Real-Time, Reliable Photovoltaic Plant Control Increases Energy Production and Grid Stability

The number of photovoltaic (PV) installations around the world has increased significantly, making PV among the fastest growing renewable energy sources. With this growth comes a need for PV owners/operators to support grid stability with operational flexibility. Emerson’s Ovation™ technology for PV power generation provides an integrated, scalable control solution to maximize kWh output and profitability while contributing to utility-grid and/or microgrid stability.

- **Accessible**: Complete control scheme visibility allows for in-house maintenance and customization of PV control logic to achieve operational goals and maximize revenue potential.
- **Secure**: Native security features enhanced by comprehensive cybersecurity services and solutions help meet compliance obligations and protect assets against cyber threats.
- **Trusted**: Global industry expertise and comprehensive lifecycle services are provided by a single, trusted vendor with a history of long-term customer service and support.
- **Scalable**: Flexible architecture accommodates small, standalone PV systems as well as integration of multiple, geographically dispersed farms of varying sizes.
- **Integrated**: Using standard communication protocols, a single platform aggregates data from field devices and enterprise-wide business systems.
- **Reliable**: Scalable solutions designed with embedded industry-specific automation strategies optimize operations while maximizing plant reliability, availability and economic performance.
Ovation: One Platform Delivering Optimized PV Power Generation

Specifically designed for the power generation industry, the Ovation automation system is expertly configured to address the numerous challenges facing PV asset managers and operators. Leveraging Emerson’s broad portfolio of field-proven solutions, including its compact controller technology, an Ovation system can be economically engineered for any size PV plant or fleet.

The U.S. Department of Homeland Security has designated Ovation control solutions as Qualified Anti-Terrorism Technology. This Designation provides significant tort protection for claims arising out of acts of cyber terrorism as defined under the U.S. SAFETY Act. The Designation covers Emerson’s Ovation control system, Power and Water Cybersecurity Suite and cybersecurity services. For more information, visit https://www.safetyact.gov.

### Benefits

<table>
<thead>
<tr>
<th>Ovation Solution</th>
<th>Actively curtail power output</th>
<th>Minimize impact of variability and intermittency</th>
<th>Maximize kWh output while supporting grid stability</th>
<th>Quickly respond to grid frequency events</th>
<th>Effectively manage multiple, diverse SCADA systems</th>
</tr>
</thead>
<tbody>
<tr>
<td>Benefits</td>
<td>Inverter setpoint control</td>
<td>Accurate ramp rate control</td>
<td>Optimized control strategies</td>
<td>Compliant response to frequency events</td>
<td>Single, integrated platform</td>
</tr>

Maximize production while complying with grid interconnection agreements
Scalable Ovation PV Architecture

Enterprise and Remote Applications

Provides secure, remote monitoring of PV operations from mobile devices or central control room for grid operators, maintenance staff, utility or power purchase agreement (PPA) host, owners, operators and asset managers.

*Measures, monitors and reports key performance indicators for increased visibility of plant or fleet operations.*

Ovation SCADA

Performs supervisory control and monitoring including data acquisition, engineering, maintenance, alarming, historical and cybersecurity functions.

*Features rugged design with built-in, wide-area networking for access to aggregated plant-wide process and equipment data.*

Solar Plant Equipment

Collects data from inverters, solar array trackers, combiner boxes, meteorological stations, transformers, switchgear and battery management systems/inverters.

*Communicates with remote terminal units (RTUs) and other field devices via a host of standard protocols with optional redundancy for reliable data transmission.*
