Ethernet I/O Card (EIOC)

- Powerful solution that communicates directly to external Ethernet Device Networks
- Easy connection to devices using Modbus TCP, EtherNet/IP, IEC61850 MMS, OPC UA client or EtherNet/IP Control Tag Integration protocols
- Proven S-series packaging
- Modular with easy to add redundancy
- Communication to any M- and S-series Controller

Introduction

The Ethernet I/O Card (EIOC) provides a platform to access data from Ethernet devices in the DeltaV system. Ethernet Devices capable of talking Modbus TCP, EtherNet/IP, IEC 61850 MMS (Manufacturing Message Specification), OPC UA client and EtherNet/IP Control Tag Integration protocols are supported.

The EIOC provides monitoring and control of Ethernet Devices on the Ethernet Device Network via control modules assigned to and executed in the EIOC. Ethernet Devices like PLCs, Motor Control Centers, drives, switchgear and others can be controlled directly by the EIOC, independent of a controller.

Benefits

Ability to communicate directly to Ethernet Device Networks. Use the EIOC to monitor and control Ethernet Devices.

- **Powerful and Scalable.** The EIOC allows a huge amount of data coming from Ethernet Devices to be accessed in DeltaV, and is scalable to fit your needs with licensing based on the number of devices you connect. The EIOC can bring:
  - Up to 32,000 signals from 256 Ethernet Devices when using Modbus TCP, EtherNet/IP, or IEC61850 MMS.
  - Up to 30,000 signals from 64 Ethernet Devices when using OPC UA client protocol.
  - Up to 2000 tags (10 signals per tag) from 256 Ethernet Devices when using EtherNet/IP Control Tag Integration Protocol.
Monitoring. Data values integrated into the EIOC can be used in Control Modules running inside the EIOC. These control modules allow alarm generation, history collection, and viewing by the operator, as with control modules running in a Controller using traditional DeltaV native I/O.

Supports control functionality. In addition, function blocks allowing for discrete control and limited PID control are supported for the EIOC. No assignment to a controller is required. Motors, switchgear, variable frequency drives; or any device that communicate via Ethernet protocols can be controlled directly from the EIOC.

Easy to connect to Ethernet Devices using Modbus TCP, EtherNet/IP, IEC61850 MMS, OPC UA client and EtherNet/IP Control Tag Integration protocols. Use the EIOC Ethernet protocols to connect your DeltaV system to your Ethernet Device Networks.

Huge processing capacity. Each EIOC is capable of handling a huge amount of Data in up to 2000 Control Modules.

EIOC is part of the DeltaV Control Network. 60 EIOC’s can be added directly to the DeltaV Control Network, allowing maximum freedom in segregating your networks.

Flexible networking. User configurable IP addressing for the Ethernet Device Network allows the EIOC to be used in almost any plant environment regardless of the networking scheme. When designing a simplex Ethernet Device Network, consider that the EIOC and the Ethernet Devices must be on the same IP subnet to communicate. Also, when designing a redundant Ethernet Device Network, consider that the primary and secondary ports in the EIOC must be in different subnets to follow best engineering practices.

Easy to use. The EIOC is easy to use as it provides a native way to bring Ethernet protocol data into the DeltaV system. Specific ease of use features include:

- You can choose between the 5 different Ethernet protocols supported in the EIOC. Only one protocol is supported at a time and requires the proper licensing.
- Updates for the EIOC and drivers are included within DeltaV.
- Configured in DeltaV Explorer. All needed configuration for the Ethernet Devices is done in DeltaV Explorer and DeltaV Control Studio, just like Traditional I/O signals. The data can be configured in DeltaV Control Modules, displayed on DeltaV Live and DeltaV Operate graphics, and stored in the DeltaV Continuous Historian.

Modular and Easy to add Redundancy. The dual universal carrier hosts all the needed components for a redundant setup (redundant Power input Terminals and redundant Ethernet Isolation ports). The EIOC becomes redundant just by adding a second EIOC on the dual universal carrier. The configuration will change automatically, confirming that the two EIOCs are now working as a redundant pair. Manual switchovers can be controlled in DeltaV Diagnostics Explorer. The redundant Ethernet ports provide isolation between DeltaV Control Network communication and the redundant Ethernet Device Network. The EIOC also implements Parallel Redundant Protocol (PRP) for an added layer of robustness, providing a seamless switchover between primary and secondary networks.

Product Description

The EIOC is a big pipe for the integration of process data from 3rd party Ethernet Devices, such as PLCs and smart field devices such as Intelligent Field Devices (IFDs) and Intelligent Electronic Devices (IEDs). A network of these Ethernet Devices can be directly connected to the EIOC. The Ethernet Devices can communicate to the EIOC using one of five protocols; Modbus TCP, EtherNet/IP, IEC61850 MMS, OPC UA client and EtherNet/IP Control Tag Integration. The EIOC connects directly into the DeltaV Control Network and can be placed remotely in an enclosure in the field.

The EIOC is an independent embedded data server. This means that there is no need for a separate controller to process the data being integrated into the EIOC. Control Modules needed to process the data from the Ethernet Devices are assigned and executed in the EIOC. In this way, communications with the devices are fast and direct. Any parameters from the modules running in the EIOC can be read by both S-series and M-series controllers using External References when needed in control strategies at the controller level.
When configuring the EIOC Control Modules, all typical Function blocks needed for continuous operation are available; however, the usage of the following Function blocks are limited in the EIOC:

- 256 DC’s, EDC’s and DCC’s – used for such applications as motor control in MCCs.
- 26 PID’s – analog control where all or most of the signals are coming from Ethernet Devices.
- 16 SEQS – Sequence function block used for sequencing motor control states.
- 16 STDs – State Transition Diagram used in sequencing and can be used with the SEQ function blocks.
- Batch control, SFCs, PLMs, and Equipment Modules are not supported in the EIOC.

To maintain the capacity of the EIOC, consideration should be taken to keep modules as lean as possible. Heavy configuration in the modules will decrease the capacity of 2000 modules in the EIOC.

Listed by category, the following is a complete list of the function blocks available with the EIOC.

**Advanced Control** – None

**Advanced Functions** – State Transition, Step Sequencer

**Analog Control** – Analog Tracking, Calc/Logic, Filter, Input Selector, Scaler, Signal Characterizer, Signal Generator, Signal Selector, Bias/Gain, Manual Loader, PID, Rate Limit, Ramp, Enhanced Ramp, Splitter, Limit

**Energy Metering** – None

**IO** – Alarm Detection, AI, AO, DI, DO

**Tag I/O** – DI, DO, AI, AO

**Logical** – All

**Math** – All

**Special Items** – All

**Timer Counter** – All

Access to DeltaV Live graphics, DeltaV Operate graphics, and the alarms and history collection from EIOC control modules follows the same rules and mechanisms as control modules running in the controllers in a DeltaV System.

The EIOC mounts on the dual universal carrier, which includes redundant Power input Terminals as well as redundant Ethernet Isolation ports. The Ethernet Isolation ports isolate the redundant DeltaV Control Network communication from the redundant Ethernet Device Networks. An Industrial Networks Firewall is recommended to provide added security based on deep packet inspection to restrict communications at the Ethernet device and Ethernet protocol level. In this way, Robustness and Security is ensured.
The DeltaV system with a redundant Ethernet I/O Card and simplex connection to the Ethernet Device Network.

**Supported Industrial Ethernet Protocols:**

**Modbus TCP Interface**

The Modbus TCP interface will support Modbus data sources such as PLCs, MCCs, analyzers and similar devices communicating Modbus TCP. The Modbus TCP interface is a Modbus client (Master) reading and writing data from/to Modbus servers (Slave devices). The Modbus server devices can be Modbus TCP devices or Modbus serial devices using a Modbus TCP gateway.

The Modbus TCP interface supports the following types of data access:

- Reading input data from Modbus Coils, Discrete Input, Holding Registers, and Input Registers.
- Writing output data to Coils and Holding registers.

All reads will be performed periodically and outputs will be sent when they are written.

**EtherNet/IP**

The EtherNet/IP protocol allows data sources such as PLCs, Intelligent Field Devices (IFDs), variable-speed drives, MCCs, and analyzers; as well as other devices communicating EtherNet/IP to connect directly to DeltaV via the EIOC.

The EtherNet/IP interface will support connections for both implicit and explicit messaging to allow access to both Class 1 and Class 3 EtherNet/IP I/O adapters. Redundancy with EtherNet/IP Class 1 Implicit and Class 3 Explicit messaging for control (sending outputs to the devices) require special considerations due to exclusive owner communications defined by the protocol. Please refer to the DeltaV System Planning Guide for more information. Class 3 PCCC and UCMM with Logix tags message classes are also supported.
IEC 61850 (MMS)

The IEC 61850 MMS interface will allow data from Intelligent Electronic Devices (IEDs) such as motor protection relays, motor starters, motor control centers, switchgear, and similar MMS-based devices to be integrated into DeltaV. The MMS interface will be a client reading and writing data from/to the Intelligent Electronic Device which acts as the server.

The EIOC only supports reading and writing of real time signals using this protocol. Reading historical data or Goose applications are not supported.

OPC UA Client

The OPC UA Client in the EIOC provides native client implementation of a Data Access profile (real time data) compliant with OPC UA version 1.02. The OPC UA client will read and write up to 30,000 real time signals coming from up to 64 OPC UA servers.

EtherNet/IP Control Tag Integration protocol

The EtherNet/IP Control Tag Integration protocol utilizes EtherNet/IP Class 3 messaging to provide integration with tag-based PLC data sources. Referencing data by tag name eliminates the need for register mapping. Read or write up to 10 signals per tag, and up to 2000 tags per EIOC for a total of 20,000 signals. The EtherNet/IP Control Tag Integration protocol supports reading string type signals and read/write of arrays up to 64 elements each (max 100 arrays per EIOC).

The EtherNet/IP Control Tag Integration protocol supports integration with ControlLogix and CompactLogix PLCs utilizing tags.

Parallel Redundant Protocol (PRP)

PRP is a network protocol standard for Ethernet that provides seamless failover against failure of any network component. Therefore, it is a great solution when high availability and short switchover time is required (e.g. electrical monitoring using IEC 61850 MMS). PRP allows for communications in Primary and Secondary ports of the Ethernet Device Network in the EIOC to happen at the same time. This means that a device connected to the Ethernet Device network is getting the same information at the same time, through different network paths. In case of failure in one of the networks it basically provides a zero-time to recovery (no time to switchover) and eliminates any single point of failure in a redundant Ethernet Device Network.

PRP is independent of the application-protocol and can be used by most Industrial Ethernet protocols. In the EIOC, PRP is an optional feature than can be enabled at the port level and is available with all the protocols supported in the EIOC. When enabled, PRP runs on top of the protocol that is selected at that time.

For PRP to work properly, the Ethernet Devices connected to the redundant network needs to support PRP natively as well. If the devices do not support PRP natively, then a RedBox must be used to allow the connection into the PRP network without having bad status in diagnostics.
EIOC Configuration

The EIOC is configured in the I/O network level of DeltaV Explorer and it does not count towards the controller node count limit (limited to 60 EIOCs per system). The hierarchy of the EIOC in DeltaV Explorer consist of:

- **EIOC**
  - **Assigned Modules** – Modules configured and running inside the EIOC
  - **Hardware Alarms** – Hardware alarms associated with the EIOC
  - **PO1** – EIOC port, where the Ethernet Device Network and protocol is setup.
  - **PDT** – The Ethernet Devices are added and configured under the EIOC port as Physical Devices (PDTs). The amounts of PDTs that can be configured will vary depending of the protocol selected in the port and the amount of device licenses assigned. The PDTs can be renamed
  - **LDT** – Logical Devices (LDTs) are added under the PDTs to configure signals or control tags depending of the protocol that has been selected at the port level. DST licenses are applied at this level.

EIOC Licensing

Licensing for the EIOC is easy and scalable. Just buy the hardware assembly for the EIOC, simplex or redundant. No additional license is required for redundancy. Then decide which protocol you need (one per EIOC is permitted), and pick the appropriate license. Next, determine how many Ethernet Devices you need to connect, and pick the license containing the required number. Once the EIOC is configured one DST license will be consumed per LDT, with the type being determined based on the highest value configured in the LDT (except for the EtherNet/IP Control Tag Integration Protocol). For the EtherNet/IP Control Tag Integration protocol, one DST license is consumed per Control Tag. The DST license is consumed based on the type of Control Tag that is configured.

PRP does not require a license, as it is included as part of the EIOC functionality.

Summary

The EIOC supports communications with Ethernet Devices using Modbus TCP, EtherNet/IP, IEC61850 MMS, OPC UA client and Ethernet/IP Control Tag Integration protocols. The EIOC supports a huge capacity of data for monitoring or control. The Capacity, polling and switchover times vary based on protocol, device type, and loading. Refer to the DeltaV System Planning Guide for more information.

The EIOC capacity lends itself to very large integration projects with limited control needs. For applications that require batch or sequence control (class-based units, PLMs, SFCs, and Equipment Modules are not supported in the EIOC) or more complex control that requires other functionality such as traditional, bus, or Electronic Marshalling IO, then a PK controller or a VIM2 card combined with a DeltaV controller could be a better solution. Please consult your local Emerson office for more details.
## Protocol specifications of the EIOC

### Modbus TCP
- Modbus TCP protocol as specified by www.modbus.org except for limited amount of register types, it only allows 9999 of each category
- Register addresses are limited in the following ranges:
  - Coils: 1 – 9999
  - Discrete Inputs: 10001 - 19999
  - Input Registers: 30001 – 39999
  - Holding Registers: 40001 – 49999
- Uses MODICON (PLC) based addressing (Modbus absolute addressing is not supported)
- EIOC is always the Modbus Master that reads and writes data from and to Modbus slave devices

*Please review the VIM2 product data sheet as an alternative to provide added Modbus TCP functionality (e.g. Modbus RTU, Modbus ASCII, etc.)*

### EtherNet/IP Interface
- EtherNet/IP interface in the EIOC is a Scanner Device (Master) that reads and writes data from EtherNet/IP Adapter devices (slaves).
- EtherNet/IP interface supports the following types of messaging connections:
  - Implicit messages (Class 1)
  - Explicit messages (Class 3)
  - Class 3 with PCCC
  - UCMM with Logix Tags
- Configuration of this messages connections is only supported via manual configuration on the DeltaV Explorer at the LDT level or bulk edit configuration. EDS files are not supported

*Please review the VIM2 product data sheet as an alternative to provide added EtherNet/IP functionality (e.g. EDS file support.)*

### EtherNet/IP Control Tag Integration
- EtherNet/IP Control Tag integration is based on EtherNet/IP Class 3 messaging to provide integration with tag-based PLC data sources
- EIOC is a Scanner Device (Master) that reads and writes data from PLCs configured as slaves
- Supports integration with ControlLogix and CompactLogix PLCs utilizing tags based on add on instructions and structures
- Support browsing of add on instructions via the Rockwell Logix 5000 L5X file
- Only supports read/write of ControlLogix controller scoped tags, and not program tags
- Implicit Class1, Explicit Class 3, Class 3 with PCC and UCMM messages are not supported in combination with this protocol

### OPC UA Client
- EIOC is a Client that reads and writes data from OPC UA servers
- Supports only the DA profile (real time data).
- Is based on OPC UA standard version 1.02 that supports the following:
  - OPC Binary Transportation
  - 128 or 256-bit encryption levels
  - Message Signing
  - Digital Certificates – Self Signed and Certificate Authority (CA)
  - Support browsing of configuration online and offline via a NodeSet file

*Please review the DeltaV OPC UA product data sheet for more information regarding other OPC UA clients and servers available in DeltaV*

### IEC 61850 MMS
- IEC 61850 Manufacturing Message Specification (MMS) interface is a client that reads and writes real time data from and to Intelligent Electronic Device servers.
- Reading or writing historical data is not supported

Certifications

The following certifications are available for the EIOC:

- **CE:**
  - EMC - EN 61326-1
- **FM:**
  - FM 3600
  - FM 3611
- **CSA:**
  - CSA C22.2 No. 213-M1987
  - CSA C22.2 No. 1010-1
- **ATEX:**
  - ATEX 94/9/EC
  - EN60079-0
  - EN60079-15
- **IEC-Ex:**
  - IEC60079-0
  - IEC60079-15
- **Marine Certifications: IACS E10**
  - ABS Certificate of Design Assessment
  - DNV-GL Marine Certificate
- **Wurldtech:**
  - Achilles Communications Certification Level 2 (v13.3.1)

Hazardous Area/Location

The EIOC can be installed and used based on the following Standards:

- **FM (USA):**
  - Class I, Division 2, Groups A, B, C, D, T4
- **cFM (Canada):**
  - Class I, Division 2, Groups A, B, C, D, T4
- **ATEX:**
  - II 3G Ex nA IIC T4 Gc
- **IEC Ex:**
  - II 3G Ex nA IIC T4 Gc

Regarding the Installation instructions please refer to the following Documents:
- Class 1 Division 2 Installation Instructions DeltaV S-Series (12P5402)
- Zone 2 Installation Instructions DeltaV S-Series (12P5404)
## Ordering Information

<table>

## Related Products

- **PK controller** – DeltaV controller with native Ethernet ports to connect to Ethernet Devices, allowing full control functionality in combination with all DeltaV I/O.
- **VIM2 card** – M and S series card that in combination with a DeltaV controller can provide an interface to Ethernet Devices for full control functionality in combination with all DeltaV I/O.
- **OPC UA** – The different OPC UA servers and clients in the DeltaV system allows data reads and writes to and from 3rd party application in an easy, reliable and secure way.
- **DeltaV Simulate** – Use of Ethernet I/O cards in a DeltaV Simulate system is limited to Virtual Ethernet I/O cards (vEIOC) in v14. The physical EIOC is not supported in DeltaV Simulate v14.

## Prerequisites

- For Modbus TCP, EtherNet/IP and IEC61850, DeltaV 13.3.1 or higher is required.
- For OPC UA client, EtherNet/IP Control Tag Integration, PRP and scalable licensing, DeltaV 14.3.1 or higher is require.
