IMPORTANT NOTICE

This document provides basic installation guidelines for the Rosemount® 8732. It does not provide instructions for detailed configuration, diagnostics, maintenance, service, troubleshooting, explosion-proof, flame-proof, or intrinsically safe (I.S.) installations. Refer to the Rosemount 8732 reference manual (document number 00809-0100-4663) for more instructions. The manual and this QIG are also available electronically on www.rosemount.com.

WARNING

Failure to follow these installation guidelines could result in death or serious injury:

Installation and servicing instructions are for use by qualified personnel only. Do not perform any servicing other than that contained in the operating instructions, unless qualified. Verify that the operating environment of the sensor and transmitter is consistent with the appropriate FM, CSA, ATEX, or IECEx approval.

Do not connect a Rosemount 8732 to a non-Rosemount sensor that is located in an explosive atmosphere.

WARNING

The sensor liner is vulnerable to handling damage. Never place anything through the sensor for the purpose of lifting or gaining leverage. Liner damage can render the sensor useless.

To avoid possible damage to the sensor liner ends, do not use metallic or spiral-wound gaskets. If frequent removal is anticipated, take precautions to protect the liner ends. Short spool pieces attached to the sensor ends are often used for protection.

Correct flange bolt tightening is crucial for proper sensor operation and life. All bolts must be tightened in the proper sequence to the specified torque limits. Failure to observe these instructions could result in severe damage to the sensor lining and possible sensor replacement.

WARNING

Rosemount 8705 Magnetic Flowtube units ordered with non-standard paint options may be subject to electrostatic discharge.

To avoid electrostatic charge build-up, do not rub the meter body with a dry cloth or clean with solvents.
STEP 1: PRE-INSTALLATION

Before installing the Rosemount 8732 Magnetic Flowmeter Transmitter, there are several pre-installation steps that should be completed to make the installation process easier:

- Identify the options and configurations that apply to your application
- Set the hardware switches if necessary
- Consider mechanical, electrical, and environmental requirements

Mechanical Considerations

The mounting site for the Rosemount 8732 transmitter should provide enough room for secure mounting, easy access to conduit ports, full opening of the transmitter covers, and easy readability of the display screen (see Figure 1).

If the Rosemount 8732 is mounted separately from the sensor, it is not subject to limitations that might apply to the sensor.

Figure 1. Rosemount 8732 Dimensional Drawing

NOTE:

* M20 and PG 13.5 connections are available with the use of threaded conduit adapters.
Environmental Considerations
To ensure maximum transmitter life, avoid excessive heat and vibration. Typical problem areas:
  • high-vibration lines with integrally mounted transmitters
  • warm-climate installations in direct sunlight
  • outdoor installations in cold climates.
Remote-mounted transmitters may be installed in the control room to protect the electronics from the harsh environment and provide easy access for configuration or service. Both remotely and integrally mounted Rosemount 8732 transmitters require external power so there must be access to a suitable power source.

Installation Procedures
Rosemount 8732 installation includes both detailed mechanical and electrical installation procedures.

Mount the Transmitter
At a remote site the transmitter may be mounted on a pipe up to two inches in diameter or against a flat surface.

Pipe Mounting
To mount the transmitter on a pipe:
1. Attach the mounting bracket to the pipe using the mounting hardware.
2. Attach the Rosemount 8732 to the mounting bracket using the mounting screws.

Hardware Jumpers/Switches
The 8732 electronics board is equipped with two user-selectable hardware switches. These switches set the Simulate Enable and Transmitter Security. The standard configuration for these switches when shipped from the factory are as follows:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simulate Enable</td>
<td>OFF</td>
</tr>
<tr>
<td>Transmitter Security</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Changing Hardware Switch Settings
In most cases, it is not necessary to change the setting of the hardware switches. If you need to change the switch settings, complete the steps outlined in the manual.

Electrical Considerations
Before making any electrical connections to the Rosemount 8732, consider local and plant electrical standards and be sure to have the proper power supply, conduit, and other accessories necessary to comply with these standards.

Rotate Transmitter Housing
The electronics housing can be rotated on the sensor in 90° increments by loosening the four mounting bolts on the bottom of the housing, and reinstalling the bolts. When the housing is returned to its original position, be sure the surface is clean and there is no gap between the housing and the sensor.
STEP 2: HANDLING

Handle all parts carefully to prevent damage. Whenever possible, transport the system to the installation site in the original shipping containers. PTFE-lined sensors are shipped with end covers that protect it from both mechanical damage and normal unrestrained distortion. Remove the end covers just before installation.

Figure 2. Rosemount 8705 Sensor Support for Handling
STEP 3: MOUNTING

Upstream/Downstream Piping
To ensure specification accuracy over widely varying process conditions, install the sensor a minimum of five straight pipe diameters upstream and two pipe diameters downstream from the electrode plane (see Figure 3).

Figure 3. Upstream and Downstream Straight Pipe Diameters

Installations with reduced straight runs from 0 to five pipe diameters are possible. In reduced straight pipe run installations, performance will shift to as much as 0.5% of rate. Reported flow rates will still be highly repeatable.

Flow Direction
The sensor should be mounted so the FORWARD end of the flow arrow, shown on the sensor identification tag, points in the direction of flow through the sensor.
Quick Installation Guide
00825-0100-4663, Rev BC
December 2012

Sensor Location
The sensor should be installed in a location that ensures the sensor remains full during operation. Vertical installation allows upward process fluid flow and keeps the cross-sectional area full, regardless of flow rate. Horizontal installation should be restricted to low piping sections that are normally full.

Sensor Orientation
The electrodes in the sensor are properly orientated when the two measurement electrodes are in the 3 and 9 o'clock positions or within 45° from the vertical, as shown on the right of Figure 5. Avoid any mounting orientation that positions the top of the sensor at 90° from the vertical position as shown on the left of Figure 5.
STEP 4: INSTALLATION

Flanged Sensors

Gaskets
The sensor requires a gasket at each of its connections to adjacent devices or piping. The gasket material selected must be compatible with the process fluid and operating conditions. Metallic or spiral-wound gaskets can damage the liner. Gaskets are required on each side of a grounding ring. All other applications (including sensors with lining protectors or a grounding electrode) require only one gasket on each end connection.

Figure 6. Flanged gasket placement

Flange Bolts

NOTE
Do not bolt one side at a time. Tighten each side simultaneously. Example:
1. Snug left
2. Snug right
3. Tighten left
4. Tighten right

Do not snug and tighten the upstream side and then snug and tighten the downstream side. Failure to alternate between the upstream and downstream flanges when tightening bolts may result in liner damage.

Suggested torque values by sensor line size and liner type are listed in Table 1 for ASME B16.5 and Table 2 for EN flanges. Consult the factory if the flange rating of the sensor is not listed. Tighten flange bolts on the upstream side of the sensor in the incremental sequence shown in Figure 7 to 20% of the suggested torque values. Repeat the process on the downstream side of the sensor. For sensors with more or less flange bolts, tighten the bolts in a similar crosswise sequence. Repeat this entire tightening sequence at 40%, 60%, 80%, and 100% of the suggested torque values or until the leak between the process and sensor flanges stop.

If leakage has not stopped at the suggested torque values, the bolts can be tightened in additional 10% increments until the joint stops leaking, or until the measured torque value
reaches the maximum torque value of the bolts. Practical consideration for the integrity of the liner often leads the user to distinct torque values to stop leakage due to the unique combinations of flanges, bolts, gaskets, and sensor liner material.

Check for leaks at the flanges after tightening the bolts. Failure to use the correct tightening methods can result in severe damage. Sensors require a second tightening 24 hours after the initial installation. Over time, sensor liner materials may deform under pressure.

Wafer Sensors

Gaskets
The sensor requires a gasket at each of its connections to adjacent devices or piping. The gasket material selected must be compatible with the process fluid and operating conditions. Metallic or spiral-wound gaskets can damage the liner. Gaskets are required on each side of a grounding ring. See Figure 8 below.

Figure 8. Wafer gasket placement

Alignment
1. On 1.5 through 8-inch (40 through 200 mm) line sizes. Rosemount strongly recommends installing the alignment spacers provided to insure proper centering of the wafer sensor between the process flanges. Sensor sizes of 0.15, 0.30, 0.5 and 1 in. (4 through 25 mm), do not require alignment spacers.
2. Insert studs for the bottom side of the sensor between the pipe flanges and center the alignment spacer in the middle of the stud. See Figure 8 for the bolt hole locations recommended for the spacers provided. Stud specifications are listed in Table 3.
3. Place the sensor between the flanges. Make sure that the alignment spacers are properly centered on the studs. For vertical flow installations slide the oring over the stud to keep the spacer in place. See Figure 8. To ensure the spacers match the flange size and class rating for the process flanges see Table 4.
4. Insert the remaining studs, washers, and nuts.
5. Tighten to the torque specifications shown in Table 5. Do not overtighten the bolts or the liner may be damaged.

Table 3. Stud Specifications

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

NOTE
Sensor sizes of 0.15, 0.30, and 0.5 in. mount between AMSE 1/2-inch flanges. Using carbon steel bolts on sensor sizes of 0.15, 0.30, 0.5 and 1 in. (15 and 25 mm), rather than the required stainless steel bolts, will degrade the flow sensor measurement.

To order an Alignment Spacer Kit (qty 3 spacers) use p/n 08711-3211-xxxx along with the Dash No. above.
Flange Bolts
Wafer sensors require threaded studs. See Figure 7 for torque sequence. Always check for leaks at the flanges after tightening the flange bolts. All sensors require a second torquing 24 hours after initial flange bolt tightening.

Sanitary Sensors
Gaskets
The sensor requires a gasket at each of its connections to adjacent devices or piping. The gasket material selected must be compatible with the process fluid and operating conditions. Gaskets are supplied between the IDF fitting and the process connection fitting, such as a Tri-Clamp fitting, on all Rosemount 8721 Sanitary sensors except when the process connection fittings are not supplied and the only connection type is an IDF fitting.

Alignment and Bolting
Standard plant practices should be followed when installing a magmeter with sanitary fittings. Unique torque values and bolting techniques are not required.

Figure 9. Rosemount 8721 Sanitary Installation
STEP 5: GROUNDING

Use Table 6 to determine which process grounding option to follow for proper installation. The sensor case should be earth grounded in accordance with national and local electrical codes. Failure to do so may impair the protection provided by the equipment.

Table 6. Process Grounding Installation

STEP 6: WIRING

This wiring section covers the connection between the transmitter and sensor, the FOUNDATION fieldbus segment, and supplying power to the transmitter. Follow the conduit information, cable requirements, and disconnect requirements in the sections below.

Conduit Ports and Connections

Both the sensor and transmitter junction boxes have ports for 1/2-inch NPT conduit connections with optional CM20 or PG 13.5 connections available. These connections should be made in accordance with national, local, and plant electrical codes. Unused ports should be sealed with metal plugs. Proper electrical installation is necessary to prevent errors due to electrical noise and interference. Separate conduits are not necessary for the coil drive and signal cables, but a dedicated conduit line between each transmitter and sensor is required. Shielded cable must be used for best results in electrically noisy environments. When preparing all wire connections, remove only the insulation required to fit the wire completely under the terminal connection. Removal of excessive insulation may result in an unwanted electrical short to the transmitter housing or other wire connections. For flanged sensors installed into an application requiring IP68 protection, sealed cable glands, conduit, and conduit plugs that meet IP68 ratings are required.

Conduit Requirements

A single dedicated conduit run for the coil drive and signal cable is needed between the sensor and the remote transmitter. See Figure 14. Bundled cables in a single conduit are likely to create interference and noise problems in the system. Use one set of cables per conduit run.

Figure 14. Conduit Preparation

STEP 6 CONTINUED...

Run the appropriate size cable through the conduit connections in your magnetic flowmeter system. Run the power cable from the power source to the transmitter. Run the coil drive and signal cables between the flowmeter sensor and transmitter.

- Installed signal wiring should not be run together and should not be in the same cable tray as AC or DC power wiring.
- Device must be properly grounded or earthed according to local electric codes.
- Rosemount combination cable part number 08732-0753-1003 (ft.) or 08732-0753-2004 (m) is required to be used to meet EMC requirements.

Transmitter to Sensor Wiring

The transmitter can be integral to the sensor or remotely mounted following the wiring instructions.

Remote Mount Cable Requirements and Preparation

For installations using the individual coil drive and signal cable, lengths should be limited to less than 1,000 feet (300 meters). Equal length cable is required for each. See Table 7.

For installations using the combination coil drive and signal cable, lengths should be limited to less than 330 feet (100 meters). See Table 7.

Prepare the ends of the coil drive and signal cables as shown in Figure 15. Limit the unshielded wire length to 1-inch on both the coil drive and signal cables. Any unsheathed wire should be wrapped with proper insulation. Excessive lead length or failure to connect cable shields can create electrical noise resulting in unstable meter readings.

NOTE
Dimensions are in inches (millimeters).
STEP 6 CONTINUED...

To order cable specify length as quantity desired.
25 feet = Qty (25) 08732-0753-1003

WARNING

Potential Shock Hazard Across Terminals 1 & 2 (40 Vac).

Wiring the Transmitter to the Sensor

When using individual cables for coil drive and signal, refer to Table 8. If using the combination coil drive and signal cable, refer to Table 9. See Figure 16 for transmitter specific wiring diagram.

1. Connect the coil drive cable using terminals 1, 2, and 3 (ground).
2. Connect the signal cable using terminals 17, 18, and 19.

STEP 6 CONTINUED...

NOTE
When using the Rosemount supplied combination cable, the signal wires for terminals 18 and 19 contain an additional shield wire. These two shield wires should be tied with the main shield wire at terminal 17 at the sensor terminal block and cut back to the insulation in the transmitter junction box. See Figure 17.

Figure 16. Remote Mount Wiring Diagram

Figure 17. Combination Coil and Signal Cable Wiring Diagram
STEP 6 CONTINUED...

Integral Mount Transmitters

The interconnecting wire harness for an integral mount transmitter is installed at the factory. See Figure 18. Do not use cable other than that supplied by Emerson Process Management, Rosemount, Inc.

Figure 18. 8732EST Integral Mount Wiring Diagram

FOUNDATION Fieldbus Connection Wiring

Transmitter Communication Input

The FOUNDATION fieldbus communication requires a minimum of 9 V dc and a maximum of 32 V dc at the transmitter communication terminals. Do not exceed 32 V dc at the transmitter communication terminals. Do not apply ac line voltage to the transmitter communication terminals. Improper supply voltage can damage the transmitter.

Field Wiring

Power independent of the transmitter power supply must be supplied for FOUNDATION fieldbus communications. Use shielded, twisted pair for best results. In order to get maximum performance in new applications, twisted pair cable specifically designed for fieldbus communications should be used. The number of devices on a fieldbus segment is limited by the power supply voltage, the resistance of the cable, and the amount of current drawn by each device. See Table 10 for cable specifications.

Power Conditioning
Each fieldbus power supply requires a power conditioner to decouple the power supply output from the fieldbus wiring segment.

Figure 19. Power Connections
Transmitter Wiring Connection

Follow the steps listed below to wire the model 8732E FOUNDATION Fieldbus transmitter:

1. Ensure Power Conditioner and cable meet the requirements shown above in 'Field Wiring'.
2. Ensure the transmitter is not powered.
3. Route Fieldbus wire through appropriate conduit entry.
4. Connect one Fieldbus wire to terminal 1 and the other Fieldbus wire to terminal 2. The 8732E Fieldbus transmitter is polarity insensitive. See Figure 20.

When wiring to screw terminals, crimped lugs are recommended. Tighten the terminals to ensure adequate contact. Both transmitter covers must be fully engaged to meet explosion proof requirements. Do not remove the transmitter covers in an explosive atmosphere when the transmitter is powered.

Figure 20. 8732E FOUNDATION Fieldbus Wiring Diagram
Powering the Transmitter

The 8732E transmitter is designed to be powered by 90–250 Vac, 50–60 Hz or 12–42 Vdc. Before connecting power to the Rosemount 8732E, consider the following standards and be sure to have the proper power supply, conduit, and other accessories. Wire the transmitter according to national, local, and plant electrical requirements for the supply voltage. See Figure 21.

Supply Wire Requirements

Use 12 to 18 AWG wire rated for the proper temperature of the application. For connections in ambient temperatures above 140 °F (60 °C), use a wire rated for 176 °F (80 °C). For ambient temperatures greater than 176 °F (80 °C), use a wire rated for 230 °F (110 °C). For DC powered transmitters with extended cable lengths, verify that there is a minimum of 12 V DC at the terminals of the transmitter.

Disconnects

Connect the device through an external disconnect or circuit breaker. Clearly label the disconnect or circuit breaker and locate it near the transmitter and per local electrical control.

Installation Category

The installation category for the 8732E is (Overvoltage) Category II.

Overcurrent Protection

The Rosemount 8732E flowmeter transmitter requires overcurrent protection of the supply lines. Maximum ratings of overcurrent devices are shown in Table 11.

Rosemount 8732

8732E Power Supply
For AC power applications (90-250 VAC, 50-60 Hz) connect AC Neutral to terminal 9 (AC N/L2) and connect AC Line to terminal 10 (AC/L1). For DC power applications connect negative to terminal 9 (DC -) and positive to terminal 10 (DC +). Units powered by 12-42 V DC power supply may draw up to 1 amp of current. See Figure 22 for terminal block connections.

Figure 22. 8732E Transmitter Power Connections

Cover Jam Screw
For transmitter housings shipped with a cover jam screw, the screw should be properly installed once the transmitter has been wired and powered up. Follow these steps to install the cover jam screw:
1. Verify that the cover jam screw is completely threaded into the housing.
2. Install the transmitter housing cover and verify that the cover is tight against the housing.
3. Using an M4 hex wrench, loosen the jam screw until it contacts the transmitter cover.
4. Turn the jam screw an additional 1/2 turn counterclockwise to secure the cover.
   (Note: Application of excessive torque may strip the threads.)
5. Verify that the cover cannot be removed.
Step 7: Basic Configuration

Quick Start-Up

Once the magnetic flowmeter system is installed and communication is established, configuration of the transmitter must be completed. The standard transmitter configuration, without Option Code C1, Custom Configuration, is shipped with the following parameters:

- Engineering Units: ft/s
- Sensor Size: 3-in.
- Sensor Calibration Number: 100000501000000

Assigning Device Tag and Node Address

The 8732E Magnetic Flowmeter Transmitter with FOUNDATION fieldbus is shipped with a blank tag and a temporary address to allow a host to automatically assign an address and a tag. If the tag or address need to be changed, use the features of the configuration tool. The tools do the following:

- Change the tag to a new value.
- Change the address to a new address.

When the device is at a temporary address, only the tag and address can be changed or written to. The resource, transducer, and function blocks are all disabled.

Flow-Specific Block Configuration

AI Block

The Analog Input (AI) function block provides the primary interface of the measurement to the control and/or monitoring systems. To properly configure the device, four parameters must be set in order to correctly interface between the AI block and transducer block.

1. Set the CHANNEL parameter to AI1.CHANNEL = 1 (Flow).
   In the 8732E Magnetic Flowmeter Transmitter only one channel is available.
2. Set the XD_SCALE. The default configuration is 0-30 ft/s.
3. Set the L_TYPE as Direct. L_TYPE can be either Direct or Indirect.
4. If setting the L_TYPE as indirect, OUT_SCALE range must be configured.

General Block Configuration

In general, only the transducer block and AI block have configurations for flow-specific parameters. All other function blocks are configured by linking the AI block to other blocks to be used for control and/or monitoring applications.

NOTE

Refer to the FOUNDATION™ fieldbus Block product manual, document 00809-0100-4783, for more details on configuring and troubleshooting the AI block.

Rosemount 8732

KOSHA - Korea

E9 KOSHA Flameproof
Certificate No: 2008-2094-Q1X
Ex de IIC or Ex de [ia] IIC T6
without LOI (-50 °C ≤ Ta ≤ +60 °C)
with LOI (-20°C ≤ Ta ≤ +60 °C)
V_{\text{max}} = 250 V AC or 42 V DC

EK KOSHA Flameproof
Certificate No: 2008-2094-Q1X
Ex de IIB or Ex de [ia] IIB T6
without LOI (-50 °C ≤ Ta ≤ +60 °C)
with LOI (-20°C ≤ Ta ≤ +60 °C)
V_{\text{max}} = 250 V AC or 42 V DC

GOST - Russia

E8 GOST Flameproof
Ex de IIC T6 or Ex de [ia] IIC T6
without LOI (-50 °C ≤ Ta ≤ +60 °C)
with LOI (-20°C ≤ Ta ≤ +60 °C)
IP67

EM GOST Flameproof
Ex de IIB T6 or Ex de [ia] IIB T6
without LOI (-50 °C ≤ Ta ≤ +60 °C)
with LOI (-20°C ≤ Ta ≤ +60 °C)
IP67

\(^{(1)}\) CE Marking is standard on Rosemount 8705, 8711, and 8721. No hazardous location certifications are available on the Rosemount 570TM.

\(^{(2)}\) Available in line sizes up to 8 in. (200 mm) only.
Figure 24. Declaration of Conformity

We,

Rosemount Inc.
12001 Technology Drive
Eden Prairie, MN 55344-3695
USA

declare under our sole responsibility that the product(s),

Model 8732E Magnetic Flowmeter Transmitter

manufactured by,

Rosemount Inc.
12001 Technology Drive
Eden Prairie, MN 55344-3695
USA

and

8200 Market Boulevard
Chanhassen, MN 55317-9687
USA

to which this declaration relates, is in conformity with the provisions of the European Community Directives, including the latest amendments, as shown in the attached schedule.

Assumption of conformity is based on the application of harmonized or applicable technical standards and, when applicable or required, a European Community notified body certification, as shown in the attached schedule.
