Micro Motion® H-Series Hygienic Coriolis Flow and Density Sensors
Safety and approval information

This Micro Motion product complies with all applicable European directives when properly installed in accordance with the instructions in this manual. Refer to the EU declaration of conformity for directives that apply to this product. The EU declaration of conformity, with all applicable European directives, and the complete ATEX Installation Drawings and Instructions are available on the internet at www.emerson.com or through your local Micro Motion support center.

Information affixed to equipment that complies with the Pressure Equipment Directive, can be found on the internet at www.emerson.com.

For hazardous installations in Europe, refer to standard EN 60079-14 if national standards do not apply.

Other information

Full product specifications can be found in the product data sheet. Troubleshooting information can be found in the configuration manual. Product data sheets and manuals are available from the Micro Motion web site at www.emerson.com.

Return policy

Follow Micro Motion procedures when returning equipment. These procedures ensure legal compliance with government transportation agencies and help provide a safe working environment for Micro Motion employees. Micro Motion will not accept your returned equipment if you fail to follow Micro Motion procedures.

Return procedures and forms are available on our web support site at www.emerson.com, or by phoning the Micro Motion Customer Service department.

1 Planning

1.1 Installation checklist

☐ Make sure that the hazardous area specified on the approval tag is suitable for the environment in which the meter will be installed.

☐ Verify that the local ambient and process temperatures are within the limits of the meter.

☐ If your sensor has an integral transmitter, no wiring is required between the sensor and transmitter. Follow the wiring instructions in the transmitter installation manual for signal and power wiring.

☐ If your transmitter has remote-mounted electronics, follow the instructions in this manual for wiring between the sensor and the transmitter, and then follow the instructions in the transmitter installation manual for power and signal wiring.

☐ For optimal performance, install the sensor in the preferred orientation. The sensor will work in any orientation as long as the flow tubes remain full of process fluid.

</thead>
</table>
Table 1-3: Preferred sensor orientation (continued)

<table>
<thead>
<tr>
<th>Gases</th>
<th>Slurries and self-draining applications</th>
</tr>
</thead>
</table>

☐ Install the meter so that the flow direction arrow on the sensor case matches the actual forward flow of the process. (Flow direction is also software-selectable.)

1.2 Best practices

The following information can help you get the most from your sensor.

- There are no pipe run requirements for Micro Motion sensors. Straight runs of pipe upstream or downstream are unnecessary.
- If the sensor is installed in a vertical pipeline, liquids and slurries should flow upward through the sensor. Gases should flow downward.
- Keep the sensor tubes full of process fluid.
- For halting flow through the sensor with a single valve, install the valve downstream from the sensor.
- Minimize bending and torsional stress on the meter. Do not use the meter to align misaligned piping.
- The sensor does not require external supports. The flanges will support the sensor in any orientation.

1.3 Temperature limits

Sensors can be used in the process and ambient temperature ranges shown in the temperature limit graphs. For the purposes of selecting electronics options, temperature limit graphs should be used only as a general guide. If your process conditions are close to the gray area, consult with your Micro Motion representative.

**Note**

- In all cases, the electronics cannot be operated where the ambient temperature is below -40 °F (-40.0 °C) or above 140 °F (60.0 °C). If a sensor is to be used where the ambient temperature is outside of the range permissible for the electronics, the electronics must be remotely located where the ambient temperature is within the permissible range, as indicated by the shaded areas of the temperature limit graphs.
- Temperature limits may be further restricted by hazardous area approvals. Refer to the hazardous area approvals documentation shipped with the sensor or available from the Micro Motion H-Series Hygienic Coriolis Flow and Density Meters Product Data Sheet. For further questions, contact customer service.
• The extended-mount electronics option allows the sensor case to be insulated without covering the transmitter, core processor, or junction box, but does not affect temperature ratings. When insulating the sensor case at elevated process temperatures (above 140 °F (60.0 °C)), please ensure electronics are not enclosed in insulation as this may lead to electronics failure.

Ambient and process temperature limits for all H-Series meters

1.4 Recommendations for hygienic and self-draining applications

H-Series sensors are self-draining when installed in a vertical pipeline.

For optimal cleanability and drainability:

• If possible, install the sensor in a vertical pipeline with the process fluid flowing upward through the sensor.
• If the sensor must be installed in a horizontal pipeline, drainage is accomplished by air purge evacuation of the pipeline circuit.
• For clean-in-place (CIP) applications, Micro Motion recommends using the generally-accepted flow velocity of at least 1.5 m/s for cleaning the sensor.
• The gap between the electronics housing and sensor body should be inspected periodically. Manually clean this gap when necessary.
• Tri-clamp and DIN 11851 style process connections require special gaskets to comply with EHEDG requirements for hygienic design.
Figure 1-1: Installation for self-draining applications

A. Process pipeline
B. Direction of normal process flow
C. Direction of drainage
2 Mounting

2.1 Mount the sensor

Use your common practices to minimize torque and bending load on process connections.

**About this task**

**Tip**
To reduce the risk of condensation problems, do not orient transmitters or sensor junction boxes with their conduit openings pointing upward.

**CAUTION**
Do not lift the sensor by the electronics or purge connections. Lifting the sensor by the electronics or purge connections can damage the device.

**Figure 2-1: Mounting the sensor**

**Notes**
- Do not use the sensor to support the piping.
- The sensor does not require external supports. The flanges will support the sensor in any orientation.
2.2 Attach extended electronics

If your installation has a sensor with extended electronics, you will need to install the extender onto the sensor case.

About this task

Note
Extended core processors are matched at the factory to specific sensors. Keep each core processor together with the sensor with which it was shipped.

⚠️ CAUTION
Keep the extender and feedthrough clean and dry. Moisture or debris in the extender or feedthrough can damage electronics and result in measurement error or flowmeter failure.

Procedure

1. Remove and recycle the plastic cap from the feedthrough on the sensor.

2. Loosen the clamping screw and remove the clamping ring. Leave the O-ring in place on the feedthrough.

3. Remove and recycle the plastic plug from the extender.

A. Transmitter or core processor
B. Extender
C. O-ring
D. Feedthrough
E. Clamping ring
F. Clamping screw
G. Plastic plug
H. Plastic cap
4. Fit the extender onto the feedthrough by carefully aligning the notches on the bottom of the extender with the notches on the feedthrough.

5. Close the clamping ring and tighten the clamping screw to 13 in lbf (1.47 N m) to 18 in lbf (2.03 N m).
3 Transmitter power and I/O wiring

3.1 Options for wiring

The wiring procedure you follow depends on which electronics option you have.

Table 3-1: Wiring procedures by electronics option

<table>
<thead>
<tr>
<th>Electronics option</th>
<th>Wiring procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integral transmitter</td>
<td>The transmitter is already connected to the sensor. No wiring is required between sensor and transmitter. See the transmitter installation manual for wiring the power and signal cable to the transmitter.</td>
</tr>
<tr>
<td>Extended electronics</td>
<td>The electronics are separated from the sensor by an extender and must be attached as described in Attach extended electronics. There is no wiring required because the physical connection includes the electrical connection.</td>
</tr>
<tr>
<td>MVD™ Direct Connect™</td>
<td>There is no transmitter to wire. See the Micro Motion MVD Direct Connect Meters manual for wiring the power and signal cable between the sensor and the direct host.</td>
</tr>
<tr>
<td>Integral core processor with remote transmitter</td>
<td>The core processor is already connected to the sensor. Connect a 4-wire cable between the core processor and transmitter. Refer to Connect 4-wire cable.</td>
</tr>
</tbody>
</table>

⚠️ DANGER
Make sure the hazardous area specified on the sensor approval tag is suitable for the environment in which the sensor will be installed. Failure to comply with the requirements for intrinsic safety in a hazardous area could result in an explosion.

⚠️ CAUTION
Fully close and tighten all housing covers and conduit openings. Improperly sealed housings can expose electronics to moisture, which can cause measurement error or flowmeter failure. Inspect and grease all gaskets and O-rings.

3.2 Connect 4-wire cable

3.2.1 4-wire cable types and usage

Micro Motion offers two types of 4-wire cable: shielded and armored. Both types contain shield drain wires.

The cable supplied by Micro Motion consists of one pair of red and black 18 AWG (0.823 mm²) wires for the VDC connection, and one pair of white and green 22 AWG (0.326 mm²) wires for the RS-485 connection.

User-supplied cable must meet the following requirements:
- Twisted pair construction.
- Applicable hazardous area requirements, if the core processor is installed in a hazardous area.
- Wire gauge appropriate for the cable length between the core processor and the transmitter, or the host.

### Table 3-2: Wire gauge

<table>
<thead>
<tr>
<th>Wire gauge</th>

<tbody>
<tr>
<td>VDC 22 AWG (0.326 mm²)</td>
<td>300 ft (91 m)</td>
</tr>
<tr>
<td>VDC 20 AWG (0.518 mm²)</td>
<td>500 ft (152 m)</td>
</tr>
<tr>
<td>VDC 18 AWG (0.823 mm²)</td>
<td>1,000 ft (305 m)</td>
</tr>
<tr>
<td>RS-485 22 AWG (0.326 mm²) or larger</td>
<td>1,000 ft (305 m)</td>
</tr>
</tbody>
</table>

#### 3.2.2 Prepare a cable with a metal conduit

**Procedure**

1. Remove the core processor cover using a flat-blade screw driver.
2. Run the conduit to the sensor.
3. Pull the cable through the conduit.
4. Cut the drain wires and let them float at both ends of the conduit.

#### 3.2.3 Prepare a cable with user-supplied cable glands

**Procedure**

1. Remove the core processor cover using a flat-blade screw driver.
2. Pass the wires through the gland nut and gland body.

![Diagram of gland components](image)

- **A. Gland body**
- **B. Gland nut**

3. Terminate the RS-485 shield and drain wires to the housing internal grounding screw.
4. Assemble the gland according to vendor instructions.

#### 3.2.4 Prepare a cable with Micro Motion-supplied cable glands

**Procedure**

1. Remove the core processor cover using a flat-blade screw driver.
2. Pass the wires through the gland nut and clamping insert.
3. Strip the cable jacket.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NPT gland type</td>
<td>Strip 4.5 in (114 mm)</td>
</tr>
<tr>
<td>M20 gland type</td>
<td>Strip 4.25 in (108 mm)</td>
</tr>
</tbody>
</table>

4. Remove the clear wrap and filler material.
5. Strip most of the shielding.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NPT gland type</td>
<td>Strip all but 0.75 in (19 mm)</td>
</tr>
<tr>
<td>M20 gland type</td>
<td>Strip all but 0.5 in (13 mm)</td>
</tr>
</tbody>
</table>

6. Wrap the drain wires twice around the shield and cut off the excess drain wires.

7. For foil (shielded cable) only:

**Note**
For braided (armored cable) skip this step and continue to the next step.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| NPT gland type     | a. Slide the shielded heat shrink over the drain wires. Ensure that the wires are completely covered.  
b. Apply 250 °F (121.1 °C) heat to shrink the tubing. Do not burn the cable.  
c. Position the clamping insert so the interior end is flush with the braid of the heat shrink. |

A. **Shielded heat shrink**
B. **After heat is applied**
### Connect the wires to the core processor terminals

After the 4-wire cable has been prepared and shielded (if required), connect the individual wires of the 4-wire cable to the terminals on the core processor.

**Procedure**

1. Connect the wires to the core processor terminals.
2. Reinstall the core processor cover.
3. Torque the cover screws to:
   - 10 in lbf (1.13 N·m) to 13 in lbf (1.47 N·m) for an aluminum housing
   - minimum 19 in lbf (2.15 N·m) for a stainless steel housing
   If properly seated, there will be no gap between cover and base.
4. Connect the wires to the transmitter terminals using the transmitter installation manual.
3.3 Connect the 9-wire cable

Procedure

1. Prepare and install the cable according to the instructions in the *Micro Motion 9-Wire Flowmeter Cable Preparation and Installation Guide*.

2. Insert the stripped ends of the individual wires into the terminal blocks of the junction box. Ensure that no bare wires remain exposed.

3. Match the wires color for color. For wiring at the transmitter or remote core processor, refer to the transmitter documentation.

4. Tighten the screws to hold the wires in place.

5. Ensure integrity of gaskets, then tightly close and seal the junction box cover and all housing covers.

6. Refer to the transmitter installation manual for signal and power wiring instructions.
4 Grounding

The meter must be grounded according to the standards that are applicable at the site. The customer is responsible for knowing and complying with all applicable standards.

Prerequisites

Use the following guides for grounding practices:

- In Europe, IEC 79-14 is applicable to most installations, in particular Sections 12.2.2.3 and 12.2.2.4.
- In the U.S.A. and Canada, ISA 12.06.01 Part 1 provides examples with associated applications and requirements.

If no external standards are applicable, follow these guidelines to ground the sensor:

- Use copper wire, 14 AWG (2.08 mm$^2$) or larger wire size.
- Keep all ground leads as short as possible, less than 1 Ω impedance.
- Connect ground leads directly to earth, or follow plant standards.

⚠️ CAUTION

Ground the flowmeter to earth, or follow ground network requirements for the facility. Improper grounding can cause measurement error.

Procedure

- Check the joints in the pipeline.
  - If the joints in the pipeline are ground-bonded, the sensor is automatically grounded and no further action is necessary (unless required by local code).
  - If the joints in the pipeline are not grounded, connect a ground wire to the grounding screw located on the sensor electronics.

Tip

The sensor electronics may be a transmitter, core processor, or junction box. The grounding screw may be internal or external.
5 Supplementary information

5.1 Purge the sensor case

Prerequisites

Make sure the following are available before beginning the purge procedure:

- Teflon™ tape
- Argon or nitrogen gas sufficient to purge the sensor case

About this task

Whenever a purge plug is removed from the sensor case, you must repurge the case.

Procedure

1. Shut down the process, or set control devices for manual operation. Before performing the case purging procedure, shut down the process or set the control devices for manual operation. Performing the purge procedure while the flowmeter is operating could affect measurement accuracy, resulting in inaccurate flow signals.

2. Remove both purge plugs from the sensor case. If purge lines are being used, open the valve in the purge lines.

⚠️ DANGER

- Stay clear of the rupture disk pressure relief area. High-pressure fluid escaping from the sensor can cause severe injury or death. The sensor must be oriented so that personnel and equipment will not be exposed to any discharge along the pressure relief path.
- Take all necessary precautions when removing purge plugs. Removing a purge plug compromises the secondary containment of the sensor and could expose the user to process fluid.
- Improper pressurization of the sensor case could result in personal injury.

⚠️ CAUTION

Be sure to use thread protectors when removing the purge fitting so as not to damage the disk membrane surrounding the rupture disk.

3. Prepare the purge plugs for reinstallation by wrapping them with 2–3 turns of Teflon tape.

4. Connect the supply of nitrogen or argon gas to the inlet purge connection or open the inlet purge line. Leave the outlet connection open.

- Exercise caution to avoid introducing dirt, moisture, rust, or other contaminants into the sensor case.
- If the purge gas is heavier than air (such as argon), locate the inlet lower than the outlet, so that the purge gas will displace air from bottom to top.
- If the purge gas is lighter than air (such as nitrogen), locate the inlet higher than the outlet, so that the purge gas will displace air from top to bottom.

5. Make sure that there is a tight seal between the inlet connection and sensor case, so that air cannot be drawn by suction into the case or purge line during the purging process.

6. Run purge gas through the sensor.

The purge time is the amount of time required for full exchange of atmosphere to inert gas. The larger the line size, the greater amount of time is required to purge the case. If purge lines are being used, increase the purge time to fill the additional volume of the purge line.

**Note**
Keep the purge gas pressure below 7.25 psi (0.5 bar).

<table>
<thead>
<tr>
<th>Table 5-1: Purge time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sensor model</td>
</tr>
<tr>
<td>H025</td>
</tr>
<tr>
<td>H050</td>
</tr>
<tr>
<td>H100</td>
</tr>
<tr>
<td>H200</td>
</tr>
<tr>
<td>H300</td>
</tr>
</tbody>
</table>

7. At the appropriate time, shut off the gas supply, then immediately seal the purge outlet and inlet connections with the purge plugs.

Avoid pressurizing the sensor case. If pressure inside the case elevates above atmospheric pressure during operation, the flowmeter density calibration will be inaccurate.

8. Make sure that the purge fitting seals are tight so that air cannot be drawn by suction into the sensor case.
