Joining Technologies for Plastics
The perfect solution for every application

Branson is everywhere you need us to be for plastics joining. With technical facilities and sales/support offices throughout the Americas, Europe and Asia, our global perspective and local presence set us apart from the competition. We offer more plastics joining technologies than anyone and can provide the process best suited for each application. Our unsurpassed industry experience helps you get to market quickly, with quality products manufactured with the highest efficiencies.

Manufacture in a single location? Design in Europe or the Americas with production in Asia? Branson works closely with you through every stage of a project, including consultation, design, material feasibility, prototype development, product testing and final production. We team with integrators and manufacturers, developing OEM equipment that can be installed seamlessly and integrated into automated systems. Our support services include employee training, engineering assistance, creating new/modified parts, troubleshooting, preventative maintenance and repair.

Branson can successfully meet your plastics joining challenge with our application experience, technical expertise and responsive service.
Ultrasonic Welding

In ultrasonic welding, high-frequency vibrations generate heat at the interface of the parts to be joined, melting the plastic and creating a strong bond. The technique is fast, efficient, non-contaminating and requires no consumables. It produces a clean weld site with highly uniform joint quality, providing exceptional performance, consistency, and reliability. Easily integrated into automated systems, our equipment can be readily customized to fit exact specifications of welded parts.

Following are the processes we offer to meet a wide variety of plastics joining applications.

Ultrasonic welding is well suited for assembling parts with delicate internal electronic components and can be used to insert, stake, stud weld, degate, or spot weld thermoplastics, and slit or laminate thermoplastic films and fabrics.
Vibration Welding

Vibration welding creates high-strength, leakproof hermetic seals with most thermoplastics and is useful for assembling irregularly shaped parts. The solid weld flash makes this technique attractive for industrial parts assembly. It is economical and fast for high-volume production, and flexible for multiple tool changeouts in the same machine.

The process creates friction/heat at the joint interface of the parts to be mated, until the right molten state is reached. The plastic then solidifies under clamping pressure and forms a permanent bond. In addition to linear vibration welding, only Branson offers orbital vibration technology, increasing joint welding opportunities to meet a wider range of requirements.

Hybrid Process for Clean Vibration Joints

Hybrid welding combines infrared and vibration processes, offering more options and applications for smart molding joint design. Branson’s innovative technology incorporates localized broadband infrared preheating into the vibration weld tooling. Proprietary metal foil emitters melt the joint area's surface before the vibration process starts, minimizing particles generated during the vibration weld phases and producing clean, high-strength joints, with reduced residual stresses, material-specific friction and welding time.

Spin Welding

Spin welding is ideal for joining thermoplastics where the part-to-part interface is round. The process brings the part interfaces together, under pressure, with a circular motion. Frictional heat is generated, causing the joint area to melt and fuse together into a strong, hermetic seal. Spin welding is highly economical, relatively quiet, adaptable to automation, and provides fast cycle times.
**Infrared Welding**

Infrared welding, a non-contact assembly method, uses localized radiant heat from contour-adopted, broadband metal foil emitters to melt the mating surfaces of the parts to be assembled. This permits greater freedom in designing parts such as complex curved joints and internal walls. The technique produces strong, airtight Welds with a solid, homogeneous bead and very good flash quality. Compatible with most thermoplastics, infrared welding is particularly appropriate for higher-temperatures processing, and is effective on semi-crystalline resins such as polyethylene and polypropylene. In addition, the infrared heat source is precisely controlled, important when dealing with heat-sensitive parts.

**Hot Plate Welding**

Hot plate welding utilizes a heated platen that directly contacts the mating surfaces of the parts to be joined. This technique is cost-effective and compatible with most thermoplastics. Greater latitude in parts design is possible, since the hot plate method can weld parts and internal walls, and assemble thin-wall parts, complex geometries, large/multiple small parts and parts with loose internal components.

**Laser Welding**

Laser welding joins materials not easily welded by other thermal assembly methods. This innovative technique is based on the STTIr™ (Simultaneous Through Transmission Infrared) principle, where laser energy passes through one plastic component and is absorbed by the second component. This results in heating/melting of the interface, where controlled clamp force is applied and the parts are joined.

The technique heats the entire weld surface simultaneously and has a rapid cycle time, making it well suited to high-volume applications. Minimal flash and no particulate produce parts with excellent cosmetic properties. Laser welding also permits preassembled parts to be joined without affecting internal components, allowing for 3-D joint configurations and more flexible part design.
Markets and Applications

Branson’s plastics joining technologies meet the specialized requirements of a range of applications in a variety of business sectors, delivering product integrity, superior part performance, excellent value and, ultimately, customer satisfaction. Branson offers customers an eco-friendly outcome – energy efficient, free from consumables, and recyclable, without chemical adhesives and solvents.

Automotive
Instrument panels, fuel management components, filter assemblies, lamps, sensors, glove box/knee bolsters, instrument clusters, interior trim, HVAC housings, air intake manifolds, air filters, bottles, carbon canisters, glove box lids, air channels, electronic modules, exterior lighting, resonators, door panels, center consoles, fuel tanks, bumpers, front grilles, air-ducts, cooling systems, oil pans.

Medical
Surgical tools, diagnostic cassettes, fluidic devices, cardiology reservoirs, blood and gas filters, IV spikes, drug delivery systems, face masks, implantable devices, insulin pumps, surgical gowns, blood donation kits, dialysis tubes, disposable clothing, pump cylinders, blood basins, sensor components, dialysis systems.

Electronics
Electronic modules, devices and housings, inkjet and toner cartridges, digital cameras, cell phones, media storage devices, battery packs (battery cells), connectors, sensors, portable memory devices, micro disks, navigation systems.
And more –

The applications above represent just a sampling of products created with Branson joining equipment. Today, we are also working with new energy products such as batteries, solar components, green film, and fuel cells.

Packaging
Condiment dispensers, blister packages, stand-up pouches, juice/milk cartons and spouts, pantyhose packages, plastic coated paper cups, flexible plastic and laminate tubes, yogurt cups, coffee capsules, flexible pouches, plastic containers, valve/sleeping bags.

Textiles and Nonwovens
Quilted and laminated fabrics, bedspreads, mattress pads, climate mats, diapers/nappies, hook-and-loop materials, filters and filter bags, belts, sanitary pads, blinds, films, tarpaulins, curtains, labels.

Appliances
Steam irons, pump housings, vacuum cleaner subassemblies, front panels, dishwasher spray arms, water flow systems, dryer cabinets, ventilation systems, refrigerator components.
Branson’s unmatched global resources ensure optimal solutions for the most challenging materials joining and precision cleaning applications.

With 1600+ employees in over 70 sites worldwide, we can rapidly respond to our customers’ needs, wherever they are located. Branson understands local markets and regulations, and the open collaboration among our global offices and extensive staff of application specialists quickly produces solutions for customers. We partner with companies of every size and scope to help resolve critical issues ranging from market changes, product quality/life cycles and production costs, to employee safety and environmental compliance. And, Branson’s commitment to the publicly funded industrial collective research initiative and cooperation with various research centers have produced widespread innovations in plastics joining technology that are benefiting companies everywhere.

Branson is a leading innovator in the Industrial Automation division of Emerson, a diversified global manufacturing and technology company. Emerson is a progressive company working to develop products and processes to resolve global issues, including energy supply and distribution, information and networking, climate and environment, manufacturing efficiency, and product performance. Emerson is dedicated to the pursuit of breakthrough technology developments never before envisioned.

Branson brings exceptional quality, fast delivery and competitive prices. Contact your nearest regional center today.
