Increase recovery of more valuable products
• Maximize feed rate upon demand
• Increase column throughput

Ensure on-spec quality and throughput.
With Emerson’s advanced control solutions for crude distillation units, combined with best-in-class measurement capabilities, you’ll consistently save energy costs while minimizing disturbances and reducing quality giveaway.

Crude Unit Application Solutions Guide

Services offered...

• Valve Condition Monitoring time series analysis
• Control valve calibration
• Regulator configuration and repair
• Pressure relief valve configuration and repair
• Technology upgrades and retrofit
• Product and system training
• Pressure relief valve spare pool management
• Valve sizing and selection

Hydroprocessing Solutions

Hydroprocessing refers to two separate but similar processes: hydrotreating and hydrocracking. The hydrocracker unit is important to meet low sulfur diesel while taking advantage of opportunistic market conditions between gasoline and diesel, so keeping this unit operating reliably and effectively is imperative. Safety is also a challenge with this unit due to high pressures, hydrogen, hydrogen sulfide, fired heaters, and potential reactor temperature excursion. Hydrotreaters are critical in protecting downstream process catalysts, as poor performance can significantly affect product yield and efficiency and potentially require an earlier shutdown for catalyst replacement.

What’s your opportunity?

• Increase quality and yields with better regulatory controls that improve temperature control of the fired heater and hydrogen quench controls
• Improve functioning safety and operate within increasingly stringent environmental regulations with automation solutions that deliver better measurement, control, and diagnostic information
• Meet low sulfur fuel requirements

Maximize uptime with tight reactor bed temperature control and improved downstream catalyst performance.

Emerson’s advanced hydrocracker solutions provide tighter control in the field, more accurate temperature measurements, detection of potential problems, and enhanced insight into the hydrocracker’s performance. Hydrocracker Unit Application Solutions Guide

Using our hydrotreating solutions, you’ll gain the tight control, accurate measurements, and real-time compositional data needed to maximize the yield of higher-value products while reducing the typical operator intervention needed to keep your process running well.

Services offered...

• Startup optimization and performance testing
• Valve Condition Monitoring and analysis
• Control valve online and offline diagnostics
• Regulator configuration and repair
• Pressure relief valve configuration and repair
• Technology upgrades and retrofit
• Product and system training
• Leak detection
• Pressure relief valve spare pool management
• Outgassing valve sizing and selection

Fluidized Catalytic Cracking Solutions

The Fluid Catalytic Cracking (FCC) is a dynamic and complex process, operating in severe conditions where plugging and catalyst reversal are always a risk. With a significant portion of the refinery’s heavy petroleum being processed in the FCC unit, a slowdown or shutdown can directly impact the refinery’s profitability.

The FCC unit is also an important source of butene and pentene olefins used in refinery processes such as the alkylation unit. As a critical unit in the refinery, the alkylation unit’s optimum operation is essential.

What’s your opportunity?

• Reduce steam usage while maintaining quality with improved distillation control in the gas concentration section
• Reduce FCC complexity to convert low value heavy oils to higher value products
• Size and select the right control valve to prevent catalyst erosion and avoid process interruptions
• Keep assets running reliably in spite of severe reactor and regenerator temperatures.

Detect line plugging and catalyst reversal in real time.

Using Emerson solutions for FCC, you’ll have the tight control over your process and real-time measurement accuracy needed to ensure smooth and efficient operation.

Catalytic Reformer Solutions

As a primary process unit, the catalytic reformer is essential to providing high-octane gasoline component, petrochemical intermediate feedstock, and hydrogen for the rest of the refinery, and any upset in the reformer can easily cause a slowdown or shutdown in these processes.

What’s your opportunity?

• Maintain optimum catalytic reformer performance and consistent hydrogen availability
• Ensure reformer availability for hydrogen generation and high octane gasoline component

Ensure reliable high-octane component, petrochem intermediates, and hydrogen supply with precise heater control.

With Emerson’s catalytic reformer solutions, you’ll gain precise control of heater outlet temperature to ensure product quality and the accurate asset health measurements needed to ensure your reformer consistently supplies the hydrogen needed.

Services offered...

• Valve Condition Monitoring and analysis
• Control valve calibration
• Regulator configuration and repair
• Pressure relief valve configuration and repair
• Technology upgrades and retrofit
• Product and system training
• Pressure relief valve spare pool management
• Valve sizing and selection
Featured Catalytic Reformer Solutions

**Fisher Catalyst Handling Valve**
Reduce crushing of the catalyst and pressure build up downstream by controlling gravity feed of the catalyst through the valve.
- Specially-designed flow passages eliminate solids accumulation that can hinder valve operation, which can extend the life of the catalyst spheres, reduce maintenance cost, and improve regeneration efficiency

Hydrogen Generation Solutions

The hydrocracker, hydrotreaters, and isomerization units rely on a consistent supply of pure hydrogen to avoid slowdowns and shutdowns. Coupled with the need to process heavier and higher sulfur crude slates, generating and managing hydrogen production is more critical than ever.

What’s your opportunity?

- Ensure reliable hydrogen generation and distribution
- Meet increasing hydrogen demand and purity requirements to fulfill downstream requirements
- Increase availability for on-spec hydrogen to maximize constant refinery utilization
- Improve hydrogen purity control, leading to a longer catalyst lifespan

Ensure reliable hydrogen generation and distribution.

Using Emerson hydrogen generation solutions, you can ensure the supply and purity of hydrogen created will enable you to improve hydrocracking, minimize coke laydown, and increase catalyst life and throughput.

Services offered...

Delayed Coker Solutions

The coker is an important processing unit for extracting high-value fuel products from the bottom of the oil barrel, but unmonitored disturbances during coke drum switchovers can often lead to process slowdowns or even shutdowns.

Because it is typically one of the “dirtiest” and most high maintenance processes in the refinery, maintaining a safe, healthy environment around the coker is critical. Anything that can be done to increase reliability, lower maintenance costs, and enable higher on-stream time is valuable.

What’s your opportunity?
- Consistently meet side-cut specifications and improve safety by streamlining your coke removal process
- Minimize the cycle time between drum switching
- Achieve an accurate and reliable material balance around the coker, optimizing the unit’s efficiency

Services offered...
- Valve Condition Monitoring and analysis
- Control valve calibration
- Regulator configuration and repair
- Pressure relief valve configuration and repair
- Technology upgrades and retrofit
- Product and system training
- Valve sizing and selection

### Additional products

- Fisher FIELDVUE digital valve controller
Sulfur Recovery Solutions

An imbalance of combustion air in sulfur recovery units could result in too much hydrogen sulfide or sulfur dioxide in the tail gas and possibly cause a shutdown of the entire refinery—and corrosion is an ongoing challenge. Overall refinery throughput can also be negatively impacted if the sulfur being removed is not able to be fully processed.

What’s your opportunity?

• Maintain reliable and safe combustion control and reduce the effects of corrosion
• Avoid limited throughput due to sulfur content

Safely recover sulfur and ensure regulatory compliance.
With Emerson final element solutions, you can help ensure the combustion air ratio is properly controlled to maintain safe and reliable sulfur recovery.

Services offered...
• Valve Condition Monitoring and analysis
• Control valve calibration
• Regulator configuration and repair
• Pressure relief valve configuration and repair
• Technology upgrades and retrofit
• Product and system training
• Valve sizing and selection

Tank Solutions

Tanks contain large quantities of materials with significant commercial value so it’s important to safeguard quality and control operations related to storage and movements. The rise in the number of products and the increasing customer and market demands have resulted in logistical, environmental, and inventory challenges that can be solved with additional insight from appropriate instrumentation and control systems.

What’s your opportunity?

• Improve the way tanks and terminals are managed by integrating tank gauging systems with the site’s automatic control system
• Enhance visibility of tank status and movements to avoid cross-contaminating product or improper valve alignment
• Expand your process monitoring and automation capabilities
• Improve safety with better alarm management

Improve inventory insight, quality tracking, and safety.

With Emerson’s tank solutions, you can gain better insight into your tank inventory, and detect potential safety and environmental incidents early enough to avoid any product loss.

Services offered...

• Valve Condition Monitoring and analysis
• Regulator configuration and repair
• Pressure relief valve configuration and repair
• Technology upgrades and retrofit
• Product and system training
• Tank walkdown to understand stranded diagnostics

**Automated Isolation Valves**

Isolate refinery products, manage blending and utilities with fully engineered automated isolation solutions.
- Zero leakage shutoff
- Low fugitive emission designs
- Responsive automation

### Enardo
**Flame Arrestors**

Protect against vapor ignition by reducing the temperature and momentum of a flame.
- Detonation models for the most extreme conditions
- Range covers both unconfined and confined applications and gas groups B, C, and D
- Wireless extended burn and fouling detection available

### Anderson Greenwood
**High- and Low-Pressure Pilot Valves**

Maintain a specific pressure in the vapor space of the tank by precisely controlling the flow of a gas.
- High- and low-pressure pilot valves reduce cost of ownership and complexity against traditional control loops and multiple spring actuated control systems

### Enardo™
**Wireless Monitoring Panel**

- Reduce operational emergencies
- Monitor and troubleshoot problems before they occur
- Minimize the need to climb onto tanks
- Base Maintenance schedules on actual operational data

### Enardo™
**Emergency Vents**

Protect against abnormal, high pressure conditions with high pressure relief.
- Full range, including hinged and lift-up styles
- Tight sealing technology
- Wireless remote monitoring option

Continuous support in the face of changing market and operating conditions

Emerson leads the way with industry-defining end-to-end digital service experiences, enabling you achieve superior outcomes through our maintenance, reliability, and performance offerings. The tools we’ve developed support the digital transformation of the refining industry, providing the confidence to extract the maximum value from your service and technology investments. Our teams partner with you across the globe to help you maintain safe operation, improve reliability, and optimize plant performance.

With over 200 regional service centers and 80+ mobile service centers worldwide, local experts are available to work with you to understand your unique challenges and enable you to find a solution. Our broad portfolio of service offerings allows us to tailor our support to align with your specific business goals.

### Valve Condition Monitoring
Leverage smart valve technology and Emerson expertise to help your workforce make informed performance and reliability decisions.
Webpage: Valve Condition Monitoring ►

### Digital Walkdown & Installed Base Assessment
Train new hires, improve your current workforce skills, and help your team adapt to new technology or products.
Flyer: Digital Walkdown & Installed Base Assessment ►

### Turnaround Services
Identify, prioritize, and plan long-term plant reliability improvements to reduce maintenance events and enhance refinery performance.
Brochure: Shutdowns, Turnarounds & Outages ►

### Startup and Commissioning
Certified technicians meticulously work through approvals, calibration, testing, and certification to deliver a comprehensive handover, on time and on budget.
