1. The pressure/temperature limits in this manual and any applicable standard or code limitation for the valve should not be exceeded. 2. Certain bonnet bolting material selections may require a CL600 easy-e valve assembly to be derated. Contact your Emerson sales office .			

1.2 Description

These single-port valves have cage guiding, quick-change trim and unbalanced push-down-to-close valve plug action. Valve configurations are as follows:

ES—Globe style valve (Figure 1) with metal-to-metal seating as standard for all general applications over a wide range of pressure drops and temperatures and metal-to-PTFE seating is optional for more stringent shutoff requirements.

EAS—Angle valve version of ES, used to facilitate piping or in applications where a self draining valve body is required.

1.3 Specifications

Typical specifications for these valves are shown in Table 1.

Section 2: Installation

WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in Table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

Table 2. Available Shutoff Classifications per ANSI/FCI 70-2 and IEC 60534-4

Seating	Shutoff Class
Metal	IV (standard)
	V
PTFE	VI

CAUTION

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop and controlled fluid conditions. Since some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

Before installing the valve, inspect the valve and pipelines for any damage and any foreign material which may cause product damage.

1. Before installing the valve, inspect the valve and associated equipment for any damage and any foreign material.
2. Make certain the valve body interior is clean, that pipelines are free of foreign material and that the valve is oriented so that pipeline flow is in the same direction as the arrow on the side of the valve.

3. The control valve assembly may be installed in any orientation unless limited by seismic criteria. However, the normal method is with the actuator vertical above the valve. Other positions may result in uneven valve plug and cage wear and improper operation. With some valves, the actuator may also need to be supported when it is not vertical. For more information, consult your [Emerson sales office](#).
4. Use accepted piping and welding practices when installing the valve in the line. Internal elastomeric parts may stay in place during the welding procedure. For flanged valves, use a suitable gasket between the valve and pipeline flanges.

CAUTION

Depending on valve body materials used, post weld heat treating may be required. If so, damage to internal elastomeric and plastic parts, as well as internal metal parts is possible. Shrunk-fit pieces and threaded connections may also loosen. In general, if post weld heat treating is to be performed, all trim parts should be removed. Contact your [Emerson sales office](#) for additional information.

5. With a leak-off bonnet construction, remove the pipe plugs (keys 14 and 16, Figure 8) to hook up the leak-off piping. If continuous operation is required during inspection or maintenance, install a three-valve bypass around the control valve assembly.
6. If the actuator and valve are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.

WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions.

Valves with ENVIRO-SEAL live-loaded packing or HIGH-SEAL Heavy-Duty live-loaded packing will not require this initial re-adjustment. See the Fisher instruction manuals titled ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)) or Heavy-Duty Live-Loaded Packing System ([D101453X012](#)) (as appropriate) for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the Parts Kits sub-section near the end of this manual.

Section 3: Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing lubrication, packing maintenance, trim maintenance and ENVIRO-SEAL bellows seal replacement. All maintenance operations may be performed with the valve in the line.

WARNING

Avoid personal injury or damage to property from sudden release of pressure or uncontrolled process fluid. Before starting disassembly:

- **Do not remove the actuator from the valve while the valve is still pressurized.**
- **Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.**
- **Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open the valve.**
- **Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.**
- **Vent the power actuator loading pressure and relieve any actuator spring compression.**
- **Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.**
- **The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings or when loosening the packing box pipe plug.**
- **Check with your process or safety engineer for any additional measures that must be taken to protect against process media.**

CAUTION

Follow instructions carefully to avoid damaging the product surfaces, which could result in damage to the product.

NOTE

Whenever a gasket seal is disturbed by removing or shifting gasketed parts, a new gasket should be installed upon reassembly. This is necessary to ensure a good gasket seal since the used gasket may not seal properly.

NOTE

If the valve has ENVIRO-SEAL or HIGH-SEAL live-loaded packing installed, refer to Instruction Manuals ENVIRO-SEAL Packing System for Sliding-Stem Valves (D101642X012) or HIGH-SEAL Live-Loaded Packing System (D101453X012), for packing instructions. Figure 9 shows a typical HIGH-SEAL Packing system. Figures 10, 11 and 12 show typical ENVIRO-SEAL packing systems.

If the valve has an ENVIRO-SEAL bellows seal bonnet installed, refer to this manual. See the ENVIRO-SEAL Bellows Seal and Bonnet section for information on the bellows seal bonnet.

2. SA193-B8M annealed.

3. SA193-B8M strain hardened.

4. For other materials, contact your [Emerson sales office](#) for torques.

3.1 Packing Lubrication

NOTE

ENVIRO-SEAL or HIGH-SEAL packing does not require lubrication.

WARNING

To avoid personal injury or property damage resulting from fire or explosion, do not lubricate packing used in oxygen service or in processes with temperatures over 260°C / 500°F.

If a lubricator or lubricator/isolating valve (Figure 2) is provided for PTFE/composition or other packings that require lubrication, it will be installed in place of the pipe plug (key 14, Figure 8). Use a good quality silicon-base lubricant. Packing used in oxygen service or in processes with temperatures over 260°C / 500°F should not be lubricated. To operate the lubricator, simply turn the cap screw clockwise to force the lubricant into the packing box. The lubricator/isolating valve operates the same way except the isolating valve must first be opened and then closed after lubrication is completed.

3.2 Packing Maintenance

Key numbers refer to Figure 3 for PTFE V-ring packing and to Figure 5 for PTFE/composition packing, unless otherwise indicated.

For spring-loaded single PTFE V-ring packing, the spring (key 8, Figure 3) maintains a sealing force on the packing. If leakage is noted around the packing follower (key 13, Figure 3), check to be sure the shoulder on the packing follower is touching the bonnet. If the shoulder is not touching the bonnet, tighten the packing flange nuts (key 5, Figure 8) until the shoulder is against the bonnet. If leakage cannot be stopped in this manner, proceed to the replacing packing procedure.

If there is undesirable packing leakage with other than spring-loaded packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts.

If the packing is relatively new and tight on the stem and if tightening the packing flange nuts does not stop the leakage, it is possible that the valve stem is worn or nicked so that a seal cannot be made. The surface finish of a new valve stem is critical for making a good packing seal. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches around the packing box wall. If performing any of the following procedures, inspect the valve stem and packing box wall for nicks and scratches.

Replacing Packing

WARNING

Refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

1. Isolate the control valve from the line pressure and release pressure from the valve.
2. Disconnect the operating lines from the actuator and any leak-off piping from the bonnet. Disconnect the stem connector, then remove the actuator from the valve by unscrewing the yoke locknut (key 15, Figure 8) or the hex nuts (key 26, Figure 8).

WARNING

To avoid personal injury or property damage caused by uncontrolled movement of the bonnet, loosen the bonnet by following the instructions in the next step. Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet. If the cage sticks to the bonnet, proceed carefully with bonnet removal.

NOTE

The following step also helps to provide additional assurance that the valve body fluid pressure has been relieved.

3. Hex nuts (key 5, Figure 8) attach the bonnet to the valve. Loosen these nuts or cap screws approximately 3 mm / 1/8 in. Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and valve body. Work the prying tool around the bonnet until the bonnet loosens.

DOUBLE ARRANGEMENTS

B1428-3

Figure 4. PTFE Packing Arrangements for Use in ENVIRO-SEAL Bellows Seal Bonnets

SINGLE ARRANGEMENTS

DOUBLE ARRANGEMENTS

A5863-1

4. Loosen the packing flange nuts (key 5, Figure 8) so that the packing is not tight on the valve stem. Remove any travel indicator parts from the valve stem threads.

⚠ CAUTION

Avoid damage to the seating surface caused by the valve plug and stem assembly dropping from the bonnet after being lifted part way out. When lifting the bonnet, temporarily install a valve stem locknut on the valve stem. This locknut will prevent the valve plug and stem assembly from dropping out of the bonnet.

If the cage starts to lift with the bonnet, tap it with a plastic mallet or other soft material, to be sure it stays in the valve.

5. Completely remove the cap screws (not shown) or hex nuts (key 16; Figure 13, 14 or 15) that bolt the bonnet and valve together and carefully lift the bonnet off.
6. Remove the locknut and separate the valve plug and stem from the bonnet. Set the parts on a protective surface to prevent damage to gasket or seating surfaces.

Figure 7. Detail of Graphite Ribbon/Filament Packing for Plain and Extension Bonnets

A5864-1

NOTE:

1. 0.102 mm / 0.004 in. THICK SACRIFICIAL ZINC WASHERS; USE ONLY ONE BELOW EACH GRAPHITE RIBBON RING.

⚠ WARNING

To avoid personal injury due to leaking fluid, avoid damaging gasket sealing surfaces. The seating surface of the valve plug (key 2) is critical for proper shutoff. Protect these surfaces accordingly.

⚠ CAUTION

To prevent possible product damage, cover the opening in the valve in the following procedure to prevent foreign material from getting into the valve body cavity.

7. Remove the bonnet gasket (key 10, Figures 13 through 15) and cover the opening in the valve to protect the gasket surface and prevent foreign material from getting into the valve body cavity.
8. Remove the packing flange nuts, packing flange, upper wiper and packing follower (keys 5, 3, 12 and 13, Figure 8). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall. Clean the packing box and the metal packing parts.
9. Inspect the valve stem threads and packing box surfaces for any sharp edges which might cut the packing. Scratches or burrs could cause packing box leakage or damage to the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts by following the appropriate steps in the Trim Maintenance procedure.
10. Remove the covering protecting the valve body cavity and install a new bonnet gasket (key 10, Figures 13 through 15), making sure the gasket seating surfaces are clean and smooth. Then slide the bonnet over the stem and onto the stud bolts (key 15, Figure 13, 14 or 15) or onto the valve body cavity if cap screws (not shown) will be used instead.

NOTE

Proper performance of the bolting procedures in step 11 compresses the spiral wound gasket (key 12, Figures 13 through 15) or load ring (key 26, Figure 14) enough to both load and seal the seat ring gasket (key 13, Figure 13, 14 or 15). It also compresses the outer edge of the bonnet gasket (key 10, Figures 13 through 15) enough to seal the body-to-bonnet joint.

The proper bolting procedures in step 11 include—but are not limited to—ensuring that bolting threads are clean and evenly tightening the cap screws or the nuts onto the studs, in a crisscross pattern. Because of the boltup characteristics of spiral wound gaskets, tightening one cap screw or nut may loosen an adjacent cap screw or nut. Repeat the crisscross tightening pattern several times until each cap screw or nut is tight and the body-to-bonnet seal is made.

11. Install bolting, using proper bolting procedures during tightening so that the body-to-bonnet joint will withstand test pressures and application service conditions. The bolt torques in Table 3 may be used as guidelines.

12. Install new packing and the metal packing box parts according to the appropriate arrangement in Figure 3, 5 or 7. For split ring packing, alternate the positions of the splits to avoid creating a leak path. Place a smooth-edged pipe over the valve stem and gently tap each soft packing part into the packing box, being sure that air is not trapped between adjacent soft parts.
13. Slide the packing follower, upper wiper and packing flange (keys 13, 12 and 3, Figure 8) into position. Lubricate the packing flange studs (key 4, Figure 8) and the faces of the packing flange nuts (key 5, Figure 8). Install the packing flange nuts.
14. For spring-loaded PTFE V-ring packing, tighten the packing flange nuts until the shoulder on the packing follower (key 13, Figure 8) contacts the bonnet.

For ENVIRO-SEAL or HIGH-SEAL live-loaded packing, refer to the note at the beginning of the Maintenance section.

For graphite packing, tighten the packing flange nuts to the maximum recommended torque shown in Table 4. Then, loosen the packing flange nuts and retighten them to the recommended minimum torque shown in Table 4.

For other packing types, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in Table 4. Then, tighten the remaining flange nuts until the packing flange is level and at a 90-degree angle to the valve stem.
15. Mount the actuator on the valve assembly and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual.

3.3 Trim Maintenance

WARNING

Refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

In the following applicable procedures, to avoid damaging parts, do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

Except where indicated, key numbers in this section are referenced in Figure 13 for standard NPS 1/2 through 6 constructions, Figure 14 for NPS 8 ES valves, Figure 15 for Whisper Trim III and Whisper NXG trim cage detail and Figure 16 for WhisperFlo trim.

Disassembly

1. Remove the actuator and the bonnet according to steps 1 through 6 of the Replacing Packing procedure of the Maintenance section.

**Table 4. Recommended Torque for Packing Flange Nuts
(Not for Spring-Loaded Packing)**

VALVE STEM DIAMETER		PRESSURE RATING	GRAPHITE TYPE PACKING				PTFE TYPE PACKING			
			Minimum Torque		Maximum Torque		Minimum Torque		Maximum Torque

		CL600	34	300	50	444	16	144	24	216
31.8	1-1/4	CL300	33	288	49	432	16	144	24	216
		CL600	45	396	66	588	22	192	33	288

WARNING

To avoid personal injury due to leaking fluid, avoid damaging gasket sealing surfaces. The surface finish of the valve stem (key 7) is critical for making a good packing seal. The inside surface of the cage or cage/baffle assembly (key 3) or cage retainer (key 31), is critical for smooth operation of the valve plug. The seating surfaces of the valve plug (key 2) and seat ring (key 9) are critical for proper shutoff. Unless inspection reveals otherwise, assume all these parts are in good condition and protect them accordingly.

2. Packing parts can be removed if desired. Replace these parts as described in the Replacing Packing procedure. Remove the load ring (key 26) from an NPS 8 ES valve or the cage adaptor (key 4) from any restricted trim valve and wrap it for protection.

2. Packing parts can be removed if desired. Replace these parts as described in the Replacing Packing procedure. Remove the load ring (key 26) from an NPS 8 ES valve or the cage adaptor (key 4) from any restricted trim valve and wrap it for protection.
3. Lift the valve plug and stem assembly out of the valve and set it on a protective surface. If the valve plug is to be reused, protect the valve plug seating surface to prevent scratches. On an NPS 6 ES valve with Whisper Trim III cage or WhisperFlo trim, also remove the bonnet spacer (key 32) and bonnet gasket (key 10) on top of the spacer. Then on any construction with a cage retainer (key 31), remove the cage retainer and its associated gaskets.
A Whisper Trim III and WhisperFlo trim cage retainer has two 3/8 in.-16 UNC tappings in which screws or bolts can be installed for lifting.
4. Remove the cage or cage/baffle assembly (key 3), the associated gaskets (keys 10, 11 and 12) and shim (key 51 for the ES valve, key 27 for the EAS valve). If the cage is stuck in the valve body, use a rubber mallet to strike the exposed portion of the cage at several points around its circumference.
5. Remove the seat ring or liner (key 9) or disk seat (key 22), seat ring gasket (key 13) and the seat ring adaptor (key 5) and adaptor gasket (key 14) where used in a restricted trim seat ring construction. PTFE seat constructions use a disk (key 23) sandwiched between the disk seat and disk retainer (key 21).
6. Inspect parts for wear or damage which would prevent proper operation of the valve. Replace or repair trim parts according to the following procedure for lapping metal seats or other valve plug maintenance procedures as appropriate.

Table 5. Valve Stem Connection Torque and Pin Replacement

VALVE STEM CONNECTION (VSC)		BOLT TORQUE, MINIMUM TO MAXIMUM		HOLE SIZE	
mm	in.	N•m	Lbf•ft	mm	in.
9.5	3/8	40 to 47	25 to 35	2.41 to 2.46	0.095 to 0.097
12.7	1/2	81 to 115	60 to 85	3.20 to 3.25	0.126 to 0.128
19.1	3/4	237 to 339	175 to 250	4.80 to 4.88	0.189 to 0.192
25.4	1	420 to 481	310 to 355	6.38 to 6.45	0.251 to 0.254
31.8	1-1/4	827 to 908	610 to 670	6.38 to 6.45	0.251 to 0.254

Table 6. Standard Material Designations

Standard Designation	Common Name or Trade Name
CoCr-A Hardfacing Alloy R30006 S17400 SST S31600 SST	CoCr-A Alloy 6 Casting 17-4PH Stainless Steel 316 Stainless Steel
S41000, S41600, CA15 WCC Carbon Steel Casting	13Cr 400-Series SST WCC

⚠ CAUTION

To avoid damaging the ENVIRO-SEAL bellows seal bonnet assembly, do not attempt to lap the metal seating surfaces. The design of the assembly prevents rotation of the stem and any forced lapping rotation will damage internal components of the ENVIRO-SEAL bellows seal bonnet.

Lapping Metal Seats

A certain amount of leakage should be expected with metal-to-metal seating in any valve body. If the leakage becomes excessive, however, the condition of the seating surfaces of the valve plug and seat ring can be improved by lapping. (Deep nicks should be machined out rather than ground out.) Use a good quality lapping compound of a mixture of 280 to 600-grit. Apply the compound to the bottom of the valve plug.

Assemble the valve to the extent that the cage and the cage retainer and bonnet spacer (if used) are in place and the bonnet is bolted to the valve body. A simple handle can be made from a piece of strap iron locked to the valve plug stem with nuts. Rotate the handle alternately in each direction to lap the seats. After lapping, remove the bonnet and clean the seat surfaces. Completely assemble as described in the assembly portion of the trim maintenance procedure and test the valve for shutoff. Repeat the lapping procedure if leakage is still excessive.

⚠ CAUTION

To avoid weakening the stem or adaptor that may cause failure in service, never reuse an old stem or adaptor with a new valve plug. Using an old stem or adaptor with a new plug requires drilling a new pin hole in the stem (or adaptor in case an ENVIRO-SEAL bellows seal bonnet is being used), which will weaken the stem. However, a used valve plug may be reused with a new stem or adaptor.

Valve Plug Maintenance

Except where indicated, key numbers in this section are referenced in Figure 13 for standard NPS 1/2 through 6 constructions, Figure 14 for NPS 8 ES valves, Figure 15 for Whisper Trim III and Whisper NXG trim cage detail and Figure 16 for WhisperFlo trim.

1. Remove the valve plug (key 2) according to the disassembly portion of the trim maintenance procedure.
2. To replace the valve stem (key 7), drive out the pin (key 8). Unscrew the valve plug from the stem or adaptor.

3. To replace the adaptor (key 24, Figure 8) on ENVIRO-SEAL bellows seal bonnets, place the plug stem assembly and valve plug in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out or drill out the pin (key 36, Figure 8). Reverse the plug stem assembly in the soft-jaw chuck or vise. Grip the flat areas on the valve stem just below the threads for the actuator/stem connection. Unscrew the valve plug/adaptor assembly (key 24, Figure 8) from the valve stem assembly (key 20, Figure 8).
4. Screw the stem or adaptor into the valve plug. Tighten to the torque value given in Table 5. Refer to Table 5 to select the proper hole size. Drill through the stem or adaptor, using the hole in the valve plug as a guide. Remove any chips or burrs and drive in a new pin to lock the assembly.
5. For ENVIRO-SEAL bellows seal bonnets, grip the flats of the stem extending out of the top of the bellows shroud with a soft-jaw chuck or other type of vise. Screw the valve plug/adaptor assembly onto the valve stem. Tighten as necessary to align the pin hole in the stem with one of the holes in the adaptor. Secure the adaptor to the stem with a new pin.

Assembly

Except where indicated, key numbers in this section are referenced in Figure 13 for standard NPS 1/2 through 6 constructions, Figure 14 for NPS 8 ES valves, Figure 15 for Whisper Trim III and Whisper NXG trim cage detail and Figure 16 for WhisperFlo trim.

1. With a restricted trim seat ring construction, install the adaptor gasket (key 14) and seat ring adaptor (key 5).
2. Install the seat ring gasket (key 13), seat ring or liner (key 9) or disk seat (key 22). With a PTFE seat construction, install the disk and disk retainer (keys 21 and 23).
3. Install the cage or cage/baffle assembly (key 3). Any rotational orientation of the cage or assembly with respect to the valve is acceptable. A Whisper Trim III cage designated by level A3, B3 or C3 may be installed with either end up. The level D3 cage/baffle assembly, however, must be installed with the hole pattern end next to the seat ring. If a cage retainer (key 31) is to be used, place it on top of the cage.
4. Slide the valve plug (key 2) and stem assembly or valve plug and ENVIRO-SEAL bellows seal assembly, into the cage.
5. Place the gaskets (key 10 or keys 11, 12 and 14, if used) and the shim (key 27 or key 51) on top of the cage or cage retainer. If there is a cage adaptor (key 4) or a bonnet spacer (key 32), set it on the cage or cage retainer gaskets and place another flat sheet gasket (key 10) on top of the adaptor or spacer. If there is only a cage retainer, place another flat sheet gasket on the retainer.
6. With an NPS 8 ES valve, install the load ring (key 26).

CAUTION

To avoid damaging packing with the valve stem threads, use care when installing the bonnet if the packing was not removed from the bonnet.

Table 7. Recommended Torque for ENVIRO-SEAL Bellows Seal Packing Flange Nuts

VALVE SIZE	VALVE STEM DIAMETER THROUGH PACKING	MINIMUM TORQUE		MAXIMUM TORQUE	
		N•m	Lbf•in	N•m	Lbf•in
1/2 to 2	1/2	3	24	5	48
3 to 4	1	7	60	10	84

7. Mount the bonnet on the valve and complete assembly according to steps 10 through 14 of the Replacing Packing procedure, omitting steps 11 and 12 if new packing is not being installed and being sure to observe the note prior to step 11.

3.4 ENVIRO-SEAL Bellows Seal and Bonnet

Replacing a Plain or Extension Bonnet with an ENVIRO-SEAL Bellows Seal (Stem/Bellows Assembly) and Bonnet

1. Remove the actuator and bonnet according to steps 1 through 6 of the Replacing Packing procedure of the Maintenance section.
2. With care, remove the valve plug and stem assembly from the valve body. If necessary, lift out the cage, also.

CAUTION

To prevent possible product damage, cover the opening in the valve in the following procedure to protect the sealing surfaces and to prevent foreign material from getting into the valve body cavity.

3. Remove and discard the existing bonnet gasket. Cover the valve body opening to protect sealing surfaces and to prevent foreign material from entering the valve body cavity.

NOTE

The ENVIRO-SEAL stem/bellows assembly for easy-e valves is available only with a threaded and drilled plug/adaptor/stem connection. The existing valve plug can be reused with the new stem/bellows assembly or a new plug can be installed.

4. Inspect the existing valve plug. If the plug is in good condition, it can be reused with the new ENVIRO-SEAL stem/bellows assembly. To remove the existing valve plug from the stem, first, place the existing plug stem assembly and valve plug in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out or drill out the pin (key 8).

5. Then, reverse the plug stem assembly in the soft-jaw chuck or vise. Grip the valve stem in an appropriate place and unscrew the existing plug from the valve stem.

**CAUTION**

When installing a valve plug on the ENVIRO-SEAL stem/bellows assembly, the valve stem must not be rotated. Damage to the bellows may result.

To avoid damaging parts, do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

NOTE

The ENVIRO-SEAL stem/bellows assembly has a one-piece stem.

6. To attach the valve plug to the stem of the new ENVIRO-SEAL stem/bellows assembly, it is necessary to first attach the plug to the adaptor (key 24). Locate the adaptor. Notice that a hole has not been drilled in the threads where the plug screws onto the adaptor. Secure the valve plug in a soft-jaw chuck or other type of vise. Do not grip the plug on any seating surface. Position the plug in the chuck or vise for easy threading of the adaptor. Thread the adaptor into the valve plug and tighten to the appropriate torque value.
7. Select the proper size of drill bit and drill through the adaptor using the hole in the valve plug as a guide. Remove any metal chips or burrs and drive in a new pin to lock the plug/adaptor assembly together.
8. Attach the plug/adaptor assembly to the ENVIRO-SEAL stem/bellows assembly by first securing the stem/bellows assembly in a soft-jaw chuck or other type of vise so that the jaws of the chuck or vise grip the flats of the stem extending out of the top of the bellows shroud. Screw the valve plug/adaptor assembly onto the valve stem. Tighten as necessary to align the pin hole in the stem with one of the holes in the adaptor. Secure the adaptor to the stem with a new pin.
9. Inspect the seat ring (key 9) and soft seat parts (keys 21, 22 and 23). Replace, if necessary.
10. Place a new gasket (key 10) into the valve body in place of the bonnet gasket. Install the new stem/bellows assembly with valve plug/adaptor by placing it into the valve body on top of the new bellows gasket.
11. Place a new gasket (key 22) over the stem/bellows assembly. Place the new ENVIRO-SEAL bonnet over the stem/bellows assembly.

NOTE

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

12. Properly lubricate the bonnet stud bolts. Install and tighten the bonnet hex nuts to the proper torque.
13. Install new packing and the metal packing box parts according to the appropriate arrangement in Figure 3.
14. Install the packing flange. Properly lubricate the packing flange stud bolts and the faces of the packing flange nuts.

For ENVIRO-SEAL or HIGH-SEAL live-loaded packing, refer to the note at the beginning of the Maintenance section.

For graphite packing, tighten the packing flange nuts to the maximum recommended torque shown in Table 7. Then, loosen the packing flange nuts and retighten them to the recommended minimum torque shown in Table 7.

For other packing types, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in Table 7. Then, tighten the remaining flange nuts until the packing flange is level and at a 90-degree angle to the valve stem.
15. Install travel indicator parts, stem locknuts and mount the actuator on the valve body according to the procedure in the appropriate actuator instruction manual.

Replacement of an Installed ENVIRO-SEAL Bellows Seal (Stem/Bellows Assembly)

1. Remove the actuator and bonnet according to steps 1 through 6 of the Replacing Packing procedure of the Maintenance section.

⚠ CAUTION

To prevent possible product damage, cover the opening in the valve in the following procedure to protect the sealing surfaces and to prevent foreign material from getting into the valve body cavity.

2. With care, remove the ENVIRO-SEAL stem/bellows assembly. If necessary, lift out the cage, also. Remove and discard the existing bonnet gasket and bellows gasket. Cover the valve body opening to protect sealing surfaces and to prevent foreign material from entering the valve body cavity.

NOTE

The ENVIRO-SEAL stem/bellows assembly for easy-e valves is available only with a threaded and drilled plug/adaptor/stem connection. The existing valve plug can be reused with the new stem/bellows assembly or a new plug can be installed.

3. Inspect the existing valve plug. If the plug is in good condition, it can be reused with the new stem/bellows assembly.

**CAUTION**

When removing/installing a valve plug on the ENVIRO-SEAL stem/bellows assembly, the valve stem must not be rotated. Damage to the bellows may result.

To avoid damaging parts, do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

NOTE

The ENVIRO-SEAL stem/bellows assembly has a one-piece stem.

4. To remove the existing valve plug from the stem, first, place the existing plug stem assembly and valve plug in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out or drill out the pin.
5. Then, reverse the plug stem assembly in the soft-jaw chuck or vise. Grip the flat areas on the valve stem just below the threads for the actuator/stem connection. Unscrew the existing plug from the valve stem.
6. To attach either the existing valve plug or a new one to the stem of the new ENVIRO-SEAL stem/bellows assembly, it is necessary to first attach the plug to the adaptor. Locate the adaptor. Notice that a hole has not been drilled in the threads where the plug screws onto the adaptor. Secure the valve plug in a soft-jaw chuck or other type of vise. Do not grip the plug on any seating surface. Position the plug in the chuck or vise for easy threading of the adaptor. Thread the adaptor into the valve plug and tighten to the appropriate torque value.
7. Complete the installation by following steps 7 through 9 and steps 12 through 15 of the ENVIRO-SEAL Bellows Seal and Bonnet installation instructions given above.

Purging the ENVIRO-SEAL Bellows Seal Bonnet

The ENVIRO-SEAL bellows seal bonnet has been designed so that it can be purged or leak tested. Refer to Figure 8 for an illustration of an ENVIRO-SEAL bellows seal bonnet and perform the following steps for purging or leak testing.

1. Remove the two diametrically opposed pipe plugs (key 16).
2. Connect a purging fluid to one of the pipe plug connections.
3. Install appropriate piping or tubing in the other pipe plug connection to pipe away the purging fluid or to make a connection to an analyzer for leak testing.
4. When purging or leak testing has been completed, remove the piping or tubing and reinstall the pipe plugs (key 16).

Section 4: Parts

4.1 Parts Ordering

Each body-bonnet assembly is assigned a serial number which can be found on the valve. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts, refer to the serial number and to the eleven-character part number for each part required from the following parts kit or parts list information.

Refer to Table 6 for standard and common material designations.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

4.2 Parts Kits

NOTE

Kits do not apply to Alloy C (N10276 and CW2M), Alloy 20 (N08020 and CN7M) or Alloy 400 (N04400 and M35-1) trims.

Gasket Kits

Gasket Kits (includes keys 10, 11, 12, 13 and 51); Plus 14 and 20 on Some Restricted Capacity Valves

ENVIRO-SEAL Packing Retrofit Kits

Retrofit kits include parts to convert valves with existing standard bonnets to the ENVIRO-SEAL packing box construction.

Refer to Figure 10 for key numbers for PTFE packing, to Figure 11 for key numbers for Graphite ULF packing and to Figure 12 for key numbers for duplex packing.

PTFE kits include keys 200, 201, 211, 212, 214, 215, 217, 218, tag and cable tie. Graphite ULF kits include keys 200, 201, 207, 208, 209, 210, 211, 212, 214, 216, 217, tag and cable tie. Duplex kits include keys 200, 201, 207, 209, 211, 212, 214, 215, 216, 217, tag and cable tie.

Stems and packing box constructions that do not meet Fisher stem finish specifications, dimensional tolerances and design specifications may adversely alter the performance of this packing kit.

For part numbers of individual components in the ENVIRO-SEAL packing kits, refer to instruction manual ENVIRO-SEAL Packing System for Sliding-Stem Valves, [D101642X012](#).

Table 10. ENVIRO-SEAL Packing Retrofit Kits

ENVIRO-SEAL Packing Repair Kits

Repair kits include parts to replace the “soft” packing materials in valves that already have ENVIRO-SEAL packing arrangements installed or in valves that have been upgraded with ENVIRO-SEAL retrofit kits.

Refer to Figure 10 for key numbers for PTFE packing, to Figure 11 for key numbers for Graphite ULF packing and to Figure 12 for key numbers for duplex packing.

PTFE repair kits include keys 214, 215 and 218. Graphite ULF repair kits include keys 207, 208, 209, 210 and 214. Duplex repair kits include keys 207, 209, 214 and 215.

Stems and packing box constructions that do not meet Fisher stem finish specifications, dimensional tolerances and design specifications may adversely alter the performance of this packing kit.

For part numbers of individual components in the ENVIRO-SEAL packing kits, refer to instruction manual ENVIRO-SEAL Packing System for Sliding-Stem Valves, [D101642X012](#).

easy-e Low-e Bonnet Repair Kits

Kit consists of plain bonnet, Graphite / Inconel gasket set, ENVIRO-SEAL packing retro-fit kit, packing flange, packing flange studs and nuts. New stem is not included.

Table 12. easy-e Low-e Bonnet Repair Kits

Bonnet Material	Packing Type	Valve Size, NPS	Stem Size, in.	Part Number

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual includes installation, maintenance and parts information for NPS 1 through 8 Fisher ET valves and NPS 1 through 6 EAT valves, through CL600 ratings. Refer to separate manuals for instructions covering the actuator and accessories.

WARNING

Do not install, operate or maintain ET valves without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

1. The pressure/temperature limits in this manual and any applicable standard or code limitation for valve should not be exceeded. 2. Certain bonnet bolting material selections may require a CL600 easy-e valve assembly to be derated. Contact your Emerson sales office.																																

Table 2. Available Shutoff Classifications per ANSI/FCI 70-2 and IEC 60534-4

Valve	Seating	Shutoff Class
All except those with Cavitrol III cages	PTFE (standard)	V - air test
		V - water test (optional)
	Metal	IV
		V (optional) ⁽²⁾
ET with Cavitrol III 1-stage cage	Metal	IV (standard)
		V (optional)
ET with Cavitrol III 2-stage cages	Metal	V
ET with PEEK Anti-Extrusion Rings	Metal	V to 316°C / 600°F
ET with 3.4375 to 7-in. port	Soft or Metal	VI
ET and EAT with TSO (Tight Shutoff Trim)	Replaceable, protected soft seat	TSO ⁽¹⁾
ET with R31233 DST	Metal	V
1. This is a special non-ANSI/FCI leakage class. 2. Class V shutoff requires spring-loaded seal ring, radiused-seat plug and wide-bevel seat ring (not available with 8-in. port, quick-opening cage). Not available with trims 4, 29 and 85.		

1.2 Description

These single-port valves have cage guiding, quick-change trim and balanced push-down-to-close valve plug action. Valve configurations are as follows:

ET-Globe-style valve (Figure 1) with metal-to-PTFE seating (standard for all except Cavitrol III cages and DST) for stringent shutoff requirements or metal-to-metal seating (standard for Cavitrol III cages and DST, optional for all others) for higher temperatures.

EAT-Angle version of ET, used to facilitate piping or in applications which require a self-draining valve.

1.3 Specifications

Typical specifications for these valves are shown in Table 1.

emerson.com/mytraining

Section 2: Installation

WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in Table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for overpressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some valve body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

Before installing the valve, inspect the valve and pipelines for any damage and any foreign material which may cause product damage.

1. Before installing the valve, inspect the valve and associated equipment for any damage and any foreign material.
2. Make certain the valve body interior is clean, that pipelines are free of foreign material and that the valve is oriented so that pipeline flow is in the same direction as the arrow on the side of the valve.
3. The control valve assembly may be installed in any orientation unless limited by seismic criteria. However, the normal method is with the actuator vertical above the valve. Other positions may result in uneven valve plug and cage wear and improper operation. With some valves, the actuator may also need to be supported when it is not vertical. For more information, consult your [Emerson sales office](#).
4. Use accepted piping and welding practices when installing the valve in the line. For flanged valves, use a suitable gasket between the valve and pipeline flanges.

CAUTION

Depending on valve body materials used, post weld heat treating may be required. If so, damage to internal elastomeric and plastic parts, as well as internal metal parts is possible. Shrink-fit pieces and threaded connections may also loosen. In general, if post weld heat treating is to be performed, all trim parts should be removed. Contact your [Emerson sales office](#) for additional information.

5. With a leak-off bonnet construction, remove the pipe plugs (keys 14 and 16, Figure 14) to hook up the leak-off piping. If continuous operation is required during inspection or maintenance, install a three-valve bypass around the control valve assembly.
6. If the actuator and valve are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.

WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Valves with ENVIRO-SEAL live-loaded packing or HIGH-SEAL live-loaded packing will not require this initial readjustment. See the Fisher instruction manuals, ENVIRO-SEAL Packing System for Sliding-Stem Valves or HIGH-SEAL Live-Loaded Packing System (as appropriate), for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the Parts Kits section.

Section 3: Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing lubrication, packing maintenance, trim maintenance and ENVIRO-SEAL bellows seal bonnet replacement. All maintenance operations may be performed with the valve in the line.

WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

⚠ CAUTION

Follow instructions carefully to avoid damaging the product surfaces, which could result in damage to the product.

Trim Cartridge is a single use repair solution. It is not recommended to remove and reinstall Trim Cartridge after initial installation so valve assemblies with Trim Cartridge will not support an open and inspect maintenance strategy. If the valve contains Trim Cartridge (Trim Cartridges can be identified by a name plate on the bonnet flange, the use of a packing nut and “Fisher” embossed below the yoke mounting), please refer to Fisher ET and EZ easy-e Valves with Trim Cartridge Instruction Manual ([D104358X012](#)) for appropriate maintenance procedures.

NOTE

Whenever a gasket seal is disturbed by removing or shifting gasketed parts, install a new gasket during reassembly. This ensures a good gasket seal because the used gasket may not seal properly.

3.1 Packing Lubrication

NOTE

ENVIRO-SEAL and HIGH-SEAL packing do not require lubrication.

⚠ WARNING

To avoid personal injury or property damage resulting from fire or explosion, do not lubricate packing used in oxygen service or in processes with temperatures over 260°C / 500°F.

If a lubricator or lubricator/isolating valve (Figure 2) is provided for PTFE/composition or other packings that require lubrication, it will be installed in place of the pipe plug (key 14, Figure 14). Use a good quality silicon-base lubricant. Do not lubricate packing used in oxygen service or in processes with temperatures over 260°C / 500°F. To operate the lubricator, simply turn the cap screw clockwise to force the lubricant into the packing box. The lubricator/isolating valve operates the same way except open the isolating valve before turning the cap screw and then close the isolating valve after lubrication is completed.

3.2 Packing Maintenance

NOTE

For valves with ENVIRO-SEAL packing, see the Fisher instruction manual, ENVIRO-SEAL Packing System for Sliding-Stem Valves, [D101642X012](#), for packing instructions.

For valves with HIGH-SEAL packing, see the Fisher instruction manual, HIGH-SEAL Live-Loaded Packing System, [D101453X012](#), for packing instructions.

Valve assemblies with Trim Cartridge utilize a packing nut design and are only available with ENVIRO-SEAL packing. If the valve contains Trim Cartridge (Trim Cartridges can be identified by a name plate on the bonnet flange, the use of a packing nut and “Fisher” embossed below the yoke mounting), please refer to Fisher ET and EZ easy-e Valves with Trim Cartridge Instruction Manual ([D104358X012](#)) for appropriate packing maintenance instructions.

Key numbers refer to Figure 3 for PTFE V-ring packing and to Figure 4 for PTFE/composition packing, unless otherwise indicated.

For spring-loaded single PTFE V-ring packing, the spring (key 8) maintains a sealing force on the packing. If leakage is noted around the packing follower (key 13), check to be sure the shoulder on the packing follower is touching the bonnet. If the shoulder is not touching the bonnet, tighten the packing flange nuts (key 5, Figure 14) until the shoulder is against the bonnet. If leakage cannot be stopped in this manner, proceed to the Replacing Packing procedure.

Figure 2. Lubricator and Lubricator/Isolating Valve (Optional)

10A9421-A
AJ5428-D
A0832-2

If there is undesirable packing leakage with other than spring-loaded packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts.

If the packing is relatively new and tight on the stem and if tightening the packing flange nuts does not stop the leakage, the valve stem may be worn or nicked so that a seal cannot be made. The surface finish of a new valve stem is critical for making a good packing seal. If the leakage comes from the outside diameter of the packing, the leakage may be caused by nicks or scratches around the packing box wall. If performing any of the following procedures, inspect the valve stem and packing box wall for nicks and scratches.

Replacing Packing

WARNING

Refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve and drain the process media from both sides of the valve. If using a power actuator, also shut off all pressure lines to the power actuator and release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Disconnect the operating lines from the actuator and any leak-off piping from the bonnet. Disconnect the stem connector, then remove the actuator from the valve by unscrewing the yoke locknut (key 15, Figure 14) or the hex nuts (key 26, Figure 14).
3. Loosen the packing flange nuts (key 5, Figure 14) so that the packing is not tight on the valve stem. Remove any travel indicator parts and stem locknuts from the valve stem threads.

WARNING

To avoid personal injury or property damage caused by uncontrolled movement of the bonnet, loosen the bonnet by following the instructions in the next step. Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D100398X012

ET Valve

February 2026

NOTE

The following step also helps to provide additional assurance that the valve body fluid pressure has been relieved.

CAUTION

Avoid damaging the seating surface caused by the valve plug and stem assembly dropping from the bonnet (key 1, Figure 14) after being lifted part way out. When lifting the bonnet, temporarily install a valve stem locknut on the valve stem. The locknut will prevent the valve plug and stem assembly from dropping out of the bonnet.

4. Hex nuts (key 16, Figure 16, 17 or 20) or cap screws (not shown) attach the bonnet (key 1, Figure 14) to the valve body (key 1, Figure 16, 17 or 20). Loosen these nuts or cap screws approximately 3 mm / 1/8 in. Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and valve. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, remove the nuts or cap screws completely and carefully lift the bonnet off the valve.

Table 4. Recommended Torque for Packing Flange Nuts

VALVE STEM DIAMETER		PRESSURE RATING	GRAPHITE TYPE PACKING				PTFE TYPE PACKING			
			Minimum Torque		Maximum Torque		Minimum Torque		Maximum Torque	
mm	in.		N-m	Lbf-in	N-m	Lbf-in	N-m	Lbf-in	N-m	Lbf-in
9.5	3/8	CL125, 150	3	27	5	40	1	13	2	19
		CL250, 300	4	36	6	53	2	17	3	26
		CL600	6	49	8	73	3	23	4	35
12.7	1/2	CL125, 150	5	44	8	66	2	21	4	31
		CL250, 300	7	59	10	88	3	28	5	42
		CL600	9	81	14	122	4	39	7	58
19.1	3/4	CL125, 150	11	99	17	149	5	47	8	70
		CL250, 300	15	133	23	199	7	64	11	95
		CL600	21	182	31	274	10	87	15	131
25.4	1	CL300	26	226	38	339	12	108	18	162
		CL600	35	310	53	466	17	149	25	223
31.8	1-1/4	CL300	36	318	54	477	17	152	26	228
		CL600	49	437	74	655	24	209	36	314

5. Remove the locknut and separate the valve plug and stem from the bonnet. Set the parts on a protective surface to prevent damage to gasket or seating surfaces.

 CAUTION

To prevent possible product damage, cover the opening in the valve in the following procedure to prevent foreign material from getting into the valve body cavity.

6. Remove the bonnet gasket (key 10, Figure 16, 17 or 20) and cover the opening in the valve to protect the gasket surface and prevent foreign material from getting into the valve body cavity.
7. Remove the packing flange nuts, packing flange, upper wiper and packing follower (keys 5, 3, 12 and 13, Figure 14). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall. Clean the packing box and the metal packing parts.
8. Inspect the valve stem threads and packing box surfaces for any sharp edges which might cut the packing. Scratches or burrs could cause packing box leakage or damage to the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts by following the appropriate steps in the Trim Maintenance procedure.
9. Remove the covering protecting the valve body cavity and install a new bonnet gasket (key 10, Figure 16, 17 or 20), making sure the gasket seating surfaces are clean and smooth. Then slide the bonnet over the stem and onto the stud bolts (key 15, Figure 16, 17 or 20) or onto the valve body cavity if cap screws (not shown) will be used instead.

NOTE

Proper performance of the bolting procedures in step 10 compresses the spiral wound gasket (key 12, Figure 16 or 17) or load ring (key 26, Figure 20) enough to both load and seal the seat ring gasket (key 13, Figure 16, 17 or 20). It also compresses the outer edge of the bonnet gasket (key 10, Figure 16 through 20) enough to seal the body-to-bonnet joint.

The proper bolting procedures in step 10 include—but are not limited to—ensuring that bolting threads are clean and evenly tightening the cap screws or the nuts onto the studs, in a crisscross pattern. Tightening one cap screw or nut may loosen an adjacent cap screw or nut. Repeat the crisscross tightening pattern several times until each cap screw or nut is tight and the body-to-bonnet seal is made.

Figure 5. Detail of Graphite Ribbon/Filament Packing for Plain and Extension Bonnets

SINGLE ARRANGEMENTS

A5864

DOUBLE ARRANGEMENTS

NOTE:

1. 0.102 mm / 0.004 IN. THICK SACRIFICIAL ZINC WASHERS; USE ONLY ONE BELOW EACH GRAPHITE RIBBON RING.

NOTE

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

10. Lubricate the bolting (not necessary if factory pre-lubricated stud bolt nuts are used) and install it, using accepted bolting procedures during tightening, so that the body-to-bonnet joint will withstand test pressures and application service conditions. Use the bolt torques in Table 3 as guidelines.
11. Install new packing and the metal packing box parts according to the appropriate arrangement in Figure 3, 4 or 5. Place a smooth-edged pipe over the valve stem and gently tap each soft packing part into the packing box.
12. Slide the packing follower, upper wiper and packing flange (keys 13, 12 and 3, Figure 14) into position. Lubricate the packing flange studs (key 4, Figure 14) and the faces of the packing flange nuts (key 5, Figure 14). Install the packing flange nuts.
13. For spring-loaded PTFE V-ring packing, tighten the packing flange nuts until the shoulder on the packing follower (key 13, Figure 14) contacts the bonnet.

For graphite packing, tighten the packing flange nuts to the maximum recommended torque shown in Table 4. Then, loosen the packing flange nuts and retighten them to the recommended minimum torque shown in Table 4.

For other packing types, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in Table 4. Then, tighten the remaining flange nut until the packing flange is level and at a 90° angle to the valve stem.

For ENVIRO-SEAL or HIGH-SEAL live-loaded packing, refer to the note at the beginning of Packing Maintenance.

14. Mount the actuator on the valve assembly and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual.

Figure 6. TSO (Tight Shutoff Trim), Detail of Protected Soft Seat

A7088

3.3 Trim Maintenance

⚠ WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

NOTE

If the valve contains Trim Cartridge (check if a Trim Cartridge name plate is present on the bonnet) please refer to Fisher ET and EZ easy-e Valves with Trim Cartridge Instruction Manual ([D104358X012](#)).

⚠ CAUTION

Trim Cartridge is a single use repair solution. It is not recommended to remove and reinstall Trim Cartridge after initial installation so valve assemblies with Trim Cartridge will not support an open and inspect maintenance strategy. If the valve contains Trim Cartridge (Trim Cartridges can be identified by a name plate on the bonnet flange, the use of a packing nut and "Fisher" embossed below the yoke mounting), please refer to Fisher ET and EZ easy-e Valves with Trim Cartridge Instruction Manual ([D104358X012](#)) for appropriate maintenance procedures.

Except where indicated, key numbers in this section are referenced in Figure 16 for standard NPS 1 through 6 constructions, Figure 17 for Whisper Trim III and Whisper NXG detail, Figures 18 and 19 for WhisperFlo trim, Figure 20 for Cavitrol III detail and the NPS 8 ET valve and Figures 22 through 25 for R31233 DST.

Disassembly

1. Remove the actuator and the bonnet according to steps 1 through 6 of the Replacing Packing procedure in the Maintenance section.

WARNING

To avoid personal injury due to leaking fluid, avoid damaging gasket sealing surfaces. The surface finish of the valve stem (key 7) is critical for making a good packing seal. The inside surface of the cage or cage/baffle assembly (key 3) or cage retainer (key 31), is critical for smooth operation of the valve plug. The seating surfaces of the valve plug (key 2) and seat ring (key 9) are critical for proper shutoff. Unless inspection reveals otherwise, assume all these parts are in good condition and protect them accordingly.

2. Remove the packing flange nuts, packing flange, upper wiper and packing follower (keys 5, 3, 12 and 13 in Figure 14). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall. Clean the packing box and the metal packing parts.
3. Inspect the valve stem threads and packing box surfaces for any sharp edges which might cut the packing. Scratches or burrs could cause packing box leakage or damage to the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts.
4. Remove the load ring (key 26) from an NPS 8 ET valve or the cage adaptor (key 4) from any restricted-trim valve through NPS 4 and wrap it for protection.
5. On an NPS 6 ET valve with Whisper Trim III/NXG or WhisperFlo cage, also remove the bonnet spacer (key 32) and bonnet gasket (key 10) on top of the spacer. Then on any construction with a cage retainer (key 31), remove the cage retainer and its associated gaskets. A Whisper Trim III and WhisperFlo cage retainer has two 3/8-in.-16 UNC tappings in which screws or bolts can be installed for lifting.
6. Remove the cage or cage/baffle assembly (key 3), the associated gaskets (keys 10, 11 and 12) and shim (key 51). If the cage is stuck in the valve, use a rubber mallet to strike the exposed portion of the cage at several points around its circumference.
7. For constructions other than TSO (tight shutoff) trim, remove the seat ring or liner (key 9) or disk seat (key 22), seat ring gasket (key 13) and the seat ring adaptor (key 5) and adaptor gasket (key 14) where used in a restricted-trim seat ring construction. PTFE-seat constructions use a disk (key 23) sandwiched between the disk seat and disk retainer (key 21).

8. For TSO (tight shutoff) trim constructions, perform the following steps (refer to Figures 6 and 7):
 - a. Remove the retainer, backup ring, anti-extrusion rings and piston ring.
 - b. Remove the set screws that lock the outer plug to the inner plug.
 - c. Using a strap wrench or similar tool, unscrew the outer plug from the inner plug. Do not damage the outer plug guide surfaces.
 - d. Remove the protected soft seat seal.
 - e. Inspect the parts for damage and replace if needed.
9. For all constructions, inspect parts for wear or damage which would prevent proper operation of the valve. Replace or repair trim parts according to the following procedure for Lapping Metal Seats or other valve plug maintenance procedures as appropriate.

Disassembly for R31233 DST Constructions

1. Remove the actuator and the bonnet according to steps 1 through 6 of the Replacing Packing procedure in the Maintenance section.
2. Remove the packing flange nuts, packing flange, upper wiper and packing follower (keys 5, 3, 12 and 13 in Figure 14). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall. Clean the packing box and the metal packing parts.
3. Inspect the valve stem threads and packing box surfaces for any sharp edges which might cut the packing. Scratches or burrs could cause packing box leakage or damage to the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts.
4. Carefully lift the valve plug/stem assembly (key 5) out of the valve and protect the stem and plug seating surfaces.

CAUTION

When lifting the valve plug/stem assembly out of the valve (key 5), be certain that the cage elements (key 2 or key 2A and 2B and key 4) remain in the valve. This will prevent cage damage that might be caused by the cages dropping back into the valve after being lifted part way out. Use care to avoid damaging gasket sealing surfaces.

The surface finish of the valve stem is critical for making a good packing seal. The inside surface of the cage is critical for smooth operation of the valve plug and for making a seal with the seal ring (key 8). The seating surfaces of the valve plug and the seat ring (if applicable, some designs may integrate the seat ring with the cage as a single element) on a metal-seat construction are critical for tight shutoff. Assume all these parts are in good condition and protect them accordingly, unless inspection reveals otherwise.

5. Remove the spiral wound gaskets (load ring used in the NPS 8 design as shown in Figure 25) from the top of the cage (key 2) (some designs may refer to the cage as the upper cage, key 2A).

6. Remove the cage (key 2) or upper cage (key 2A), bonnet spacer (key 3 if applicable), seat ring (key 4 if applicable, some designs may integrate the seat ring with the cage as a single element) and remaining cage elements (key 2A and 2B if applicable) from the valve body. A gasket is used between the cage and body. Where applicable, gaskets are also used between the cages or between cage and seat ring. Remove and discard these gaskets. The gaskets should not be reused.

NOTE

The NPS 6 design (see Figure 24) uses unique trim packaging method, so its bonnet spacer (key 3) should be removed first, followed by the spiral wound gaskets (key 65) and upper/lower cage parts (keys 2A and 2B). The bonnet spacer has two 1/4-20 tapping holes into which bolts or screws can be installed for lifting.

7. Inspect parts for wear or damage that would prevent proper operation of the valve. All gasket surfaces on the trim parts and in the body must be cleaned of any graphite residue and must be free from nicks and scratches. The seating surfaces of the valve plug and seat ring need to be free from nicks, scratches or any other damage for proper shut off. Replace or repair trim parts as needed.

Lapping Metal Seats

CAUTION

To avoid damaging the ENVIRO-SEAL Bellows Seal Bonnet assembly, do not attempt to lap the metal seating surfaces. The design of the assembly prevents rotation of the stem and any forced lapping rotation will damage internal components of the ENVIRO-SEAL Bellows Seal bonnet.

Except with respect to the ENVIRO-SEAL Bellows Seal Bonnet assembly, with metal-seat constructions, lapping seating surfaces of the valve plug and seat ring or liner (keys 2 and 9, Figure 16, 17 or 20) can improve shutoff. (Deep nicks should be machined out rather than ground out.) Use a good quality lapping compound of a mixture of 280 to 600-grit. Apply the compound to the bottom of the valve plug.

Assemble the valve to the extent that the cage and the cage retainer and bonnet spacer (if used) are in place and the bonnet is bolted to the valve body. A simple handle can be made from a piece of strap iron locked to the valve plug stem with nuts. Rotate the handle alternately in each direction to lap the seats. After lapping, remove the bonnet and clean the seat surfaces. Completely assemble as described in the Assembly portion of the Trim Maintenance procedure and test the valve for shutoff. Repeat the lapping procedure if leakage is still excessive.

Figure 7. Typical Balanced TSO Trim

Valve Plug Maintenance

Except where indicated, key numbers in this section are referenced in Figure 16 for standard NPS 1 through 6 constructions, Figure 17 for Whisper Trim III and Whisper NXG detail, Figures 18 and 19 for WhisperFlo trim, Figure 20 for Cavitrol III detail and the NPS 8 ET valve and Figures 22 through 25 for R31233 DST.

⚠ CAUTION

To avoid the valve plug seal ring (key 28) not sealing properly, be careful not to scratch the surfaces of the ring groove in the valve plug or any of the surfaces of the replacement ring.

1. With the valve plug (key 2) removed according to the Disassembly portion of the Trim Maintenance procedure, proceed as appropriate:

For the two-piece seal ring, The ring cannot be reused because it is a closed ring which must be pried and/or cut from the groove. Once the seal ring is removed, the elastomeric backup ring (key 29), which is also a closed ring, can be pried from the groove.

⚠ CAUTION

To avoid damaging the seal ring, slowly and gently stretch it for the following procedure. Avoid jerking sharply on the ring.

To install a new two-piece seal ring, apply a general purpose silicone-base lubricant to both the backup ring and seal ring (keys 29 and 28). Place the backup ring over the stem (key 7) and into the groove. Place the seal ring over the top edge of the valve plug (key 2) so that it enters the groove on one side of the valve plug. Slowly and gently stretch the seal ring and work it over the top edge of the valve plug. The PTFE material in the seal ring must be permitted time to cold-flow during the stretching procedure, so avoid jerking sharply on this ring. Stretching the seal ring over the valve plug may make it seem unduly loose when in the groove, but it will contract to its original size after insertion into the cage.

For the spring-loaded seal ring, the ring used on a valve plug having a 136.5 mm / 5.375 in. or less port diameter may be removed undamaged by first working the retaining ring (key 27) off with a screwdriver. Then carefully slide the metal backup ring (key 29) and seal ring (key 28) off the valve plug (key 2). The spring-loaded seal ring used on a valve plug having a 178 mm / 7-in. or greater port diameter must be carefully pried and/or cut from its groove. Therefore, it cannot be reused.

A spring-loaded seal ring must be installed so that its open side faces toward the valve stem or toward the seat of the plug depending on flow direction, as shown in view A of Figure 16 or 20. To install a spring-loaded seal ring on a valve plug with a 136.5 mm / 5.375 in. or less port diameter, slide the seal ring (key 28) onto the valve plug followed by the metal backup ring (key 29). Then install the retaining ring (key 27) by inserting one end in the groove and, while turning the plug, press the ring into the groove. Again, be careful not to scratch any surfaces of the ring or plug.

CAUTION

To avoid damaging the seal ring, slowly and gently stretch it for the following procedure. Avoid jerking sharply on the ring.

To install the seal ring on a valve plug with 178 mm / 7-in. or greater port diameter, lubricate it with a general purpose silicone-base lubricant. Then gently stretch the seal ring and work it over the top edge of the valve plug. The PTFE material in the seal ring must be permitted time to cold-flow during the stretching procedure, so avoid jerking sharply on the ring. Stretching the seal ring over the valve plug may make it seem unduly loose when in the groove, but it will contract to its original size after insertion into the cage.

CAUTION

Never reuse an old stem or adaptor with a new valve plug. Using an old stem or adaptor with a new plug requires drilling a new pin hole in the stem (or adaptor, in case an ENVIRO-SEAL bellows seal bonnet is being used). This drilling weakens the stem or adaptor and may cause failure in service. However, a used valve plug may be reused with a new stem or adaptor, except with Cavitrol III trim.

NOTE

The valve plug and valve plug stem for 2-stage Cavitrol III trim are a matched set and must be ordered together. If the 2-stage Cavitrol III valve plug or valve plug stem is damaged, replace the entire assembly (key 2, Figure 20).

For plain bonnets and style 1 extension bonnets, the valve plug (key 2), valve stem (key 7) and pin (key 8) are available completely assembled. Refer to the keys 2, 7 and 8 Valve Plug and Stem Assembly tables in the Parts List.

2. To replace the valve stem (key 7), drive out the pin (key 8). Unscrew the valve plug from the stem or adaptor.
3. To replace the adaptor (key 24, Figure 14) on ENVIRO-SEAL bellows seal bonnets, place the plug stem assembly and valve plug in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out the pin (key 36, Figure 14). Reverse the plug stem assembly in the soft-jaw chuck or vise.
Grip the flat areas on the valve stem just below the threads for the actuator/stem connection. Unscrew the valve plug/adaptor assembly (key 24, Figure 14) from the valve stem assembly (key 20, Figure 14).
4. Screw the new stem or adaptor into the valve plug. Tighten to the torque value given in Table 5. Refer to Table 5 to select the proper hole size. Drill through the stem or adaptor, using the hole in the valve plug as a guide. Remove any chips or burrs and drive in a new pin to lock the assembly.

Table 5. Valve Stem Connection Assembly Torque and Pin Replacement

VALVE STEM DIAMETER		TORQUE, MINIMUM TO MAXIMUM		HOLE SIZE	
mm	in.	N·m	Lbf·ft	mm	in.
9.5	3/8	40 to 47	25 to 35	2.41 to 2.46	0.095 to 0.097
12.7	1/2	81 to 115	60 to 85	3.20 to 3.25	0.126 to 0.128
19.1	3/4	237 to 339	175 to 250	4.80 to 4.88	0.189 to 0.192
25.4	1	420 to 481	310 to 355	6.38 to 6.45	0.251 to 0.254
31.8	1-1/4	827 to 908	610 to 670	6.38 to 6.45	0.251 to 0.254

5. For ENVIRO-SEAL bellows seal bonnets, grip the flats of the stem extending out of the top of the bellows shroud with a soft-jaw chuck or other type of vise. Screw the valve plug/adaptor assembly onto the valve stem. Tighten as necessary to align the pin hole in the stem with one of the holes in the adaptor. Secure the adaptor to the stem with a new pin.

Valve Plug Maintenance for R31233 DST Constructions

Except where indicated, key numbers in this section are referenced in Figures 22 through 25 for NPS 3 through 8 valve constructions with R31233 DST.

With the valve plug removed, according to the Trim Disassembly section of this manual, proceed as appropriate:

1. Inspect the valve plug (key 5) and stem for nicks, scratches or other damage that would prevent proper operation of the valve. If replacement of either is necessary, replace as a complete valve plug and stem assembly (key 5).
2. All DST trims use the spring-loaded seal ring (key 8) as the sealing element between plug and cage (key 2 or 2A). The spring-loaded seal ring may be removed by first working the retaining ring (key 10) off with a screwdriver. Then, carefully slide the metal backup ring (key 9), anti-extrusion ring (key 63) and seal ring (key 8) off the valve plug. Inspect the retaining ring and backup ring for damage and replace as needed. Discard the old plug seal ring and anti-extrusion ring.
3. The spring-loaded seal ring (key 8) must be installed so that the open side faces toward the seat of the plug, as shown in Figures 22 through 25. To install the spring-loaded seal ring on a valve plug, first lubricate it with a general purpose silicone-base lubricant, then gently slide the seal ring (key 8) and anti-extrusion ring (key 63) onto the valve plug followed by the metal backup ring (key 9). Then, install the retaining ring (key 10) by inserting one end in the groove end, while turning the plug, press the ring into the groove. Use caution not to scratch any surfaces of the ring or plug.

CAUTION

To avoid damaging the seal ring (key 8), slowly and gently stretch it prior to assembly. Avoid jerking sharply on the ring.

Assembly

Except where indicated, key numbers in this section are referenced in Figure 16 for standard NPS 1 through 6 constructions, Figure 17 for Whisper Trim III and Whisper NXG detail, Figures 18 and 19 for WhisperFlo trim, Figure 20 for Cavitrol III detail and the NPS 8 ET valve and Figures 22 through 25 for R31233 DST.

1. With a restricted-trim seat ring construction, install the adaptor gasket (key 14) and seat ring adaptor (key 5).
2. Install the seat ring gasket (key 13), seat ring or liner (key 9) or disk seat (key 22). With a PTFE-seat construction, install the disk and disk retainer (keys 21 and 23).
3. Install the cage or cage/baffle assembly (key 3). Any rotational orientation of the cage or assembly with respect to the valve body is acceptable. A Whisper Trim III cage designated by level A3, B3 or C3 may be installed with either end up. The level D3 cage/baffle assembly or Cavitrol III cage assembly, however, must be installed with the hole pattern end next to the seat ring. If a cage retainer (key 31) is to be used, place it on top of the cage.

4. For constructions other than TSO (tight shutoff) trim, slide the valve plug (key 2) and stem assembly or valve plug and ENVIRO-SEAL bellows seal assembly, into the cage. Make sure the seal ring (key 28) is evenly engaged in the entrance chamfer at the top of the cage (key 3) or cage retainer (key 31) to avoid damaging the ring.
5. For TSO (tight shutoff) trim constructions, perform the following steps (refer to Figures 6 and 7).
 - a. Thread the outer plug onto the inner plug until the parts seat metal to metal, using a strap wrench or similar tool that will not damage the outer plug guide surfaces.
 - b. Mark the top of the inner plug and outer plug with alignment marks in the assembled position.
 - c. Disassemble the outer plug from the inner plug and install the seal over the inner plug, so that the seal rests below the threaded area.
 - d. Thread the outer plug onto the inner plug and tighten with a strap wrench or similar tool until the alignment marks line up. This will ensure that the plug parts are metal to metal and the seal is compressed properly. Do not damage the outer plug guide surfaces.
 - e. Install set screws centering the inner plug in the outer plug and torque to 11 N•m / 8 lbf•ft.
 - f. Assemble the piston ring, anti-extrusion rings, backup ring and retainer.
6. For all constructions, place the gaskets (keys 12, 11 or 14 if used and 10) and the shim (key 51) on top of the cage or cage retainer. If there is a cage adaptor (key 4) or a bonnet spacer (key 32), set it on the cage or cage retainer gaskets and place another flat sheet gasket (key 10) on top of the adaptor or spacer. If there is only a cage retainer, place another flat sheet gasket on the retainer.
7. With an NPS 8 ET valve, install the load ring (key 26).
8. Mount the bonnet on the valve body and complete assembly according to steps 10 through 14 of the Replacing Packing procedure. Be sure to observe the note prior to step 10.

Assembly for R31233 DST Constructions

After all trim maintenance has been completed, reassemble the valve by following the numbered steps below. Be certain that all gasket surfaces have been well cleaned.

CAUTION

Inspect the gasket surfaces of all parts. These surfaces must be in good condition, with all foreign material removed. Small burrs less than approximately 0.076 mm / 0.003 in. in height can be ignored. Scratches or burrs that run across the serrations are not permitted under any conditions, because they will prevent the gaskets from sealing properly.

Proceed as appropriate:

For construction with a one-piece cage:

1. Install the body-cage gasket (key 19) into the gasket surface in the bottom of the valve body (key 1). Install the cage (key 2) into the valve body, being careful that the gasket remains in proper alignment.
2. If a bonnet spacer (key 3) is used in the assembly, install a new body-to-bonnet spacer gasket (key 68) into the groove on top of the valve. Lower the bonnet spacer onto the valve body.
3. Install the spiral wound gaskets (key 65) on top of the cage (key 2).
4. Install new seal ring (key 8) on the valve plug (see the Valve Plug Maintenance section). Inspect and replace as necessary. Install the valve plug/stem assembly (key 5) into the cage (key 2), being careful not to damage the rings, make sure the plug/stem assembly is properly centered on the seating position. Also, make sure the valve plug sealing parts are evenly engaged by the chamfer in the top inside diameter of the cage (key 2).
5. Install a new bonnet gasket (key 11) into the gasket groove of the bonnet spacer (key 3, if equipped). Slide the bonnet (key 18) over the valve stem and complete the assembly according to steps 11 through 15 of the Replacing Packing section. Be sure to observe the note and caution prior to step 11.

For construction with multi-cage elements:

1. Install the body-cage gasket (key 19) into the gasket surface in the bottom of the valve body (key 1). Install the lower cage (key 2B) into the valve body, being careful the gasket remains in proper alignment.
2. If a separated seat ring part (key 4) is used in the assembly (see Figure 25), install the gasket (key 12) into the gasket seating surface on the top of the lower cage (key 2B). Install the seat ring (key 4) into the valve body, being careful that the gasket remains in proper alignment. The seat ring must fit over the guide boss on the lower cage.
3. If a bonnet spacer (key 3) is used in the assembly, install a new body-to-bonnet spacer gasket (key 68) into the groove on top of the valve body (key 1). Lower the bonnet spacer onto the valve body. For NPS 6 design, the upper cage (key 2A) should be installed first, then the bonnet spacer (key 3).

For NPS 6, 3-stage (see Figure 24), a gasket (key 12) is used between upper cage (key 2A) and lower cage (key 2B). Install the gasket into the gasket seating surface on the top of the lower cage (key 2B). Install the upper cage (key 2A) into the valve body, being careful that the gasket remains in proper alignment. The upper cage (key 2A) must fit over the guide boss on the lower cage (key 2B). Install the spiral wound gaskets (key 65) next and then the bonnet spacer (key 3).

4. Install the upper cage (key 2A) on top of the seat ring (key 4) or lower cage (key 2B) depending on different constructions. Attention should be paid to make sure appropriate guiding and fit. Install the spiral wound gasket (key 65) or load ring (key 69 in Figure 25) on top of the upper cage (key 2A).

5. Install new seal on the valve plug (see the Valve Plug Maintenance section). Inspect and replace as necessary. Install the valve plug/stem assembly (key 5) into the cage(s), being careful not to damage the rings, make sure the plug/stem assembly is properly centered on the seating position. Also, make sure the valve plug sealing parts are evenly engaged by the chamfer in the top inside diameter of the cage.
6. Install a new bonnet gasket (key 11) into the gasket groove of the bonnet spacer (key 3, if equipped). Slide the bonnet (key 18) over the valve stem and complete the assembly according to steps 11 through 15 of the Replacing Packing section. Be sure to observe the note and caution prior to step 11.

3.4 ENVIRO-SEAL Bellows Seal Bonnet

Replacing a Plain or Extension Bonnet with an ENVIRO-SEAL Bellows Seal Bonnet (Stem/Bellows Assembly)

1. Remove the actuator and bonnet according to steps 1 through 5 of the Replacing Packing procedure in the Maintenance section.
2. With care, remove the valve plug and stem assembly from the valve body. If necessary, also lift out the cage.

CAUTION

To prevent possible product damage, cover the opening in the valve in the following procedure to protect the sealing surfaces and to prevent foreign material from getting into the valve body cavity.

3. Remove and discard the existing bonnet gasket. Cover the valve body opening to protect sealing surfaces and to prevent foreign material from entering the valve body cavity.

NOTE

The ENVIRO-SEAL stem/bellows assembly for easy-e valves is available only with a threaded and drilled plug/adaptor/stem connection. The existing valve plug can be reused with the new stem/bellows assembly or a new plug can be installed.

4. Inspect the existing valve plug. If the plug is in good condition, it can be reused with the new ENVIRO-SEAL stem/bellows assembly. To remove the existing valve plug from the stem, first, place the existing plug stem assembly and valve plug in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out or drill out the pin (key 8).
5. Reverse the plug stem assembly in the soft-jaw chuck or vise. Grip the valve stem in an appropriate place and unscrew the existing plug from the valve stem.

Table 6. Recommended Torque for ENVIRO-SEAL Bellows Seal Packing Flange Nuts

VALVE SIZE, NPS	VALVE STEM DIAMETER THROUGH PACKING	MINIMUM TORQUE		MAXIMUM TORQUE	
		N·m	Lbf·in	N·m	Lbf·in
1 to 2	1/2	2	22	4	33
3 to 8	1	5	44	8	67

**CAUTION**

When installing a valve plug on the ENVIRO-SEAL stem/bellows assembly, the valve stem must not be rotated. Damage to the bellows may result.

To avoid product damage, do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

NOTE

The ENVIRO-SEAL stem/bellows assembly has a one-piece stem.

**CAUTION**

To avoid damaging parts, do not grip the valve plug on any seating surface in the following procedure.

6. To attach the valve plug to the stem of the new ENVIRO-SEAL stem/bellows assembly, first attach the plug to the adaptor (key 24). Locate the adaptor. Notice that a hole has not been drilled in the threads where the plug screws onto the adaptor. Secure the valve plug in a soft-jaw chuck or other type of vise. Do not grip the plug on any seating surface. Position the plug in the chuck or vise for easy threading of the adaptor. Thread the adaptor into the valve plug and tighten to the appropriate torque value.
7. Select the proper size of drill bit and drill through the adaptor using the hole in the valve plug as a guide. Remove any metal chips or burrs and drive in a new pin to lock the plug/adaptor assembly together.
8. Attach the plug/adaptor assembly to the ENVIRO-SEAL stem/bellows assembly by first securing the stem/bellows assembly in a soft-jaw chuck or other type of vise so that the jaws of the chuck or vise grip the flats of the stem extending out of the top of the bellows shroud. Screw the valve plug/adaptor assembly onto the valve stem. Tighten as necessary to align the pin hole in the stem with one of the holes in the adaptor. Secure the adaptor to the stem with a new pin.
9. Inspect the seat ring (key 9) and soft seat parts (keys 21, 22 and 23); replace, if necessary.
10. Place a new gasket (key 10) into the valve body in place of the bonnet gasket. Install the new stem/bellows assembly with valve plug/adaptor by placing it into the valve body on top of the new bellows gasket.
11. Place a new gasket (key 22) over the stem/bellows assembly. Place the new ENVIRO-SEAL bonnet over the stem/bellows assembly.

Figure 8. PTFE Packing Arrangements for Use in ENVIRO-SEAL Bellows Seal Bonnets

**FOR S31600 (316 SST)
PACKING BOX PARTS**

**FOR ALL PACKING BOX
MATERIALS EXCEPT S31600**

SINGLE ARRANGEMENTS

DOUBLE ARRANGEMENTS

NOTE

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

**CAUTION**

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

12. Properly lubricate the bonnet stud bolts. Install and tighten the bonnet hex nuts to the proper torque.
13. Install new packing and the metal packing box parts according to the appropriate arrangement in Figure 8 or 9.
14. Install the packing flange. Properly lubricate the packing flange stud bolts and the faces of the packing flange nuts.

For graphite packing, tighten the packing flange nuts to the maximum recommended torque shown in Table 6. Then, loosen the packing flange nuts and retighten them to the recommended minimum torque shown in Table 6.

For other packing types, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in Table 6. Then, tighten the remaining flange nut until the packing flange is level and at a 90° angle to the valve stem.
15. Install travel indicator parts and stem locknuts; mount the actuator on the valve body according to the procedure in the appropriate actuator instruction manual.

Replacement of an Installed ENVIRO-SEAL Bellows Seal Bonnet (Stem/Bellows Assembly)

1. Remove the actuator and bonnet according to steps 1 through 5 of the Replacing Packing procedure in the Maintenance section.

**CAUTION**

To prevent possible product damage, cover the opening in the valve in the following procedure to protect the sealing surfaces and to prevent foreign material from getting into the valve body cavity.

2. Carefully remove the ENVIRO-SEAL stem/bellows assembly. If necessary, also lift out the cage. Remove and discard the existing bonnet gasket and bellows gasket. Cover the valve body opening to protect sealing surfaces and to prevent foreign material from entering the valve body cavity.

CAUTION

The ENVIRO-SEAL stem/bellows assembly for easy-e valves is available only with a threaded and drilled plug/adaptor/stem connection. The existing valve plug can be reused with the new stem/bellows assembly or a new plug can be installed. If the existing valve plug is reused and the adaptor is in good condition, it may be also reused. However, never reuse an old adaptor with a new valve plug. Using an old adaptor with a new valve plug requires drilling a new pin hole in the adaptor. This drilling weakens the adaptor and may cause failure in service. However, a used valve plug may be reused with a new adaptor, except with Cavitrol III trim.

3. Inspect the existing valve plug and adaptor. If they are in good condition, they can be reused with the new stem/bellows assembly and they do not need to be separated.

CAUTION

When removing/installing a valve plug on the ENVIRO-SEAL stem/bellows assembly, the valve stem must not be rotated. Damage to the bellows may result.

To avoid product damage, do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

NOTE

The ENVIRO-SEAL stem/bellows assembly has a one-piece stem.

4. If the valve plug and adaptor are not in good condition and must be replaced, first remove the valve plug/adaptor assembly from the stem/bellows assembly; then remove the valve plug from the adaptor. First, place the stem/bellows assembly and valve plug in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out or drill out the pin (key 8, Figure 16, 17 or 20). Drive out the pin (key 36, Figure 14).
5. Reverse the stem/bellows and plug/adaptor assembly in the soft-jaw chuck or vise. Grip the flat areas on the valve stem just below the threads for the actuator/stem connection. Unscrew the plug/adaptor assembly from the stem/bellows assembly. Unscrew the valve plug from the adaptor.

6. To attach either the existing valve plug or a new one to the stem of the new ENVIRO-SEAL stem/bellows assembly, first attach the plug to the adaptor (if the valve plug was removed from the adaptor) as follows:
 - a. Locate the adaptor. Notice that a hole has not been drilled in the threads where the plug screws onto the adaptor.

CAUTION

To avoid damaging parts, do not grip the valve plug on any seating surface in the following procedure.

Figure 9. Double Graphite Ribbon/Filament Arrangements for Use in ENVIRO-SEAL Bellows Seal Bonnets

A5870

NOTE:

1. 0.102 mm / 0.004 IN. THICK SACRIFICIAL ZINC WASHERS; USE ONLY ONE BELOW EACH GRAPHITE RIBBON RING.

- b. Secure the valve plug in a soft-jaw chuck or other type of vise. Do not grip the plug on any seating surface. Position the plug in the chuck or vise for easy threading of the adaptor.
 - c. Thread the adaptor into the valve plug and tighten to the appropriate torque value.
7. Complete the installation by following steps 7 through 9 and steps 12 through 15 of the ENVIRO-SEAL Bellows Seal Bonnet installation instructions found on pages 25 through 28.

Purging the ENVIRO-SEAL Bellows Seal Bonnet

The ENVIRO-SEAL bellows seal bonnet can be purged or leak tested. Refer to Figure 14 for an illustration of an ENVIRO-SEAL bellows seal bonnet and perform the following steps for purging or leak testing.

1. Remove the two diametrically opposed pipe plugs (key 16).
2. Connect a purging fluid to one of the pipe plug connections.
3. Install appropriate piping or tubing in the other pipe plug connection to pipe away the purging fluid or to make a connection to an analyzer for leak testing.
4. When purging or leak testing has been completed, remove the piping or tubing and reinstall the pipe plugs (key 16).

Table 7. Standard Material Designations

Standard Designation	Common Name or Tradename

S41000 SST S41600 SST WCC Carbon steel casting	410 Stainless steel 416 Stainless steel WCC

Section 4: Parts

4.1 Parts Ordering

Each body-bonnet assembly is assigned a serial number which can be found on the valve. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts, refer to the serial number and to the eleven-character part number for each part required from the following parts kit or parts list information.

Refer to Table 7 for standard and common material designations.

NOTE

If the valve contains Trim Cartridge (Trim Cartridges can be identified by a name plate on the bonnet flange, the use of a packing nut and "Fisher" embossed below the yoke mounting), please refer to Fisher ET and EZ easy-e Valves with Trim Cartridge Instruction Manual ([D104358X012](#)) for parts ordering guidance.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

4.2 Parts Kits

Gasket Kits

Gasket Kits (includes keys 10, 11, 12, 13 and 51; plus 14 and 20 on some restricted capacity valves)

ENVIRO-SEAL Packing Retrofit Kits

Retrofit kits include parts to convert valves with existing standard bonnets to the ENVIRO-SEAL packing box construction. Refer to Figure 11 for key numbers for PTFE packing, to Figure 12 for key numbers for Graphite ULF packing and to Figure 13 for key numbers for duplex packing. PTFE kits include keys 200, 201, 211, 212, 214, 215, 216, 217, 218, tag and cable tie. Graphite ULF kits include keys 200, 201, 207, 208, 209, 210, 211, 212, 214, 217, tag and cable tie. Duplex kits include keys 200, 201, 207, 209, 211, 212, 214, 215, 216, 217, tag and cable tie.

Stems and packing box constructions that do not meet Emerson stem finish specifications, dimensional tolerances and design specifications, may adversely alter the performance of this packing kit.

For part numbers of individual components in the ENVIRO-SEAL packing kits, refer to instruction manual ENVIRO-SEAL Packing System for Sliding-Stem Valves, [D101642X012](#).

Duplex	RPACKXRT212	RPACKXRT222	RPACKXRT232	RPACKXRT242	RPACKXRT252

ENVIRO-SEAL Packing Repair Kits

Repair kits include parts to replace the “soft” packing materials in valves that already have ENVIRO-SEAL packing arrangements installed or in valves that have been upgraded with ENVIRO-SEAL retrofit kits. Refer to Figure 11 for key numbers for PTFE packing, to Figure 12 for key numbers for Graphite ULF packing and to Figure 13 for key numbers for duplex packing. PTFE repair kits include keys 214, 215 and 218. Graphite ULF repair kits include keys 207, 208, 209, 210 and 214. Duplex repair kits include keys 207, 209, 214 and 215.

Stems and packing box constructions that do not meet Emerson stem finish specifications, dimensional tolerances and design specifications, may adversely alter the performance of this packing kit.

For part numbers of individual components in the ENVIRO-SEAL packing kits, refer to instruction manual ENVIRO-SEAL Packing System for Sliding-Stem Valves, [D101642X012](#).

Figure 1. Fisher ET Control Valve with Trim Cartridge and 667 Actuator

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for NPS 1 through 4 Fisher ET and EZ valves with Trim Cartridge. Refer to separate manuals for instructions covering the actuator and accessories.

Do not install, operate, or maintain an ET or EZ valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Table 1. Specifications

Maximum Inlet Pressure^(1,2)**Cast Iron Valves**

Flanged: Consistent with CL125B or 250B pressure-temperature ratings per ASME B16.1

Steel and Stainless Steel Valves

Flanged: Consistent with CL150, 300, or 600⁽³⁾ pressure-temperature ratings per ASME B16.34

Screwed or Welding: Consistent with CL600 pressure-temperature ratings per ASME B16.34

Shutoff Classifications per ANSI/FCI 70-2 and IEC 60534-4

■ Class IV, standard ■ Class V, optional

Flow Characteristics

■ Equal percentage ■ Linear

Flow Direction

ET Linear or Equal Percentage Cage: Normally down

EZ Linear or Equal Percentage Cage: Normally up

Approximate Weights

VALVE SIZE, NPS	TRIM CARTRIDGE WEIGHT		VALVE ASSEMBLY WEIGHT	
	kg	lb	kg	lb
1	7	14	14	30
1-1/2	8	16	20	45
2	10	22	30	67
3	15	32	54	125
4	21	46	77	170

1. The pressure/temperature limits in this manual and any applicable standard or code limitation for valve should not be exceeded.

2. Trim Cartridge contains a pressure retaining bonnet. Ensure Trim Cartridge is suitable for the application's required pressure class rating.

3. Certain bonnet bolting material selections may require a CL600 easy-e valve assembly to be derated. Contact your [Emerson sales office](#).

Description

Trim Cartridge is a complete control valve repair solution that incorporates a full trim recommended spare parts list (RSPPL) replacement plus a new bonnet in a single, factory assembled repair cartridge. Trim Cartridge has the same fit and function of traditional easy-e trim, making it backwards compatible into existing easy-e constructions. In addition to being pre-assembled, each Trim Cartridge is tested to ensure CL V shutoff capability and has the live loaded ENVIRO-SEAL™ packing set, allowing for a simplified installation that reduces trim repair time and complexity.

Specifications

Typical specifications for these valves are shown in table 1.

Educational Services

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for overpressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

Before installing the valve, inspect the valve and pipelines for any damage and any foreign material which may cause product damage.

1. Isolate the control valve from the pipeline pressure.
2. Release pressure and drain process media from both sides of the control valve.
3. If using a power actuator, also shut off all pressure lines to the power actuator, and release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while the working on the equipment.
4. Disconnect the operating lines from the actuator and any leak-off piping from the bonnet.
5. Disconnect the stem connector and remove the actuator from the valve by unscrewing the yoke locknut. Remove any travel indicator parts and stem locknuts from the valve stem threads.

⚠ WARNING

To avoid personal injury due to leaking fluid, avoid damaging gasket sealing surfaces on the valve body, bonnet, and cage. The surface finish of the valve stem is critical for making a good packing seal. Unless inspection reveals otherwise, assume all these parts are in good condition and protect them accordingly.

6. Loosen the body/bonnet nuts (figure 2, key 2) approximately 3 mm (1/8 inch). Then loosen the body-to-bonnet gasket joint by either rocking the bonnet or prying between the bonnet and valve. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, remove the nuts completely (see figure 6, key 2).
7. Remove the bonnet and all trim components.
8. Remove and discard the cage gasket (key 4) and the bonnet gasket (key 3).
9. Clean and inspect the cage and bonnet gasket surfaces.
10. Install a new cage gasket (key 4) and a new bonnet gasket (key 3) into the valve body.

11. Install the new Trim Cartridge (key 1) into the valve body.

Note

Trim Cartridge is a single use repair solution. Once the spiral wound gasket has been compressed during installation, it may not provide the proper seat load if the Trim Cartridge is removed and reinstalled.

12. Apply lithium-based lubricant to body-to-bonnet bolting, install bolting, and tighten in a criss-cross pattern using the torque guidelines in table 2.

Note

The proper bolting procedures include--but are not limited to--ensuring that bolting threads are undamaged and lubricated, and evenly tightening the cap screws, or the nuts onto the studs, in a criss-cross pattern. Tightening one cap screw or nut may loosen an adjacent cap screw or nut. Repeat the crisscross tightening pattern several times until each cap screw or nut is tight and the body- to - bonnet seal is made.

Proper performance of the bolting procedures compresses the spiral wound gasket enough to both load and seal the cage gasket (key 4). It also compresses the bonnet gasket (key 3) enough to seal the body-to-bonnet joint.

1	129	95	64	47
1-1/2 or 2	96	71	45	33
3	169	125	88	65
4	271	200	156	115

1. Determined from laboratory tests.
2. SA193-B8M annealed.
3. For other lubricants, bolting materials, or coated bolting, contact your [Emerson sales office](#) for torques.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

Maintenance

Inspection and maintenance frequency depends on the severity of service conditions. When the Trim Cartridge is installed, the spiral wound gasket (which is not repairable) is compressed in order to load and seal the cage gasket (figure 2, key 4). If the Trim Cartridge is removed and reinstalled, the spiral wound gasket may not provide sufficient load after initial compression. Therefore, it is not recommended to remove and reinstall Trim Cartridge after initial installation. Valve packing can be serviced as it does not require decompression of the spiral wound gasket. This section includes instructions for packing maintenance in the Trim Cartridge.

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

CAUTION

Follow instructions carefully to avoid damaging the product surfaces, which could result in damage to the product

Packing Replacement

ENVIRO-SEAL packing systems are designed for quality performance over extended periods. This longevity allows for packing maintenance to be performed at regularly scheduled plant outages or turnarounds.

Use the following instructions when inspecting or replacing ENVIRO SEAL packing. Additional information can be found in the ENVIRO-SEAL Sliding-Stem Valves Instruction Manual ([D101642X012](#))

If changing the packing system material to a different material, such as PTFE to Graphite ULF, it is good practice to review the actuator sizing, as packing friction will change.

CAUTION

To prevent product damage caused by scratching or damaging the packing box wall, take care when removing the old packing parts from the packing box.

1. Isolate the control valve from the line pressure.
2. Release pressure and drain process media from both sides of the control valve.
3. If using a power actuator, also shut off all pressure lines to the power actuator, and release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while working on the equipment.
4. Disconnect the operating lines from the actuator and any leak-off piping from the bonnet.
5. Disconnect the stem connector and then remove the actuator from the valve by unscrewing the yoke locknut.
6. Remove any travel indicator parts and stem locknuts from the valve stem threads.
7. Remove the packing nut (figure 3, 4, or 5, key 3) from bonnet.
8. Remove packing parts from bore using a packing extraction tool and check for damage to valve stem or packing box bore.
9. Install the ENVIRO-SEAL packing parts into the packing box. Use figure 3, 4, or 5 to ensure the packing parts and spring pack are assembled in correct order.
10. Install the spring pack assembly with the attached springs, onto the stem, ensuring the Belleville springs are stacked properly and packing box parts are assembled in the correct order (figures 3, 4, or 5). Packing parts cannot function properly if the Belleville springs or other packing parts are not stacked correctly.
11. Lubricate the packing nut (figure 3, 4, or 5, key 3) with anti-seize lubricant and install hand tight.

Tightening Procedures - Packing Nut

1. To achieve maximum benefit from the ENVIRO-SEAL packing system, the packing nut must compress the Belleville springs to their “target load.” The target load is the point where the Belleville springs are designed for optimum performance, when compressed to 85% of their maximum deflection, or nearly flat. (Maximum deflection is when the springs are 100% compressed, or completely flat). To obtain the target load of 85% compression of maximum deflection, perform the following:
 - Tighten the packing nut until the Belleville springs are compressed 100% (or completely flat), as detected by a rapid increase in nut torque.
 - For PTFE or Duplex packing, loosen packing flange nut 1/2 turn (180° of rotation).
 - For Graphite ULF packing, loosen packing flange nut 1/4 turn (90° of rotation).

The “target load” of 85% compression has now been reached.

Refer to the appropriate valve and actuator instruction manuals when connecting the valve to the actuator. Under normal conditions, the packing nut should not require retightening.

2. However, when servicing, if the springs do not remain at the target load of 85% compression, retighten the packing box nut according to step 1 above.

Other Considerations

When repacking a valve with ENVIRO-SEAL packing that has been in service, check the condition of the packing bore after the packing has been removed. A good guideline to use in checking the condition of the packing bore is the 20/20 rule. If less than 20% of the surface area of the bore is pitted and if there are no pits deeper than 0.020 inch, then the packing should work as designed. This does not need to be an exact measurement; visual inspection is adequate. If the packing bore does not meet these criteria, the unit should be replaced.

Figure 3. ENVIRO-SEAL PTFE Packing Arrangement

Parts Ordering

Each body-bonnet assembly is assigned a serial number which can be found on the valve. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. In addition, each Trim Cartridge is assigned a part serial number which can be found on the Trim Cartridge bonnet. Refer to either the body-bonnet serial number or Trim Cartridge part serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts, refer to the serial number or part serial number and to the eleven-character part number for each part required from the following parts kit information.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts Kits

ENVIRO-SEAL Packing Repair Kits

Repair kits include parts to replace the “soft” packing materials in valves that already have ENVIRO-SEAL packing arrangements installed or in valves that have been upgraded with ENVIRO-SEAL retrofit kits. Refer to figure 3 for key numbers for PTFE packing, to figure 4 for key numbers for Graphite ULF packing, and to figure 5 for key numbers for duplex packing. PTFE repair kits include keys 13, 15, 16, 17, and 18. Graphite ULF repair kits include keys 22, 24, 25, 26, and 27. Duplex repair kits include keys 16, 17, 18, 22, 24, and 25.

Stems and packing box constructions that do not meet Emerson stem finish specifications, dimensional tolerances, and design specifications, may adversely alter the performance of this packing kit.

Packing Kits (ENVIRO-SEAL) Repair

PACKING MATERIAL	STEM DIAMETER, mm (INCH) YOKE BOSS DIAMETER, mm (INCH)	
	9.5 (3/8) 54 (2-1/8)	12.7 (1/2) 71 (2-13/16)

Inspection and Maintenance Schedules	2
Parts Ordering	2
Installation	3
Maintenance	4
Latest Published Instruction Manual	5

Introduction

The product covered in this document is no longer in production. This document, which includes the latest published version of the instruction manual, is made available to provide updates of newer safety procedures. Be sure to follow the safety procedures in this supplement as well as the specific instructions in the included instruction manual.

Part numbers in the included instruction manual should not be relied on to order replacement parts. For replacement parts, contact your [Emerson sales office](#).

For more than 30 years, Fisher products have been manufactured with asbestos-free components. The included manual might mention asbestos containing parts. Since 1988, any gasket or packing which may have contained some asbestos, has been replaced by a suitable non-asbestos material. Replacement parts in other materials are available from your sales office.

Safety Instructions

Please read these safety warnings, cautions, and instructions carefully before using the product.

These instructions cannot cover every installation and situation. Do not install, operate, or maintain this product without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage it is important to carefully read, understand, and follow all of the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your Emerson sales office before proceeding.

Specifications

This product was intended for a specific range of service conditions--pressure, pressure drop, process and ambient temperature, temperature variations, process fluid, and possibly other specifications. **Do not expose the product to service conditions or variables other than those for which the product was intended.** If you are not sure what these conditions or variables are, contact your [Emerson sales office](#) for assistance. Provide the product serial number and all other pertinent information that you have available.

Inspection and Maintenance Schedules

All products must be inspected periodically and maintained as needed. The schedule for inspection can only be determined based on the severity of your service conditions. Your installation might also be subject to inspection schedules set by applicable governmental codes and regulations, industry standards, company standards, or plant standards.

In order to avoid increasing dust explosion risk, periodically clean dust deposits from all equipment.

When equipment is installed in a hazardous area location (potentially explosive atmosphere), prevent sparks by proper tool selection and avoiding other types of impact energy.

Parts Ordering

Whenever ordering parts for older products, always specify the serial number of the product and provide all other pertinent information that you can, such as product size, part material, age of the product, and general service conditions. If you have modified the product since it was originally purchased, include that information with your request.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher product, because they may void your warranty, might adversely affect the performance of the product, and could cause personal injury and property damage.

Installation

⚠ WARNING

- Personal injury or equipment damage caused by sudden release of pressure or bursting of parts may result if the valve assembly is installed where service conditions could exceed the limits given in the applicable product literature, the limits on the appropriate nameplates, or the mating pipe flange rating. Use pressure-relieving devices as required by government or relevant industry codes and good engineering practices. If you cannot determine the ratings and limits for this product, contact your [Emerson sales office](#) before proceeding.
- To avoid personal injury, always wear protective gloves, clothing, and eyewear when performing any installation operations.
- To avoid personal injury or property damage, use proper lifting and rigging practices while lifting, installing or removing the valve assembly. Be sure to use lifting and rigging equipment properly sized and selected for the weight and configuration of the valve assembly or component being lifted.
- Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions.
- Many rotary shaft valves are not necessarily grounded to the pipeline when installed in a flammable, hazardous, oxygen service, or explosive atmospheres. An explosion is possible, due to the discharge of static electricity from the valve components. To avoid personal injury or property damage, make sure that the valve is grounded to the pipeline before placing the control valve assembly into service. Use and maintain alternate shaft-to-body bonding, such as a shaft-to-body bonding strap assembly.
- Rotary shaft valves are designed and intended for installation between flanges. Personal injury or property damage may result from improper installation. To avoid personal injury or property damage caused by the sudden release of pressure or bursting of parts, do not use or install rotary shaft valves (including single lug constructions) for dead-end service.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
- If installing into an existing application, also refer to the WARNING in the Maintenance section.
- When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. To avoid possible personal injury and because some valve/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your Emerson sales office.

CAUTION

- Ensure that the valve and adjacent pipelines are free of foreign material that could damage the valve seating surfaces.

Maintenance

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Always wear protective gloves, clothing, and eyewear.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure.
- Do not remove the actuator while the valve is pressurized.
- Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring pre-compression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box might contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids might spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug. Cautiously remove parts so that fluid escapes slowly and safely.
- Many valve parts that are moving can injure you by pinching, cutting, or shearing. To help prevent such injury, stay clear of any moving part.
- Never apply pressure to a partially assembled valve.
- To avoid personal injury or property damage caused by uncontrolled movement of a valve bonnet, loosen the bonnet by following these instructions: Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet. Loosen bonnet nuts approximately 3 mm (0.125 inch). Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and body. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, proceed with bonnet removal.
- As you remove parts, such as valve shafts, other parts, such as disks can fall from the valve body or suddenly move to another position in the valve. To avoid injury from falling or moving parts, be sure to support parts and be sure they are in a stable position as you disassemble the valve.
- Personal injury could result from packing leakage. Do not scratch the drive shaft or packing box wall while removing packing parts.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Neither Emerson, Emerson Automation Solutions, nor any of their affiliated entities assumes responsibility for the selection, use or maintenance of any product. Responsibility for proper selection, use, and maintenance of any product remains solely with the purchaser and end user.

Figure 1. NPS 24 x 20 Fisher EWT Valve with Piston Actuator and FIELDVUE™ DVC6200 Digital Valve Controller

W9156-2

Introduction

Scope of Manual

This instruction manual includes installation and maintenance information for NPS 12 through 24 x 20 CL150 through 600 Fisher EUD, EUT, EUT-2, EWD, EWT, and EWT-2 valves, and the NPS 12 and 20 x 16 CL900 EUD, EUT-2, EWD, and EWT-2 valves. (Size designations such as NPS 20 x 16 are end connection size x nominal trim size.)

Refer to separate manuals for instructions covering the actuator and accessories.

Do not install, operate, or maintain an EUD, EUT, EUT-2, EWD, EWT, or EWT-2 valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

1. Other pressures on application.

2. The pressure/temperature limits in this instruction manual and in any applicable standard limitations should not be exceeded.

Description

All valve types covered in this manual (EUD, EUT, EUT-2, EWD, EWT, and EWT-2 valves) can be used for either throttling or on-off control of a wide variety of liquids and gasses. They are single-port, globe-style valves with cage guiding, balanced valve plugs, and a push-down-to-close action. EUT, EWT, and EWT-2 valves have a spring-loaded PTFE seal between the plug and cage; the EUD and EWD valves have two graphite piston rings between the plug and cage. See figure 5, 6, or 7 for seal details.

EUT-2 and EWT-2 valves have a seat ring threaded into the cage. A spring-loaded PTFE seal is used to seal between the seat ring and the valve body. Standard seating is metal-to-metal, but optional soft metal seats are also available. A typical EUT-2 or EWT-2 valve is shown in figure 5.

EUD and EWD valves have a seat ring bolted into the valve body with cap screws. Seating is metal-to-metal. A typical EUD or EWD valve is shown in figure 6.

EUT and EWT valves have a seat ring bolted into the valve body with cap screws. These valves have metal-to-metal seating and use PEEK anti-extrusion rings in the plug seal arrangement to increase the upper temperature limit of the seal to 316°C (600°F). A typical EUT valve is shown in figure 7.

Cavitrol III, Whisper Trim III, and WhisperFlo trim cages are available in these valves. Cavitrol trim helps eliminate cavitation damage in liquid service in a properly sized valve and Whisper Trim III and WhisperFlo trim cages help attenuate aerodynamic noise in gas service.

Fisher WhisperFlo trim represents state of the art solutions for applications that demand ultimate aerodynamic noise attenuation.

Control valves with WhisperFlo cages provide additional aerodynamic noise attenuation in very demanding vapor or gas applications with high-pressure drops. A WhisperFlo cage with an appropriately sized valve body is designed to reduce the noise level up to -40 dBA. For special applications, -50 dBA attenuation can be achieved.

Specifications

Typical specifications for these valves are shown in tables 1 and 2. Some of the specifications for a given valve assembly as it comes from the factory appear on the actuator nameplate if the valve is part of a complete control valve assembly.

Installation

⚠ WARNING

To avoid personal injury or property damage resulting from the sudden release of pressure, do not install the valve assembly where service conditions could exceed the limits given in this manual or on the appropriate nameplates. Use pressure-relieving devices as required by government or accepted industry codes and good engineering practices.

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

The valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Because some valve body/trim material combinations are limited in their pressure drop and temperature range capabilities, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#) or Local Business Partner.

⚠ WARNING

If you are hoisting the valve, use nylon slings to protect the surfaces.

Carefully position the slings to prevent damage to the actuator tubing and any accessories. Also, take care to prevent people from being injured in case the hoist or rigging slips unexpectedly. Refer to table 6 for valve assembly weights. It is important to use adequately sized hoists and chains or slings to handle the valve.

1. Before installing the valve, inspect the valve and associated equipment for any damage and any foreign material.
2. Make certain that the valve body interior is clean, that pipelines are free of foreign material, and the valve is oriented so that pipeline flow is in the same direction as the arrow on the side of the valve.

CAUTION

For long service life and more effective operation, the process liquid must be clean. If the valve being installed has a Whisper Trim, WhisperFlo, or Cavitrol Trim cage with small internal flow passages, impurities or entrained solids in the

process liquid may cause irreparable erosion damage to the seating surfaces and may plug cage holes and passages, causing cavitation damage. During valve installation or the plant cleaning cycle, install a strainer upstream from the valve to help free pipelines of foreign material.

3. The control valve assembly may be installed in any orientation unless limited by seismic criteria. However, the normal method is with the actuator vertical above the valve. Other positions may result in uneven valve plug and cage wear and in improper operation. Support the actuator if it is not installed in the vertical position. For more information, consult your [Emerson sales office](#) or Local Business Partner.
4. Use accepted piping and welding practices when installing the valve in the line. You can leave internal elastomeric parts in place when welding. For flanged valves, use a suitable gasket between the valve and pipeline flanges.

CAUTION

Depending on valve body materials used, post weld heat treating might be required. If so, damage to internal elastomeric and plastic parts, as well as internal metal parts is possible. Shrunk-fit pieces and threaded connections might also loosen. If post weld heat treating is to be performed, all trim parts should be removed. Contact your Emerson sales office or Local Business Partner for additional information.

5. With a leak-off bonnet construction, remove the 1/4 NPT pipe plugs (key 14, figure 4) from the bonnet to hook up the leak-off piping.
6. If continuous operation of the plant is required during inspection or maintenance of the valve, install a three-valve bypass around the control valve assembly.
7. If the actuator and valve are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however some readjustment will be required to meet specific service conditions.

If the valve has ENVIRO-SEAL™ live-loaded packing or HIGH-SEAL ULF live-loaded packing installed, this initial re-adjustment will probably not be required. See the Fisher instruction manuals titled ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)) or HIGH-SEAL ULF Live-Loaded Packing System ([D101453X012](#)) (as appropriate) for packing instructions.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing lubrication, packing maintenance, trim maintenance, lapping seating surfaces, and valve plug maintenance. All maintenance operations may be performed with the valve in the line.

⚠ WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut off all pressure lines to the power actuator, release all pressure from the actuator, and use lock-out procedures to prevent injury while you work on the equipment.

Figure 2. Lubricator and Lubricator/Isolating Valve

Note

Whenever a gasket seal is disturbed by removing or shifting gasketed parts, a new gasket should be installed upon reassembly. This is necessary to ensure a good gasket seal because the used gasket might not seal properly.

Note

If the valve has ENVIRO-SEAL live-loaded packing or HIGH-SEAL ULF live-loaded packing installed, see the Fisher instruction manuals titled ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)) or HIGH-SEAL ULF Live-Loaded Packing System ([D101453X012](#)) (as appropriate) for packing instructions.

Packing Lubrication

CAUTION

Do not lubricate graphite packing. Graphite packing is self-lubricated. Additional lubrication may result in slip-stick movement of the valve.

If a lubricator or lubricator/isolating valve (figure 2) is provided for PTFE/composition or other packings that require lubrication, it will be installed in place of the 1/4 NPT pipe plug (key 14, figure 4). Use a silicon-base lubricant. To operate the lubricator, turn the cap screw clockwise to force the lubricant into the packing box. The lubricator/isolating valve operates the same way except the isolating valve must first be opened and then closed after lubrication is completed.

Packing Maintenance

This procedure does not cover ENVIRO-SEAL or HIGH-SEAL packing; refer to separate manuals for instructions on those packing types.

Key numbers are shown in figure 3 unless otherwise indicated.

For spring-loaded single PTFE V-ring packing, the spring (key 8) maintains a sealing force on the packing. If leakage is noted around the packing follower (key 13), check to be sure the shoulder on the packing follower is touching the bonnet. If the shoulder is not touching the bonnet, tighten the packing flange nuts (key 5, figure 4) until the shoulder is against the bonnet. If leakage cannot be stopped in this manner, proceed to the Replacing Packing section.

If there is undesirable packing leakage with other than spring-loaded packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts.

If the packing is relatively new and tight on the stem and if tightening the packing flange nuts does not stop the leakage, it is possible that the valve stem is worn or nicked so that a seal cannot be made. The surface finish of a new

valve stem is critical for making a good packing seal. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches around the packing box wall. If performing any of the following procedures, inspect the valve stem and packing box wall for nicks and scratches.

Replacing Packing

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut off all pressure lines to the power actuator, release all pressure from the actuator, and use lock-out procedures to prevent injury while you work on the equipment.
2. Remove any leak-off piping from the bonnet. Disconnect the stem connector, and then remove the actuator from the valve by unscrewing the hex nuts (key 26, figure 4).
3. Loosen the packing flange nuts (key 5, figure 4) so that the packing is not tight on the valve stem. Remove any travel indicator parts and stem locknuts from the valve stem threads.

CAUTION

Avoid damage to the seating surfaces caused by the valve plug and stem assembly dropping from the bonnet after being lifted part way out.

When lifting the bonnet (key 1, figure 4), either be sure that the valve plug and stem assembly remains in the valve and on the seat or, temporarily install a valve stem locknut on the valve stem. This locknut will prevent the valve plug and stem assembly from dropping out of the bonnet.

⚠ WARNING

To avoid personal injury or property damage caused by uncontrolled movement of the bonnet, loosen the bonnet by following the instructions in the next step. Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet. If the cage sticks to the bonnet, proceed carefully with bonnet removal.

Note

The following step also provides additional assurance that the valve body fluid pressure has been relieved.

4. Hex nuts (key 16, figures 5 or 6) attach the bonnet to the valve body. Loosen these nuts or cap screws approximately 3 mm (1/8 inch). Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and valve body. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, remove the nuts completely and carefully lift the bonnet (key 1, figure 4).
5. Set the bonnet on a protective surface to prevent damage to the bonnet gasket surface.
6. Whenever the bonnet has been removed, replace the bonnet gasket and the cage gasket (keys 10 and 11, figures 5 and 6). Remove the bonnet gasket.
7. Lift the valve plug and stem assembly out of the valve body and set it on a protective surface. If the valve plug is to be reused, protect the valve plug seating surface to prevent scratches.
8. Install screws or bolts into the tapped holes in the top of the cage assembly (key 3), and carefully lift it out of the valve body. Remove the cage gasket (key 11).
9. If further trim maintenance is required, refer to the Trim Maintenance section.

Figure 4. Typical Globe Valve Bonnet

20 x 16	CL900	1750	1290
20, 24 x 20	CL150 - 600	4240	3130

1. For B7, B7M, B16, and 660 bolting materials. For other materials, contact your [Emerson sales office](#) or Local Business Partner for torque values.

CAUTION

To prevent damage to the valve cavity, packing box wall, and packing surfaces, observe the instructions in the next three steps.

10. Cover the opening in the valve body to protect the gasket surface and prevent foreign material from getting into the valve cavity.
11. Remove the packing flange nuts, packing flange, upper wiper, and packing follower (keys 5, 3, 12, and 13, figure 4). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall. Clean the packing box and the metal packing parts.
12. Inspect the valve stem threads and packing box surfaces for any sharp edges that might cut the packing. Scratches or burrs could cause packing box leakage or damage to the new packing. If the surface condition cannot be improved by light sanding or honing with a tool similar to an automotive brake-cylinder hone, replace the damaged parts.
13. Remove the covering protecting the valve cavity, and install a new cage gasket (key 11, figure 5 and 6), making sure the gasket seating surfaces are clean and smooth.
14. Re-install the trim parts by following the Trim Replacement section. Install a new bonnet gasket (key 10, figure 5 and 6).

Note

Proper performance of the tightening procedures in step 15 compresses the bonnet and cage gaskets (keys 10 and 11, figure 5 and 6) enough to seal the body-to-bonnet joint.

The bolting procedures in step 15 include--but are not limited to--ensuring that bolting threads are clean and evenly tightening the hex nuts onto the studs in a crisscross pattern. Because of the boltup characteristics of the gaskets, tightening one nut may loosen an adjacent nut. Repeat the crisscross tightening pattern several times until each nut is tight and the body-to-bonnet seal is made.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

15. Lubricate the stud bolts (key 15, figure 5 and 6) with anti-seize lubricant, slide the bonnet over the stem and onto the bolts, and secure with the stud bolt nuts (key 16, figure 5 and 6), using accepted bolting procedures during tightening so that the body-to-bonnet joint will withstand test pressures and application service conditions. Refer to table 4 for bolting torque guidelines.
16. Install new packing and the metal packing box parts according to the appropriate arrangement in figure 3. Place a smooth-edged pipe over the valve stem, and gently tap each soft packing part into the packing box one piece at a time, being sure that air is not trapped between adjacent soft parts.
17. Slide the packing follower, upper wiper, and packing flange (keys 13, 12, and 3, figure 4) into position. Lubricate the packing flange studs (key 4, figure 4) and the faces of the packing flange nuts (key 5, figure 4). Replace the packing flange nuts.

18. For spring-loaded PTFE V-ring packing, tighten the packing flange nuts until the shoulder on the packing follower (key 13, figure 4) contacts the bonnet.

For graphite packing, tighten the packing flange nuts to the maximum recommended torque shown in table 3. Then, loosen the packing flange nuts and retighten them to the recommended minimum torque shown in table 3.

For other packing types, tighten the packing flange nuts alternately in small, equal increments until one of the nuts reaches the minimum recommended torque shown in table 3. Then, tighten the remaining flange nut until the packing flange (key 3, figure 4) is at a 90-degree angle to the valve stem.

19. Mount the actuator on the valve assembly, and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual. Check for leakage around the packing follower when the valve is being put into service. Retighten the packing flange nuts as required.

Trim Maintenance

Trim Removal

Except where indicated, key numbers in this section are shown in figure 5 for EUT-2 and EWT-2 valves and in figure 6 for EUD and EWD valves.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut off all pressure lines to the power actuator, release all pressure from the actuator, and use lock-out procedures to prevent injury while you work on the equipment.
2. Remove the actuator and the bonnet according to steps 2 through 5 of the Replacing Packing Section.

CAUTION

Use care to avoid damaging gasket surfaces.

The surface finish of the valve stem (key 7) is critical for making a good packing seal. The inside surface of the cage or cage assembly (key 3) is critical for smooth operation of the valve plug and for making a seal with the seal ring (key 28). The seating surfaces of the valve plug (key 2) and seat ring (key 9) are critical for proper shutoff. Assume all these parts are in good condition, and protect them accordingly unless inspection reveals otherwise.

3. Packing parts can be removed if desired. Replace these parts as described in the Packing Replacement section.
4. Lift the valve plug and stem assembly out of the valve body and set it on a protective surface. If the valve plug is to be reused, protect the valve plug seating surface to prevent scratches.
5. Install screws or bolts into the tapped holes in the top of the cage assembly (key 3), and carefully lift it out of the valve body. Remove the gaskets (keys 10 and 11).
6. Proceed as appropriate:

For EUT-2 or EWT-2 valves (figure 5), the valve has a seat ring seal ring (key 6). Inspect this seal ring, and remove it if replacement is necessary. The seat ring is screwed into the cage and secured with two tack welds, one on each side of the cage. Remove the tack welds by grinding or filing them off.

- For all sizes except NPS 12 and 16x12, there are slots cut in the seat ring. Insert a bar through the slots and turn the seat ring out of the cage.
- For NPS 12 and 16x12, there are two 3/8 inch UNC tapped holes in the bottom of the seat ring. Screw cap screws into these holes. Use a bar to pry against the cap screws and turn the seat ring out of the cage.

For EUD, EWD, EUT, and EWT valves (figure 6), unscrew the seat ring cap screws (key 49). Install screws or bolts into the tapped holes in the top of the seat ring (key 9) and carefully lift it out of the valve body. Remove the gasket (key 13).

7. Inspect parts for wear or damage that would prevent proper operation of the valve. Replace or repair trim parts according to the following Lapping Seating Surfaces or Valve Plug Maintenance procedures as appropriate.

Lapping Seating Surfaces

A certain amount of leakage should be expected with metal-to-metal seating in any valve body. If the leakage becomes excessive, however, the condition of the seating surfaces of the valve plug and seat ring can be improved by lapping. (Deep nicks should be machined out rather than ground out.) Use a good quality lapping compound of a mixture of 280 to 600-grit. Apply the compound to the bottom of the valve plug.

Assemble the valve to the extent that the cage or cage assembly is in place and the bonnet is bolted to the valve body. A simple handle can be made from a piece of strap iron locked to the valve plug stem with nuts. Rotate the handle alternately in each direction to lap the seats. After lapping, remove the bonnet, and clean the seat surfaces. Completely assemble the valve as described in the Trim Replacement section, and test the valve for shutoff. Repeat the lapping procedure if leakage is still excessive.

Valve Plug Maintenance

Except where indicated, key numbers in this section are shown in figure 5 for EUT-2 and EWT-2 valves and in figure 6 for EUD and EWD valves.

CAUTION

For valves with a PTFE seal ring (figure 5, 6, or 7), if replacing the valve plug seal ring (key 28), be careful not to scratch the surfaces of the ring groove in the valve plug or any of the surfaces of the replacement ring, or the replacement ring may not seal properly.

1. Remove the valve plug (key 2) according to the Disassembly section.
2. For seal-ring constructions, carefully pry or cut the seal ring (key 28, figure 5, 6, or 7) from its groove in the plug.

Install the replacement spring-loaded seal ring with the open side facing the top or bottom of the valve plug, depending on flow direction. The open side of the seal ring should face up (toward the actuator) in flow-up installations and down in flow-down installations.

To install the seal ring, first lubricate it with general-purpose, lithium-base lubricant. Then gently stretch the seal ring and work it over the top edge of the valve plug. Give the PTFE material in the seal ring time to cold flow during the stretching procedure. Avoid jerking sharply on the ring. Stretching the seal ring over the valve plug might make it seem loose when it is in the groove, but it will shrink to its original size after you have installed the plug into the cage.

3. For piston-ring constructions, each of the piston rings (key 28, figure 5, 6, or 7) is in two halves; remove the halves.

Each new graphite piston ring is furnished as a complete ring, and each must be broken into two approximately equal portions. Do this by placing the ring on edge on a smooth, hard surface and striking the ring squarely with a hammer. Be sure to match the broken ends when installing the ring sections in the valve plug grooves.

Figure 5. Typical Fisher EUT-2 or EWT-2 Valve

E1488

NOTE:

1> SEAL RING OPENING MUST FACE SEAT RING FOR FLOW DOWN APPLICATIONS AND MUST FACE ACTUATOR FOR FLOW UP APPLICATIONS

CAUTION

Never reuse an old stem (key 7) with a new valve plug. Using an old stem with a new plug requires drilling a new pin hole in the stem. This weakens the stem and may cause it to fail in service. However, a used valve plug may be reused with a new stem.

4. To replace the valve stem (key 7), drill out the pin (key 8) and unscrew the stem from the valve plug.

5. Screw the new stem tightly into the valve plug. Drill through the stem, using a 1/4-inch diameter drill for the 31.8 mm (1-1/4 inch) stem diameter used in this valve. Use the hole in the valve plug as a guide. Remove any chips or burrs, and drive in a new pin to lock the assembly.

Trim Replacement

Except where indicated, key numbers are shown in figure 5 and 6.

1. Proceed as appropriate:

For EUT-2 or EWT-2 valves:

For all sizes except NPS 12 and 16x12, turn the seat ring (key 9) into the cage (key 3) with a bar inserted through the seat ring slots.

For NPS 12 and 16x12, insert cap screws into the two 3/8 inch UNC tapped holes in the bottom of the seat ring (key 9). Use a bar to pry against the cap screws and turn the seat ring (key 9) into the cage (key 3).

For all sizes, tack weld the seat ring to the cage using minimal heat. Two welds, 6 mm (1/4-inch) long and 180 degrees apart, are required. Install the seat ring seal ring (key 6) so that its open side faces the valve stem for Cavitrol III trim and flow-down standard cages. Reverse the seal ring for Whisper Trim III, WhisperFlo, and flow-up standard cages. Lubricate the seal ring with a general-purpose, lithium-base lubricant, and place it over the bottom end of the seat ring. Start the ring in the groove on one side of the seat ring, and gently work it over the seat ring.

For EUD and EWD valves (figure 6) and EUT and EWT valves (figure 7), install the seat ring gasket (key 13).

Temporarily install screws or bolts into the tapped holes in the seat ring (key 9), making sure the seating surface is facing up. Lower the seat ring into the valve body. Remove the temporary screws or bolts.

Secure the seat ring (key 9) with the cap screws (key 49). Tighten the cap screws in a criss-cross pattern to a torque of 39 N•m (29 lbf•ft) for NPS 12 and NPS 16x12 valves and to 92 N•m (68 lbf•ft) for NPS 16 through NPS 24x20 valves.

2. Install a cage gasket (key 11) into the valve. Temporarily install screws or bolts into the tapped holes in the top of the cage assembly (key 3) to help while installing this piece into the valve. Any rotational orientation of the cage or assembly with respect to the valve is acceptable.

For EUT-2 and EWT-2 valves, use care to avoid damaging the seat ring seal ring and cage seating surfaces while handling the heavy parts. To help insert the cage or assembly into the valve, lubricate the outside diameter of the seat ring seal ring with lithium grease.

3. Slide the valve plug (key 2) and stem assembly into the cage.

For valves with a seal ring, make sure the valve plug seal ring (key 28) is evenly engaged in the entrance chamfer at the top of the cage or cage assembly to avoid damaging the ring.

For valves with piston rings, make sure the rings are fully engaged into the piston ring groove and flush with the outside diameter of the plug.

4. Install the bonnet gasket (key 10).

CAUTION

If the packing is to be reused and was not removed from the bonnet, use care when installing the bonnet to avoid damaging the packing with the valve stem threads.

5. Mount the bonnet on the valve, and complete assembly according to steps 15 through 19 of the Replacing Packing section, omitting steps 16 and 17 if new packing is not being installed and being sure to observe the note before step 15.

Figure 6. Typical Fisher EUD Valve

Figure 8. Fisher EUD and EWD with Bore Seal Trim

Retrofit: Installing Bore Seal Trim

Note

Additional actuator thrust is required for a valve with Bore Seal trim. When installing Bore Seal trim in an existing valve, contact your [Emerson sales office](#) or Local Business Partner for assistance in determining new actuator thrust requirements.

Assemble the new valve plug/retainer assembly (with Bore Seal plug seal) using the following instructions:

CAUTION

To avoid leakage when the valve is returned to service, use appropriate methods and materials to protect all sealing surfaces of the new trim parts while assembling the individual parts and during installation in the valve body.

1. Apply a suitable high-temperature lubricant to the inside diameter of the Bore Seal plug seal. Also, lubricate the outside diameter of the valve plug where the Bore Seal plug seal must be pressed into the proper sealing position (figure 8).
2. Orient the Bore Seal plug seal for correct sealing action based on the process fluid flow direction through the valve.
 - The open interior of the Bore Seal plug seal must face up in a valve with flow-up construction (figure 8).
 - The open interior of the Bore Seal plug seal must face down in a valve with flow-down construction (figure 8).
3. Place the Bore Seal plug seal over the top of the valve plug. The retainer will help guide the Bore Seal down onto the plug (figure 8). Do not force the Bore Seal over the plug. For flow down constructions, skip to step 5.
4. An installation tool (see table 5) must be inserted into the Bore Seal prior to using the retainer to guide it down the plug.

19.75	(1)								n/a

1. For sizes, contact your Emerson sales office.

5. Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the Bore Seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench. For flow down constructions, skip to step 7.
6. Remove the retainer and then the installation tool. Place the Bore Seal retainer back onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
7. Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place (figure 10) to secure the Bore Seal retainer.
8. Install the new plug/retainer assembly with Bore Seal on the new stem following the appropriate instructions in the Trim Replacement section of this manual.
9. Install piston rings by following instructions in the Trim Replacement section of this manual.
10. Remove the existing valve actuator and bonnet following the appropriate instructions in the Replacing Packing section of this manual.

CAUTION

Do not remove the existing valve stem from the valve plug unless you are planning to replace the valve stem.

Never reuse an old valve stem with a new plug or reinstall a valve stem after it has been removed. Replacing a valve stem requires drilling a new pin hole in the stem. This drilling weakens the stem and may cause failure in service. However, a used valve plug may be reused with a new valve stem.

11. Remove the existing valve stem and plug, cage, and seat ring from the valve body following the appropriate instructions in the Trim Removal section of this manual.
12. Replace all gaskets according to appropriate instructions in the Trim Replacement section of this manual.
13. Install the new seat ring, cage, valve plug/retainer assembly, and stem into the valve body and completely reassemble the valve package following the appropriate instructions in the Trim Replacement section of this manual.

CAUTION

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the Bore Seal and contact the seat ring. You can correctly seat the valve plug by using the same force calculated for full load when sizing your actuator. With no pressure drop across the valve, this force will adequately drive the valve plug to the seat ring, thus giving the Bore Seal a predetermined permanent set.

With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

Replacement of Installed Bore Seal Trim

Trim Removal (Bore Seal Constructions)

1. Remove the valve actuator and bonnet following the appropriate instructions in the Replacing Packing section of this manual.

CAUTION

To avoid leakage when the valve is returned to service, use appropriate methods and materials to protect all sealing surfaces of the trim parts during maintenance.

Use caution when removing piston ring(s) and the Bore Seal to avoid scratching any sealing surface.

CAUTION

Do not remove the valve stem from the plug/retainer assembly unless you are planning to replace the valve stem.

Never reuse an old valve stem with a new plug or reinstall a valve stem after it has been removed. Replacing a valve stem requires drilling a new pin hole in the stem. This drilling weakens the stem and may cause failure in service. However, a used valve plug may be reused with a new valve stem.

2. Remove the plug/retainer assembly (with Bore Seal), cage, and seat ring from the valve body following the appropriate instructions in the Trim Removal section of this manual.
3. Locate the staked thread on top of the valve plug (figure 10). The staked thread secures the retainer. Use a drill with a 1/8 inch bit to drill out the staked area of the thread. Drill approximately 1/8 inch into the metal to remove the staking.

Figure 10. Stake the Threads of the Bore Seal Retainer

4. Locate the break between sections of the piston ring(s). Using an appropriate tool such as a flat-blade screwdriver, carefully pry out the piston ring from the groove in the Bore Seal retainer.
5. After removing the piston ring, locate the 1/4-inch diameter hole in the groove.
6. Select an appropriate tool such as a punch and place the tip of the tool into the hole with the body of the tool held tangent to the outside diameter of the retainer. Strike the tool with a hammer to rotate the retainer and free it from the valve plug. Remove the retainer from the plug.
7. Use an appropriate tool such as a flat-blade screwdriver to pry the Bore Seal plug seal off the plug. Use caution to avoid scratches or other damage to the sealing surfaces where the Bore Seal plug seal makes contact with the valve plug (figure 11).
8. Inspect the lower seating surface where the valve plug contacts the seat ring for wear or damage which would prevent proper operation of the valve. Also, inspect the upper seating surface inside the cage where the Bore Seal plug seal contacts the cage, and inspect the sealing surface where the Bore Seal plug seal makes contact with the plug (figure 11).
9. Replace or repair trim parts according to the following procedure for lapping metal seats, remachining metal seats, or other valve plug maintenance procedures as appropriate.

Lapping Metal Seats (Bore Seal Constructions)

Before installing a new Bore Seal plug seal, lap the lower seating surface (valve plug to seat ring, figure 11) following appropriate procedures in the Lapping Seats section of this manual.

Remachining Metal Seats (Bore Seal Constructions)

A valve plug with a Bore Seal metal plug seal features two seating surfaces. One seating surface is found where the valve plug contacts the seat ring. The second seating surface is found where the Bore Seal contacts the upper seating surface in the cage. The cage does not require any machining, even when the plug and / or seat ring have been machined.

Figure 11. Lower (Valve Plug to Seat Ring) and Upper (Bore Seal to Cage) Seating Surfaces

Trim Replacement (Bore Seal Constructions)

1. Apply a suitable high-temperature lubricant to the inside diameter of the Bore Seal plug seal. Also, lubricate the outside diameter of the valve plug where the Bore Seal plug seal must be pressed into the proper sealing position (figure 8).
2. Orient the Bore Seal plug seal for correct sealing action based on the process fluid flow direction through the valve.
 - The open interior of the Bore Seal plug seal must face up in a valve with flow-up construction (figure 8).
 - The open interior of the Bore Seal plug seal must face down in a valve with flow-down construction (figure 8).
3. Place the Bore Seal plug seal over the top of the valve plug. The retainer will help guide the Bore Seal down onto the plug. Do not force the Bore Seal over the plug. For flow down constructions, skip to step 5.
4. An installation tool (see table 5) must be inserted into the Bore Seal prior to using the retainer to guide it down the plug.
5. Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the Bore Seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench. For flow down constructions, skip to step 7.
6. Remove the retainer and then the installation tool. Place the Bore Seal retainer back onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
7. Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place (figure 10) to secure the Bore Seal retainer.
8. Replace the piston ring(s) following instructions in the Trim Replacement section of this manual.
9. Return the seat ring, cage, plug/retainer assembly, and stem to the valve body and completely reassemble the valve package following the appropriate instructions in the Trim Replacement section of this manual.

CAUTION

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the Bore Seal and contact the seat ring. You can correctly seat the valve plug by using the same force calculated for full load when sizing your actuator. With no pressure drop across the valve, this force will adequately drive the valve plug to the seat ring, thus giving the Bore Seal a predetermined permanent set.

With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

Figure 12. Typical Fisher WhisperFlo Trims

Parts Ordering

Each body-bonnet assembly is assigned a serial number, which can be found on the valve. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Refer to the serial number when contacting your [Emerson sales office](#) or Local Business Partner for technical assistance. When ordering replacement parts, refer to the serial number and to the key number and part name from the following list. Specify the desired material, if known. Part numbers are shown for packing box parts. Specify the part number if you are ordering packing parts.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual includes installation, maintenance and parts information for Fisher NPS 4x2 through 12x8 EWD, EWS and EWT valves (Figure 1). Refer to separate manuals for instructions covering the actuator and accessories.

WARNING

Do not install, operate or maintain an EW valve without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Flow Characteristics	WhisperFlo Aerodynamic Trim Pressure Ratings ^(1,2)
Standard Cages: ■ Linear, ■ quick opening or ■ equal percentage Whisper Trim™ and Cavitrol™ Cages: Linear WhisperFlo Trim: Linear (restricted linear cages and special, characterized cages are available—consult your Emerson sales office)	Up to 1500 psi drop
Flow Directions	WhisperFlo Velocity Limits
EWS and Standard Cage: Normally up EWD or EWT with Standard Cage: Normally down Whisper Trim Cages: Always up Cavitrol Cages: Always down WhisperFlo Trim: Flow up (standard)—through the seat ring and out through the cage orifices	WhisperFlo trim is designed for 0.3 MACH as an inherent outlet velocity limit. Variations higher and lower may be applied per special applications
	WhisperFlo Rangeability
	100:1
	WhisperFlo Noise Attenuation
	Approximately -40 dBA maximum depending on the $\Delta P/P_1$ ratio per IEC 534-8-3 calculation procedure. See Fisher Specification Manager.
	Additional Specifications
	For specifications such as materials, port diameters, valve plug travels, yoke boss diameters and stem diameters, refer to the Parts List.
1. The pressure or temperature limits in this manual and any applicable standard limitations should not be exceeded. 2. Certain bonnet bolting material selections may require a CL600 easy-e valve assembly to be derated. Contact your Emerson sales office. 3. There are two different CL900 NPS 8x6 valve bodies, one for use only with Cavitrol III cages and the other for use with all other constructions. A CL900 valve with Cavitrol III cage can take full CL900 pressure drops. For information on other NPS 8x6 constructions that can take full CL900 pressure drops, contact your Emerson sales office. All other trim constructions are limited to CL600 pressure/temperature limits even though installed in a CL900 valve.	

Figure 2. Cutaway Detail of the Fisher WhisperFlo Trim, Valve Body Typical

W6825-1

1.2 Description

These single-port globe-style valves have cage guiding, clamped seat rings and push-down-to-close valve plug action. Valve configurations are as follows:

EWD: Balanced valve plug with metal-to-metal seating for all general applications over a wide range of pressure drops and temperatures.

C-seal trim is available for EWD valves, CL300 and CL600, in sizes NPS 6x4x2-1/2, 6x4, 8x4, 8x6, 12x6, 10x8 and 12x8.

With C-seal trim, a balanced valve can achieve high-temperature, Class V shutoff. Because the C-seal plug seal is formed from metal (N07718 nickel alloy) rather than an elastomer, a valve equipped with the C-seal trim can be applied in processes with a fluid temperature of up to 593°C / 1100°F, provided other material limits are not exceeded.

EWS: Unbalanced valve plug with metal-to-metal or optional metal-to-PTFE seating for all general applications requiring better shutoff capabilities than can be obtained with the EWD valve.

EWT: Balanced valve plug with either metal-to-PTFE seating (standard for all except Cavitrol III cages) for stringent shutoff requirements or metal-to-metal seating (standard for Cavitrol III cages, optional for all others) for higher temperatures.

Control valves with WhisperFlo cages (Figure 2) provide additional attenuation for aerodynamic noise in very demanding vapor or gas applications with high-pressure drops. A WhisperFlo cage with an appropriately sized valve body is designed to reduce the noise level up to -40 dBA. For special applications, -50 dBA attenuation can be achieved.

1.3 Specifications

Typical specifications for these valves are shown in Table 1.

Table 2. Shutoff Classification Per ANSI/FCI 70-2 and IEC 60534-4

Valve	Seating	Shutoff Class
EWD	Metal	II (standard)
		III (optional for NPS 6x4 through 12x6 valves with optional single graphite piston ring or for NPS 10x8 and 12x8 valves with optional double piston rings)
		IV (optional for NPS 6x4 through 12x8 valves with optional multiple graphite piston rings)
EWS	Metal	IV (standard)
		V (optional, consult your Emerson sales office)
EWS	PTFE	VI
EWT with all except Cavitrol III cages	PTFE	Standard Air Test (maximum leakage is 0.05 mL/min/psid/inch port diameter)
		V (optional)
	Metal	IV (standard)
	Metal	V (optional) ⁽¹⁾
EWT with 1-stage Cavitrol III cage	Metal	IV (standard)
		V (optional)
EWT with 2-stage Cavitrol III cage	Metal	V

1. Class V shutoff for EWT requires spring loaded seal ring, radius-seat plug, wide-bevel seat ring and seat lapping. Not available with 8-in. port, quick-opening cage. Not available with S31600 (316 SST) valve plug and seat ring.

Table 3. Additional Shutoff Classification for C-seal Trim Per ANSI/FCI 70-2 and IEC 60534-4

Valve	Valve Size, NPS	Port Diameter, in.	Cage Style	Leakage Class
EWD (CL300, CL600)	6x4x2-1/2	2.875	Equal Percentage, Linear, Whisper I, Cavitrol III (2-stage)	V (for port diameters from 2.875 through 8-in. with optional C-seal trim)
	6x4 8x4	4.375	Equal Percentage, Linear, Whisper I, Cavitrol III (1-stage)	
	8x6 and 12x6	5.375	Whisper III (A3, B3, D3, D3), Cavitrol III (2-stage)	
	8x6 12x6	7	Equal Percentage, Linear, Whisper I, Cavitrol III (1-stage)	
	10x8 12x8	8	Equal Percentage, Linear, Whisper I, Cavitrol III (1-stage)

Section 2: Installation

WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in Table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

Table 4. Approximate Weights

END CONNECTION		VALVE SIZE, NPS													
		4X2		6X4		8X4		8X6		10X8		12X6		12X8	
		Kg	Lb	Kg	Lb	Kg	Lb	Kg	Lb	Kg	Lb	Kg	Lb	Kg	Lb

	Buttwelding	61	135	122	270	177	390	272	600	512	1130	526	1160	658	1450
CL900	Flanged	---	---	---	---	---	---	612	1350	---	---	---	---	1361	3000
	Buttwelding	---	---	---	---	---	---	454	1000	---	---	---	---	1293	2850

NOTICE

To avoid product damage, inspect the valve before installation for any damage or any foreign material that may have collected in the valve body. Also remove any pipe scale, welding slag or other foreign material from the pipeline.

1. Before installing the valve, inspect the valve body cavity and associated equipment for any damage and any foreign material.
2. Make certain the valve body interior is clean, that pipelines are free of foreign material and that the valve is oriented so that pipeline flow is in the same direction as the arrow on the side of the valve.
3. Install the control valve assembly in any orientation unless limited by seismic criteria. However, the normal method is with the actuator vertical above the valve. Other positions may result in uneven valve plug and cage wear and in improper operation. With some valves, the actuator may also need to be supported when it is not vertical. For more information, consult your Emerson sales office.

NOTE

If installing a valve with small internal flow passages, such as with WhisperFlo, Whisper Trim or Cavitrol cages, consider installing an upstream strainer to prevent the lodging of particles in these passages. This is especially important if the pipeline cannot be thoroughly cleaned or if the flowing medium is not clean.

4. Use accepted piping and welding practices when installing the valve in the line. For flanged valve bodies, use a suitable gasket between the valve body and pipeline flanges.

NOTICE

Depending on valve body materials used, post weld heat treating may be required. If so, damage to internal elastomeric and plastic parts, as well as internal metal parts is possible. Shrink-fit pieces and threaded connections may also loosen. In general, if post weld heat treating is to be performed, remove all trim parts. Contact your Emerson sales office for additional information.

5. With a leak-off bonnet construction, remove the pipe plugs (keys 14 and 16, Figure 21) from the bonnet to hook up the leak-off piping. If continuous operation is required during inspection or maintenance, install a three-valve bypass around the control valve assembly.
6. If the actuator and valve are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.

**WARNING**

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Valves with ENVIRO-SEAL live-loaded packing or HIGH-SEAL live-loaded packing will not require this initial re-adjustment. See Fisher instruction manuals, ENVIRO-SEAL Packing System for Sliding-Stem Valves, [D101642X012](#) or HIGH-SEAL Live-Loaded Packing System, [D101453X012](#), (as appropriate), for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the parts kit sub-section near the end of this manual.

2.1 Lifting Valve Assembly

WARNING

Failure to follow these lifting guidelines and accepted lifting and rigging practices could result in property damage and personal injury or death.

All lifting and rigging must be completed in accordance with federal/national/provincial, state and local regulations and applicable lifting and rigging equipment standards. Only personnel trained in proper lifting and rigging practices shall perform valve/actuator assembly lifting, rigging and installation. Because each lift will be unique, the method of lifting the valve assembly, the correct location for attaching and lifting the valve assembly and what the valve assembly will do when lifted shall be considered for each lift.

Lifting and rigging equipment used to lift, install or remove a valve assembly or component must be properly selected and sized for the weight and configuration of the valve assembly or component being lifted. The weight of the complete valve assembly, including attached accessories, must be taken in consideration for this purpose. The lifting and rigging equipment must be properly maintained and inspected for damage before each use.

If the valve is supplied with an actuator or handwheel, do not use the actuator or handwheel to lift the complete valve assembly. Lifting lugs attached to the actuator must not be used to lift the complete valve assembly unless clearly marked as being rated to support the complete valve assembly weight.

Lifting lugs or other lifting equipment attached to the valve or actuator must never be used to lift or support the weight of attached piping.

NOTICE

Care must be taken when lifting the valve/actuator assembly to ensure all accessories and tubing are not damaged in the process. Accessories and tubing may need to be removed prior to lifting to prevent damage and properly reinstalled before use. Protect valve flange faces, butt weld ends and other connection surfaces from damage during lifting.

Remove the valve/actuator assembly from its shipping container with appropriate lifting and rigging equipment for the valve/actuator assembly weight and configuration to be lifted. The valve and bonnet assembly weight is provided in Table 4. Consult the appropriate actuator and valve accessory instruction manuals for the weight of each additional component, then determine the total weight of the complete valve assembly. The location of the valve/actuator assemblies center of gravity must be considered during lifting, installation and removal. Additional slings or other lifting equipment, such as a load leveler, may be necessary to prevent toppling of the equipment during lifting or to rotate the valve assembly into a different orientation for installation.

2.2 Inverted Globe Valve Applications (Actuator Below Valve)

Due to space restrictions in your application, you may be required to mount the valve/actuator assembly in an inverted orientation, with the actuator positioned below the valve. If so, the following procedures will help you with disassembly and assembly techniques.

WARNING

Avoid personal injury or property damage caused by components dropping.

With the valve/actuator upside down, components may drop during disassembly or assembly. Be careful not to position yourself below the valve in the path of falling parts.

As the bonnet/plug/cage is lowered from the valve body, the center of gravity will be above the lifting points. Take care to prevent the assembly from tipping over as it is lowered. Either leave the actuator attached to the plug and bonnet, attach straps to the stem or provide other means to prevent tipping.

Disassembly

1. Provide adequate support to the actuator while removing it from the bonnet.
2. Provide adequate support to the bonnet while removing the bonnet nuts.
3. Be aware that the bonnet/plug/cage may tip over as they are lowered from the valve body. Make provision to prevent tipping.
4. Be aware that the cage and seat ring may not come out with the bonnet and plug/stem assembly. If this occurs, make provision to support these parts, as they may fall out unexpectedly.

Assembly

1. Start this assembly procedure with the plug/stem assembly already installed in the bonnet.
2. Put the gaskets and cage onto the bonnet and plug.
3. Place the seat ring with the seat ring gasket onto the cage, if applicable with the valve design.
4. Raise this bonnet/plug/cage assembly up into the valve body. Make provision to prevent tipping of these parts as they are being raised into the valve body.
5. Torque the bonnet nuts.
6. Mount the actuator.

Section 3: Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing lubrication, packing maintenance, trim maintenance and ENVIRO-SEAL bellows seal bonnet replacement. All maintenance operations may be performed with the valve in the line.

WARNING

Avoid personal injury or property damage from sudden release of process pressure. Before performing any maintenance operations:

- **Do not remove the actuator from the valve while the valve is still pressurized.**
- **Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.**
- **Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open the valve.**
- **Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.**
- **Vent the pneumatic actuator loading pressure and relieve any actuator spring precompression.**
- **Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.**
- **The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings or when loosening the packing box pipe plug.**
- **Check with your process or safety engineer for any additional measures that must be taken to protect against process media.**

NOTICE

Follow instructions carefully to avoid damaging the product surfaces, which could result in damage to the product.

NOTE

Whenever a gasket seal is disturbed by removing or shifting gasketed parts, install a new gasket upon reassembly. This is necessary to ensure a good gasket seal because the used gasket may not seal properly.

Figure 3. Lubricator and Lubricator/Isolating Valve (Optional)

3.1 Packing Lubrication

NOTE

Do not lubricate graphite packing. Graphite packing is self-lubricated. Additional lubrication may result in slip-stick movement of the valve.

NOTE

ENVIRO-SEAL or HIGH-SEAL packing does not require lubrication.

WARNING

To avoid personal injury or property damage resulting from fire or explosion, do not lubricate packing used in oxygen service or in processes with temperatures over 260°C / 500°F.

If a lubricator or lubricator/isolating valve (Figure 3) is provided for PTFE/composition or other packings that require lubrication, it will be installed in place of the pipe plug (key 14, Figure 21). Use a good quality silicon-base lubricant. Do not lubricate packing used in oxygen service or in processes with temperatures over 260°C / 500°F. To operate the lubricator, simply turn the cap screw clockwise to force the lubricant into the packing box. The lubricator/isolating valve operates the same way, except open the isolating valve before turning the cap screw and then close the isolating valve after lubrication is completed.

3.2 Packing Maintenance

NOTE

For valves with ENVIRO-SEAL live-loaded packing, see the Fisher instruction manual, ENVIRO-SEAL Packing System for Sliding-Stem Valves, [D101642X012](#), for packing instructions. For valves with HIGH-SEAL live-loaded packing, see the Fisher instruction manual, HIGH-SEAL Live-Loaded Packing System, [D101453X012](#), for packing instructions.

Key numbers refer to Figure 4 for PTFE V-ring packing and to Figure 5 for PTFE/composition packing, unless otherwise indicated.

For spring-loaded single PTFE V-ring packing, the spring (key 8, Figure 4) maintains a sealing force on the packing. If leakage is noted around the packing follower (key 13, Figure 4), check to be sure the shoulder on the packing follower is touching the bonnet. If the shoulder is not touching the bonnet, tighten the packing flange nuts (key 5, Figure 21) until the shoulder is against the bonnet. If leakage cannot be stopped in this manner, go to the Replacing Packing procedure.

Figure 5. Detail of PTFE/Composition Packing Arrangements

12A8188-A
12A7815-A
12A8173-A
A2619-1

If there is undesirable packing leakage with other than spring-loaded packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts.

If the packing is relatively new and tight on the stem and if tightening the packing flange nuts does not stop the leakage, the valve stem may be worn or nicked so that a seal cannot be made. The surface finish of a new valve stem is critical for making a good packing seal. If the leakage comes from the outside diameter of the packing, the leakage may be caused by nicks or scratches around the packing box wall. If performing any of the following procedures, inspect the valve stem and packing box wall for nicks and scratches.

Replacing Packing

WARNING

Avoid personal injury or property damage from sudden release of process pressure. Before performing any maintenance operations:

- **Do not remove the actuator from the valve while the valve is still pressurized.**
- **Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.**
- **Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.**
- **Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.**
- **Vent the pneumatic actuator loading pressure and relieve any actuator spring precompression.**
- **Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.**
- **The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings or when loosening the packing box pipe plug.**
- **Check with your process or safety engineer for any additional measures that must be taken to protect against process media.**

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator and release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Disconnect the operating lines from the actuator and any leak-off piping from the bonnet. Disconnect the stem connector and then remove the actuator from the valve by unscrewing the yoke locknut (key 15, Figure 21) or the hex nuts (key 26, Figure 21).
3. Loosen the packing flange nuts (key 5, Figure 21) so that the packing is not tight on the valve stem. Remove any travel indicator parts and stem locknuts from the valve stem threads.

WARNING

To avoid personal injury or property damage caused by uncontrolled movement of the bonnet, loosen the bonnet by following the instructions in the next step. Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet.

NOTE

The following step also helps to provide additional assurance that the valve body fluid pressure has been relieved.

4. Hex nuts (key 16, Figure 22, 23 or 24) attach the bonnet (key 1, Figure 21) to the valve body (key 1, Figure 22, 23 or 24). Loosen these nuts approximately 3 mm / 1/8 in. Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and valve body. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, proceed with bonnet removal as described in the following steps.

NOTICE

To avoid damage to the seating surface caused by the valve plug and stem assembly dropping from the bonnet after being lifted part way out, temporarily install a valve stem locknut on the valve stem when lifting the bonnet. The locknut prevents the valve plug and stem assembly from dropping out of the bonnet.

5. Completely remove the hex nuts (key 16) and carefully lift the bonnet off the valve body.
6. Remove the locknut and separate the valve plug and stem from the bonnet. Set the parts on a protective surface to prevent damage to gasket or seating surfaces.
7. Remove the bonnet gasket (key 10, Figures 22 through 24) and cover the opening in the valve body to protect the gasket surface and prevent foreign material from getting into the valve body cavity.
8. Remove the packing flange nuts, packing flange, upper wiper and packing follower (keys 5, 3, 12 and 13, Figure 21). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall. Clean the packing box and the metal packing parts.
9. Inspect the valve stem threads and packing box surfaces for any sharp edges that might cut the packing. Scratches or burrs could cause packing box leakage or damage to the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts by following the appropriate steps in the Trim Maintenance procedure.
10. Remove the covering protecting the valve cavity and install a new bonnet gasket (key 10, Figures 22 through 24), making sure the gasket seating surfaces are clean and smooth. Place the stem and valve plug into the valve body and slide the bonnet over the stem and onto the stud bolts (key 15, Figure 22, 23 or 24).

Figure 6. Detail of Graphite Ribbon/Filament Packing

SINGLE ARRANGEMENTS

DOUBLE ARRANGEMENTS

A6067

NOTE:

1. 0.102 mm / 0.004 in. THICK SACRIFICIAL ZINC WASHERS; USE ONLY ONE BELOW EACH GRAPHITE RIBBON RING.

NOTE

Proper performance of the tightening procedures in step 11 compresses the spiral wound gasket (key 12, Figures 22 through 23) or load ring (key 26, Figure 24) enough to both load and seal the seat ring gasket (key 13, Figure 22, 23 or 24). It also compresses the outer edge of the bonnet gasket (key 10, Figures 22 through 24) enough to seal the body-to-bonnet joint.

The proper bolting procedures in step 11 include—but are not limited to—ensuring that bolting threads are clean and evenly tightening the nuts onto the studs in a criss-cross pattern. Because of the bolt-up characteristics of spiral wound gaskets, tightening one nut may loosen an adjacent nut. Repeat the criss-cross tightening pattern several times until each nut is tight and the body-to-bonnet seal is made.

NOTE

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

**WARNING**

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

11. Lubricate the bolting (not necessary if factory pre-lubricated stud bolt nuts are used) and install it, using proper bolting procedures during tightening so that the body-to-bonnet joint will withstand test pressures and application service conditions. Use the bolt torques in Table 5 as guidelines.
12. Install new packing and the metal packing box parts according to the appropriate arrangement in Figure 4, 5 or 6. Place a smooth-edged pipe over the valve stem and gently tap each soft packing part into the packing box.
13. Slide the packing follower, upper wiper and packing flange (keys 13, 12 and 3, Figure 21) into position. Lubricate the packing flange studs (key 4, Figure 21) and the faces of the packing flange nuts (key 5, Figure 21). Install the packing flange nuts.

14. For spring-loaded PTFE V-ring packing, tighten the packing flange nuts until the shoulder on the packing follower (key 13, Figure 21) contacts the bonnet.
For graphite packing, tighten the packing flange nuts to the maximum recommended torque shown in Table 6.
Then, loosen the packing flange nuts and retighten them to the recommended minimum torque shown in Table 6.
For ENVIRO-SEAL or HIGH-SEAL live-loaded packing, refer to the note at the beginning of the Packing Maintenance section.
For other packing types, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in table. Then, tighten the remaining flange nuts until the packing flange is level and at a 90-degree angle to the valve stem.
15. Mount the actuator on the valve assembly and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual.

3.3 Trim Maintenance

WARNING

Avoid personal injury or property damage from sudden release of process pressure. Before performing any maintenance operations:

- **Do not remove the actuator from the valve while the valve is still pressurized.**
- **Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.**
- **Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open the valve.**
- **Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.**
- **Vent the pneumatic actuator loading pressure and relieve any actuator spring precompression.**
- **Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.**
- **The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings or when loosening the packing box pipe plug.**
- **Check with your process or safety engineer for any additional measures that must be taken to protect against process media.**

Table 5. Body-to-Bonnet Bolt Torque Guidelines Using Anti-Seize Lubricant⁽²⁾

31.8		CL600	49	437	74	655	24	209	36	314

1. Lubricate with anti-seize compound.

NOTICE

In the following applicable procedures, to avoid damaging parts, do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

For C-seal construction, see the appropriate C-seal sections in this instruction manual.

Except where indicated, key numbers in this section are referenced in Figure 22 for EWD constructions, Figure 22 for restricted trim detail, Figure 23 for EWS constructions and Figure 24 for EWT constructions. Refer to Figures 26 and 27 for Cavitrol III, Figure 28 for Whisper Trim III and Whisper NXG trim detail and Figure 29 for WhisperFlo construction.

Trim Removal

1. Remove the actuator and the bonnet according to steps 1 through 5 of the Replacing Packing procedure.

NOTICE

When lifting the valve plug stem (key 7) and attached valve plug (key 2) out of the valve, be certain that the cage (key 3) remains in the valve (key 1). This will prevent cage damage that might be caused by the cage dropping back into the valve after being lifted part way out.

Use care to avoid damaging gasket sealing surfaces. Any damage to the gasket sealing surfaces could cause the valve to leak.

Each graphite piston ring (key 6) in an EWD valve is brittle and in two pieces. Use care to avoid damage to the piston ring(s) caused by dropping or rough handling.

The surface finish of the valve stem (key 7) is critical for making a good packing seal. The inside surface of the cage or cage/baffle assembly (key 3) or cage retainer (key 31) is critical for smooth operation of the valve plug and for making a seal with the piston ring (key 6) or seal ring (key 28). The seating surfaces of the valve plug (key 2) and the seat ring (key 9) on a metal-seat construction are critical for tight shutoff. Protect these parts accordingly while disassembling the trim.

2. Remove the packing flange nuts, packing flange, upper wiper and packing follower (keys 5, 3, 24 and 25, Figure 21). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall. Clean the packing box and the metal packing parts.
3. Inspect the valve stem threads and packing box surfaces for any sharp edges which might cut the packing. Scratches or burrs could cause packing box leakage or damage to the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts.
4. Remove the load ring (key 26) from an NPS 10x8 or 12x8 valve or the cage adaptor (key 4) from any restricted-trim valve through NPS 8x4 and wrap it for protection.
5. On a 102 mm / 4-in. travel valve with Whisper Trim I cage or on any NPS 8x6 or 12x6 valve with Whisper Trim III cage, remove the bonnet spacer (key 32) and bonnet gasket (key 10) on top of the spacer. Then on any construction with a cage retainer (key 31), remove the cage retainer and its associated gaskets. A Whisper Trim III cage retainer has two 3/8-in - 16 UNC tappings in which screws or bolts can be installed for lifting.
6. Remove the cage or cage/baffle assembly (key 3) and the associated gaskets (keys 10, 11 and 12). With full-capacity constructions that have FGM gasket sets, a shim (key 53) is used instead of the cage gasket (key 11). If the cage is stuck in the valve, use a rubber mallet to strike the exposed portion of the cage at several points around its circumference.

Figure 7. TSO (Tight Shutoff Trim), Detail of Protected Soft Seat

A7088

7. For constructions other than TSO (tight shutoff trim), remove the seat ring (key 9) or disk seat (key 22), seat ring gasket (key 13) and the seat ring adaptor (key 5) and adaptor gasket (key 14) where used in a restricted-capacity construction. EWS and EWT PTFE-seat constructions use a disk (key 23) sandwiched between the disk seat and disk retainer (key 21). A CL900 NPS 8x6 EWT construction with Cavitrol III cage has its spiral wound gasket (key 12) on the side of the seat ring opposite the seat ring gasket.
8. For TSO (tight shutoff trim) constructions, perform the following steps (refer to Figures 7 and 8):
 - Remove the piston ring, anti-extrusion rings, backup ring and retainer.
 - Remove the set screws that lock the outer plug to the inner plug.
 - Using a strap wrench or similar tool, unscrew the outer plug from the inner plug. Do not damage the outer plug guide surfaces.
 - Remove the protected soft seat seal.
 - Inspect the parts for damage and replace if needed.
9. For all constructions, inspect parts for wear or damage that would prevent proper operation of the valve. Replace or repair trim parts according to the following procedures for lapping metal seats or other valve plug maintenance procedures, as appropriate.

Lapping Metal Seats

NOTICE

To avoid damaging the ENVIRO-SEAL bellows seal bonnet assembly, do not attempt to lap the metal seating surfaces. The design of the assembly prevents rotation of the stem and any forced rotation will damage internal components of the ENVIRO-SEAL bellows seal bonnet.

Figure 8. Typical Balanced TSO Trim

A7096

Except with respect to the ENVIRO-SEAL Bellows Seal Bonnet assembly, with metal seat constructions, seating surfaces of the valve plug and seat ring (keys 2 and 9, Figures 24 through 26) can be lapped for improved shutoff. (Deep nicks should be machined out rather than ground out.) Use a good quality lapping compound of a mixture of 280 to 600-grit. Apply the compound to the bottom of the valve plug.

Assemble the valve to the extent that the cage (and cage retainer and bonnet spacer, if used) is in place and the bonnet is bolted to the valve. A simple handle can be made from a piece of strap iron locked to the valve plug stem with nuts. Rotate the handle alternately in each direction to lap the seats. After lapping, remove the bonnet and clean the seat surfaces. Completely assemble the valve as described in the Trim Replacement portion of the Trim Maintenance section and test the valve for shutoff. Repeat the lapping procedure if leakage is still excessive.

Valve Plug Maintenance

Except where indicated, key numbers in this section are referenced in Figure 22 for EWD valve plugs, Figure 23 for EWS valve plugs and Figure 24 for EWT valve plugs.

NOTICE

If replacing the piston ring (key 6) or seal ring (key 28), be careful not to scratch the surfaces of the ring groove in the valve plug or any of the surfaces of the replacement ring or the replacement ring may not seal properly.

1. With the valve plug (key 2) removed, according to the Trim Removal section, proceed as appropriate:

For the EWD carbon-filled PTFE piston ring, the ring is split in one place. If there is visible damage, spread the ring slightly and remove it from the groove in the valve plug. To install a carbon-filled PTFE piston ring, spread the ring apart slightly at the split and install it over the stem and into the groove in the valve plug. The open side must face along the stem, depending on flow direction, as shown in Figure 22.

For each EWD graphite piston ring, the ring can be easily removed since it is in two pieces. A new graphite piston ring is furnished as a complete ring. Use a vise with smooth or taped jaws to break this replacement ring into halves. Place the new ring in the vise so that the jaws will compress the ring into an oval. Slowly compress the ring until it snaps on both sides. If one side snaps first, do not try to tear or cut the other side. Instead, keep compressing the ring until the other side snaps. Be sure to match the broken ends when installing the ring in the valve plug groove.

For the EWT two-piece seal ring, the ring cannot be reused as it is a closed ring, which must be pried and/or cut from the groove. Then the elastomeric backup ring (key 29) can be spread slightly and removed.

To install a new two-piece seal ring, apply a general purpose silicone-base lubricant to both the backup ring and seal ring (keys 29 and 28). Place the backup ring over the stem (key 7) and into the groove. Place the seal ring over the top edge of the valve plug (key 2) so that it enters the groove on one side of the valve plug. Slowly and gently stretch the seal ring and work it over the top edge of the valve plug. The PTFE material in the seal ring must be permitted time to cold-flow during the stretching procedure; so avoid jerking sharply on this ring. Stretching the seal ring over the valve plug may make it seem unduly loose when in the groove, but it will contract to its original size after insertion into the cage.

For the EWT spring-loaded seal ring, the ring used on a valve plug having a 136.5 mm / 5.375 in. or less port diameter may be removed undamaged by first working the retaining ring (key 27) off with a screwdriver. Then carefully slide the metal backup ring (key 29) and seal ring (key 28) off the valve plug (key 2). The spring-loaded seal ring used on a valve plug having a 178 mm / 7-in. or greater port diameter must be carefully pried and/or cut from its groove. Therefore, it cannot be reused.

A spring-loaded seal ring must be installed so that its open side faces toward either the top or the bottom of the valve plug, depending on flow direction, as shown in view A of Figure 24. To install a spring-loaded seal ring on a valve plug with a 136.5 mm / 5.375 in. or less port diameter, slide the seal ring (key 28) onto the valve plug followed by the metal backup ring (key 29). Then install the retaining ring (key 27) by inserting one end in the groove and, while turning the plug, press the ring into the groove. Again, be careful not to scratch any surfaces of the ring or plug.

To install the seal ring on a valve plug with 178 mm / 7-in. or greater port diameter, lubricate it with a general purpose silicone-base lubricant. Then gently stretch the seal ring and work it over the top edge of the valve plug. The PTFE material in the seal ring must be permitted time to cold-flow during the stretching procedure; so avoid jerking sharply on the ring. Stretching the seal ring over the valve plug may make it seem unduly loose when in the groove, but it will contract to its original size after insertion into the cage.

NOTICE

Never reuse an old stem or adaptor with a new valve plug. Using an old stem or adaptor with a new plug requires drilling a new pin hole in the stem (or adaptor in case an ENVIRO-SEAL bellows seal bonnet is being used). This drilling weakens the stem or adaptor and may cause failure in service. However, a used valve plug may be reused with a new stem or adaptor except with Cavitrol III trim.

NOTE

The valve plug and valve plug stem for Cavitrol III trim are a matched set and must be ordered together. If the Cavitrol III valve plug or valve plug stem is damaged, replace the entire assembly (key 2, Figures 26 and 27).

2. To replace the valve stem (key 7), drive out the pin (key 8). Unscrew the valve plug from the stem or adaptor.
3. To replace the adaptor (key 24, Figure 21) on ENVIRO-SEAL bellows seal bonnets, place the plug stem assembly and valve plug in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out the pin (key 36, Figure 21). Reverse the plug stem assembly and valve plug in the soft-jaw chuck or vise. Grip the flat areas on the valve stem just below the threads for the actuator/stem connection. Unscrew the valve plug/adaptor assembly (key 24, Figure 21) from the valve stem assembly (key 20, Figure 21).
4. Screw the new stem or adaptor into the valve plug. Tighten to the torque value given in Table 7. Refer to Table 7 to select the proper drill size. Drill through the stem or adaptor, using the hole in the valve plug as a guide. Remove any chips or burrs and drive in a new pin to lock the assembly.
5. For ENVIRO-SEAL bellows seal bonnets, grip the flats of the stem extending out of the top of the bellows shroud with a soft-jaw chuck or other type of vise. Screw the valve plug/adaptor assembly onto the valve stem. Tighten as necessary to align the pin hole in the stem with one of the holes in the adaptor. Secure the adaptor to the stem with a new pin.

Trim Replacement

Except where indicated, key numbers in this section are referenced in Figure 22 for EWD constructions, Figure 22 for restricted trim detail, Figure 23 for EWS construction and Figure 24 for EWT constructions. Refer to Figures 26 and 27 for Cavitrol III, Figure 28 for Whisper Trim III and Whisper NXG trim detail and Figure 29 for WhisperFlo constructions.

1. With a restricted-trim seat ring construction, install the adaptor gasket (key 14) and seat ring adaptor (key 5).
2. Install the seat-ring gasket (key 13), seat ring (key 9) or disk seat (key 22). With a PTFE-seat construction install the disk and disk retainer (keys 21 and 23). With an NPS 8x6 CL900 EWT valve with Cavitrol III cage, install the spiral wound gasket (key 12) on the seat ring.
3. Install the cage or cage/baffle assembly (key 3). Any rotational orientation of the cage or assembly with respect to the valve is acceptable. A Whisper Trim III cage designated by level A3, B3 or C3 may be installed with either end up. The level D3 cage/baffle assembly or Cavitrol III cage assembly, however, must be installed with the hole pattern end next to the seat ring. If a cage retainer (key 31) is to be used, place it on top of the cage.
4. For constructions other than TSO (tight shutoff trim), slide the valve plug (key 2) and stem assembly or valve plug and ENVIRO-SEAL bellows seal assembly into the cage. Make sure the piston ring or seal ring (key 6 or 28) is evenly engaged in the entrance chamfer at the top of the cage (key 3) or cage retainer (key 31) to avoid damaging the ring.
5. For TSO (tight shutoff) trim constructions, perform the following steps (refer to Figures 7 and 8).
 - Thread the outer plug onto the inner plug until the parts seat metal to metal, using a strap wrench or similar tool that will not damage the outer plug guide surfaces.
 - Mark the top of the inner plug and outer plug with alignment marks in the assembled position.

Table 7. Valve Stem to Plug Torque and Pin Replacement Data

VALVE STEM DIAMETER		STEM TORQUE, MINIMUM TO MAXIMUM ⁽¹⁾		DRILL SIZE, in.
mm	in.	N•m	Lbf•ft	
12.7	1/2	81 to 115	60 to 85	1/8
19.1	3/4	237 to 339	175 to 250	3/16
25.4	1	420 to 481	310 to 355	1/4
31.8	1-1/4	827 to 908	610 to 670	1/4

1. Lubricate with anti-seize compound.

- Disassemble the outer plug from the inner plug and install the seal over the inner plug, so that the seal rests below the threaded area.
- Thread the outer plug onto the inner plug and tighten with a strap wrench or similar tool until the alignment marks line up. This will ensure that the plug parts are metal to metal and the seal is compressed properly. Do not damage the outer plug guide surfaces.

- Install set screws centering the inner plug in the outer plug and torque to 11 Nm / 8 lbf•ft.
 - Assemble the piston ring, anti-extrusion rings, backup ring and retainer.
6. For all constructions, place the gaskets (keys 12, 11 or 14 if used and 10) and the shim, if used (key 53), on top of the cage or cage retainer. If there is a cage adaptor (key 4) or a bonnet spacer (key 32), set it on the cage or cage retainer gaskets and place another flat sheet gasket (key 10) on top of the adaptor or spacer. If there is only a cage retainer or bonnet spacer, place another flat sheet gasket on the retainer or spacer.
 7. With an NPS 10x8 or 12x8 valve, install the load ring (key 26).
 8. Mount the bonnet on the valve and complete assembly according to steps 11 through 15 of the Replacing Packing section. Be sure to observe the note prior to step 11.

3.4 Retrofit: Installing C-seal Trim

NOTE

Additional actuator thrust is required for a valve with C-seal trim. When installing C-seal trim in an existing valve, contact your [Emerson sales office](#) for assistance in determining new actuator thrust requirements.

Assemble the new valve plug/retainer assembly (with C-seal plug seal) using the following instructions:

NOTICE

To avoid leakage when the valve is returned to service, use appropriate methods and materials to protect all sealing surfaces of the new trim parts while assembling the individual parts and during installation in the valve body.

1. Apply a suitable high-temperature lubricant to the inside diameter of the C-seal plug seal. Also, lubricate the outside diameter of the valve plug where the C-seal plug seal must be pressed into the proper sealing position (Figure 9).
2. Orient the C-seal plug seal for correct sealing action based on the process fluid flow direction through the valve.
 - The open interior of the C-seal plug seal must face up in a valve with flow-up construction (Figure 9).
 - The open interior of the C-seal plug seal must face down in a valve with flow-down construction (Figure 9).

NOTE

An installation tool must be used to properly position the C-seal plug seal on the valve plug. A tool is available as a spare part from Emerson or a tool could be manufactured following the dimensions given in Figure 10.

3. Place the C-seal plug seal over the top of the valve plug and press the C-seal plug seal onto the plug using the C-seal installation tool. Carefully press the C-seal plug seal onto the plug until the installation tool contacts the horizontal reference surface of the valve plug (Figure 11).
4. Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the C-seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
5. Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place (Figure 12) to secure the C-seal retainer.

Figure 9. Fisher EWD with C-seal Trim

A6790

6. Install the new plug/retainer assembly with C-seal plug seal on the new stem following the appropriate instructions in the Trim Replacement section of this manual.
7. Install piston rings by following instructions in the Trim Replacement section of this manual.
8. Remove the existing valve actuator and bonnet following the appropriate instructions in the Replacing Packing section in this manual.

NOTICE

Do not remove the existing valve stem from the valve plug unless you are planning to replace the valve stem.

Never reuse an old valve stem with a new plug or reinstall a valve stem after it has been removed. Replacing a valve stem requires drilling a new pin hole in the stem. This drilling weakens the stem and may cause failure in service. However, a used valve plug may be reused with a new valve stem.

9. Remove the existing valve stem and plug, cage and seat ring from the valve body following the appropriate instructions in the Trim Removal section in this manual.
10. Replace all gaskets according to appropriate instructions in the Trim Replacement section in this manual.
11. Install the new seat ring, cage, valve plug/retainer assembly and stem into the valve body and completely reassemble the valve package following the appropriate instructions in the Trim Replacement section in this manual.
12. With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

Figure 11. Installing the C-seal Plug Seal Using the Installation Tool

A6778

NOTE: PRESS INSTALLATION TOOL OVER VALVE PLUG UNTIL THE TOOL CONTACTS THE HORIZONTAL REFERENCE SURFACE OF THE VALVE PLUG.

Figure 12. Stake the Threads of the C-seal Retainer

A6779

NOTICE

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the C-seal plug seal and contact the seat ring. You can correctly seat the valve plug by applying the full actuator load. This force will adequately drive the valve plug to the seat ring, thus giving the C-seal plug seal a predetermined permanent set. Once this is done, the plug/retainer assembly, the cage and the seat ring become a matched set.

3.5 Replacement of Installed C-seal Trim

Trim Removal (C-seal Constructions)

1. Remove the valve actuator and bonnet following the appropriate instructions in the Replacing Packing section in this manual.

NOTICE

To avoid leakage when the valve is returned to service, use appropriate methods and materials to protect all sealing surfaces of the trim parts during maintenance.

Use caution when removing piston ring(s) and C-seal plug seal to avoid scratching any sealing surface.

NOTICE

Do not remove the valve stem from the plug/retainer assembly unless you are planning to replace the valve stem.

Never reuse an old valve stem with a new plug or reinstall a valve stem after it has been removed. Replacing a valve stem requires drilling a new pin hole in the stem. This drilling weakens the stem and may cause failure in service. However, a used valve plug may be reused with a new valve stem.

2. Remove the plug/retainer assembly (with C-seal plug seal), cage and seat ring from the valve body following the appropriate instructions in the Trim Removal section of this manual.
3. Locate the staked thread on top of the valve plug (Figure 12). The staked thread secures the retainer. Use a drill with a 1/8 inch bit to drill out the staked area of the thread. Drill approximately 1/8 in. into the metal to remove the staking.

4. Locate the break between sections of the piston ring(s). Using an appropriate tool such as a flat-blade screwdriver, carefully pry out the piston ring(s) from the groove(s) in the C-seal retainer.
5. After removing the piston ring(s), locate the 1/4-inch diameter hole in the groove. In a retainer with two piston ring grooves, the hole will be found in the upper groove.
6. Select an appropriate tool such as a punch and place the tip of the tool into the hole with the body of the tool held tangent to the outside diameter of the retainer. Strike the tool with a hammer to rotate the retainer and free it from the valve plug. Remove the retainer from the plug.
7. Use an appropriate tool such as a flat-blade screwdriver to pry the C-seal plug seal off the plug. Use caution to avoid scratches or other damage to the sealing surfaces where the C-seal plug seal makes contact with the valve plug (Figure 13).

Figure 13. Lower (Valve Plug to Seat Ring) and Upper (C-seal Plug Seal to Cage) Seating Surfaces

A6780

NOTE:

1. UPPER SEATING SURFACE IS THE AREA OF CONTACT BETWEEN THE C-SEAL METAL PLUG SEAL AND THE CAGE.

8. Inspect the lower seating surface where the valve plug contacts the seat ring for wear or damage which would prevent proper operation of the valve. Also, inspect the upper seating surface inside the cage where the C-seal plug seal contacts the cage and inspect the sealing surface where the C-seal plug seal makes contact with the plug (Figure 13).
9. Replace or repair trim parts according to the following procedure for lapping metal seats, remachining metal seats or other valve plug maintenance procedures as appropriate.

Lapping Metal Seats (C-seal Constructions)

Before installing a new C-seal plug seal, lap the lower seating surface (valve plug to seat ring, Figure 13) following appropriate procedures in the Lapping Metal Seats section of this manual.

Remachining Metal Seats (C-seal Constructions)

See Figure 14. A valve plug with a C-seal metal plug seal features two seating surfaces. One seating surface is found where the valve plug contacts the seat ring. The second seating surface is found where the C-seal plug seal contacts the upper seating surface in the cage. If you machine the seats on the seat ring and/or plug, you must machine an equal dimension from the seating area in the cage.

NOTICE

If metal is removed from the seat ring and plug and a corresponding amount is not removed from the cage seating area, the C-seal plug seal will be crushed as the valve closes and the C-seal retainer will strike the seating area of the cage, preventing the valve from closing.

Figure 14. Example of Machining the Lower (Valve Plug to Seat Ring) and Upper (C-seal Plug Seal to Cage) Seating Surfaces

A6781 / IL

NOTES:

- PLUS
1. REMOVAL OF 0.254 mm / 0.010 in. FROM THE VALVE PLUG
 2. REMOVAL OF 0.254 mm / 0.010 in. FROM THE SEAT RING
 3. REMOVAL OF 0.508 mm / 0.020 in. FROM THE UPPER SEATING SURFACE IN THE CAGE
 4. THESE VALUES ARE FOR EXAMPLE ONLY. REMOVE ONLY THE MINIMUM AMOUNT OF MATERIAL REQUIRED TO REFURBISH THE SEATS.

Trim Replacement (C-seal Constructions)

1. Apply a suitable high-temperature lubricant to the inside diameter of the C-seal plug seal. Also, lubricate the outside diameter of the valve plug where the C-seal plug seal must be pressed into the proper sealing position (Figure 9).
2. Orient the C-seal plug seal for correct sealing action based on the process fluid flow direction through the valve.
 - The open interior of the C-seal plug seal must face up in a valve with flow-up construction (Figure 9).
 - The open interior of the C-seal plug seal must face down in a valve with flow-down construction (Figure 9).

NOTE

An installation tool must be used to properly position the C-seal plug seal on the valve plug. A tool is available as a spare part from Emerson or a tool could be manufactured following the dimensions given in Figure 10.

3. Place the C-seal plug seal over the top of the valve plug and press it onto the plug using the installation tool. Carefully press the C-seal plug seal onto the plug until the installation tool contacts the horizontal reference surface of the valve plug (Figure 11).
4. Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the C-seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
5. Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place (Figure 12) to secure the C-seal retainer.
6. Replace the piston ring(s) following instructions in the Trim Replacement section of this manual.
7. Return the seat ring, cage, plug/retainer assembly and stem to the valve body and completely reassemble the valve package following the appropriate instructions in the Trim Replacement section of this manual.
8. With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

NOTICE

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the C-seal plug seal and contact the seat ring. You can correctly seat the valve plug by applying the full actuator load. This force will adequately drive the valve plug to the seat ring, thus giving the C-seal plug seal a predetermined permanent set. Once this is done, the plug/retainer assembly, the cage and the seat ring become a matched set.

3.6 ENVIRO-SEAL Bellows Seal Bonnet

Replacing a Plain or Extension Bonnet with an ENVIRO-SEAL Bellows Seal Bonnet (Stem/Bellows Assembly)

Except where indicated, key numbers in this section are referenced in Figure 22 for EWD constructions, Figure 22 for restricted trim detail, Figure 23 for EWS constructions and Figure 24 for EWT constructions. Refer to Figures 26 and 27 for Cavitrol III, Figure 28 for Whisper Trim III and Whisper NXG trim detail and Figure 29 for WhisperFlo constructions.

Table 8. Recommended Torque for ENVIRO-SEAL Bellows Seal Bonnet Packing Flange Nuts⁽¹⁾

VALVE SIZE, NPS	VALVE STEM DIAMETER THROUGH PACKING	MINIMUM TORQUE		MAXIMUM TORQUE	
		N•m	Lbf•in	N•m	Lbf•in
4x2	1/2	2	22	4	33
6x4 to 12x8	1	5	44	8	67

1. Lubricate with anti-seize compound.

1. Remove the actuator and bonnet according to steps 1 through 6 of the Replacing Packing procedure in the Maintenance section.
2. Lift out the cage.
3. Remove and discard the existing bonnet gasket. Cover the valve body opening to protect sealing surfaces and to prevent foreign material from entering the valve body cavity.

NOTE

The ENVIRO-SEAL stem/bellows assembly for easy-e™ valves is available only with a threaded and drilled plug/adaptor/stem connection. The existing valve plug can be reused with the new stem/bellows assembly or a new plug can be installed.

4. Inspect the existing valve plug. If the plug is in good condition, it can be reused with the new ENVIRO-SEAL stem/bellows assembly. To remove the existing valve plug from the stem, first, place the existing plug stem assembly in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out or drill out the pin (key 8).
5. Then, reverse the plug stem assembly in the soft-jaw chuck or vise. Grip the valve stem in an appropriate place and unscrew the existing plug from the valve stem.

NOTICE

When installing a valve plug on the ENVIRO-SEAL stem/bellows assembly, the valve stem must not be rotated. Damage to the bellows may result.

Do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

NOTE

The ENVIRO-SEAL stem/bellows assembly has a one-piece stem.

6. To attach the valve plug to the stem of the new ENVIRO-SEAL stem/bellows assembly, it is necessary to first attach the plug to the adaptor (key 24, Figure 21). Locate the adaptor. Notice that a hole has not been drilled in the threads where the plug screws onto the adaptor. Secure the valve plug in a soft-jaw chuck or other type of vise. Do not grip the plug on any seating surface. Position the plug in the chuck or vise for easy threading of the adaptor. Thread the adaptor into the valve plug and tighten to the appropriate torque value.
7. Select the proper size of drill bit and drill through the adaptor using the hole in the valve plug as a guide. Remove any metal chips or burrs and drive in a new pin (key 8) to lock the plug/adaptor assembly together.
8. Attach the plug/adaptor assembly to the ENVIRO-SEAL stem/bellows assembly by first securing the stem/bellows assembly in a soft-jaw chuck or other type of vise so that the jaws of the chuck or vise grip the flats of the stem extending out of the top of the bellows shroud. Screw the valve plug/adaptor assembly onto the valve stem. Tighten the plug/adaptor assembly until it is snug. Then turn the plug/adaptor assembly to the next pin hole in the valve stem. Drive in new pin (key 36, Figure 21) to lock the assembly.

Figure 15. PTFE Packing Arrangement for Use in ENVIRO-SEAL Bellows Seal Bonnets

A5886-1

9. Inspect the seat ring (key 9). Replace, if necessary.
10. Place a new gasket (key 10) into the valve body in place of the bonnet gasket. Install the new stem/bellows assembly with valve plug/adaptor by placing it into the valve body on top of the new bellows gasket.
11. Place a new gasket (key 22, Figure 21) over the stem/bellows assembly. Place the new ENVIRO-SEAL bonnet over the stem/bellows assembly.

NOTE

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

12. Properly lubricate the bonnet stud bolts. Install and tighten the bonnet hex nuts to the proper torque.
13. Install the new packing and the metal packing box parts according to the appropriate arrangement in Figure 15 or 16.
14. Install the packing flange. Properly lubricate the packing flange stud bolts and the faces of the packing flange nuts.

Figure 16. Double Graphite Ribbon/Filament Arrangements for Use in ENVIRO-SEAL Bellows Seal Bonnets

For graphite packing, tighten the packing flange nuts to the maximum recommended torque shown in Table 8. Then, loosen the packing flange nuts and retighten them to the recommended minimum torque shown in Table 8.

For other packing types, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in Table 8. Then, tighten the remaining flange nut until the packing flange is level and at a 90-degree angle to the valve stem.

15. Install the travel indicator parts and stem locknuts; mount the actuator on the valve body according to the procedure in the appropriate actuator instruction manual.

Replacement of an Installed ENVIRO-SEAL Bellows Seal Bonnet (Stem/Bellows Assembly)

1. Remove the actuator and bonnet according to steps 1 through 6 of the Replacing Packing procedure of the Maintenance section.
2. Lift out the cage. Remove and discard the existing bonnet gasket and bellows gasket. Cover the valve body opening to protect sealing surfaces and to prevent foreign material from entering the valve body cavity.

NOTICE

The ENVIRO-SEAL stem/bellows assembly for easy-e valves is available only with a threaded and pinned plug/adaptor/stem connection. The existing valve plug can be reused with the new stem/bellows assembly or a new plug can be installed. If the existing valve plug is reused and the adaptor is in good condition, it may be reused also. However, never reuse an old adaptor with a new valve plug. Using an old adaptor with a new valve plug requires drilling a new pin hole in the adaptor. This drilling weakens the adaptor and may cause failure in service. However, a used valve plug may be reused with a new adaptor.

3. Inspect the existing valve plug and adaptor. If they are in good condition, they can be reused with the new stem/bellows assembly and they do not need to be separated.

NOTICE

When removing/installing a valve plug on the ENVIRO-SEAL stem/bellows assembly, the valve stem must not be rotated. Damage to the bellows may result.

Do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

NOTE

The ENVIRO-SEAL stem/bellows assembly has a one-piece stem.

4. If the valve plug and adaptor are not in good condition and must be replaced, the valve plug/adaptor assembly must first be removed from the stem/bellows assembly and then the valve plug removed from the adaptor. First, place the stem/bellows assembly and valve plug in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out or drill out the pin (key 8). Drive out the pin (key 36, Figure 21).
5. Then, reverse the stem/bellows and plug/adaptor assembly in the soft-jaw chuck or vise. Grip the flat areas on the valve stem just below the threads for the actuator/stem connection. Unscrew the plug/adaptor assembly from the stem/bellows assembly. Unscrew the valve plug from the adaptor.
6. To attach either the existing or a new valve plug to the stem of the new ENVIRO-SEAL stem/bellows assembly, first attach the plug to the adaptor (if the valve plug was removed from the adaptor) as follows:
 - Locate the adaptor. Notice that a hole has not been drilled in the new adaptor threads where the plug screws onto the adaptor.
 - Secure the valve plug in a soft-jaw chuck or other type of vise. Do not grip the plug on any seating surface. Position the plug in the chuck or vise for easy threading of the adaptor.
 - Thread the adaptor into the valve plug and tighten to the appropriate torque value.
7. Complete the installation by following steps 7 through 15 of the ENVIRO-SEAL Bellows Seal Bonnet installation instructions given above.

Purging the ENVIRO-SEAL Bellows Seal Bonnet

The ENVIRO-SEAL bellows seal bonnet has been designed so that it can be purged or leak tested. Refer to Figure 21 for an illustration of an ENVIRO-SEAL bellows seal bonnet. Perform the following steps for purging or leak testing.

1. Remove the two diametrically opposed pipe plugs (key 16, Figure 21).
2. Connect a purging fluid to one of the pipe plug connections.
3. Install appropriate piping or tubing in the other pipe plug connection to pipe away the purging fluid or to make a connection to an analyzer for leak testing.
4. When purging or leak testing has been completed, remove the piping or tubing and reinstall the pipe plugs (key 16, Figure 21).

Section 4: Parts

4.1 Parts Ordering

Each body-bonnet assembly is assigned a serial number, which can be found on the valve. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts, refer to the serial number and to the 11-character part number for each part required from the following parts list.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

4.2 Parts Kits

Gasket Kits

Gasket Kits (includes keys 10, 12, 13 and 53; plus 11 and 14 for restricted trim)

Table 9. Gasket Kits

VALVE SIZE, NPS	Standard Trim Cage Whisper Trim I Cage Cavitrol III - 1 Stage Cage	Cavitrol III - 2 Stage Cage Whisper Trim III / NXG Cage WhisperFlo Cage

4.3 Packing Kits

Standard Packing Repair Kits

Packing repair kits for standard packing include keys 6, 8, 10, 11 and 12.

NOTE

Kits do not apply to alloy C (N10276 and CW2M), Alloy 20 (N08020 and CN7M) or alloy 400 (N04400 and M35-1) trims.

Table 10. Standard Packing Repair Kits (Non Live-Loaded)

HIGH-SEAL and ENVIRO-SEAL Packing Retrofit Kits

Retrofit kits include parts to convert valves with existing standard bonnets to the HIGH-SEAL or ENVIRO-SEAL packing box construction. Refer to Figure 17 for key numbers for HIGH-SEAL packing. For ENVIRO-SEAL packing, refer to Figure 18 for PTFE packing key numbers, Figure 19 for Graphite ULF packing key numbers and Figure 20 for duplex packing key numbers.

Stems and packing box constructions that do not meet Emerson stem finish specifications, dimensional tolerances and design specifications, may adversely alter the performance of this packing kit.

Table 11. HIGH-SEAL Packing Retrofit Kits

ENVIRO-SEAL Packing Repair Kits

Repair kits include parts to replace the "soft" packing materials in valves that already have ENVIRO-SEAL packing arrangements installed or in valves that have been upgraded with ENVIRO-SEAL retrofit kits. Refer to Figure 18 for key numbers for PTFE packing, Figure 19 for key numbers for Graphite ULF packing and Figure 20 for key numbers for duplex packing.

Stems and packing box constructions that do not meet Emerson stem finish specifications, dimensional tolerances and design specifications, may adversely alter the performance of this packing kit.

W3310

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for Fisher NPS 8 x 6 and 12 x 8 EWN Series and EW-1 Series valves (figure 1). Refer to separate manuals for instructions covering the actuator and accessories.

Do not install, operate, or maintain an EWN or EW-1 Series valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

These single-port globe-style valves have cage guiding, threaded seat rings, metal-to-metal seating, and push-down-to-close valve plug action. Additional details are given in tables 1 and 2.

Specifications

Typical specifications for these valves are shown in table 1. Some of the specifications for a given valve assembly as it was shipped from the factory appear on the actuator nameplate if the valve is part of a complete control valve assembly.

Installation

WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a suitable overpressure protection device as required by local, state, and Federal codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some valve body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#) or Local Business Partner.

If hoisting the valve, the use of a nylon sling is recommended to protect the painted surfaces. Also be careful to position the sling so there will be no damage to the tubing or any accessories.

1. Before installing the valve, inspect the valve body and associated equipment for any damage and any foreign material. Make certain that the valve body interior is clean, pipelines are free of foreign material, and the valve is oriented so that pipeline flow is in the same direction as the arrow on the side of the valve body.

2. The control valve assembly may be installed in any orientation unless limited by seismic criteria. However, the normal method is with the actuator vertical above the valve. Other positions may result in uneven valve plug and cage wear and in improper operation. With some valves, the actuator may also need to be supported when it is not vertical. For more information, consult your [Emerson sales office](#) or Local Business Partner.

Figure 2. Lubricator and Lubricator/Isolating Valve (Key 14)

Note

If the valve being installed has a Whisper Trim cage with small internal flow passages, consideration should be given to installing an upstream strainer to prevent the lodging of particles in these passages. This is especially important if the pipeline cannot be thoroughly cleaned or if the flowing medium is not clean.

3. Use accepted piping and welding practices when installing the valve in the line. Internal elastomeric parts may stay in place during the welding procedure. For flanged valves, use a suitable gasket between the valve body and pipeline flanges.

CAUTION

Depending on valve body materials used, post weld heat treating may be required. If so, damage to internal elastomeric and plastic parts, as well as internal metal parts is possible. Shrunk-fit pieces and threaded connections may also loosen. In general, if post weld heat treating is to be performed, all trim parts should be removed. Contact your [Emerson sales office](#) or Local Business Partner for additional information.

4. With a leak-off bonnet construction, remove the 1/4 NPT pipe plugs (keys 14 and 16, figure 6) to hook up the leak-off piping. If continuous operation is required during inspection or maintenance, install a three-valve bypass around the control valve assembly.
5. If the actuator and valve are shipped separately, refer to the appropriate actuator instruction manual for the actuator mounting procedure.

WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing lubrication, packing replacement, trim maintenance, and lapping seating surfaces. All maintenance operations may be performed with the valve body in the line.

WARNING

Avoid personal injury or damage to property from sudden release of pressure or uncontrolled process fluid. Before starting disassembly:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Note

Whenever a gasket seal is disturbed by removing or shifting gasketed parts, a new gasket should be installed upon reassembly. This is necessary to ensure a good gasket seal.

Packing Lubrication

CAUTION

Do not lubricate graphite packing. Graphite packing is self-lubricated. Additional lubrication may result in slip-stick movement of the valve.

⚠ WARNING

To avoid personal injury or property damage resulting from fire or explosion, do not lubricate packing used in oxygen service or in processes with temperatures over 260°C (500°F).

If a lubricator or lubricator/isolating valve (figure 2) is provided for PTFE/composition or other packings that require lubrication, it will be installed in place of the 1/4 NPT pipe plug (key 14, figure 6). Use a silicon-base lubricant. Packing used in oxygen service or in processes with temperatures over 260°C (500°F) should not be lubricated. To operate the lubricator, turn the cap screw clockwise to force the lubricant into the packing box. The lubricator/isolating valve operates the same way except the isolating valve must first be opened and then closed after lubrication is completed.

Packing Maintenance

This section covers only PTFE V-ring and PTFE/composition packing. Refer to a separate manual for graphite laminate/filament packing if used. Key numbers refer to figure 3 for PTFE V-ring packing and to figure 4 for PTFE/composition packing unless otherwise indicated.

For spring-loaded single PTFE V-ring packing, the spring (key 8, figure 3) maintains a sealing force on the packing. If leakage is noted around the packing follower (key 13, figure 3), check to be sure the shoulder on the packing follower is touching the bonnet. If the shoulder is not touching the bonnet, tighten the packing flange nuts (key 5, figure 6) until the shoulder is against the bonnet. If leakage cannot be stopped in this manner, proceed to the Replacing Packing section.

If there is undesirable packing leakage with other than spring-loaded packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts.

If the packing is relatively new and tight on the stem and if tightening the packing flange nuts does not stop the leakage, it is possible that the valve stem is worn or nicked so that a seal cannot be made. The surface finish of a new valve stem is 0.1 micro-meter (4 micro-inches) rms. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches around the packing box wall. If performing any of the following procedures, inspect the valve stem and packing box wall for nicks and scratches.

Adding Packing Rings

When using packing with a lantern ring (key 8, figure 3 or 4), it is possible to add packing rings above the lantern ring as a temporary measure without removing the actuator from the valve body.

1. Remove the packing flange nuts (key 5, figure 6), and lift the packing flange and follower (keys 3 and 13, figure 6) away from the valve body.
2. It may be possible to dig out the old packing rings on top of the lantern ring, but use care to avoid scratching the valve stem or packing box wall. Clean all metal parts to remove particles that would prevent the packing from sealing.
3. If split-ring packing is being added, spread the rings over the stem, and slide the rings into the packing box.

If solid-ring packing is being added, remove the stem connector, and slip the rings over the end of the valve stem.

4. Replace the packing flange and packing follower. Tighten the packing flange nuts (key 5, figure 6) only far enough to stop leakage under operating conditions.
5. If the valve-actuator stem connection was taken apart, reconnect according to the appropriate actuator instruction manual.
6. Check for leakage around the packing follower when the valve is being put into service. Retighten the packing flange nuts as required.

Figure 3. PTFE V-Ring Packing Arrangements

Replacing Packing

⚠ WARNING

Observe the warning at the start of the Maintenance section.

1. Disconnect the operating lines from the actuator and any leak-off piping from the bonnet. Disconnect the stem connector, and then remove the actuator from the valve by unscrewing the yoke locknut (key 15, figure 6) or the hex nuts (key 26, figure 6).

Figure 4. Detail of PTFE/Composition Packing Arrangements

2. Loosen the packing flange nuts (key 5, figure 6) so that the packing is not tight on the valve stem. Remove any travel indicator parts and stem locknuts from the valve stem threads.

CAUTION

When lifting the bonnet (key 1, figure 6), be sure that the valve plug and stem assembly remains in the valve and on the seat. This will avoid damage to the seating surfaces as a result of the assembly dropping from the bonnet after being lifted part way out. The parts are also easier to handle separately.

3. Unscrew the hex nuts (key 16, figure 7 through 10) that bolt the bonnet and valve body together, and carefully lift the bonnet off the valve stem.
4. If the valve plug and stem assembly starts to lift with the bonnet, use a brass or lead hammer on the end of the stem and tap it back down. Set the bonnet on a protective surface to prevent damage to the bonnet gasket surface.
5. Remove the bonnet gasket (key 10, figure 7 through 10), and cover the opening in the valve body to protect the gasket surface and prevent foreign material from getting into the valve body cavity.
6. Remove the packing flange nuts, packing flange, upper wiper, and packing follower (keys 5, 3, 12, and 13, figure 6). Carefully push out all the remaining packing parts from the valve body side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall. Clean the packing box and the metal packing parts.
7. Inspect the valve stem threads and packing box surfaces for any sharp edges that might cut the packing. Scratches or burrs could cause packing box leakage or damage to the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts.
8. Remove the covering protecting the valve body cavity, and install a new bonnet gasket (key 10, figure 7 through 10), making sure the gasket seating surfaces are clean and smooth.

Table 4. Valve Body-to-Bonnet Bolt Torque Guidelines⁽¹⁾

VALVE SIZE, NPS		BOLT TORQUES ⁽²⁾ FOR FIELD-LUBRICATED BOLTING	
		N•m	Lbf•Ft
8 x 6 CL900		542	400
12 x 8	CL300 or 600	691	510
	CL900 with steel or alloy steel bolting	2440	1800
	CL900 with stainless steel bolting	2712	2000
1. For other materials, contact your Emerson sales office or Local Business Partner for torques. 2. Determined from laboratory tests.			

Note

Proper performance of the tightening procedures in step 9 compresses the outer edge of the bonnet gasket (key 10, figure 7 through 10) enough to seal the valve body-to-bonnet joint.

The bolting procedures in step 9 include -- but are not limited to -- ensuring that bolting threads are clean and evenly tightening the hex nuts onto the studs in a crisscross pattern. Because of the boltup characteristics of the bonnet gasket, tightening one nut may loosen an adjacent nut. Repeat the crisscross tightening pattern several times until each nut is tight and the valve body-to-bonnet seal is made. When the operating temperature has been reached, perform this torquing procedure once again.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

9. Lubricate the stud bolts (key 15, figure 7 through 10) with anti-seize lubricant, slide the bonnet over the stem and onto the bolts, and secure with the stud bolt nuts (key 16, figure 7 through 10), using accepted bolting procedures during tightening so that the valve body-to-bonnet joint will withstand test pressures and application service conditions. The bolt torques in table 4 may be used as guidelines unless accepted bolting procedures dictate otherwise.
10. Install new packing and the metal packing box parts according to the appropriate arrangement in figure 3 or 4. Place a smooth-edged pipe over the valve stem, and gently tap each soft packing part into the packing box, being sure that air is not trapped between adjacent soft parts.
11. Slide the packing follower, upper wiper, and packing flange (keys 13, 12, and 3, figure 6) into position. Lubricate the packing flange studs (key 4, figure 6) and the faces of the packing flange nuts (key 5, figure 6). Replace the packing flange nuts.
12. For spring-loaded PTFE V-ring packing, tighten the packing flange nuts until the shoulder on the packing follower (key 13, figure 6) contacts the bonnet.

For other packing types, tighten the packing flange nuts far enough to stop leakage under operating conditions.

13. Mount the actuator on the valve body assembly, and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual. Check for leakage around the packing follower when the valve is being put into service. Retighten the packing flange nuts as required.

Trim Removal

⚠ WARNING

Observe the warning at the start of the Maintenance section.

Except where indicated, key numbers in this section are referenced in figures 7 and 8 for EWN Series constructions and in figures 9 and 10 for EW-1 Series constructions.

1. Remove the actuator and the bonnet according to steps 1 through 5 of the Replacing Packing section.

CAUTION

When lifting the valve plug stem (key 7) and attached valve plug (key 2) out of the valve body, be certain that the cage or cage assembly (key 3) remains in the valve body (key 1). This is to prevent damage caused by the cage or cage assembly dropping back into the valve body after being lifted part way out.

Use care to avoid damaging gasket sealing surfaces. Any damage to the gasket sealing surfaces could cause the valve to leak.

The graphite piston ring (key 5) in an EWD-1 or EWND-1 valve body is brittle and in two pieces. Use care to avoid damage to the piston ring caused by dropping or rough handling.

The surface finish of the valve stem (key 7) is critical for making a good packing seal. The inside surface of the cage or cage assembly (key 3) is critical for smooth operation of the valve plug and for making a seal with the piston ring or seal ring (key 5). The seating surfaces of the valve plug (key 2) and seat ring (key 9) are critical for tight shutoff. Protect these parts accordingly while disassembling the trim.

Table 5. Pin Replacement

VALVE STEM CONNECTION (VSC)		DRILL SIZE, INCH
mm	Inches	
19.1	3/4	3/16
25.4	1	1/4
31.8	1-1/4	1/4

2. Packing parts can be removed if desired. Replace these parts as described in the Packing Replacement section.
3. Lift the valve plug and stem assembly out of the valve body and set it on a protective surface. If the valve plug is to be reused, protect the valve plug seating surface to prevent scratches.
4. Install screws or bolts into the tapped holes in the top of the cage or cage assembly, and carefully lift it out of the valve body. Remove the associated gaskets (key 10 and, if used, key 11).
5. The EWNT-2 valve body has a seat ring seal ring (key 6). Inspect this seal ring, and remove it if replacement is necessary. The EWNT-2 seat ring is screwed into the cage and secured with two tack welds, one on each side of the cage. The seat ring can be removed by grinding or filing off the tack welds and then inserting a bar through slots cut in the seat ring to turn it out of the cage.
6. To remove the seat ring (key 9) from an EW-1 or EWN-1 Series valve, use a seat ring removal tool made as shown in figure 5. Use a piece of pipe of the indicated size and schedule, machine as appropriate, and then weld a collar of the indicated dimensions around the pipe. Engage the seat ring lugs with the 44.5 mm (1-3/4-inch) groove of the tool, and then remove the seat ring by slipping a suitable length of pipe through the 76.2 mm (3-inch) diameter hole in the other end of the tool to provide leverage.

- Inspect parts for wear or damage that would prevent proper operation of the valve. Replace or repair trim parts according to the following Lapping Seating Surfaces or Valve Plug Maintenance procedures as appropriate.

Lapping Seating Surfaces

Seating surfaces of the valve plug and seat ring (keys 2 and 9, figure 7 through 10) can be lapped for improved shutoff. (Deep nicks should be machined out rather than ground out.) Use a commercial lapping compound or a mixture of 600-grit carborundum and solidified vegetable oil.

Assemble the valve to the extent that the cage or cage assembly is in place and the bonnet bolted to the valve. A simple handle can be made from a piece of strap iron locked to the valve plug stem with nuts. Rotate the handle alternately in each direction to lap the seats. After lapping, remove the bonnet, and clean the seat surfaces. Completely assemble the valve as described in the Trim Replacement section, and test the valve for shutoff. Repeat the lapping procedure if leakage is still excessive.

Figure 5. Removal Tool Required for Seat Ring Threaded to Valve Body (also see tables 6 and 7)

Valve Plug Maintenance

Except where indicated, key numbers in this section are referenced in figures 7 and 8 for EWN Series valve plugs and in figures 9 and 10 for EW-1 Series valve plugs.

CAUTION

If replacing the valve plug piston ring or seal ring (key 5), be careful not to scratch the surfaces of the ring groove in the valve plug or any of the surfaces of the replacement ring, or the replacement ring may not seal properly.

1. With the valve plug (key 2) removed according to the Disassembly section, proceed as appropriate:

For the EWD-1 or EWND-1 graphite piston ring, the ring or rings can be easily removed since each ring is in two halves. A new graphite piston ring is furnished as a complete ring and must be broken into two approximately equal portions. Do this by placing the ring horizontally in a vise and applying pressure until the ring snaps. An alternate method is to place the ring on edge on a smooth, hard surface and strike the ring squarely with a hammer. Be sure to match the broken ends when installing the ring in the valve plug groove.

For the EWT-1, EWNT-1, or EWNT-2 spring-loaded seal ring, the ring used on the valve plug for an NPS 8 x 6 valve body may be removed undamaged by first working the retaining ring (key 13) off with a screwdriver. Then carefully slide the metal backup ring (key 12) and seal ring (key 5) off the valve plug (key 2). The spring-loaded seal ring used on the valve plug for an NPS 12 x 8 valve body must be carefully pried and/or cut from its groove. Therefore, it cannot be reused.

A spring-loaded seal ring must be installed so that its open side faces toward either the top or the bottom of the valve plug, depending on flow direction, as shown in view A of figure 7, 8, or 10. To install a spring-loaded seal ring on the valve plug for an NPS 8 x 6 valve body, slide the seal ring (key 5) onto the valve plug followed by the metal backup ring (key 12). Then install the retaining ring (key 13) by inserting one end in the groove and, while turning the plug, press the ring into the groove. Again, be careful not to scratch any surfaces of the ring or plug.

To install the seal ring on the valve plug for an NPS 12 x 8 valve body, lubricate it with a general purpose silicone-base lubricant. Then gently stretch the seal ring, and work it over the top edge of the valve plug. The PTFE material in the seal ring must be permitted time to cold-flow during stretching procedure; so avoid jerking sharply on the ring. Stretching the seal ring over the valve plug may make it seem unduly loose when in the groove, but it will contract to its original size after insertion into the cage.

CAUTION

Never reuse an old stem with a new valve plug. Using an old stem with a new plug requires drilling a new pin hole in the stem. This weakens the stem and may cause it to fail in service. However, a used valve plug may be reused with a new stem.

2. To replace the valve stem (key 7) on all designs, drive out the pin (key 8) and unscrew the stem from the valve plug.
3. Tightly turn in the new stem; then refer to table 5 to select the proper drill size. Drill through the stem, using the hole in the valve plug as a guide. Remove any chips or burrs, and drive in a new pin to lock the assembly.

Trim Replacement

Except where indicated, key numbers are referenced in figures 7 and 8 for EWN Series constructions and in figures 9 and 10 for EW-1 Series constructions.

1. With an EW-1 or EWN-1 Series construction, lubricate the threads of the seat ring (key 9) with anti-seize lubricant and then install the seat ring into the valve body according to figure 5. Engage the seat ring lugs with the grooved end of the tool, and then secure the seat ring by slipping a suitable length of pipe through the hole in the other end to provide leverage. For NPS 8x6 valves, tighten to 6800 N•m (5000 lbf•ft). For NPS 12x8 valves, tighten to 10,800 N•m (8000 lbf•ft).
2. With an EWNT-2 construction, turn the seat ring into the cage with a bar inserted through the seat ring slots. Tack weld the seat ring to the cage using minimal heat. Two welds, 6 mm (1/4 inch) long and 180 degrees apart, are required. Install the seat ring seal ring (key 6) so that its open side faces along the valve stem as shown in view B of figure 8. Lubricate the seal ring with a general purpose silicone-base lubricant, and place it over the bottom end of the seat ring. Start the ring in the groove on one side of the seat ring, and gently work it over the seat ring.
3. Install a bonnet gasket (key 10) or the cage gasket if used (key 11) into the valve body. Temporarily install screws or bolts into the tapped holes in the top of the cage or cage assembly (key 3) to help while installing this piece into the valve body. Any rotational orientation of the cage or assembly with respect to the valve body is acceptable.

Use care to avoid damaging the seat ring seal ring and cage seating surfaces while handling the heavy parts. To help insert the cage or assembly into the valve body, lubricate the outside diameter of the seat ring seal ring if used or the cage/seat ring seating surfaces with a general purpose silicone-base lubricant.

4. Slide the valve plug (key 2) and stem assembly into the cage. Make sure the valve plug piston ring or seal ring (key 5) is evenly engaged in the entrance chamfer at the top of the cage or cage assembly to avoid damaging the ring.

CAUTION

If the packing is to be reused and was not removed from the bonnet, use care when installing the bonnet to avoid damaging the packing with the valve stem threads.

5. Mount the bonnet on the valve body, and complete assembly according to steps 9 through 13 of the Replacing Packing section, omitting steps 10 and 11 if new packing is not being installed and being sure to observe the note prior to step 9.

Parts Ordering

Each valve body-bonnet assembly is assigned a serial number, which can be found on the valve body. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Refer to the serial number when contacting your [Emerson sales office](#) or Local Business Partner for technical assistance. When ordering replacement parts, refer to the serial number and to the 11-character part number for each part required from the following parts list.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts List

Note

Part numbers are shown for recommended spares only. For part numbers not shown, contact your [Emerson sales office](#) or Local Business Partner.

Bonnet Assembly (figure 2, 3, 4, or 6)

Key	Description	Part Number
1	Bonnet If you need a bonnet, order by valve size and stem diameter, serial number, and desired material.	
5	Packing Flange Nuts (2 req'd)	

Key	Description	Part Number
6*	Single PTFE V-Ring Packing Set	See following table
7*	Individual Packing Ring	See following table
8	Packing Box Spring or Lantern Ring	See following table
10	Special Washer	See following table
11	Packing Box Ring	See following table
12*	Upper Wiper	See following table
13	Packing Follower	See following table
14	Packing Box Pipe Plug	
14	Packing Box Lubricator, steel/ 440 SST	
14	Packing Box Lubricator/Isolating Valve Assy, Cd pl steel	
15	Yoke Locknut for 19.1 mm (3/4 in.) stem dia bonnet	
16	Pipe Plug for double-tapped bonnet	
25	Cap Screw for 25.4 mm (1 in.) or 31.8 mm (1-1/4 in.) stem dia bonnet, steel (8 req'd)	
26	Hex Nut for 25.4 mm (1 in.) or 31.8 mm (1-1/4 in.) stem dia bonnet, pl steel (8 req'd)	
27	Pipe Nipple (for use only w/lube/iso valve)	
30*	Lower Wiper	See following table
31*	Male Adaptor	See following table
32*	Female Adaptor	See following table

Figure 1. Fisher EZ Valve with 657 Actuator and DVC6000 Digital Valve Controller

W8120A-1

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for NPS 1/2 through 4 Fisher EZ valves through CL600 ratings. Refer to separate manuals for instructions covering the actuator and accessories.

Do not install, operate, or maintain an EZ valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

EZ valves (figure 1) are globe-style with integral end connections, post guiding, and quick-change trim. These valves are used in chemical or hydrocarbon processing applications or in applications that require control of non-lubricating, viscous, or other hard-to-handle fluids.

Table 1. Specifications

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for overpressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

Figure 2. Optional Packing Lubricator and Lubricator/Isolating Valve

CAUTION

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your Emerson Automation Solutions sales office.

1. Before installing the valve, inspect it and any associated equipment for damage and any foreign material. Make certain the valve interior is clean, that pipelines are free of foreign material, and that the valve is oriented so that pipeline flow is in the same direction as the arrow on the side of the valve.
2. The control valve assembly may be installed in any orientation unless limited by seismic criteria. However, the normal method is with the actuator vertical above the valve. Other positions may result in uneven valve plug and seat ring retainer wear, and improper operation. With some valves, the actuator may also need to be supported when it is not vertical. For more information, consult your [Emerson sales office](#).
3. Use accepted piping and welding practices when installing the valve in the line. Internal elastomeric parts may stay in place during the welding procedure. For flanged valves, use a suitable gasket between the valve body flange and pipeline flanges.

CAUTION

Depending on valve body materials used, post weld heat treating may be required. If so, damage to internal elastomeric and plastic parts, as well as internal metal parts is possible. Shrunk-fit pieces and threaded connections may also loosen. In general, if post weld heat treating is to be performed, all trim parts should be removed. Contact your Emerson sales office for additional information.

4. With a leak-off bonnet construction, remove the pipe plugs (key 14) to hook up the leak-off piping. If continuous operation is required during inspection or maintenance, install a three-valve bypass around the control valve assembly.
5. If the actuator and valve are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Valves with ENVIRO-SEAL live-loaded packing or HIGH-SEAL Heavy-Duty live-loaded packing will not require this initial re-adjustment. See the Fisher instruction manuals titled ENVIRO-SEAL Packing System for Sliding-Stem Valves or Heavy-Duty Live-Loaded Packing System (as appropriate) for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the Parts Kits sub-section near the end of this manual.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing lubrication, packing maintenance, trim maintenance, and ENVIRO-SEAL bellows seal replacement. All maintenance operations may be performed with the valve in the line.

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

CAUTION

Trim Cartridge is a single use repair solution. It is not recommended to remove and reinstall Trim Cartridge after initial installation so valve assemblies with Trim Cartridge will not support an open and inspect maintenance strategy. If the valve contains Trim Cartridge (Trim Cartridges can be identified by a name plate on the bonnet flange, the use of a packing nut, and “Fisher” embossed below the yoke mounting), please refer to Fisher ET and EZ easy-e Valves with Trim Cartridge Instruction Manual ([D104358X012](#)) for appropriate maintenance procedures.

Note

Whenever a gasket seal is disturbed by removing or shifting gasketed parts, a new gasket should be installed upon reassembly. This is necessary to ensure a good gasket seal since the used gasket may not seal properly.

If the valve has ENVIRO-SEAL or HIGH-SEAL live-loaded packing installed, refer to instruction manuals ENVIRO-SEAL Packing System for Sliding Stem Valves, [D101642X012](#), or HIGH-SEAL Live Loaded Packing System, [D101453X012](#), for packing instructions. Figure 6 shows a typical HIGH-SEAL packing system. Figures 7 and 8 show typical ENVIRO-SEAL systems.

Figure 3. PTFE V-Ring Packing Arrangements for Plain and Extension Bonnets

Packing Lubrication

Note

ENVIRO-SEAL or HIGH-SEAL packing does not require lubrication.

If an optional lubricator or lubricator/isolating valve (figure 2) is provided for PTFE/composition or other packings that require lubrication, it will be installed in an optional tapped hole in the bonnet. Use a good quality silicon-base lubricant. Packing used in oxygen service or in processes with temperatures over 260°C (500°F) should not be lubricated. To operate the lubricator, simply turn the cap screw clockwise to force the lubricant into the packing box. The lubricator/isolating valve must first be opened and then closed after lubrication is completed.

Figure 4. PTFE/Composition Packing Arrangements for Plain and Extension Bonnets

Packing Maintenance

This section covers PTFE V-ring, PTFE/composition, and graphite/ribbon packing as used in plain and extension bonnets. Unless otherwise indicated, key numbers refer to figure 3 for PTFE V-ring packing, figure 4 for PTFE/composition packing, and figure 5 for graphite ribbon/filament packing.

For spring-loaded single PTFE V-ring packing, the spring (key 8, figure 3) maintains a sealing force on the packing. If leakage is noted around the packing follower (key 13, figure 3), check to be sure the shoulder on the packing follower is touching the bonnet. If the shoulder is not touching the bonnet, tighten the packing flange nuts (key 5, figure 11), until the shoulder is against the bonnet. If leakage cannot be stopped in this manner, proceed to the Replacing Packing procedure.

If there is unacceptable packing leakage with other than spring-loaded packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts.

Note

Valve assemblies with Trim Cartridge utilize a packing nut design and are only available with ENVIRO-SEAL packing. If the valve contains Trim Cartridge (Trim Cartridges can be identified by a name plate on the bonnet flange, the use of a packing nut, and "Fisher" embossed below the yoke mounting), please refer to Fisher ET and EZ easy-e Valves with Trim Cartridge Instruction Manual ([D104358X012](#)) for appropriate packing maintenance instructions.

If the packing is relatively new and tight on the stem, and if tightening the packing flange nuts does not stop the leakage, the valve stem may be worn or nicked so that a seal cannot be made. The surface finish of a valve stem is critical for making a good packing seal. If the leakage comes from the outside diameter of the packing, the leakage

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

EZ Valve
August 2021

Instruction Manual
D100401X012

may be caused by nicks or scratches around the packing box wall. If performing any of the following procedures, inspect the valve stem and packing box wall for nicks and scratches.

An illustration of a HIGH-SEAL live-loaded packing system is shown in figure 6. Illustrations of ENVIRO-SEAL live-loaded packing systems are shown in figures 7, 8, and 9.

Replacing Packing

⚠ WARNING

Observe the warning at the start of the Maintenance section.

This section covers replacing packing used in plain and extension bonnets. PTFE V-ring packing is shown in figure 3, PTFE/composition packing is shown in figure 4, and graphite/ribbon packing is shown in figure 5.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut off all pressure lines to the power actuator, and release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Disconnect the operating lines from the actuator and any leak-off piping from the bonnet. Disconnect the stem connector and then remove the actuator from the valve by unscrewing the yoke locknut (key 15, figure 11).

⚠ WARNING

To avoid personal injury or property damage caused by uncontrolled movement of the bonnet, loosen the bonnet by following the instructions in the next step. Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet. If the seat ring retainer sticks to the bonnet, proceed carefully with bonnet removal.

Note

The following step also provides additional assurance that the valve body fluid pressure has been relieved.

3. Hex nuts (key 16, figure 11) attach the bonnet to the valve. Loosen these nuts or cap screws approximately 3 mm (1/8-inch). Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and valve body. Work the prying tool around the bonnet until the bonnet loosens.
4. Loosen the packing flange nuts (key 5, figure 11) so that the packing is not tight on the valve stem. Remove any travel indicator parts and stem locknuts from the valve stem threads.

CAUTION

Avoid damaging the seating surface caused by the valve plug and stem assembly dropping from the bonnet after being lifted part way out. When lifting the bonnet, temporarily install a valve stem locknut on the valve stem. This locknut will prevent the valve plug and stem assembly from dropping out of the bonnet.

5. Completely remove the cap screws (not shown) or hex nuts (key 16, figure 12) that bolt the bonnet and valve body together and carefully lift the bonnet off.
6. Remove the locknut and separate the valve plug and stem from the bonnet. Set the parts on a protective surface to prevent damage to gasket or seating surfaces.
7. Remove the bonnet gasket (key 10, figure 12) and cover the opening in the valve to protect the gasket surface and to prevent foreign material from getting into the valve body cavity.
8. Remove the packing flange nuts, packing flange, upper wiper, and packing follower (keys 5, 3, 12, and 13, figure 11). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall. Clean the packing box and the metal packing parts.

9. Inspect the valve stem threads and the packing box surfaces for any sharp edges which might cut the packing. Scratches or burrs could cause packing box leakage or damage to the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts.
10. Remove the covering protecting the valve cavity and install a new bonnet gasket (key 10, figure 12), making sure the gasket seating surfaces are clean and smooth. Then slide the bonnet over the stem and onto the stud bolts (key 15, figure 12), or onto the valve cavity if cap screws (not shown) are used instead.

Note

Proper performance of the tightening procedures in step 11 compresses the spiral wound gasket (key 12, figure 12) enough to both load and seal the seat ring gasket (key 13, figure 12). The tightening procedures also compresses the outer edge of the bonnet gasket (key 10, figure 12) enough to seal the body-to-bonnet joint.

The accepted bolting procedures referred to in step 11 include--but are not limited to--ensuring that bolting threads are clean, and evenly tightening the cap screws, or the nuts onto the studs, in a crisscross pattern. Because of the boltup characteristics of spiral wound gaskets, tightening one cap screw or nut may loosen an adjacent cap screw or nut. Repeat the crisscross tightening pattern several times until each cap screw or nut is tight and the body-to-bonnet seal is made.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

11. Install bolting, using accepted bolting procedures during tightening so that the body-to-bonnet joint can withstand test pressures and application service conditions. The bolt torques in table 2 may be used as guidelines unless accepted bolting procedures dictate otherwise.
12. Install new packing and the metal packing box parts according to the appropriate arrangement in figure 3, 4, or 5. If split-ring packing is being added, alternate the position of the splits to avoid a leak path. Place a smooth-edged pipe over the valve stem and gently tap each soft packing part into the packing box, being sure that air is not trapped between adjacent soft parts.

Installation of graphite ribbon packing requires special care to avoid trapping air between the rings. Start with only one ring at a time without forcing the top of the packing ring below the bottom of the entrance chamfer of the packing box. Thus, when a ring is added, the stack should not be pushed into the cavity more than the thickness of the added ring.

13. Slide the packing follower, upper wiper, and packing flange (keys 13, 12, and 3, figure 11) into position. Lubricate the packing flange studs (key 4, figure 11) and the faces of the packing flange nuts (key 5, figure 11). Install the packing flange nuts.

Note

The torque values discussed in step 14 and shown in table 3 are recommended guidelines only and are presented as a starting point for this procedure. Tightening the packing flange nuts to a torque value that exceeds the table guidelines, in order to obtain a seal, may indicate other problems.

14. For spring-loaded PTFE V-ring packing, tighten the packing flange nuts until the shoulder on the packing follower (key 13, figure 11) contacts the bonnet.

For graphite packing, tighten the packing flange nuts to the maximum recommended torque shown in table 3. Then, loosen the packing flange nuts, and retighten them to the recommended minimum torque shown in table 3.

For other packing types, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in table 3. Then, tighten the remaining flange nuts until the packing flange is level and at a 90-degree angle to the valve stem.

For ENVIRO-SEAL or HIGH-SEAL live-loaded packing, refer to the note at the beginning of the Maintenance section on page 5 of this manual.

15. Mount the actuator on the valve body and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual.

Table 3. Recommended Torque for Packing Flange Nuts (Not for Spring-Loaded Packing)

Trim Maintenance

WARNING

Observe the warning at the start of the Maintenance section.

CAUTION

Trim Cartridge is a single use repair solution. It is not recommended to remove and reinstall Trim Cartridge after initial installation so valve assemblies with Trim Cartridge will not support an open and inspect maintenance strategy. If the valve contains Trim Cartridge (Trim Cartridges can be identified by a name plate on the bonnet flange, the use of a packing nut, and “Fisher” embossed below the yoke mounting), please refer to Fisher ET and EZ easy-e Valves with Trim Cartridge Instruction Manual ([D104358X012](#)) for appropriate maintenance procedures.

This procedure describes how the valve trim can be completely disassembled. When inspection or repairs are required, perform only those steps necessary to accomplish the task.

Disassembly

Except where indicated, key numbers referenced in the following steps are found in figure 12.

1. Remove the actuator and the bonnet according to steps 1 through 6 of the Replacing Packing procedure of the Maintenance section.

⚠ WARNING

Avoid personal injury or property damage from valve or packing leakage.

Any damage to the gasket sealing surfaces could cause the valve to leak.

The surface finish of the valve stem (key 7) is critical for making a good packing seal. The inside surface of the seat ring retainer is critical for smooth operation of the valve plug.

The seating surfaces of the valve plug and seat ring (keys 2 and 9) are critical for proper shutoff.

Protect these parts accordingly while disassembling the trim. Gasket selection criteria is provided on page 34 of this instruction manual.

2. Packing parts can be removed if desired. Replace these parts as described in the Replacing Packing procedure.

Valves with Plain or Extension Bonnets

Perform the following steps to remove the valve trim.

1. Lift the valve plug and stem assembly [or the plug guide, disk retainer, and disk (keys 27, 28, and 29, figure 13) if used], out of the valve body and set it on a protective surface.

Note

With some valve plug sizes and configurations, the seat ring retainer and bushing assembly (keys 3 and 26, figures 12 and 13) will come out of the valve body with the valve plug and stem assembly, and in other valve plug sizes and configurations, the valve plug or tip will slide through the seat ring retainer and bushing assembly, leaving the retainer and bushing assembly in the valve body.

2. With the valve plug and stem assembly out of the valve, either slide the seat ring retainer and bushing assembly (keys 3 and 26), and gaskets and shim (keys 10, 12, and 25) up over the valve plug and stem or lift the seat ring retainer and bushing assembly and associated gaskets and shim out of the valve body. If the valve plug is to be reused, protect the valve plug seating surface to prevent scratches.

3. For valves with metal seats, drive out the pin (key 8) and unscrew the valve stem (key 7) from the valve plug (key 2).
4. For valves with 0.25 and 0.375-inch ports and composition seats, refer to figure 13. Drive out the pin (key 8) and unscrew the valve stem (key 7) from the valve plug guide (key 27). Unscrew the disk retainer (key 28) from the valve plug guide. Remove the disk (key 29) from the valve plug tip (key 30).

For valves with 0.5 through 2-inch ports and composition seats, refer to figure 13. Drive out the pin (key 8) and unscrew the valve stem (key 7) from the valve plug guide (key 27). Drive out pin (key 31) and unscrew the tip (key 30) from the valve plug guide. Remove the disk (key 29) from the valve plug guide.

For valves with 3 and 4-inch ports and composition seats, refer to figure 13. Drive out the pin (key 8) and unscrew the valve stem from the valve plug guide (key 27). Remove the cap screw (key 32) to remove the tip (key 30) from the valve plug guide. Remove the disk (key 29).

5. Remove the seat ring and seat ring gasket (keys 9 and 13).
6. Inspect parts for wear or damage that would prevent proper operation of the valve. Replace or repair trim parts according to the following Lapping Metal Seats or Assembly procedure as appropriate.

Valves with Overtravel (EZ-OVT) Trim

Perform the following steps to remove the valve trim.

1. Lift the bonnet flat sheet gasket, gasket shim, and spiral wound gasket (keys 10, 25, and 12) from the valve body. Discard the old gaskets.
2. Lift the valve plug and stem assembly (key 30, figure 13) out of the valve body and set it on a protective surface.

Note

The seat ring retainer and bushing assembly (keys 3 and 26) will come out of the valve body with the valve plug and stem assembly.

3. Lift the seat ring (key 9) out of the valve body. There will be a flat sheet gasket located between the seat ring and valve body shelf (key 13). If the gasket does not come out of the valve body with the seat ring, be sure to remove the gasket from the valve body. Discard the gasket and tape or otherwise protect the seating surface of the seat ring to prevent damage.
4. Inspect all parts for wear and damage which would prevent proper operation of the valve. All gasket surfaces on the trim parts and in the valve body must be cleaned of any graphite residue and must be free from nicks and scratches. The seating surfaces of the valve plug post and seat ring must be free from nicks, scratches, or any other damage which could affect the proper shutoff. Replace or repair trim parts as appropriate.

Note

If the soft seat disk is damaged, the entire plug assembly must be replaced.

Valves with ENVIRO-SEAL Bellows Seal Bonnets

Perform the following steps to remove the valve trim.

1. Lift the stem/bellows assembly with valve plug attached [or the plug guide, disk retainer, and disk (keys 27, 28, and 29, figure 13) if used], seat ring retainer and gaskets out of the valve body and set them on a protective surface.

Note

With some valve plug sizes and configurations, the seat ring retainer and bushing assembly (keys 3 and 26, figures 12 and 13) will come out of the valve body with the stem/bellows, and in other valve plug sizes and configurations, the valve plug or tip will slide through the seat ring retainer and bushing assembly, leaving the retainer and bushing assembly in the valve body.

2. If the seat ring retainer and bushing assembly (keys 3 and 26) stayed in the valve, lift them out along with gaskets and shim (keys 10, 12, and 25).
3. If the seat ring retainer and bushing assembly (keys 3 and 26) came out of the valve with the stem/bellows assembly, move the seat ring retainer and bushing assembly against the shoulder of the valve plug (key 2) or valve plug guide (key 27, figure 13) to provide access to the pin (key 36, figure 11).

VALVE STEM		BOLT TORQUE		DRILL SIZE, INCH	D DIMENSION	
mm	Inch	N•m	Lbf•ft		mm	Inch
9.5	3/8	40-47	25-35	3/32	16	0.625
12.7	1/2	81-115	60-85	1/8	19	0.75
19.0	3/4	237-339	175-250	3/16	25	1

Figure 10. Bolt Torque for Plug/Stem Connection and Plug/Adaptor Connection and Pin Replacement

4. Place the stem/bellows assembly and valve plug or valve plug guide in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug or valve plug guide that is not a seating or guiding surface. Drive out the pin (key 36, figure 11).
5. Remove the stem/bellows assembly from the soft-jaw chuck or vise. Place a wrench on the flat areas on the valve stem just below the threads for the actuator/stem connection to keep the stem from turning. Then, unscrew the adaptor (key 24, figure 11), which also includes the valve plug (key 2) or valve plug guide (key 27, figure 13), from the stem/bellows assembly (key 20, figure 11).
6. Remove the seat ring retainer and bushing assembly (keys 3 and 26) by sliding it over the adaptor. If the valve plug is to be reused, protect the valve plug seating surface to prevent scratches.
7. For valves with metal seats, drive out the pin (key 8) and unscrew the adaptor (key 24, figure 11) from the valve plug (key 2).
8. For valves with 0.25 and 0.375-inch ports and composition seats, refer to figure 13. Drive out the pin (key 8) and unscrew the adaptor (key 24, figure 11) from the valve plug guide (key 27). Unscrew the disk retainer (key 28) from the valve plug guide. Remove the disk (key 29) from the valve plug tip (key 30).

For valves with 0.5 through 2-inch ports and composition seats, refer to figure 13. Drive out the pin (key 8) and unscrew the adaptor (key 24, figure 11) from the valve plug guide (key 27). Drive out the pin (key 31) and unscrew the tip (key 30) from the valve plug guide. Remove the disk (key 29) from the valve plug guide.

For valves with 3 and 4-inch ports and composition seats, refer to figure 13. Drive out the pin (key 8) and unscrew the adaptor (key 24, figure 11) from the valve plug guide (key 27). Remove the cap screw (key 32) to remove the tip (key 30) from the valve plug guide. Remove the disk (key 29).

9. Remove the seat ring and seat ring gasket (keys 9 and 13).
10. Inspect parts for wear or damage that would prevent proper operation of the valve. Replace or repair trim parts according to the following Assembly procedure as appropriate.

Lapping Metal Seats on Valves with Plain and Extension Bonnets

CAUTION

To avoid damaging the ENVIRO-SEAL Bellows Seal Bonnet assembly, do not attempt to lap the metal seating surfaces on valves with ENVIRO-SEAL bellows seal bonnets. The design of the bonnet assembly prevents rotation of the stem and any forced lapping rotation will damage internal components of the ENVIRO-SEAL Bellows Seal bonnet.

With metal-seat constructions, seating surfaces of the valve plug and seat ring (key 2, figure 12) can be lapped for improved shutoff. (Deep nicks should be machined out rather than ground out.) Use a good quality lapping compound of a mixture of 280 to 600-grit. Apply the compound to the bottom of the valve plug.

Assemble the valve to the extent that the seat ring retainer is in place and the bonnet is bolted to the valve body. A simple handle can be made from a piece of strap iron locked to the valve plug stem with nuts. Rotate the handle alternately in each direction to lap the seats. After lapping, remove the bonnet and clean the seat surfaces. Completely assemble as described in the assembly portion of the Trim Maintenance procedure and test the valve for shutoff. Repeat the lapping procedure if leakage is still excessive.

Note

EZ valves with Overtravel (EZ-OVT) trim should not be lapped.

Assembly

This procedure assumes that all the trim and associated gaskets were removed from the valve body. If these parts were not all removed, start the assembly procedure at the appropriate step. Except where indicated, key numbers referenced in the following steps are found in figure 12.

Valves with Plain or Extension Bonnets

Perform the following steps to assemble and install the trim.

CAUTION

To avoid weakening the stem that may cause failure in service, never reuse an old stem with a new valve plug. Using an old stem with a new plug requires drilling a new pin hole in the stem, which will weaken the stem. However, a used valve plug may be reused with a new stem.

1. For valves with metal seats, screw the valve stem (key 7) into the valve plug (key 2). Tighten to the torque value given in figure 10. Refer to figure 10 to select the proper drill size. Drill through the stem using the hole in the valve plug as a guide. Remove any chips or burrs and drive in a new pin (key 8) to lock the assembly.
2. For valves with 0.25 and 0.375-inch ports and composition seats, refer to figure 13. Place the disk (key 29) on the valve plug tip (key 30). Place the disk retainer (key 28) over the disk, and then thread the disk retainer onto the valve plug guide (key 27).

CAUTION

To avoid failure in service for valves with 0.5 through 1-inch ports and composition seats, never reuse an old valve plug guide with a new valve plug tip. Using an old valve plug guide with a new plug tip requires drilling a new pin hole in the valve plug guide, which will weaken the guide. However, a used valve plug tip may be reused with a new valve plug guide.

For valves with 0.5 through 1-inch ports and composition seats, refer to figure 13. Insert the disk (key 29) in the valve plug guide (key 27). Screw the tip (key 30) onto the valve plug guide to clamp the disk in place. Using a 3/32-inch bit, drill through the valve plug guide using the hole in the tip as a drilling guide. Remove any chips or burrs and drive in a new pin (key 31).

CAUTION

To avoid failure in service for valves with 1.5 and 2-inch ports and composition seats, never reuse an old valve plug tip with a new valve plug guide. Using an old valve plug tip with a new valve plug guide requires drilling a new pin hole in the valve plug tip which will weaken the tip. However, a used valve plug guide may be reused with a new valve plug tip.

For valves with 1.5 and 2-inch ports and composition seats, refer to figure 13. Insert the disk (key 29) in the valve plug guide (key 27). Screw the tip (key 30) into the valve plug guide to clamp the disk in place. Using a 3/32-inch bit, drill through the valve plug tip using the hole in the valve plug guide as a drilling guide. Remove any chips or burrs and drive in a new pin (key 31).

For valves with 3 and 4-inch ports and composition seats, refer to figure 13. Insert the disk (key 29) in the valve plug guide (key 27). Place the tip (key 30) against the valve plug guide to clamp the disk in place. Insert the cap screw (key 32) through the tip and thread it into valve plug guide to secure the tip to the valve plug guide.

CAUTION

To avoid failure in service, never reuse an old stem with a new valve plug guide. Using an old stem with a new valve plug guide requires drilling a new pin hole in the stem, which will weaken the stem. However, a used valve plug guide may be reused with a new stem except for valves with 0.5 through 1-inch ports and composition seats (see to figure 13). For these constructions, a used valve plug guide should only be used if the tip is reused.

3. For all valves with composition seats, screw the valve stem (key 7) into the valve plug guide (key 27, figure 13). Tighten to the torque value given in figure 10. Refer to figure 10 to select the proper drill size. Drill through the stem, using the hole in the valve plug guide as a drilling guide. Remove any chips or burrs and drive in a new pin (key 8) to lock the assembly.

4. Install the seat ring gasket (key 13), and replace the seat ring (key 9).

Note

With some valve plug sizes and configurations, the valve plug or tip will slide through the seat ring retainer and bushing assembly (keys 3 and 26), and in other configurations it won't.

5. If the valve plug (key 2) or valve plug tip (key 30, figure 13) will not slide through the seat ring retainer and bushing assembly (keys 3 and 26), proceed as follows:
 - a. Place the seat ring retainer and bushing assembly (keys 3 and 26) over the stem of valve plug and stem assembly or over the stem of the valve plug guide and stem assembly.
 - b. Install the seat ring retainer and bushing assembly, which also includes the valve plug and stem assembly or valve plug guide and stem assembly, on the top of the seat ring, ensuring that the seat ring retainer slips onto the seat ring properly. Any rotation orientation of the seat ring retainer with respect to the valve body is acceptable.
 - c. Place the spiral wound gasket, shim, and bonnet gasket (keys 12, 25, and 10) on the shoulder of the seat ring retainer.
6. If the valve plug (key 2) or the valve plug tip (key 30, figure 13) will slide through the seat ring retainer and bushing assembly (keys 3 and 26), proceed as follows:
 - a. Install the seat ring retainer and bushing assembly on the top of the seat ring, ensuring that the seat ring retainer slips onto the seat ring properly. Any rotation orientation of the seat ring retainer with respect to the valve body is acceptable.
 - b. Place the spiral wound gasket, shim, and bonnet gasket (keys 12, 25, and 10) on the shoulder of the seat ring retainer.
 - c. Slide the valve plug and stem assembly or the valve plug guide and stem assembly into the seat ring retainer and bushing assembly (keys 3 and 26).
7. Mount the bonnet on the valve body and complete the assembly according to steps 10 through 15 of the Replacing Packing procedure, omitting steps 12 and 13 if new packing is not being installed, and being sure to observe the note prior to step 11.

Valves with Overtravel (EZ-OVT) Trim

Perform the following steps to assemble and install the trim

1. Install the seat ring gasket (key 13) and replace the seat ring (key 9).
2. Place the seat ring retainer and bushing assembly (key 3) over the stem of the valve plug and stem assembly (key 30, figure 13).
3. Install the seat ring retainer and bushing assembly, which also includes the valve plug and stem assembly, on top of the seat ring. Ensure that the seat ring retainer slips onto the seat ring properly. Any rotation orientation of the seat ring retainer with respect to the valve body is acceptable.
4. Place the spiral wound gasket, shim, and bonnet gasket (keys 12, 25, 10) on the shoulder of the seat ring retainer.

5. Mount the bonnet on the valve body and complete the assembly according to steps 10 through 15 of the Replacing Packing procedure, omitting steps 12 and 13 if new packing is not being installed. Be sure to observe the note prior to step 11.

Note

When connecting the valve stem to the stem connecting block on the actuator, extra stem force is required on the valve plug to ensure proper seating of the plug to the seat ring. This is required to deform the soft seat disk ensuring a backup metal-to-metal mating surface between the valve plug guide post and the seat ring.

Valves with ENVIRO-SEAL Bellows Seal Bonnets

Perform the following steps to assemble and install the trim.

1. For valves with 0.25 and 0.375-inch ports and composition seats, refer to figure 13. Place the disk (key 29) on the valve plug tip (key 30). Place the disk retainer (key 28) over the disk, and then thread the disk retainer onto the valve plug guide (key 27).

CAUTION

To avoid failure in service of valves with 0.5 through 1-inch ports and composition seats, never reuse an old valve plug guide with a new valve plug tip. Using an old valve plug guide with a new plug tip requires drilling a new pin hole in the valve plug guide, which will weaken the guide. However, a used valve plug tip may be reused with a new valve plug guide.

For valves with 0.5 through 1-inch ports and composition seats, refer to figure 13. Insert the disk (key 29) in the valve plug guide (key 27). Screw the tip (key 30) onto the valve plug guide to clamp the disk in place. Using a 3/32-inch bit, drill through the valve plug guide using the hole in the tip as a drilling guide. Remove any chips or burrs and drive in a new pin (key 31).

CAUTION

To avoid failure in service of valves with 1.5 and 2-inch ports and composition seats, never reuse an old valve plug tip with a new valve plug guide. Using an old valve plug tip with a new valve plug guide requires drilling a new pin hole in the valve plug tip, which will weaken the tip. However, a used valve plug guide may be reused with a new valve plug tip.

For valves with 1.5 and 2-inch ports and composition seats, refer to figure 13. Insert the disk (key 29) in the valve plug guide (key 27). Screw the tip (key 30) into the valve plug guide to clamp the disk in place. Using a 3/32-inch bit, drill through the valve plug tip using the hole in the valve plug guide as a drilling guide. Remove any chips or burrs and drive in a new pin (key 31).

For valves with 3 and 4-inch ports and composition seats, refer to figure 13. Insert the disk (key 29) in the valve plug guide (key 27). Place the tip (key 30) against the valve plug guide to clamp the disk in place. Insert the cap screw (key 32) through the tip and thread it into valve plug guide to secure the tip to the valve plug guide.

CAUTION

To avoid weakening the adaptor that may cause failure in service, never reuse an old adaptor with a new valve plug or valve plug guide. Using an old adaptor with a new valve plug or valve plug guide requires drilling a new pin hole in the adaptor, which will weaken the adaptor. However, a used valve plug or valve plug guide may be reused with a new adaptor.

2. Thread the valve plug (key 2) or, the valve plug guide (key 27, figure 13) if the valve has composition seats, onto the adaptor (key 24, figure 11). Tighten to the torque value given in figure 10.

Note

Valve plugs may not be pre-drilled. Follow the procedure in the following step.

3. If the valve plug is not pre-drilled, drill a hole according to figure 10. Otherwise, select the proper drill size (figure 10) and drill through the adaptor using the hole in the valve plug as a guide. Remove any chips or burrs and drive in a new pin (key 8) to lock the assembly.

Note

With some valve plug sizes and configurations, the valve plug or tip will slide through the seat ring retainer and bushing assembly, and in other configurations it will not.

4. If the valve plug (key 2) or valve plug tip (key 30, figure 13) will not slide through the seat ring retainer and bushing assembly (keys 3 and 26), proceed as follows:
 - a. Slide the seat ring retainer and bushing assembly (keys 3 and 26) over the adaptor (key 24, figure 11) so that the bushing rests on the shoulder of the valve plug or valve plug guide.
 - b. Place the spiral wound gasket, shim, and bonnet gasket (keys 12, 25, and 10) on the shoulder of the seat ring retainer.
 - c. Place a wrench on the flat areas of the stem just below the threads for the actuator/stem connection to keep the stem from turning.
 - d. Screw the adaptor (key 24, figure 11), which also includes the valve plug or valve plug guide and seat ring retainer and bushing assembly and gaskets, onto the stem/bellows assembly (key 20, figure 11). Tighten the adaptor until it is snug. Then, turn the adaptor until the valve stem hole lines up with the next adaptor pin hole. Drive in a new pin (key 36) to lock the assembly.
 - e. Install the seat ring gasket (key 13), and replace the seat ring (key 9).
 - f. Install the seat ring retainer and bushing assembly, which also contains the valve plug/adaptor assembly or valve plug guide/adaptor assembly, on the top of the seat ring, ensuring that the seat ring retainer slips onto the seat ring properly. Any rotation orientation of the seat ring retainer with respect to the valve body is acceptable.
 - g. Place a new gasket (key 22, figure 11) over the stem and bellows assembly.
5. If the valve plug (key 2) or the valve plug tip (key 30, figure 13) will slide through the seat ring retainer and bushing assembly (keys 3 and 26), proceed as follows:
 - a. Place a wrench on the flat areas of the stem just below the threads for the actuator/stem connection to keep the stem from turning.
 - b. Screw the adaptor (key 24, figure 11), which also includes the valve plug or valve plug guide onto the stem/bellows assembly (key 20, figure 11). Tighten the adaptor until it is snug. Then, turn the adaptor until the valve stem hole lines up with the next adaptor pin hole. Drive in a new pin (key 36) to lock the assembly.
 - c. Install the seat ring gasket (key 13), and replace the seat ring (key 9).

- d. Install the seat ring retainer and bushing assembly on the top of the seat ring, ensuring that the seat ring retainer slips onto the seat ring properly. Any rotation orientation of the seat ring retainer with respect to the valve body is acceptable.
 - e. Place the spiral wound gasket, shim, and bonnet gasket (keys 12, 25, and 10) on the shoulder of the seat ring retainer.
 - f. Slide the valve plug/adaptor assembly or the valve plug guide/adaptor assembly and the connected stem and bellows assembly into the seat ring retainer and bushing assembly (keys 3 and 26).
 - g. Place a new gasket (key 22, figure 11) over the stem and bellows assembly.
6. Mount the bonnet on the valve body and complete the assembly according to steps 10 through 15 of the Replacing Packing procedure, omitting steps 12 and 13 if new packing is not being installed, and being sure to observe the note prior to step 11.

ENVIRO-SEAL Bellows Seal and Bonnet

Replacing a Plain or Extension Bonnet with an ENVIRO-SEAL Bellows Seal (Stem/Bellows Assembly) and Bonnet

Instructions are provided for replacing a plain or extension bonnet with an ENVIRO-SEAL bellows seal bonnet when the existing valve has a metal seat. If the valve has a composition seat, refer to figure 13 and to composition seat information in the Valves with ENVIRO-SEAL Bellows Seal Bonnet procedure of the Trim Maintenance section.

1. Remove the actuator and bonnet according to steps 1 through 6 of the Replacing Packing procedure of the Maintenance section.

Note

With some valve plug sizes and configurations, the valve plug will slide through the seat ring retainer and bushing assembly, and in other configurations it won't. If the valve plug will not slide through the seat ring retainer and bushing assembly, then the valve plug and stem assembly and the seat ring retainer and bushing assembly must be removed together.

2. Using care, remove the valve plug and stem assembly, and, if necessary, the seat ring retainer and bushing assembly from the valve body.
3. Remove and discard the existing bonnet gasket (key 10, figure 12). Cover the valve body opening to protect sealing surfaces and to prevent foreign material from entering the valve body cavity.

Note

The ENVIRO-SEAL stem/bellows assembly for easy-e valves is available only with a threaded and drilled plug/adaptor connection. The existing valve plug can be reused with the new stem/bellows assembly or a new plug can be installed.

4. Inspect the existing valve plug. If the plug is in good condition, it can be reused with the new ENVIRO-SEAL stem/bellows assembly. To remove the existing valve plug from the stem, first, place the existing plug stem assembly in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out or drill out the pin (key 8, figure 12).
5. Place a wrench on the flat areas on the existing valve stem just below the threads for the actuator/stem connection. Then, unscrew the stem from the valve plug (key 2, figure 12).

CAUTION

When installing a valve plug on the ENVIRO-SEAL stem/bellows assembly, the valve stem must not be rotated. Damage to the bellows may result.

Do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

Note

The ENVIRO-SEAL stem/bellows assembly has a one-piece stem.

Table 4. Recommended Torque for ENVIRO-SEAL Bellows Seal Packing Flange Nuts

VALVE SIZE, NPS	VALVE STEM DIAMETER THROUGH PACKING	MINIMUM TORQUE		MAXIMUM TORQUE	
		N•m	Lbf•in	N•m	Lbf•in
1/2 - 2	1/2	2	22	4	33
3 - 4	1	5	44	8	67

6. To attach the valve plug to the stem of the new ENVIRO-SEAL stem/bellows assembly, it is necessary to first attach the valve plug to the adaptor (key 24, figure 11). Locate the adaptor. Notice that a hole has not been drilled in the adaptor threads where the valve plug screws onto the adaptor.

Secure the valve plug in a soft-jaw chuck or other type of vise. Do not grip the plug on any seating surface. Position the plug in the chuck or vise for easy threading of the adaptor. Thread the adaptor into the valve plug and tighten to the torque value given in figure 10.

Note

Valve plugs may not be pre-drilled. Follow the procedure in the following step.

7. If the valve plug is not pre-drilled, drill a hole according to figure 10. Otherwise, select the proper size of drill bit (figure 10) and drill through the adaptor using the hole in the valve plug as a guide. Remove any metal chips or burrs and drive in a new pin (key 8, figure 12) to lock the valve plug/adaptor assembly together.

Note

For some valve plug configurations, you must place the valve plug/adaptor assembly inside the seat ring retainer and bushing assembly before attaching the adaptor to the stem extending from the bottom of the ENVIRO-SEAL stem/bellows assembly. If this task is necessary, then place the spiral wound gasket, shim, and bonnet gasket (keys 12, 25, and 10, figure 12) on the shoulder of the seat ring retainer. Check the existing seat ring retainer and bushing assembly for clearances. If necessary, use appropriate procedures to support the seat ring retainer while screwing the valve plug/adaptor assembly onto the valve stem extending from the ENVIRO-SEAL stem/bellows assembly.

8. Place a wrench on the flat areas of the valve stem just below the threads for the actuator/stem connection to keep the stem from turning.
9. Screw the adaptor (key 24, figure 11), which also includes the valve plug or valve plug guide and may include the seat ring retainer and bushing assembly and gaskets, onto the valve stem. Tighten the adaptor until it is

finger-tight. Then, tighten the adaptor with a wrench until the valve stem hole lines up with the next adaptor pin hole. Drive in a new pin (key 36, figure 11) to lock the assembly. Make certain the spiral wound gasket, shim, and bonnet gasket (keys 12, 25, and 10, figure 12) are located on the shoulder of the seat ring retainer.

10. Inspect the seat ring. Replace, if necessary.
11. Install the new stem/bellows assembly with valve plug/adaptor by placing it into the valve body.
12. Place a new gasket (key 22, figure 11) over the stem/bellows assembly. Place the new ENVIRO-SEAL bonnet over the stem/bellows assembly.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

13. Properly lubricate the bonnet stud bolts. Install and tighten the bonnet hex nuts to the proper torque.
14. Install new packing and the metal packing box parts according to the appropriate arrangement in figure 14 or 15.
15. Install the packing flange. Properly lubricate the packing flange stud bolts and the faces of the packing flange nuts.

For **graphite packing**, tighten the packing flange nuts to the maximum recommended torque shown in table 4. Then, loosen the packing flange nuts, and retighten them to the recommended minimum torque shown in table 4.

For **other packing types**, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in table 4. Then, tighten the remaining flange nuts until the packing flange is level and at a 90-degree angle to the valve stem.
16. Install travel indicator parts, stem locknuts, and mount the actuator on the valve body according to the procedure in the appropriate actuator instruction manual.

Replacing an Installed ENVIRO-SEAL Bellows Seal (Stem/Bellows Assembly)

Instructions are provided for replacing an ENVIRO-SEAL bellows seal (stem/bellows assembly) when the existing valve has a metal seat. If the valve has a composition seat, refer to figure 13 and to composition seat information in the Valves with ENVIRO-SEAL Bellows Seal Bonnet procedure of the Trim Maintenance section.

1. Remove the actuator and bonnet according to steps 1 through 5 of the Replacing Packing procedure of the Maintenance section.

Note

With some valve plug sizes and configurations, the valve plug will slide through the seat ring retainer and bushing assembly, and in other configurations it won't. If the valve plug will not slide through the seat ring retainer and bushing assembly, then the valve plug and stem assembly and the seat ring retainer and bushing assembly must be removed together.

- Using care, remove the valve plug and stem assembly, and, if necessary, the seat ring retainer and bushing assembly from the valve body. Remove and discard the existing bonnet gasket (key 10, figure 12) and gasket (key 22, figure 11). Cover the valve body opening to protect sealing surfaces and to prevent foreign material from entering the valve body cavity.

CAUTION

The ENVIRO-SEAL stem/bellows assembly for easy-e valves is available only with a threaded and pinned adaptor/stem connection. The existing valve plug can be reused with the new stem/bellows assembly or a new plug can be installed. If the existing valve plug is reused, and the adaptor is in good condition, it may be reused also. However, to avoid weakening the adaptor that may cause failure in service, never reuse an old adaptor with a new valve plug. Using an old adaptor with a new plug requires drilling a new pin hole in the adaptor, which will weaken the adaptor. However, a used valve plug may be reused with a new adaptor.

- Inspect the existing valve plug and adaptor. If they are in good condition, they can be reused with the new stem/bellows assembly, and they do not need to be separated.

CAUTION

When removing/installing a valve plug on the ENVIRO-SEAL stem/bellows assembly, the valve stem must not be rotated. Damage to the bellows may result.

Do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

Note

The ENVIRO-SEAL stem/bellows assembly has a one-piece stem.

- If the existing valve plug and adaptor are not in good condition and must be replaced, first, place the existing stem/bellows assembly and valve plug and adaptor assembly in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out or drill out pin (key 8, figure 12). Drive out pin (key 36, figure 11).
- Use a wrench on the flat areas on the valve stem just below the threads for the actuator/stem connection in a soft-jaw chuck or vice to keep the stem from turning. Then, unscrew the valve plug from the adaptor and the adaptor from the stem/bellows assembly.
- To attach either the existing valve plug or a new one to the stem of the new ENVIRO-SEAL stem/bellows assembly, it is necessary to first attach the valve plug to the adaptor (key 24, figure 11), if the valve plug was removed from the adaptor. Locate the adaptor. Notice that a hole has not been drilled in the new adaptor threads where the valve plug screws onto the adaptor.

If installing either a new valve plug and/or a new adaptor, secure the valve plug in a soft-jaw chuck or other type of vise. Do not grip the plug on any seating surface. Position the plug in the chuck or vise for easy threading of the adaptor. Thread the adaptor into the valve plug and tighten to the torque values given in figure 10.
- Complete the installation by following steps 7 through 16 of the Replacing a Plain or Extension Bonnet with an ENVIRO-SEAL Bellows Seal and Bonnet procedure provided in the previous section.

Purging the ENVIRO-SEAL Bellows Seal Bonnet

The ENVIRO-SEAL bellows seal bonnet has been designed so that it can be purged or leak tested. Refer to figure 11 for an illustration of an ENVIRO-SEAL bellows seal bonnet, and perform the following steps for purging or leak testing.

1. Remove the two diametrically opposed pipe plugs (key 16).
2. Connect a purging fluid to one of the pipe plug connections.
3. Install appropriate piping or tubing in the other pipe plug connection to pipe away the purging fluid or to make a connection to an analyzer for leak testing.
4. When purging or leak testing has been completed, remove the piping or tubing and reinstall the pipe plugs (key 16).

Parts Ordering

Each valve is assigned a serial number which can be found on the valve body. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts, refer to the serial number and to the 11-character part number for each part required from the following parts list.

Note

If the valve contains Trim Cartridge (Trim Cartridges can be identified by a name plate on the bonnet flange, the use of a packing nut, and "Fisher" embossed below the yoke mounting), please refer to Fisher ET and EZ easy-e Valves with Trim Cartridge Instruction Manual ([D104358X012](#)) for parts ordering guidance.

Parts Kits

Gasket parts kits are in key 10 table.

Packing Kits (non-live-loaded)

REPAIR KIT MATERIAL	STEM DIAMETER, mm (INCH) YOKE BOSS DIAMETER, mm (INCH)		
	9.5 (3/8) 54 (2-1/8)	12.7 (1/2) 71 (2-13/16)	19.1 (3/4) 90 (3-9/16)
	Part Number		
PTFE (Contains keys 6, 8, 10, 11, and 12)	RPACKX00012	RPACKX00022	RPACKX00032
Double PTFE (Contains keys 6, 8, 11, and 12)	RPACKX00042 ⁽¹⁾⁽²⁾	RPACKX00052 ⁽¹⁾	RPACKX00062 ⁽¹⁾
PTFE/Composition (Contains keys 7, 8, 11, and 12)	RPACKX00072	RPACKX00082	RPACKX00092
Single Graphite Ribbon/Filament (Contains keys 7 [ribbon ring], 7 [filament ring], 8, and 11)	RPACKX00102	RPACKX00112	RPACKX00122
Double Graphite Ribbon/Filament (Contains keys 7 [ribbon ring], 7 [filament ring], 8, and 11)	RPACKX00162	RPACKX00172	RPACKX00182
1. These parts kits contain one extra lower wiper (key 30). Discard this extra part upon assembly. 2. This parts kit contains one extra packing ring (key 7). Discard this extra part upon assembly.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for Fisher EZ-C, ET-C and EWT-C valves (see figure 1). Refer to separate manuals for instructions covering the actuator and accessories.

Do not install, operate, or maintain EZ-C, ET-C or EWT-C valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

EZ-C: globe-style, single-port, unbalanced valves with integral end connections, post guiding, metal-to-metal seating, and quick-change trim. They feature stainless steel construction materials and extension bonnets.

ET-C and EWT-C: metal-to-metal seated globe-style, single-port, cage-guided, pressure-balanced valves featuring stainless steel construction materials and extension bonnets.

Table 1. Specifications

Valve Sizes

EZ-C: NPS 1, 1-1/2, 2, 3, and 4
 ET-C: NPS 3, 4, 6, and 8
 EWT-C: NPS 6X4⁽¹⁾, 8X4, 8X6, 12X6, and 10X8

End Connection Styles⁽²⁾

CL150, 300, and 600 raised-face flanges per ASME B16.5

Maximum Inlet Pressure⁽²⁾

CL150 and 300—Valves are consistent with pressure-temperature ratings per ASME B16.34

CL600—Valves with B8M Class 2 bolting are consistent with CL600 pressure-temperature ratings per ASME B16.34 except as shown below:

EZ-C VALVES		
Valve Size, NPS	Maximum Inlet Pressure	
	Bar	Psig
1	77	1110
2	83	1200
3	94	1370

ET-C AND EWT-C VALVES		
Valve Size, NPS	Maximum Inlet Pressure	
	Bar	Psig
3	94	1370
6, 8 x 6, 12 x 6	75	1085
8, 10 x 8	96	1390

CL600—Valves with optional S20910 (XM-19) bolting are consistent with CL600 pressure-temperature ratings per ASME B16.34

Shutoff Classifications per ANSI/FCI 70-2 and IEC 60534-4

VALVE	SHUTOFF CLASS
EZ-C	Class IV—Standard
	Class VI—Optional
ET-C and EWT-C	Class IV—Standard
	Class V Air Test ⁽³⁾ —Optional

Material Temperature Capability⁽²⁾

EZ-C: -198 to 149°C (-325 to 300°F)

ET-C and EWT-C:
 -198 to 66°C (-325 to 150°F)

Maximum Allowable Actuator Thrust

See table 2

Flow Characteristics

EZ-C: Equal percentage, linear, and quick opening
 ET-C and EWT-C: Equal percentage and linear

Flow Directions

EZ-C: Up through the seat ring only
 ET-C and EWT-C: Normally down⁽⁴⁾

Approximate Weights

EZ-C:

NPS 1: 11 kg (33 lb)

NPS 1-1/2: 23 kg (48 lb)

NPS 2: 41 kg (90 lb) / 43 kg (95 lb)⁽⁵⁾

NPS 3: 60 kg (130 lb)

NPS 4: 95 kg (210 lb)

ET-C:

NPS 3: 51 kg (135 lb)

NPS 4: 95 kg (210 lb)

NPS 6: 211 kg (465 lb) / 216 kg (476 lb)⁽⁵⁾

NPS 8: 372 kg (820 lb)

EWT-C

NPS 6X4: 200 kg (440 lb)

NPS 8X4: 277 kg (610 lb)

NPS 8X6: 318 kg (700 lb)

NPS 12X6: 730 kg (1610 lb) / 323 kg (711 lb)⁽⁵⁾

NPS 10X8: 753 kg (1660 lb) / 735 kg (1621 lb)⁽⁵⁾

1. Valve size number is end connection size by normal trim size. For example, an NPS 6X4 valve has NPS 6 end connections with NPS 4 trim.

2. Do not exceed the pressure/temperature limits in this manual and any applicable code limitation.

3. Class V Air Test is optional. Test will be 50 psid air. Class V shutoff cannot be performed with water. The residual trapped moisture from testing with water can cause valve and trim damage from ice crystals formed at below freezing service temperatures.

4. Down is in through the cage and out the seal ring. (see figure 9).

5. Weight with one-piece extension bonnet. The one-piece extension bonnet for this valve size is larger than the fabricated extension bonnet.

Installation

Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. Remove actuator supply pressure, and use lockout procedures to be sure that the above measures stay in effect while you work on the equipment. Refer to the Warnings at the beginning of the Maintenance section for additional information.

WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

The valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions indicated when the valve was ordered. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. To avoid possible personal injury and because some valve/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

NOTICE

Before installing the valve, inspect the valve and pipelines for any damage and any foreign material which may cause product damage.

1. Before installing the valve, inspect the valve and associated equipment for any damage and any foreign material.
2. Make certain the valve body interior is clean, that pipelines are free of foreign material, and that the valve is oriented so that pipeline flow is in the same direction as the arrow on the side of the valve.
3. **Gas Service:** The normal method of mounting for gas service is with the actuator vertical above the valve body. However, the control valve assembly may be installed in any orientation unless limited by seismic criteria. Other positions may result in uneven valve plug and cage wear that could result in improper operation. For mounting assistance, consult your Emerson sales office.

NOTICE

To avoid possible damage to the packing, do not allow the installed actuator angle to be so flat as to allow liquid inside the bonnet to come in contact with the packing.

Also, if insulation is applied, do not let the insulation run up the extension bonnet. This could cause the packing to freeze and be damaged.

Liquid Service: The preferred method of mounting for liquid service is with the actuator vertical above the valve body. This will allow a vapor layer to form between the liquid and the packing. If there are piping constraints, the actuator can be angled slightly from vertical. However, in no case should the angle be so flat as to allow liquid inside the bonnet to come in contact with the packing. For mounting assistance, consult your Emerson sales office.

4. If insulation is applied, make sure it is applied only to the body/bonnet joint. Do not let the insulation run up the extension bonnet.
5. Use accepted piping and welding practices when installing the valve in the line. For flanged valve bodies, use a suitable gasket between the valve body and pipeline flanges.
6. If the actuator and valve are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions.

Valves with ENVIRO-SEAL™ live-loaded packing will not require this initial readjustment. See the Fisher instruction manual titled ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)) for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the parts kit sub-section near the end of this manual.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing maintenance and trim maintenance. All maintenance operations may be performed with the valve in the line.

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

NOTICE

Follow instructions carefully to avoid damaging the product surfaces, which could result in damage to the product.

Note

Whenever a gasket seal is disturbed by removing or shifting parts, a new gasket should be installed upon reassembly. This is necessary to ensure a good gasket seal since the used gasket may not seal properly.

Figure 2. Single PTFE V-Ring Packing Arrangement

Figure 3. Double PTFE V-Ring Packing Arrangements

NOTE:

(1) PACKING SET (KEY 6) CONTAINS A FEMALE ADAPTER, V-RING PACKING RINGS, MALE ADAPTER, AND LOWER WIPER RINGS.

Figure 4. Graphite Ribbon/Filament Packing Arrangements

NOTE:

(1) 0.102 mm (0.004 INCH) THICK SACRIFICIAL ZINC WASHERS: USE ONLY ONE BELOW EACH GRAPHITE RIBBON RING.

A6747

Packing Maintenance

This section covers PTFE V-ring, double PTFE, and graphite packing used in extension bonnets (figures 2, 3, and 4).

Note

If the valve has ENVIRO-SEAL live-loaded packing installed, refer to the instruction manual ENVIRO-SEAL Packing System for Sliding Stem Valves for packing instructions. Figure 6 shows typical ENVIRO-SEAL arrangements.

Standard packing key numbers are shown in figures 2, 3, and 4. ENVIRO-SEAL packing key numbers are shown in figure 6. Bonnet key number locations are shown in figure 7, and valve key numbers are shown in figures 8 and 9.

For spring-loaded single PTFE V-ring packing, the spring (key 8) maintains a sealing force on the packing. If leakage is noted around the packing follower (key 13), check to be sure the shoulder on the packing follower is touching the bonnet. If the shoulder is not touching the bonnet, tighten the packing flange nuts (key 5), until the shoulder is against the bonnet. If leakage cannot be stopped in this manner, proceed with replacing packing procedures.

If there is undesirable packing leakage with other than spring-loaded packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts.

If the packing is relatively new and tight on the stem, and if tightening the packing flange nuts does not stop the leakage, it is possible that the valve stem is worn or nicked so that a seal cannot be made. The surface finish of a new valve stem is critical for making a good packing seal. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches around the packing box wall. If performing any of the following procedures, inspect the valve stem and packing box wall for nicks and scratches.

Replacing Packing

WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

Key numbers and sequence of assembly of packing parts are shown in figures 2, 3, and 4. Bonnet key number locations are shown in figure 7, and valve key number locations are shown in figures 8 and 9, unless otherwise noted.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut off all pressure lines to the power actuator, and release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment. Observe the **Warnings** at the start of the Maintenance section.
2. Disconnect the operating lines from the actuator and any leak-off piping from the bonnet. Disconnect the stem connector and remove the actuator from the valve by unscrewing the yoke locknut (key 15) or hex nuts (key 26, not shown).
3. Loosen the packing flange nuts (key 5) so that the packing is not tight on the valve stem. Remove any travel indicator parts and stem locknuts from the valve stem threads.

WARNING

- To avoid personal injury or property damage caused by uncontrolled movement of the bonnet, loosen the bonnet by following the instructions in the next steps.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

EZ-C, ET-C, and EWT-C Valves

November 2022

Instruction Manual

D102175X012

Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet.

- To avoid personal injury or damage to the seating surface caused by the valve plug and stem assembly dropping from the bonnet after being lifted out of the valve body, observe the following instructions.

4. When lifting an EZ-C bonnet, temporarily install a valve stem locknut on the valve stem. This locknut will prevent the valve plug and stem assembly from dropping out of the bonnet.
5. When lifting an ET-C or EWT-C bonnet, be sure the plug and stem assembly and cage remain in the valve body.

⚠ WARNING

To avoid possible personal injury, review your process shutdown procedures to be sure process pressure is not applied to the valve for the following procedure.

6. Hex nuts (key 16) attach the bonnet to the valve body (key 1). Loosen these nuts or cap screws approximately 3 mm (1/8 inch). Then, loosen the body-to-bonnet joint by either rocking the bonnet or prying between the bonnet and valve body. Work with a prying tool around the bonnet until the bonnet loosens.

Table 3. Recommended Torque for Packing Flange Nuts

VALVE STEM DIAMETER		PRESSURE RATING	GRAPHITE PACKING				PTFE PACKING			
			Minimum Torque		Maximum Torque		Minimum Torque		Maximum Torque	
			N•m	Lbf-in	N•m	Lbf-in	N•m	Lbf-in	N•m	Lbf-in
9.5	3/8	150	3	27	5	40	1	13	2	19
		300	4	36	6	53	2	17	3	26
		600	6	49	8	73	3	23	4	35
12.7	1/2	150	5	44	8	66	2	21	4	31
		300	7	59	10	88	3	28	5	42
		600	9	81	14	122	4	39	7	58
19.1	3/4	150	11	99	17	149	5	47	8	70
		300	15	133	23	199	7	64	11	95
		600	21	182	31	274	10	87	15	131
25.4	1	150	19	169	29	254	9	80	14	120
		300	26	226	38	339	12	108	18	162
		600	35	310	53	466	17	149	25	223
31.8	1-1/4	150	27	238	40	357	13	113	19	169
		300	36	318	54	477	17	152	26	228
		600	49	437	74	655	24	209	36	314

Table 4. Body-to-Bonnet Torque Guidelines

VALVE SIZE, NPS	BOLT TORQUES ⁽¹⁾	
	Bolt Material ⁽²⁾	
	B8M ⁽³⁾ or S20910 (XM-19) ⁽⁴⁾	
	N•m	Lbf-ft
1	122	90
1-1/2 or 2	91	67
3	163	120
4, 6X4, or 8X4	258	190
6, 8X6, or 12X6	522	385
8 or 10X8	712	525

1. Determined from laboratory testing.
2. For bolting materials not listed in table 4, contact your [Emerson sales office](#) for torque information.
3. SA193-B8M strain hardened.
4. Hot rolled.

- If fluid leaks from the joint, it may indicate that process pressure is applied to the valve. Review your process shutdown procedures, and be sure process pressure is not applied to the valve.
 - If no fluid leaks from the joint, remove the nuts completely and carefully lift the bonnet off the valve body.
7. For EZ-C valves, remove the stem locknut. Separate the valve plug and stem from the bonnet, and set the parts on a protective surface to prevent damage to gasket or seating surfaces.
 8. For ET-C and EWT-C: If it is necessary to remove and inspect the valve trim, refer to the following Trim Maintenance section.
 9. Remove the bonnet gasket (key 10) and cover the opening in the valve to protect the gasket surface and prevent foreign material from getting into the valve body cavity.
 10. Remove the packing flange nuts, packing flange, upper wiper, and packing follower (keys 5, 3, 12, and 13). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall. Clean the packing box and metal packing parts.
 11. Inspect the valve stem threads and packing box surfaces for any sharp edges which might cut the packing. Scratches or burrs in the packing box surfaces could cause leakage or damage to the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts.
 12. If necessary, go to the Trim Maintenance procedures to remove, inspect or replace trim parts. Return to this section when installing the bonnet on the valve body.

Installing the Bonnet

13. Remove the covering protecting the valve body cavity and install a new bonnet gasket (key 10), making sure the gasket seating surfaces are clean and smooth. Then slide the bonnet over the stem and onto the stud bolts (key 15).

Note

Proper performance of the bolting procedures in step 10 compresses the spiral wound gasket (key 12) or load ring (key 26) to both load and seal the seat ring gasket (key 13). It also compresses the outer edge of the bonnet gasket (key 10) to seal the body-to-bonnet joint.

The proper bolting procedures in step 14 include, but are not limited to, ensuring that bolting threads are clean and evenly tightening the cap screws or nuts onto the studs in a crisscross pattern. Tightening one cap screw or nut may loosen an adjacent cap screw or nut. Repeat the crisscross tightening pattern several times until each cap screw or nut is tight and the body-to-bonnet seal is made.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

14. Lubricate the bolting with anti-seize lubricant and install it, using accepted bolting procedures during tightening, so that the body-to-bonnet joint will withstand test pressures and application service conditions. Use the bolt torques in table 4 as guidelines.
15. Install new packing and the metal packing box parts according to the appropriate arrangement in figures 2, 3, or 4. Place a smooth-edged pipe over the valve stem and gently tap each soft packing part into the packing box.
16. Slide the packing follower, upper wiper, and packing flange (keys 12, 13, and 3) into position. Lubricate the packing flange studs (key 4) and faces of the packing flange nuts (key 5). Install the packing flange nuts.
17. Tightening packing flange nuts (key 5):
 - a. For **spring-loaded PTFE V-ring packing**, tighten the packing flange nuts until the shoulder on the packing follower (key 13) contacts the bonnet.
 - b. For **graphite packing**, tighten the packing flange nuts to the maximum recommended torque shown in table 3. Then, loosen the packing flange nuts, and retighten them to the recommended minimum torque shown in table 3.
 - c. For **double PTFE V-ring packing**, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in table 3. Then, tighten the remaining nut until the packing flange is level and at a 90 degree angle to the valve stem.
 - d. For **ENVIRO-SEAL live-loaded packing**, refer to the Fisher instruction manual titled: ENVIRO-SEAL Packing System for Sliding-Stem Valves.
18. Mount the actuator on the valve assembly and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual.

Trim Maintenance

WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

This procedure describes how the valve trim can be completely disassembled. When inspection or repairs are required, perform only those steps necessary to accomplish the task. Observe the **Warning** at the start of the Maintenance section.

Key number locations are shown in figures 8 and 9, unless otherwise noted.

EZ-C Trim Disassembly

Key number locations are shown in figure 8, unless otherwise noted.

1. Remove the actuator and the bonnet according to steps 1 through 9 of the Replacing Packing procedures in the Maintenance section.

WARNING

To avoid personal injury due to leaking fluids, avoid damaging gasket sealing surfaces.

The surface finish of the valve stem (key 7) is critical for making a good packing seal.

The seating surfaces of the valve plug (key 2) and seat ring (key 9) are critical for proper shutoff.

Protect these surfaces accordingly.

Figure 5. Fisher EZ-C Valve Stem Torque and Pin Replacement

35A5717-C

VALVE STEM		STEM TORQUE		DRILL SIZE, INCHES	D DIMENSION	
mm	Inch	N•m	Lbf-ft		mm	Inch
9.5	3/8	40-47	25-35	3/32	16	0.625
12.7	1/2	81-115	60-85	1/8	19	0.75
19.1	3/4	237-339	175-250	3/16	25	1

Perform the following steps to remove the valve trim.

Note

With some valve plug sizes and configurations, the seat ring retainer and bushing assembly (keys 3 and 26, figure 7, 8, and 9) will come out of the valve body with the valve plug and stem assembly, and in other valve plug sizes and configurations, the valve plug will slide through the seat ring retainer and bushing assembly, leaving the retainer and bushing assembly in the valve body.

2. With the valve plug and stem assembly out of the valve body, either slide the seat ring retainer, bushing assembly (keys 3 and 26), gaskets, and shim (keys 10, 12, and 25) up over the valve plug and stem or, lift the seat ring retainer and bushing assembly, associated gaskets, and shim out of the valve body. If the valve plug is to be reused, protect the valve plug seating surface to prevent damage.
3. To disassemble the stem, plug, and pin, drive or drill out the pin (key 8) and unscrew the valve stem (key 7) from the valve plug (key 2).
4. Remove the seat ring and seat ring gasket (keys 9 and 13).
5. Inspect parts for wear or damage that could prevent proper operation of the valve. Clean, inspect and obtain replacement parts as necessary for reassembly.

EZ-C Trim Assembly

This procedure assumes that all the trim and associated gaskets were removed from the valve body. If these parts were not all removed, start the assembly procedure at the appropriate step.

NOTICE

To avoid weakening the stem that may cause failure in service, never reuse an old stem with a new valve plug. Using an old stem with a new plug requires drilling a new pin hole in the stem, which will weaken the stem. However, a used valve plug may be reused with a new stem.

Key number locations are shown in figure 8, unless otherwise noted.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

EZ-C, ET-C, and EWT-C Valves

November 2022

Instruction Manual

D102175X012

1. Screw the valve stem (key 7) into the valve plug (key 2). Tighten to the torque valve given in figure 5. Refer to figure 5 to select the proper drill size. Drill through the stem using the hole in the valve plug as a guide. Remove any chips or burrs and drive in a new pin (key 8) to lock the assembly.
2. Install the seat ring gasket (key 13) and seat ring (key 9).

Note

With some valve plug sizes and configurations, the valve plug will slide through the seat ring retainer and bushing assembly (keys 3 and 26), and in other configurations, it will not.

3. If the valve plug (key 2) will not slide through the seat ring retainer and bushing assembly (keys 3 and 26), proceed as follows:
 - a. Place the seat ring retainer and bushing assembly (keys 3 and 26) over the stem of the valve plug and stem assembly.
 - b. Install the seat ring retainer and bushing assembly, which also includes the valve plug and stem assembly, on top of the seat ring, ensuring that the seat ring retainer slips onto the seat ring properly. Any rotational orientation of the seat ring retainer with respect to the valve body is acceptable.

Table 5. Fisher ET-C and EWT-C Valve Stem Torque and Pin Replacement

VALVE STEM DIAMETER		TORQUE, MINIMUM TO MAXIMUM		DRILL SIZE, INCHES
mm	Inches	N•m	Lbf-ft	
9.5	3/8	40-47	25-35	3/32
12.7	1/2	81-115	60-85	1/8
19.1	3/4	238-339	175-250	3/16
25.4	1	421-482	310-355	1/4
31.8	1-1/4	827-908	610-670	1/4

- c. Place the spiral wound gasket, shim, and bonnet gasket (keys 12, 25, and 10) on the shoulder of the seat ring retainer.
4. If the valve plug (key 2) will slide through the seat ring retainer and bushing assembly (keys 3 and 26), proceed as follows:
 - a. Install the seat ring retainer and bushing assembly on top of the seat ring, ensuring that the seat ring retainer slips onto the seat ring properly. Any rotational orientation of the seat ring retainer with respect to the valve body is acceptable.
 - b. Place the spiral wound gasket, shim, and bonnet gasket (keys 12, 25, and 10) on the shoulder of the seat ring retainer.
 - c. Slide the valve plug and stem assembly or the valve plug guide and stem assembly into the seat ring retainer and bushing assembly (keys 3 and 26).
 5. Mount the bonnet on the valve body and complete assembly using the Replacing Packing procedures in the Maintenance section.
 6. If the valve has soft metal-to-metal seats, refer to the Coining Soft Metal-to-Metal Seats section.

ET-C and EWT-C Trim Disassembly

Key number locations are shown in figure 9, unless otherwise noted.

1. Remove the actuator and the bonnet according to steps 1 through 9 of the Replacing Packing procedure in the Maintenance section.

⚠ WARNING

To avoid personal injury due to leaking fluids, avoid damaging gasket sealing surfaces.

The surface finish of the valve stem (key 7) is critical for making a good packing seal.

The inside surface of the cage (key 3) is critical for tight shutoff and smooth operation of the valve plug.

The seating surfaces of the valve plug (key 2) and seat ring (key 9) are critical for proper shutoff.

Protect these surfaces accordingly.

Perform the following steps to remove the valve trim.

2. Remove the load ring (key 26) from an NPS 8 ET-C or NPS 10X8 EWT-C valve, and wrap it for protection.
3. Remove the plug and stem assembly from the valve body. The cage (key 3) might come out of the valve body with the plug, due to seal ring friction.
 - a. If so, carefully separate the cage from the plug and stem assembly.
 - b. If the cage was not removed from the valve body with the plug and stem assembly, remove it, the associated gaskets (keys 10 and 12), and shim (key 51).
4. Remove the seat ring (key 9) and seat ring gasket (key 13). Composition seat constructions use a disk (key 23) sandwiched between a disk seat (key 22) and disk retainer (key 21).
5. Clean, inspect, and if necessary obtain replacement parts.

ET-C and EWT-C Valve Plug Maintenance

NOTICE

To avoid the valve plug seal ring (key 28) not sealing properly and affecting valve performance, be careful not to scratch the surfaces of the ring groove on the valve plug or any of the surfaces of the replacement ring.

1. With the valve plug (key 2) removed, according to the disassembly portion of the Trim Maintenance procedure, proceed as follows:
2. The spring-loaded seal ring may be removed by first working the retaining ring (key 27) off with a screwdriver. Then carefully slide the metal backup ring (key 29) and seal ring (key 28) off the valve plug (key 2).
3. A spring-loaded seal ring must be installed so that its open side faces toward the valve stem, or toward the seat of the plug depending on flow direction, as shown in view A of figure 9. To install a spring-loaded seal ring, slide the seal ring (key 28) onto the valve plug followed by the metal backup ring (key 29).
4. Then install the retaining ring (key 27) by inserting one end in the groove and, while turning the plug, press the ring into the groove. Again, be careful not to scratch any surfaces of the ring or plug.

NOTICE

To avoid weakening the stem that may cause failure in service, never reuse an old stem with a new valve plug. Using an old stem with a new plug requires drilling a new pin hole in the stem, which will weaken the stem. However, a used valve plug may be reused with a new stem.

5. To replace the valve stem (key 7), drive or drill out the pin (key 8). Unscrew the valve plug from the stem.
6. Screw the new stem into the valve plug. Tighten to the torque value given in table 5. Refer to table 5 to select the proper drill size. Drill through the stem using the hole in the valve plug as a guide. Remove any chips or burrs and drive in a new pin to lock the assembly.

ET-C and EWT-C Trim Assembly

Key number locations are shown in figure 9, unless otherwise noted.

1. Install the seat ring gasket (key 13), and seat ring (key 9) or disk seat (key 22). With composition seat constructions, install the disk (key 23) and disk retainer (key 21).
2. Install the cage (key 3). Any rotational orientation of the cage with respect to the valve body is acceptable.
3. Lower the valve plug (key 2) and stem assembly into the cage. Make sure the seal ring (key 28) is evenly engaged in the entrance chamfer at the top of the cage (key 3) to avoid damaging the ring.
4. Place the gaskets (keys 12 and 10) and the shim (key 51) on top of the cage.
5. With an NPS 8 ET-C or NPS 10X8 EWT-C valve, install the load ring (key 26).
6. Mount the bonnet on the valve body and complete assembly using the Replacing Packing procedures in the Maintenance section. Torque guidelines for body-to-bonnet bolting are shown in table 4.
7. If the valve has soft metal-to-metal seats, refer to the Coining Soft Metal-to-Metal Seats section, below.

Coining Soft Metal-to-Metal Seats

Soft metal-to-metal seat constructions consist of a valve plug with hardfaced CoCr-A seat and a non-hardfaced S31600 seat ring. For optimum shutoff performance of these constructions, coin seats by stroking the valve plug into the seat ring at least three times with maximum actuator force.

NOTICE

To avoid possible product damage which may affect performance, do not lap soft metal-to-metal seats.

Parts Ordering

Each body-bonnet assembly is assigned a serial number which can be found on the valve. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly.

Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts, refer to the serial number and to the eleven-character part number for each part required from the following parts kit or parts list information.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

ENVIRO-SEAL Packing Retrofit Kits

Retrofit kits include parts to convert valves with existing standard bonnets to the ENVIRO-SEAL packing box construction. Refer to figure 6 for key numbers for PTFE and Graphite ULF packing.

Stems and packing box constructions that do not meet Fisher stem finish specifications, dimensional tolerances, and design specifications, may adversely alter the performance of this packing kit.

ENVIRO-SEAL Packing Retrofit Kits

PACKING MATERIAL	STEM DIAMETER AND YOKE BOSS DIAMETER, mm (INCH)			
	9.5 (3/8) 54 (2-1/8)	12.7 (1/2) 71 (2-13/16)	19.1 (3/4) 90 (3-9/16)	25.4 (1) 127 (5)

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for Fisher FB valves. For information on availability of complete assemblies and spare parts, contact your local [Emerson sales office](#). Refer to separate manuals for instructions covering the actuator and accessories.

Do not install, operate, or maintain an FB valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your Emerson sales office before proceeding.

Description

FB valves, which include FBD and FBT (figure 1), are fabricated or cast angle valves that are custom built for special applications. The basic construction, however, is similar in all the valves. For applications up to 232°C (450°F) or up to 316°C (600°F) with the use of anti-extrusion rings, the seat ring is screwed to the free end of the cage assembly of the FBT valve.

Table 1. Specifications

Valve Sizes See table 2 End Connection Styles⁽¹⁾ <i>Flanged:</i> CL150, 300, and 600 raised-face or ring-type joint flanges per ASME B16.5 <i>Buttwelding:</i> All available ASME B16.25 schedules that are consistent with ASME B16.34 Maximum Inlet Pressure⁽¹⁾ <i>Flanged:</i> Consistent with CL150, 300, and 600 pressure-temperature ratings per ASME B16.34 <i>Buttwelding:</i> Consistent with CL600 pressure-temperature ratings per ASME B16.34	Shutoff Classifications per ANSI/FCI 70-2 and IEC 60534-4 FBD: ■ Standard--Class II, ■ Optional--Class IV(with multiple piston rings), and ■ Optional Class V with Bore seal trim FBT: ■ Standard--Class IV ■ Optional--Class V Flow Characteristic Linear Flow Direction Flow direction is typically up through the valve body port and out through the cage Approximate Weights See tables 3, 4, 5, and 6
--	--

1. The pressure or temperature limits in this manual and any applicable standard limitations should not be exceeded.

The top of the cage assembly is clamped between the valve flange and bonnet, permitting unrestricted movement during thermal expansion and contraction (see figures 9 and 16). A spring-loaded seal ring provides a seal around the outside of the seat ring. The top of the cage assembly is also clamped between the valve flange and the bonnet for applications above 232°C (450°F), leaving the cage assembly free to expand and contract. For these high temperature applications, however, the seat ring is separate from the cage assembly and is welded into the FBD valve (see figure 10). No seat ring seal ring is required. The cage assembly is free to expand and contract.

These valves are available in CL150, 300, or 600 with flanged or butt weld ends. Special constructions with a CL900 rating, or with the inlet designed for a valve class rating greater than the outlet, are available on an individual basis. If the valve has an inlet pressure rating greater than the outlet pressure rating, it is especially important to have adequate overpressure protection downstream to protect against the possibility of full inlet pressure reaching the downstream system.

Specifications

Typical specifications for these valves are shown in table 1.

Installation

⚠ WARNING

To avoid personal injury or property damage resulting from the sudden release of pressure, do not install the valve assembly where service conditions could exceed the limits given in this manual or on the appropriate nameplates. Use pressure-relieving devices as required by government or accepted industry codes and good engineering practices.

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

FB Valve

January 2023

Instruction Manual

D100402X012

⚠ WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Because some body/trim material combinations are limited in their pressure drop and temperature range capabilities, do not apply any other conditions to the valve without first contacting your Emerson sales office.

1. Before installing the valve, inspect the valve and associated equipment for any damage and any foreign material. A strainer should be installed upstream of the valve to prevent particles from plugging the holes in the cage.
2. It is important to remember to install all FB valves in a flow up direction.
3. The control valve assembly should be installed with the actuator vertical above the valve. This orientation facilitates sliding the cage assembly into the valve without the use of special tools and rigging. In addition, vertical installation minimizes the possibility of damaging the seat ring seal ring or the mating chamfers, minimizes the possibility of bending the stem, and greatly reduces wear on the cage. Vertical installation, therefore, significantly extends valve life.

2. Option for ASME B16.47 series A or series B flange(s).

Figure 2. Fisher Cast FBT Flanged Valve Body Dimensions

4. Use accepted piping and welding practices when installing the valve in the line. You can leave internal elastomeric parts in the valve when you weld it. For flanged valves, use suitable gaskets between the valve flanges and pipeline flanges.

Note

Depending on valve body materials used, post-weld heat treating might be needed. Post-weld heat treatment can damage internal elastomeric, plastic, and metal parts. Shrunk-fit pieces and threaded connections might loosen. In general, if post-weld heat treating is needed, remove all trim parts. Contact your [Emerson sales office](#) for additional information.

5. If continuous operation is required during maintenance, install a three-valve bypass around the valve.
6. If the actuator and valve are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however some readjustment will be required to meet specific service conditions.

Lifting Valve Assembly

⚠ WARNING

Failure to follow these lifting guidelines and accepted lifting and rigging practices could result in property damage and personal injury or death.

All lifting and rigging must be completed in accordance with federal/national/provincial, state and local regulations and applicable lifting and rigging equipment standards. Only personnel trained in proper lifting and rigging practices shall perform valve/actuator assembly lifting, rigging and installation. Because each lift will be unique, the method of lifting the valve assembly, the correct location for attaching and lifting the valve assembly, and what the valve assembly will do when lifted shall be considered for each lift.

Lifting and rigging equipment used to lift, install or remove a valve assembly or component must be properly selected and sized for the weight and configuration of the valve assembly or component being lifted. The weight of the complete valve assembly, including attached accessories, must be taken in consideration for this purpose. The lifting and rigging equipment must be properly maintained and inspected for damage before each use.

If the valve is supplied with an actuator or handwheel, do not use the actuator or handwheel to lift the complete valve assembly. Lifting lugs attached to the actuator must not be used to lift the complete valve assembly unless clearly marked as being rated to support the complete valve assembly weight.

Lifting lugs or other lifting equipment attached to the valve or actuator must never be used to lift or support the weight of attached piping.

NOTICE

Care must be taken when lifting the valve/actuator assembly to ensure all accessories and tubing are not damaged in the process. Accessories and tubing may need to be removed prior to lifting to prevent damage and properly reinstalled before use. Protect valve flange faces, butt weld ends, and other connection surfaces from damage during lifting.

Remove the valve/actuator assembly from its shipping container with appropriate lifting and rigging equipment for the valve/actuator assembly weight and configuration to be lifted. The valve and bonnet assembly weight is provided in tables 3, 4, 5, and 6. Consult the appropriate actuator and valve accessory instruction manuals for the weight of each additional component, then determine the total weight of the complete valve assembly. The location of the valve/actuator assemblies center of gravity must be considered during lifting, installation, and removal. Additional slings or other lifting equipment, such as a load leveler, may be necessary to prevent toppling of the equipment during lifting or to rotate the valve assembly into a different orientation for installation.

For cast FB valve constructions that include lifting lugs cast integral to the body, use of properly sized shackles in each lifting lug eye is required. The correct shackle pin diameter is provided in table 7. If the valve body includes attached lifting lugs, use all the lugs provided to lift the complete valve assembly. If lifting lugs are not provided on the valve body, lift the valve assembly with lifting straps secured around the valve body flanges, valve body neck, and/or bonnet neck area.

	CL300	2.4	2.25

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing lubrication, temporary packing maintenance, packing replacement, trim maintenance, and lapping metal seats. All maintenance operations may be performed with the valve in the line.

⚠ WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Note

Whenever a gasket seal is disturbed by removing or shifting gasketed parts, a new gasket should be installed upon reassembly. This is necessary to ensure a good gasket seal since the used gasket may not seal properly.

Note

If the valve has ENVIRO-SEAL™ live-loaded packing installed, see the Fisher instruction manual entitled ENVIRO-SEAL Packing System for Sliding-Stem Valves, [D101642X012](#), for packing instructions.

If the valve has HIGH-SEAL Heavy-Duty live-loaded packing installed, see the Fisher instruction manual entitled HIGH-SEAL ULF Live-Loaded Packing System, [D101453X012](#), for packing instructions.

Packing Lubrication

If a lubricator or lubricator/isolating valve (figure 4) is provided for PTFE/composition or other packings that require lubrication, it will be installed in place of the pipe plug (key 28, figures 11 and 13). Use a good quality silicon-base lubricant. Packing used in oxygen service or in processes with temperatures over 260°C (500°F) should not be lubricated. To operate the lubricator, simply turn the cap screw clockwise to force the lubricant into the packing box. The lubricator/isolating valve operates the same way except the isolating valve must first be opened and then closed after lubrication is completed.

Temporary Packing Maintenance

With most jam-type packing, new packing rings can be added on top of the old packing rings as a temporary measure until a more complete disassembly and packing replacement can be made.

Figure 3. Packing Arrangements

To do this with split ring packing, isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. Pressurize the actuator to open the valve. Unbolt the packing flange (key 15, figures 11 and 13) and slide the packing flange wiper (key 21, figures 11 and 13) and packing follower (key 25, figures 11 and 13) up the valve stem to add packing rings. To improve the seal, the old packing rings on top of the lantern ring (key 22, figure 3) may be removed with a packing hook whenever possible. If this is done, use care to avoid scratching the valve stem or packing box wall. Clean all metal parts to remove any particles which would prevent the packing from sealing evenly against the valve stem or packing box wall.

Table 8. Recommended Torque for Packing Flange Nuts

VALVE STEM DIAMETER		PRESSURE RATING	GRAPHITE TYPE PACKING				PTFE TYPE PACKING (NON SPRING-LOADED)			
			Minimum Torque		Maximum Torque		Minimum Torque		Maximum Torque	
mm	Inches		N•m	Lbf•ft	N•m	Lbf•ft	N•m	Lbf•ft	N•m	Lbf•ft
25.4	1	CL150/300	24	18	37	27	12	9	16	12
		CL600	34	25	50	37	16	12	24	18

		CL600	45	33	66	49	22	16	33	24
50.8	2	CL150/300	43	32	65	48	20	15	31	23
		CL600	61	45	91	67	27	20	41	30

⚠ WARNING

To prevent injury to personnel and damage to equipment, make certain the valve is fully closed before separating the stem connector.

If solid ring packing is used, separate the stem connector and raise the actuator so that the packing flange and packing follower can be removed, and the packing rings can be slipped over the end of the valve stem. After the packing has been tightened down, reconnect the valve/actuator stem connection according to the appropriate actuator instruction manual.

Replacing Packing

⚠ WARNING

To prevent injury to personnel and damage to equipment, handle tools carefully around the valve plug stem (key 12, figures 9, 10, and 16) and the packing box. A gouge or scratch in the packing box wall could create a leak path. A damaged valve stem could cut a groove in the packing, allowing leakage.

1. Before removing the actuator, disconnect air, electrical, and leakoff lines which would interfere with actuator removal or valve maintenance. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve.

⚠ WARNING

To prevent injury to personnel and damage to equipment, make certain the valve is fully closed before separating the stem connector.

2. With the plug seated, remove the stem connector by loosening the stem locknuts and unscrewing the cap screws which hold the two halves together.

NOTICE

To avoid damaging the seating surface caused by the valve plug and stem assembly dropping from the bonnet after being lifted part way out, be sure that the assembly remains in the valve and on the seat. The parts are also easier to handle separately.

3. Remove the hex nuts (key 27, figures 11 and 13) from the yoke boss cap screws or stud bolts (key 26, figures 11 and 13) and lift off the actuator.
4. Remove the stem locknuts and loosen the packing flange nuts (key 17, figures 11 and 13) so that the packing is not tight on the valve stem (key 12, figures 9, 10, and 16). Then remove the large hex nuts (key 11, figures 9, 10, and 16) that bolt the bonnet and valve together.

Table 9. Recommended Bolt Torque⁽¹⁾⁽²⁾

Stud Bolt Size, Inches	3/4	7/8	1	1-1/8	1-1/4	1-3/8	1-1/2
Torque (N•m)	271	393	549	746	990	1329	1749
Torque (Lbf•ft)	200	290	405	550	730	980	1290

1. Based on alloy steel bolting ASME SA 193-B7 with heavy hex nuts. For other materials, contact your [Emerson sales office](#) for torques.
 2. Lubricate with lithium grease. For other lubricants or coated bolting, contact your Emerson sales office for torques.

Figure 4. Lubricator and Lubricator/Isolating Valve

10A9421-A
 A5428-D
 A0832-2"

5. Attach the ringed ends of a lifting chain (not furnished) to two of the yoke boss stud bolts 180 degrees apart. Then replace the nuts on the two stud bolts selected. (Use washers to retain the chain rings if necessary).
6. Check to be sure that the chain will not damage the stem threads and lift the bonnet straight up with the hoist. If the valve plug and stem assembly starts to lift with the bonnet, use a brass or lead hammer on the end of the stem and tap it back down. Set the bonnet on a cardboard or wooden surface to prevent damage to the bonnet gasket surface.
7. Remove the packing flange nuts (key 17), packing flange (key 15), upper wiper (key 21), and packing follower (key 25), all shown in figures 11 and 13.
8. Using care to avoid scratching the packing box wall, pull the packing box components out with a wire hook. The packing box components can also be pushed out of the packing cavity with a rod inserted from the bottom of the bonnet, whenever the bonnet can be positioned to permit access from the bottom.
9. Clean the packing box and the metal packing box components. Spray PTFE packing with a silicone-based lubricant.
10. Install new bonnet gaskets (key 6, figures 9, 10, and 16) and replace the bonnet.
11. Install the new packing as shown in figure 3, 11, or 13.

For spring-loaded PTFE V-ring packing, tighten the packing flange nuts until the shoulder on the packing follower (key 25, figures 11 and 13) contacts the bonnet.

For **graphite packing**, tighten the packing flange nuts to the maximum recommended torque shown in table 8. Then, loosen the packing flange nuts, and retighten them to the recommended minimum torque shown in table 8.

For **other packing types**, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in table 8. Then, tighten the remaining flange nuts until the packing flange is level and at a 90-degree angle to the valve stem.

For **ENVIRO-SEAL or HIGH-SEAL live-loaded packing**, refer to the note at the beginning of the Maintenance section.

12. Lubricate the stud bolts (key 10, figures 9, 10, and 16) and replace the nuts (key 11, figures 9, 10, and 16). Tighten the nuts down gradually in a criss-cross pattern to ensure that the bonnet is drawn down evenly. The maximum recommended torque values are shown in table 9 for the various stud bolt sizes used in the fabricated valves.
13. Mount the actuator on the valve assembly and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual.
14. After the valve has operated at line temperature for a time, retighten the hex nuts to the recommended torque value.

Trim Maintenance

The following procedure provides instruction for replacing the trim. Complete only those steps necessary to accomplish the required maintenance operations.

Key numbers in this section are referenced in figures 9, 10, and 16 and apply to FB valves, unless otherwise specified.

1. Remove the actuator and the bonnet according to steps 1 through 6 of the Replacing Packing section.
2. Screw an eyed adaptor (not furnished) onto the valve stem threads and lift the valve plug and stem assembly out of the valve. Lower it onto a cushioned surface to protect the valve plug seating surface.
3. If the valve plug (key 2) is damaged and requires replacement, always replace the entire valve plug and stem assembly.

NOTICE

To avoid weakening the stem that may cause failure in service, never reuse an old stem with a new valve plug. Using an old stem with a new plug requires drilling a new pin hole in the stem, which weakens the stem. However, a used valve plug may be reused with a new stem.

- a. Drive out the old pin (key 13), unscrew the old stem, and replace it with a new stem. Screw the new stem completely into the valve plug until the thread bottoms out against the plug.
- b. Locate the pin guide hole in the valve plug and drill a matching hole through a new stem. Use a 6.4 mm (1/4-inch) diameter drill for constructions with port sizes through 378 mm (14.875 inches); use a 9.5 mm (3/8 inch) diameter drill for constructions with 430 mm (16.9375 inch) or 506 mm (19.9375 inch) port sizes. Install a new pin.
4. If the piston ring (key 4, figure 10) in FBD or the seal ring (key 4, figures 9 and 16) in FBT is visibly damaged, remove it and replace it with a new part. Be careful not to scratch the surface of the ring groove in the valve plug or the new ring may not seal properly. Because the FBT seal ring must be pried and/or cut from the groove, it cannot be used over again.

Note

Lapping metal seats, if required, should be done before installing the piston or seal ring.

- a. Before replacing the piston ring or the valve plug seal ring, be sure the ring groove in the valve plug is clean and free of scratches. The FBD piston ring is split and can be easily placed in the groove.

NOTICE

Avoid jerking sharply on the seal ring. The PTFE or FEP material in the seal ring must be permitted time to cold-flow during the stretching procedure.

- b. The FBT seal ring is a one-piece, spring-loaded ring which must be carefully stretched over the top end of the valve plug and into the groove. First lubricate the seal ring generously and place it over the valve stem. Since the flow direction is up through the seat ring and out through the cage, the open portion of the seal ring should be up. Start the ring in the groove on one side of the valve plug and slowly and gently work it over the top edge of the valve plug.

Stretching the seal over the valve plug may make it seem unduly loose when first placed in the groove, but it will contract to its original size without requiring a waiting period before insertion into the cage.

- c. If no further trim maintenance is required, the valve can be reassembled at this point by carefully replacing the valve plug, and proceeding to step 10. If an FBT valve plug is being replaced, make sure the seal ring is evenly engaged in the entrance chamfer at the top of the cage assembly (key 3) to avoid damaging the seal ring.
5. Attach a lifting chain to the cage assembly. The cage is tapped on the top in two places to facilitate rigging. Hoist the cage assembly straight out of the valve and set it on a flat surface.

NOTICE

Avoid jerking sharply on the seal ring. The PTFE or FEP material in the seal ring must be permitted time to cold-flow during the stretching procedure.

6. The standard design for applications up to 232°C (450°F) will have a seat ring seal ring (key 5). Inspect this seal ring and, if necessary, remove it and install a new seal ring. Lubricate the seal ring generously, and place it over the bottom end of the seat ring. Start the ring in the groove on one side of the seat ring, and gently work it over the seat ring. The open portion of the seat ring seal ring should be down since flow is up through the seat ring and out through the cage.
7. In the standard design where the seat ring is screwed into the cage, it is secured with two tack welds, one on each side of the cage. The seat ring can be removed by grinding or filing off the tack welds, then inserting a bar through slots cut in the seat ring to turn it out of the cage.
8. Tack weld the new seat ring to the cage using minimal heat. Two welds, 6.4 mm (1/4-inch) long and 180 degrees apart, are required. Using a hoist, lower the cage assembly into the valve. Use care to avoid damaging the seal rings or other sealing surfaces while handling the heavy parts. To facilitate inserting the cage assembly into the valve, lubricate the outside diameter of the seat ring and the seal with lithium grease.
9. Replace the valve plug/stem assembly.

NOTICE

Place the bonnet carefully over the stem to avoid damaging the packing.

10. Install new gaskets (key 6), and replace the bonnet.
11. Lubricate the stud bolts (key 10, figures 9, 10, and 16) and replace the nuts (key 11, figures 9, 10, and 16). Tighten the nuts down gradually in a criss-cross pattern to ensure that the bonnet is drawn down evenly. The maximum recommended torque values are shown in table 9 for the various stud bolt sizes used in the fabricated valves.
12. Mount the actuator on the valve assembly and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual.

Lapping Metal Seats

A certain amount of leakage should be expected with metal-to-metal seating in any valve. If the leakage becomes excessive, however, the condition of the seating surfaces of the valve plug and seat ring can be improved by lapping. (Deep nicks should be machined out rather than ground out.) Use a good quality lapping compound of a mixture of 280 to 600-grit. Apply the compound to the bottom of the valve plug.

Figure 5. Fisher FB with Bore Seal Trim

Assemble the valve to the extent that the cage is in place and the bonnet is bolted to the valve. A simple handle can be made from a piece of strap iron locked to the valve plug stem with nuts. Rotate the handle alternately in each direction to lap the seats. After lapping, remove the bonnet and clean the seating surfaces. Completely assemble and test the valve for shutoff. Repeat the lapping procedure if leakage is still excessive.

Retrofit: Installing Bore Seal Trim

Note

Additional actuator thrust is required for a valve with Bore Seal trim. When installing Bore Seal trim in an existing valve, contact your [Emerson sales office](#) for assistance in determining new actuator thrust requirements.

Assemble the new valve plug/retainer assembly (with Bore Seal plug seal) using the following instructions:

NOTICE

To avoid leakage when the valve is returned to service, use appropriate methods and materials to protect all sealing surfaces of the new trim parts while assembling the individual parts and during installation in the valve body.

1. Apply a suitable high-temperature lubricant to the inside diameter of the Bore Seal plug seal. Also, lubricate the outside diameter of the valve plug where the Bore Seal plug seal must be pressed into the proper sealing position (figure 5).
2. Orient the Bore Seal plug seal for correct sealing action based on the process fluid flow direction through the valve.
 - a. The open interior of the Bore Seal plug seal must face up in a valve with flow-up construction (figure 5).
3. Place the Bore Seal plug seal over the top of the valve plug. The retainer will help guide the Bore Seal down onto the plug (figure 5). Do not force the Bore Seal over the plug.
4. An installation tool (see table 10) must be inserted into the Bore Seal prior to using the retainer to guide it down the plug.
5. Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the Bore Seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
6. Remove the retainer and then the installation tool. Place the Bore Seal retainer back onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
7. Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place (figure 7) to secure the Bore Seal retainer.
8. Install the new plug/retainer assembly with Bore Seal plug seal on the new stem following the appropriate instructions in the Trim Replacement section of this manual.
9. Install piston rings by following instructions in the Trim Replacement section of this manual.
10. Remove the existing valve actuator and bonnet following the appropriate instructions in the Replacing Packing section of this manual.

NOTICE

Do not remove the existing valve stem from the valve plug unless you are planning to replace the valve stem.

Never reuse an old valve stem with a new plug or reinstall a valve stem after it has been removed. Replacing a valve stem requires drilling a new pin hole in the stem. This drilling weakens the stem and may cause failure in service. However, a used valve plug may be reused with a new valve stem.

11. Remove the existing valve stem and plug, cage, and seat ring from the valve body following the appropriate instructions in the Trim Removal section of this manual.
12. Replace all gaskets according to appropriate instructions in the Trim Replacement section of this manual.

18.25	---(1)								n/a
19.9375	---(1)								n/a

1. For sizes, contact your [Emerson sales office](#).

13. Install the new seat ring, cage, valve plug/retainer assembly, and stem into the valve body and completely reassemble the valve package following the appropriate instructions in the Trim Replacement section of this manual.

NOTICE

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the Bore Seal plug seal and contact the seat ring. You can correctly seat the valve plug by using the same force calculated for full load when sizing your actuator. With no pressure drop across the valve, this force will adequately drive the valve plug to the seat ring, thus giving the Bore Seal plug seal a predetermined permanent set.

With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

Replacement of Installed Bore Seal Trim

Trim Removal (Bore Seal Constructions)

1. Remove the valve actuator and bonnet following the appropriate instructions in the Replacing Packing section of this manual.

NOTICE

To avoid leakage when the valve is returned to service, use appropriate methods and materials to protect all sealing surfaces of the trim parts during maintenance.

Use caution when removing piston ring(s) and the Bore Seal plug seal to avoid scratching any sealing surface.

NOTICE

Do not remove the valve stem from the plug/retainer assembly unless you are planning to replace the valve stem.

Never reuse an old valve stem with a new plug or reinstall a valve stem after it has been removed. Replacing a valve stem requires drilling a new pin hole in the stem. This drilling weakens the stem and may cause failure in service. However, a used valve plug may be reused with a new valve stem.

2. Remove the plug/retainer assembly (with Bore Seal plug seal) and cage from the valve body following the appropriate instructions in the Trim Removal section of this manual.
3. Locate the staked thread on top of the valve plug (figure 7). The staked thread secures the retainer. Use a drill with a 1/8 inch bit to drill out the staked area of the thread. Drill approximately 1/8 inch into the metal to remove the staking.
4. Locate the break between sections of the piston ring(s). Using an appropriate tool such as a flat-blade screwdriver, carefully pry out the piston ring(s) from the groove(s) in the Bore Seal retainer.
5. After removing the piston ring(s), locate the 1/4-inch diameter hole in the groove. In a retainer with two piston ring grooves, the hole will be found in the upper groove.
6. Select an appropriate tool such as a punch and place the tip of the tool into the hole with the body of the tool held tangent to the outside diameter of the retainer. Strike the tool with a hammer to rotate the retainer and free it from the valve plug. Remove the retainer from the plug.

7. Use an appropriate tool such as a flat-blade screwdriver to pry the Bore Seal plug seal off the plug. Use caution to avoid scratches or other damage to the sealing surfaces where the Bore Seal plug seal makes contact with the valve plug (figure 5).
8. Inspect the lower seating surface where the valve plug contacts the seat ring for wear or damage which would prevent proper operation of the valve. Also, inspect the upper seating surface inside the cage where the Bore Seal plug seal contacts the cage, and inspect the sealing surface where the Bore Seal plug seal makes contact with the plug (figure 5).

Figure 7. Stake the Threads of the Bore Seal Retainer

A6779

9. Replace or repair trim parts according to the following procedure for lapping metal seats, remachining metal seats, or other valve plug maintenance procedures as appropriate.

Lapping Metal Seats (Bore Seal Constructions)

Before installing a new Bore Seal plug seal, lap the lower seating surface (valve plug to seat ring, figure 5) following appropriate procedures in the Lapping Seats section of this manual.

Remachining Metal Seats (Bore Seal Constructions)

A valve plug with a Bore Seal metal plug seal features two seating surfaces. One seating surface is found where the valve plug contacts the seat ring. The second seating surface is found where the Bore Seal plug seal contacts the upper seating surface in the cage. The cage does not require any machining, even when the plug and / or seat ring have been machined.

Trim Replacement (Bore Seal Constructions)

1. Apply a suitable high-temperature lubricant to the inside diameter of the Bore Seal plug seal. Also, lubricate the outside diameter of the valve plug where the Bore Seal plug seal must be pressed into the proper sealing position (figure 5).
2. Orient the Bore Seal plug seal for correct sealing action based on the process fluid flow direction through the valve.
 - a. The open interior of the Bore Seal plug seal must face up in a valve with flow-up construction (figure 5).
3. Place the Bore Seal plug seal over the top of the valve plug. The retainer will help guide the Bore Seal down onto the plug. Do not force the Bore Seal over the plug.

Figure 8. Lower (Valve Plug to Seat Ring) and Upper (Bore Seal Plug Seal to Cage) Seating Surfaces

NOTE:

A6780

1 UPPER SEATING SURFACE IS THE AREA OF CONTACT BETWEEN THE BORE SEAL METAL PLUG SEAL AND THE CAGE.

4. An installation tool (see table 10) must be inserted into the Bore Seal prior to using the retainer to guide it down the plug.
5. Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the Bore Seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
6. Remove the retainer and then the installation tool. Place the Bore Seal retainer back onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
7. Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place (figure 7) to secure the Bore Seal retainer.
8. Replace the piston ring(s) following instructions in the Trim Replacement section of this manual.

9. Return the cage, plug/retainer assembly, and stem to the valve body and completely reassemble the valve package following the appropriate instructions in the Trim Replacement section of this manual.

NOTICE

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the Bore Seal plug seal and contact the seat ring. You can correctly seat the valve plug by using the same force calculated for full load when sizing your actuator. With no pressure drop across the valve, this force will adequately drive the valve plug to the seat ring, thus giving the Bore Seal plug seal a predetermined permanent set.

With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

Parts Ordering

Each body-bonnet assembly is assigned a serial number, which can be found on the valve. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts, refer to the serial number and to the key number and part name from the following list. Specify the desired material, if known. Part numbers are shown for packing box parts. Specify the part number if you are ordering packing parts.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts List

Note

Contact your [Emerson sales office](#) for part ordering information.

Graphite Ribbon/Filament Packing for Fisher™ Sliding-Stem Valves

Contents

Introduction	1
Scope of Manual	1
Description	1
Storage and Startup	2
Packing Installation	2
Parts Ordering	7

Introduction

Scope of Manual

This manual provides instructions for installing graphite ribbon and filament packing in sliding-stem valves--either as part of the field maintenance procedure for valves that originally were equipped with this kind of packing or when field-replacing other kinds of packing.

Use this manual along with the appropriate valve body instruction manual. Refer to the valve body manual for disassembly, packing removal, reassembly after the packing has been installed, and for packing part numbers and kits.

Do not install, operate, or maintain this packing without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. **To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings.** If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

Graphite ribbon/filament packing is a low-chloride, corrosion-resistant packing for use with hard-to-handle fluids, especially high-temperature steam or water. It can be used in temperatures from -18 to 538°C (0 to 1000°F) in non-oxidizing service or from -18 to 371°C (0 to 700°F) in oxidizing service. Because the packing rings are certified to contain no more than 100 ppm of chloride, this packing is also frequently used in radioactive nuclear service and will withstand a gamma radiation dosage to 1.0×10^7 Rads or 50 R/hour.

Graphite ribbon/filament packing comes in three different arrangements of graphite ribbon rings, graphite filament rings, and sacrificial zinc washers. The three different arrangements are single (figures 1 and 2), double (figure 3), and leak-off (figure 4).

The graphite ribbon rings are made from a long ribbon of flexible graphite which is wound into a ring and then pressed tightly together. The flexible graphite contains a non-metallic, inorganic, passivating inhibitor for corrosion and oxidation resistance. Graphite filament rings consist of filaments of graphite braided together. One sacrificial zinc washer is used under each graphite ring to protect the valve from pitting and corrosion attack.

Storage and Startup

If a valve will be stored for a long period of time, remove the packing rings from the packing box to prevent corrosion. When ordering a valve that will be stored, notify Emerson Automation Solutions and the valve will be shipped from the factory with the packing box empty and a special packing follower with O-ring gland seal installed between the packing flange and bonnet shoulder. All the other packing parts shown in figure 2, 3, or 4 will be shipped with the control valve assembly but in a separate bag or wrapper.

Leave the special packing follower in place until after any hydrostatic testing is completed. Then remove the follower, thoroughly air-dry the packing box, and install all the packing parts according to the appropriate arrangement drawing. The special packing follower can be saved for future hydrostatic testing, or discarded if it will no longer be used.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however some readjustment will be required to meet specific service conditions.

CAUTION

When using any packing at low temperatures, frost must not be allowed to form on the valve stem. Valve stem frost can damage packing as the stem travels through the packing rings.

Packing Installation

Packing parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement of parts depends upon the severity of service conditions or the requirements of local, state, and federal rules and regulations.

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.

- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

1. Refer to the appropriate valve body and actuator instruction manuals. Disassemble the control valve as required to gain access to the packing box. Remove the packing box components.
2. Examine the valve stem. The surface that contacts the packing must be smooth and free of scratches and nicks. If another style of graphite packing had been installed, the packing may have left a black deposit of graphite coating on the stem. If this deposit has built up or has affected the valve stem finish, the stem should be polished to a 0.1 micro-meter (4 micro-inch) RMS finish.
3. Thoroughly clean and dry the packing cavity, valve stem, and all metal packing parts (packing box ring, lantern ring, and packing follower). Also, clean the threads of the packing flange studs and nuts (figure 1). Lubricate these threads and the faces of the packing flange nuts during the remainder of the installation with a moly disulfide or equivalent type of lubricant.
4. Select the correct installation figure reference according to the valve design and packing arrangement (single, double, or leak-off).
5. Install the metal packing parts (figures 2, 3, or 4) that go to the bottom of the packing cavity.

⚠ WARNING

To avoid valve leakage during operation or personal injury, it is necessary, when installing the packing, to avoid trapping air between the rings and to give side support to the rings so they do not spread out under the compression of adding more rings. This may be accomplished by installing only one ring at a time.

6. Install only one packing ring at a time. Push each of the new packing rings into the packing box until it presses against the ring below it.

If installing double or leak-off packing, start the last lower packing ring and then force all the lower packing rings and lantern ring(s) all the way into the packing cavity. Then install the upper packing rings in the same manner.

25.4	1	14A2340
31.8	1-1/4	14A3412
50.8	2	14A3419

CAUTION

Loss of packing performance and damage to the valve stem could result if metal parts such as the packing follower come in contact with the valve stem. When installing packing parts or making packing adjustments, make sure that the inside diameter of the packing follower does not contact the valve stem.

7. Replace the packing follower, packing flange, and packing flange nuts.

Note

If the packing needs additional tightening after the valve is in service, the packing flange nuts may be tightened to the recommended maximum torque. Excessive valve stem friction may result if the recommended maximum torque is exceeded. The recommended minimum torque is necessary to maintain a stem seal.

1. With lubricated packing flange studs.

Parts Ordering

Refer to the appropriate valve body instruction manual for all bonnet packing parts.

Determine the parts needed from the appropriate packing arrangement in figures, 2, 3, or 4. Include the serial number of the valve in all correspondence concerning replacement parts or maintenance.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Figure 1. Fisher GX 3-Way Control Valve, Actuator, and FIELDVUE DVC2000 Digital Valve Controller

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for the Fisher GX 3-Way control valve and actuator system.

Do not install, operate, or maintain a GX 3-Way valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

The GX 3-Way meets the requirements of both EN and ASME standards. It is available with a complete accessory package, including the FIELDVUE™ DVC2000 integrated digital valve controller.

Table 1. Fisher GX 3-Way Valve Specifications⁽¹⁾

Specifications	EN	ASME	
Valve Body Sizes	DN 25, 40, 50, 80, 100	NPS 1, 1-1/2, 2, 3, 4	
Pressure Rating	PN 10 / 16 / 25 / 40 per EN 1092-1	CL150 / 300 per ASME B16.34	
End Connections	Flanged raised face per EN 1092-1	Flanged raised face per ASME B16.5	
Valve Body Materials	1.0619 steel	ASME SA216 WCC steel	
	1.4409 stainless steel	ASME SA351 CF3M stainless steel	
Bonnet Materials	1.4409 stainless steel / CoCr-A	ASME SA351 CF3M SST / CoCr-A	
Face-to-Face Dimensions	Based on ISA 75.08.01, see bulletin 51.1:GX 3-Way for details		
Shutoff per IEC 60534-4 and ANSI/FCI 70-2	Metal seat - Class IV (standard) Side port common high temperature construction: Metal seat - Class IV for bottom seat, Class II for upper seat

Valve Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure or bursting of pressure retaining parts might result if service conditions exceed those for which the product was intended. To avoid injury or damage, provide a relief valve for over pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

This valve is intended for a specific range of pressures, temperatures and other application specifications. Applying different pressure and temperatures to the valve could result in parts damage, malfunction of the control valve or loss of control of the process. *Do not expose this product to service conditions or variables other than those for which the product was intended.* If you are not sure what these conditions are you should contact your [Emerson sales office](#) or Local Business Partner for more complete specifications. Provide the product serial number (shown on the nameplate, figure 2) and all other pertinent information.

⚠ WARNING

If you move or work on an actuator installed on a valve with loading pressure applied, keep your hands and tools away from the stem travel path to avoid personal injury. Be especially careful when removing the stem connector to release all loading on the actuator stem whether it be from air pressure on the diaphragm or compression in the actuator springs. Likewise take similar care when adjusting or removing any optional travel stop. Refer to the relevant actuator Maintenance Instructions.

If hoisting the valve take care to prevent people from being injured in case the hoist or rigging slips. Be sure to use adequately sized hoists and chains or slings to handle the valve.

Figure 2. Fisher GX 3-Way Nameplate (Key 35)

GE35409-D

GG12218-A

ELECTRIC ACTUATOR

1. Before installing the valve, inspect it to be certain that the valve body cavity is free of all foreign material. Clean out all pipelines to remove scale, welding slag and other foreign material.
2. The control valve assembly may be installed in any orientation unless limited by seismic criteria. However, the normal method is with the actuator vertical above the valve. Other positions may result in uneven trim wear, and improper operation. With some valves, the actuator may also need to be supported when it is not vertical. For more information, consult your [Emerson sales office](#) or Local Business Partner. Flow through the valve must be in the direction indicated by the flow arrow nameplate on the valve. See figures 3 and 4.
3. Use accepted piping practices when installing the valve in the pipeline. Use a suitable gasket between the valve and the pipeline flanges.
4. If continuous operation is required during inspection or maintenance, install isolating valves on either side of the control valve with a bypass valve to control the flow while the control valve is receiving maintenance.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing is tightened before shipment; however the packing might require some readjustment to meet specific service conditions.

Maintenance

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.

- Use bypass valves or completely shut off the process to isolate the valve from the process pressure. Relieve the process pressure from all three inlets/outlet of the valve.
- Depending on the actuator construction, it will be necessary to manage the pneumatic actuator loading pressure and any actuator spring pre-compression. It is essential to refer to the relevant actuator instructions in this manual to ensure safe removal of the actuator from the valve.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Figure 3. Fisher GX 3-Way Valve Bottom-Port Common Flow Direction

GX 3-Way Valve and Actuator

July 2017

Figure 4. Fisher GX 3-Way Valve Side-Port Common Flow Direction

Table 2. Fisher GX 3-Way Rated Travel

VALVE SIZE NPS	ACTUATOR SIZE	NUMBER OF CASING BOLTS	TRAVEL	STEM CONNECTOR GAP SETTINGS
			mm	mm
1, 1-1/2	225	6	19	21
2	750	10	19	21
3, 4	750	10	38	40

Table 3. Body Nut (Key 7) Torque Requirements

VALVE SIZE	TORQUE	
	N•m	lbf•ft
DN 25 and 40 (NPS 1 and 1-1/2)	79.8	58.9
DN 50 (NPS 2)	163	120
DN 80 and 100 (NPS 3 and 4)	282	208

Note

Whenever a gasket seal is disturbed by removing or shifting gasketed parts, install a new gasket during reassembly. This ensures a good gasket seal because the used gasket may not seal properly.

Actuator Maintenance

For electric actuators, see the supplier's instruction manual.

The following sections provide procedures for actuator maintenance. Refer to figures 8, 11, and 13.

The actuator soft parts may require periodic replacement. This includes the diaphragm (key 10), diaphragm O-ring (key 109), actuator rod bushing (key 19), and the actuator rod seal (key 20).

If the actuator stroking direction is unknown, refer to the nameplate on top of the actuator casing and figure 2.

Note

When the GX 3-Way actuator is equipped with the integrated FIELDVUE DVC2000 digital valve controller (figure 1), additional considerations may be required. Refer to the FIELDVUE DVC2000 Digital Valve Controller quick start guide, [D103203X012](#), for mounting instructions.

Actuator Disassembly (For Fail-Down Constructions, see figure 11)

1. Connect a separate air supply to the lower diaphragm casing via the air supply connection on the yoke (as shown in figure 11) and apply sufficient air pressure to raise the valve plug/stem off the lower seat to mid-travel.
2. Remove the stem connector nut half (key 23), stem connector bolt half (key 24), and travel indicator (key 26).
3. Push the valve plug/stem (key 3) down until it contacts the seat.
4. Loosen the locknut (key 28) and thread the lower stem connector (key 27) down until it clears the top of the valve plug/stem (key 3).
 - For HT construction, loosen locknut (key 108) and thread the stem extension (key 106) down as far as possible (see figure 12).
5. Shut off the air pressure and disconnect the separate air supply to the lower diaphragm casing (as shown in figure 11).

WARNING

To avoid personal injury or property damage due to actuator springs (key 12) being under compression, remove the long cap screws (key 16) last.

The upper actuator casing may remain fixed to the diaphragm and lower casing during disassembly, even if the casing cap screws have been loosened. If this happens, the actuator springs are still under compression. The upper casing could suddenly come loose and jump, due to the compressed energy of the springs. If the upper casing is stuck to the diaphragm and lower casing when you begin loosening the casing cap screws, pry the casings apart with a prying tool. Always ensure that the springs are dispersing energy and the upper casing is moving against the long bolts during disassembly.

6. Remove the short actuator casing cap screws and hex nuts (keys 17 and 18) first. Once these have been removed from the actuator assembly, carefully remove the long actuator cap screws and hex nuts (keys 16 and 18), alternating between them to gradually release the spring energy (compression).
7. Remove the upper diaphragm casing (key 9) and the actuator springs (key 12).
8. Lift off the actuator stem/diaphragm assembly (includes keys 22, 11, 10, 14, 13, 109, and 15) and remove the cap screw (key 14), actuator spacer (key 13), actuator rod (key 22), and washer (key 15).
9. Replace the diaphragm (key 10), actuator rod bushing (key 19), actuator rod seal (key 20), and diaphragm O-ring (key 109), as needed.

Actuator Disassembly (For Fail-Up Constructions, see figure 8)

1. Connect a separate air supply to the air supply connection on the upper casing (shown in figure 8) and apply sufficient air pressure to move the plug/stem to mid-travel.

2. Remove the stem connector nut half (key 23), stem connector bolt half (key 24), and travel indicator (key 26).
3. Shut off the air pressure and disconnect the air supply to the upper casing.

⚠ WARNING

To avoid personal injury or property damage due to actuator springs (key 12) being under compression, remove the long cap screws (key 16) last.

The upper actuator casing may remain fixed to the diaphragm and lower casing during disassembly, even if the casing cap screws have been loosened. If this happens, the actuator springs are still under compression. The upper casing could suddenly come loose and jump, due to the compressed energy of the springs. If the upper casing is stuck to the diaphragm and lower casing when you begin loosening the casing cap screws, pry the casings apart with a prying tool. Always ensure that the springs are dispersing energy and the upper casing is moving against the long bolts during disassembly.

4. Remove the short actuator casing cap screws and hex nuts (keys 17 and 18) first. Once these have been removed from the actuator assembly, carefully remove the long actuator cap screws and hex nuts (keys 16 and 18), alternating between them to gradually release the spring energy (compression).
5. Remove the upper diaphragm casing (key 9).
6. Lift off the actuator stem/diaphragm assembly (includes keys 22, 11, 10, 14, 13, 109, and 15) and remove the cap screw (key 14), actuator spacer (key 13), actuator rod (key 22), and washer (key 15).
7. Remove the actuator springs (key 12).
8. Replace the diaphragm (key 10), actuator rod bushing (key 19), actuator rod seal (key 20), and diaphragm O-ring (key 109), as needed.

Actuator Assembly (For Fail-Down Constructions, see figure 11)

1. Install the diaphragm (key 10) on the diaphragm plate (key 11). Insert the cap screw (key 14) through the actuator spacer (key 13) and place this assembly through the diaphragm/diaphragm plate assembly.
2. Place the diaphragm O-ring (key 109) and the washer (key 15) over the center hole of the diaphragm, so that the convex part of the washer is facing down toward the diaphragm and contains the O-ring. Ensure the convex part of the washer is guided in the diaphragm center hole as shown in figure 11.
3. Screw the actuator rod (key 22) onto the cap screw (key 14) and torque to 80.0 N•m (59.1 lbf•ft). Install the actuator stem/diaphragm assembly back into the actuator yoke (key 8).
4. Place the actuator springs (key 12) onto the spring locators in the diaphragm plate (key 11).
5. Install the upper diaphragm casing (key 9) so that the ribs on the top of the upper diaphragm casing are perpendicular with the yoke legs.
6. Install the 2 long cap screws (key 16) and hex nuts (key 18) 180 degrees apart from each other and in line with the actuator yoke legs.
7. Tighten the long cap screws (key 16) and hex nuts (key 18), alternating between them to gradually compress the springs, until the two casing halves and diaphragm touch.
8. Install the remaining short cap screws (key 17) and hex nuts (key 18) to the casing.
9. Tighten the actuator casing cap screws evenly using a cross-tightening procedure. Torque to 55 N•m (40 lbf•ft).
10. If you had previously removed the actuator assembly from the valve, place the actuator assembly back onto the valve body (key 1) or yoke extension (key 105, figure 12) for HT constructions. Install the four body nuts (key 7), but tighten them only finger-tight.
11. Connect a separate air supply to the actuator air supply connection (as shown on the yoke in figure 11) and apply sufficient air pressure to raise the actuator rod (key 22) to the travel stop.
12. Tighten the body nuts (key 7) evenly using a cross-tightening procedure. See table 3 for torque requirements.

- For HT constructions, the valve body nuts (key 7) are tightened at the valve body (key 1) and at the top of the yoke extension (key 105), see figure 12.
13. With the valve plug/stem (key 3) on the lower seat, thread the lower stem connector (key 27) up to match the gap setting between the actuator rod and stem adjuster nut specified in table 2. Thread the locknut (key 28) up against the stem adjuster nut and tighten to a torque of 48 N•m (35 lbf•ft) for the 10mm stems or 175 N•m (129 lbf•ft) for 14mm stems.
 - For HT constructions see figure 12. With the valve plug/stem (key 3) on the lower seat, thread the stem extension (key 106) up to match the gap setting between the actuator rod and stem extension specified in table 2. Thread the locknut (key 108) up against the stem extension and tighten to a torque of 48 N•m (35 lbf•ft) for the 10mm stems or 175 N•m (129 lbf•ft) for 14mm stems.
 14. Stroke the actuator rod until it contacts the lower stem connector (key 27), or the stem extension (key 106, figure 12) for HT construction, and install the stem connector halves and travel indicator (keys 23, 24, and 26) with the cap screws (key 25). Install the stem connector halves in the proper orientation so that when looking at the inside of the stem connector halves, the flats are down and the beveled surfaces are up.
 15. Align the pointer of the travel indicator (key 26) with the appropriate mark on the travel scale.
 16. Tighten the stem connector cap screws (key 25) to 35 N•m (26 lbf•ft).
 17. Release the actuator pressure.

Actuator Assembly (For Fail-Up Constructions, see figure 8)

1. Position the upper diaphragm casing (key 9) upside down on the bench so that it lays flat and not off balance.

Note

If converting from fail-down to fail-up action, first move the vent cap (key 21) from the top of the casing (see figure 8) and thread into the air supply connection on the yoke leg (see figure 11).

2. Install the diaphragm (key 10) on the diaphragm plate (key 11). Place the diaphragm O-ring (key 109) and the washer (key 15) over the center hole of the diaphragm, so that the convex part of the washer is facing down toward the diaphragm and contains the O-ring. Ensure the convex part of the washer is guided in the diaphragm center hole as shown in figure 8.
3. Insert the cap screw (key 14) through the washer and diaphragm, install the actuator spacer (key 13), and screw the actuator rod (key 22) onto the cap screw (key 14) finger-tight.
4. Radially align the spring locators in the diaphragm plate assembly (key 11) with the casing cap screw holes in the diaphragm (key 10). This will ensure that the springs do not cover the air path in the yoke.
5. Torque the cap screw (key 14) to the actuator rod (key 22) to 80.0 N•m (59.1 lbf•ft) and lay this assembly into the upper diaphragm casing (key 9).
6. Place the actuator springs (key 12) onto the spring locators in the diaphragm plate (key 11).
7. Set the actuator yoke (key 8) down onto the assembly that is resting in the upper diaphragm casing (key 9) so that the yoke legs are perpendicular with the ribs on the top of the upper diaphragm casing (key 9).
8. Install the 2 long cap screws (key 16) and hex nuts (key 18) 180 degrees apart from each other and in line with the actuator yoke legs.
9. Tighten the long cap screws (key 16) and hex nuts (key 18), alternating between them to gradually compress the springs, until the two casing halves and diaphragm touch.
10. Install the remaining short cap screws (key 17) and hex nuts (key 18) to the casing.
11. Tighten the actuator casing cap screws evenly using a cross-tightening procedure. Torque to 55 N•m (40 lbf•ft).

12. If you had previously removed the actuator assembly from the valve, place the actuator assembly back onto the valve body (key 1) or yoke extension (key 105, figure 12) for HT construction. Install the body nuts (key 7) and tighten evenly using a cross-tightening procedure. See table 3 for torque requirements.
 - For HT constructions, see figure 12. Ensure the valve body nuts (key 7) are tightened at the valve body (key 1) and at the top of the yoke extension (key 105).
13. With the valve plug/stem (key 3) on the lower seat, thread the lower stem connector (key 27) up to match the gap setting between the actuator rod and stem adjuster nut specified in table 2. Thread the locknut (key 28) up against the stem locknut and tighten to a torque of 48 N•m (35 lbf•ft) for 10mm stems or 175 N•m (129 lbf•ft) for 14mm stems.
 - For HT constructions see figure 12. With the valve plug/stem (key 3) on the lower seat, thread the stem extension (key 106) up to match the gap setting between the actuator rod and stem extension specified in table 2. Thread the locknut (key 108) up against the stem extension and tighten to a torque of 48 N•m (35 lbf•ft) for the 10mm stems or 175 N•m (129 lbf•ft) for 14mm stems.
14. Stroke the actuator rod until it contacts the lower stem connector (key 27), or stem extension (key 106, figure 12), and install the stem connector halves and travel indicator (keys 23, 24, and 26) with the cap screws (key 25). Install the stem connector halves in the proper orientation so that when looking at the inside of the stem connector halves, the flats are down and the beveled surfaces are up.
15. Align the pointer of the travel indicator (key 26) with the appropriate mark on the travel scale.
16. Tighten the stem connector cap screws (key 25) to 35 N•m (26 lbf•ft).

Note

For fail-up action, the air supply tubing must be connected to the actuator upper casing at the air supply connection, see figure 8. (If converting from fail-down to fail-up, the tubing will need to be re-routed to this location).

Packing Maintenance

Key numbers refer to figure 7.

Packing Adjustment

For ENVIRO-SEAL™ spring-loaded single PTFE V-ring packing (figure 7) or for ENVIRO-SEAL graphite ULF packing (figure 7), the Belleville spring pack (key 34) maintains a sealing force on the packing. If leakage is detected around the packing follower (key 29) check to be sure that the packing follower (key 29) is tight. Using a wrench, tighten the packing follower (key 29) in 1/4 turn intervals until the leakage is stopped. If leakage cannot be stopped in this manner, proceed to the Replacing Packing section in this manual.

Replacing Packing (Pneumatic Actuators)

Isolate the control valve from the line pressure, release pressure from all three inlets/outlets of the valve body and drain the process media from the valve. Shut off all pressure lines to the actuator and release all pressure from the actuator. Use lock-out procedures to ensure that the above measures stay in effect while you work on the equipment.

1. For fail-down constructions, as shown in figure 11:
 - a. Connect a separate air supply to the lower diaphragm casing via the air supply connection on the yoke (as shown in figure 11) and apply sufficient air pressure to raise the valve plug/stem off the lower seat to mid travel.

- b. Remove the stem connector nut half (key 23), stem connector bolt half (key 24), and travel indicator (key 26).
- c. Push the valve plug stem (key 3) down until it contacts the lower seat.
- d. Loosen the locknut (key 28) and thread the lower stem connector (key 27) down until it clears the top of the valve plug stem (key 3).
 - For HT construction, loosen locknut (key 108) and thread the stem extension (key 106) down as far as possible (see figure 12).
- e. Shut off the air pressure and disconnect the separate air supply to the lower diaphragm casing (as shown in figure 11).

⚠ WARNING

To avoid personal injury or property damage by uncontrolled movement of the actuator yoke (key 8), loosen the body/yoke nuts (figure 11, key 7) by following the instructions in the next step. Do not remove a stuck actuator yoke by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the actuator yoke.

Note

The following step also provides additional assurance that the valve body fluid pressure has been relieved.

2. For fail-up constructions, as shown in figure 8:
 - a. Connect a separate air supply to the air supply connection on the upper casing (shown in figure 8) and apply sufficient air pressure to move the plug/stem to mid-travel.
 - b. Remove the stem connector nut half (key 23), stem connector bolt half (key 24), and travel indicator (key 26).
 - c. Shut off the air pressure and disconnect the air supply to the upper casing.
3. Valve body nuts (key 7) attach the actuator yoke (key 8) to the valve body (key 1). Loosen these nuts approximately 3mm (1/8 inch).
 - For HT constructions, see figure 12. Nuts (key 7) attach the yoke extension (key 105) to the valve body (key 1). Loosen these nuts approximately 3mm (1/8 inch). It is not necessary to loosen the nuts which attach the actuator yoke (key 8) to the yoke extension.
4. Then loosen the valve-to-yoke gasketed joint by either rocking the actuator yoke or prying between the valve and yoke. Work the prying tool around the yoke until it loosens.

⚠ WARNING

If there is evidence of process fluid under pressure leaking from the joint, retighten the valve body/joint nuts and return to the Warning at the beginning of the Maintenance section to ensure proper steps have been taken to isolate the valve and relieve process pressure.

5. If no fluid leaks from the joint, loosen the packing follower (key 29) two turns to relieve the packing compression load.
6. Remove the body nuts (key 7) completely.

CAUTION

To avoid property damage, place the actuator yoke on a protective surface, as described in the following procedure.

7. Carefully lift off the actuator and set it on a protective surface to prevent damage. If the bonnet (key 4) together with the valve stem plug assembly has a tendency to lift with the actuator, ensure it does not drop from the actuator.
8. Remove the lower stem connector (key 27) and locknut (key 28).
 - For HT constructions, see figure 12. Remove the stem extension (key 106) and locknut (key 108).
9. Remove the bonnet and the valve plug/stem assembly and set on a protective surface.
10. Remove the valve/yoke gasket (key 5) and cover the opening of the valve to protect the gasket surface and prevent foreign matter from getting into the valve cavity.
11. Remove the packing follower (key 29) from the bonnet (key 4).
12. Remove the Belleville spring pack (key 34) and packing spacer (key 30) from the bonnet (key 4). Carefully push out the remaining packing box parts from the bonnet (key 4) using a rounded rod or other tool which will not scratch the packing box wall. Clean the packing box and the metal packing box parts.

CAUTION

Inspect the valve stem, threads and packing box surfaces for any sharp edges that might cut the packing. Scratches or burrs could cause packing box leakage or damage the new packing.

13. Inspect the valve stem, threads and packing box surfaces for any sharp edges that might cut the packing. Scratches or burrs could cause packing box leakage or damage the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts.
14. Remove the covering protecting the valve cavity and install a new valve/yoke gasket (key 5) making sure that the gasket seating surfaces are clean and smooth.

Table 4. Packing Follower Torque

Valve Size	Packing Style	Torque N•m (lbf•ft)	Packing Style	Torque N•m (lbf•ft)
DN25 and 40	ENVIRO-SEAL PTFE	10 (7.4)	ENVIRO-SEAL ULF	35 (26)
DN50, 80, and 100	ENVIRO-SEAL PTFE	23 (17)	ENVIRO-SEAL ULF	50 (37)

15. Install a new O-ring (key 81) in the groove on the bottom of the side-port common bonnet (key 4). See figure 9. Apply a general purpose silicone base lubricant.
 - For HT constructions, see figure 12. Install a new graphite seal ring (key 107). Apply a general purpose silicone base lubricant.
16. Carefully install the bonnet (key 4) onto the valve stem.
17. Install the new packing and the metal packing box parts according to figure 7 for ENVIRO-SEAL PTFE packing and according to figure 7 for ENVIRO-SEAL graphite ULF packing. Place a smooth-edged pipe over the valve stem and gently tap each soft packing part into the packing box. Apply anti-seize lubricant to the threads and install the packing follower (key 29).
18. Install the locknut (key 28) and lower stem connector (key 27). Install the valve plug/bonnet sub assembly into the valve body (key 1).

- For HT constructions, see figure 12. Install the locknut (key 108) and stem extension (key 106). Install the valve plug/bonnet sub assembly into the valve body (key 1).
19. Mount the actuator onto the valve and install the body nuts (figure 8 key 7), but tighten them only finger-tight.
 20. For fail-down constructions, connect a separate air supply to the lower diaphragm casing air supply connection (as shown in figure 11) and apply sufficient air pressure to raise the actuator rod (key 22) to the travel stop. Proceed to the next step.
For fail-up constructions, proceed to the next step.
 21. Tighten the valve body nuts (key 7) evenly using a cross-tightening procedure. See table 3 for torque requirements.
 - For HT constructions, see figure 12. Ensure the valve body nuts (key 7) are tightened at the valve body (key 1) and at the top of the yoke extension (key 105).
 22. Thread the lower stem connector (key 27) up to match the gap setting between the actuator rod and stem adjuster nut specified in table 2. Thread the locknut (key 28) up against the stem locknut and tighten to a torque of 48 N•m (35 lbf•ft) for 10mm stems or 175 N•m (129 lbf•ft) for 14mm stems.
 - For HT constructions see figure 12. With the valve plug/stem (key 3) on the lower seat, thread the stem extension (key 106) up to match the gap setting between the actuator rod and stem extension specified in table 2. Thread the locknut (key 108) up against the stem extension and tighten to a torque of 48 N • m (35 lbf • ft) for the 10mm stems or 175 N • m (129 lbf • ft) for 14mm stems.
 23. Stroke the actuator rod until it contacts the lower stem connector (key 27) or stem extension (key 106, figure 12) and install the stem connector halves and travel indicator (keys 23, 24, and 26) with the cap screws (key 25). Install the stem connector halves in the proper orientation so that when looking at the inside of the stem connector halves, the flats are down and the beveled surfaces are up.
 24. Align the pointer of the travel indicator (key 26) with the appropriate mark on the travel scale.
 25. Tighten the stem connector cap screws (key 25) to 35 N•m (26 lbf•ft).
 26. Tighten the packing follower (key 29) to the torque specified in table 4.
- Alternately, the packing follower can be tightened by the following method:
- a. Tighten the packing follower until the Belleville springs are compressed 100% (or completely flat), as detected by a rapid increase in nut torque.
 - b. Loosen the packing follower 60° of rotation.
27. For fail-down constructions, release the actuator pressure.
 28. For fail-down constructions, ensure the vent (key 21) is installed into the upper diaphragm casing (see figure 11).
 29. For fail-up constructions, ensure the vent (key 21) is installed into the actuator yoke air supply connection. See figure 8.

Replacing Packing (Electric Actuators)

Isolate the control valve from the line pressure, release pressure from all three inlets/outlets of the valve body and drain the process media from the valve. Use lock-out procedures to ensure that the above measures stay in effect while you work on the equipment.

1. Stroke the actuator so the valve plug/stem (key 3) is at mid travel.
2. Remove the stem connector nut half (key 23), stem connector bolt half (key 24), and travel indicator (key 26).
3. Use precaution to ensure the actuator is locked in position and cannot stroke.
4. Mark the position of the locknut (key 28) on the stem for reassembly.

5. Push the valve plug stem (key 3) down until it contacts the lower seat.
6. Loosen the locknut (key 28) and thread the lower stem connector (key 27) down until it clears the top of the valve plug stem (key 3).
 - For HT construction, loosen locknut (key 108) and thread the stem extension (key 106) down as far as possible (see figure 12).

⚠ WARNING

To avoid personal injury or property damage by uncontrolled movement of the actuator yoke (key 8), loosen the body/yoke nuts (figure 11, key 7) by following the instructions in the next step. Do not remove a stuck actuator yoke by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the actuator yoke.

Note

The following step also provides additional assurance that the valve body fluid pressure has been relieved.

7. Valve body nuts (key 7) attach the actuator yoke (key 8) to the valve body (key 1). Loosen these nuts approximately 3mm (1/8 inch).
 - For HT constructions, see figure 12. Nuts (key 7) attach the yoke extension (key 105) to the valve body (key 1). Loosen these nuts approximately 3mm (1/8 inch). It is not necessary to loosen the nuts which attach the actuator yoke (key 8) to the yoke extension.
8. Then loosen the valve-to-yoke gasketed joint by either rocking the actuator yoke or prying between the valve and yoke. Work the prying tool around the yoke until it loosens.

⚠ WARNING

If there is evidence of process fluid under pressure leaking from the joint, retighten the valve body/joint nuts and return to the Warning at the beginning of the Maintenance section to ensure proper steps have been taken to isolate the valve and relieve process pressure.

9. If no fluid leaks from the joint, loosen the packing follower (key 29) two turns to relieve the packing compression load.
10. Remove the body nuts (key 7) completely.

CAUTION

To avoid property damage, place the actuator yoke on a protective surface, as described in the following procedure.

11. Carefully lift off the actuator and set it on a protective surface to prevent damage. If the bonnet (key 4) together with the valve stem plug assembly has a tendency to lift with the actuator, ensure it does not drop from the actuator.
12. Remove the lower stem connector (key 27) and locknut (key 28).
 - For HT constructions, see figure 12. Remove the stem extension (key 106) and locknut (key 108).

13. Remove the bonnet and the valve plug/stem assembly and set on a protective surface.
14. Remove the valve/yoke gasket (key 5) and cover the opening of the valve to protect the gasket surface and prevent foreign matter from getting into the valve cavity.
15. Remove the packing follower (key 29) from the bonnet (key 4).
16. Remove the Belleville spring pack (key 34) and packing spacer (key 30) from the bonnet (key 4). Carefully push out the remaining packing box parts from the bonnet (key 4) using a rounded rod or other tool which will not scratch the packing box wall. Clean the packing box and the metal packing box parts.

CAUTION

Inspect the valve stem, threads and packing box surfaces for any sharp edges that might cut the packing. Scratches or burrs could cause packing box leakage or damage the new packing.

17. Inspect the valve stem, threads and packing box surfaces for any sharp edges that might cut the packing. Scratches or burrs could cause packing box leakage or damage the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts.
18. Remove the covering protecting the valve cavity and install a new valve/yoke gasket (key 5) making sure that the gasket seating surfaces are clean and smooth.
19. Install a new O-ring (key 81) in the groove on the bottom of the side-port common bonnet (key 4). See figure 9. Apply a general purpose silicone base lubricant.
 - For HT constructions, see figure 12. Install a new graphite seal ring (key 107). Apply a general purpose silicone base lubricant.
20. Carefully install the bonnet (key 4) onto the valve stem.
21. Install the new packing and the metal packing box parts according to figure 7 for ENVIRO-SEAL PTFE packing and according to figure 7 for ENVIRO-SEAL graphite ULF packing. Place a smooth-edged pipe over the valve stem and gently tap each soft packing part into the packing box. Apply anti-seize lubricant to the threads and install the packing follower (key 29).
22. Install the locknut (key 28) and lower stem connector (key 27). Ensure they are aligned with the mark made on the stem disassembly and tighten. Install the valve plug/bonnet sub assembly into the valve body (key 1).
 - For HT constructions, see figure 12. Install the locknut (key 108) and stem extension (key 106). Install the valve plug/bonnet sub assembly into the valve body (key 1).
23. Mount the actuator onto the valve and install the body nuts (figure 8 key 7), but tighten them only finger-tight.
24. Tighten the valve body nuts (key 7) evenly using a cross-tightening procedure. See table 3 for torque requirements.
 - For HT constructions, see figure 12. Ensure the valve body nuts (key 7) are tightened at the valve body (key 1) and at the top of the yoke extension (key 105).
25. Push the valve plug/stem to the valve seat. Thread the lower stem connector (key 27) and the locknut (key 28) to the previously marked position and tighten to a torque of 48 N•m (35 lbf•ft) for 10mm stems or 175 N•m (129 lbf•ft) for 14mm stems.
 - For HT constructions see figure 12. With the valve plug/stem (key 3) on the lower seat, thread the stem extension (key 106) and the locknut (key 108) to the previously marked position and tighten to a torque of 48 N•m (35 lbf•ft) for the 10mm stems or 175 N•m (129 lbf•ft) for 14mm stems.
26. Stroke the actuator rod until it contacts the lower stem connector (key 27) or stem extension (key 106, figure 12) and install the stem connector halves and travel indicator (keys 23, 24, and 26) with the cap screws (key 25). Install

the stem connector halves in the proper orientation so that when looking at the inside of the stem connector halves, the flats are down and the beveled surfaces are up.

27. Align the pointer of the travel indicator (key 26) with the appropriate mark on the travel scale.

28. Tighten the stem connector cap screws (key 25) to 35 N•m (26 lbf•ft).

29. Tighten the packing follower (key 29) to the torque specified in table 4.

Alternately, the packing follower can be tightened by the following method:

- Tighten the packing follower until the Belleville springs are compressed 100% (or completely flat), as detected by a rapid increase in nut torque.
- Loosen the packing follower 60° of rotation.

30. Ensure that the electric actuator maximum thrust output does not exceed the values in table 5.

Table 5. GX 3-Way Electric Actuator Maximum Allowable Thrust

VALVE SIZE	STEM DIAMETER mm	TRAVEL mm	STEM MATERIAL	MAXIMUM THRUST FOR ACTUATOR TRAVEL UP AND DOWN	
				N	lbf
DN25-DN40 (NPS 1 to 1-1/2)	10	19	316L SST	6900	1550
DN50 (NPS 2)	14	19	316L SST	14000	3150
DN80-DN100 (NPS 3 to 4)	14	38	316L SST	14000	3150

Valve Trim Maintenance

Key numbers in this section refer to figures 9 and 10. Reference the flow direction nameplate (figure 5) to determine side-port common (unbalanced) or bottom-port common (balanced) trim style.

Figure 5. Fisher GX 3-Way Flow Direction Nameplate

GE34806-B

SIDE-PORT COMMON - DIVERGING

GE34805-B

SIDE-PORT COMMON - CONVERGING

Side-Port Common and Bottom-Port Common Trim Disassembly

1. Remove the actuator and bonnet assembly as described in the Replacing Packing section (steps 1 through 10).

CAUTION

Use care to avoid damaging the gasket sealing surfaces.

The surface finish of the valve stem (key 3) is critical for making a good packing seal. The seating surfaces of the seat ring or cage (key 2) and the valve plug (key 3) are critical for tight shutoff and should therefore also be treated with care and properly protected.

1. Packing parts can be removed from the bonnet if desired. Replace these parts as described in the section on Packing Maintenance.
2. Use a seat ring or cage tool made according to the dimensions in figure 6 and table 6 to remove the seat ring or cage (key 2) as follows:
 - a. Insert the tool into the valve body. Be certain the tool lugs are engaged in the corresponding recesses in the seat ring or cage.
 - b. Use care to avoid damaging or scratching the bonnet and cage guide surfaces (see figures 9 and 10).
 - c. Use a torque gun or driver having sufficient torque capabilities according to table 7. Connect the gun to a socket that snugly fits the hex head on the seat ring or cage tool.
 - d. Insert the socket onto the hex head of the seat ring or cage tool.

⚠ WARNING

Be careful to hold the torque gun, attached socket, and tool at right angles to the seat ring or cage when applying torque. Tilting the gun and socket while applying torque may cause the lugs on the seat ring or cage tool to suddenly disengage from the lugs on the seat ring or cage thus causing possible damage to the seat ring or cage and possible personal injury.

3. Remove the seat ring or cage (key 2) from the valve body.
4. Inspect parts for wear or damage that would prevent proper operation of the valve.

Side-Port Common Trim Assembly

Refer to figure 9.

1. Before installing the new seat ring, thoroughly clean the threads in the valve body. Apply suitable lubricant to the threads and to the radius surface of the seat ring (key 2). Screw the seat ring into the valve body. Using the seat ring tool, tighten the seat ring and torque according to the values in table 7. Remove all excess lubricant after tightening.
2. Clean the body/yoke gasket surfaces and install a new body/yoke gasket (key 5).
3. Remove any protective tape or covering from the valve plug/stem assembly.
4. Insert the plug/stem assembly into the seat ring.
5. Install a new bonnet O-ring (key 81) in the groove on the bonnet (see figure 9). Apply a general purpose silicone-based lubricant.
 - For HT constructions, see figure 12. Install a new graphite seal ring (key 107) in the groove on the bonnet. Apply a general purpose silicone lubricant.

CAUTION

If the packing is to be reused and was not removed from the bonnet, perform the following step carefully to avoid damaging the packing with the stem threads.

6. Install bonnet, and actuator yoke onto the valve body by completing the assembly according to steps 14 to 27 of the section Replacing Packing, omitting step 17 if new packing is not being installed.

Bottom Port Common Trim Assembly

1. Once the seal ring (key 37) is removed, the elastomeric backup ring (key 38) can be pried from the groove.
2. To install a new backup ring (key 38) and seal ring (key 37) into the cage (key 2), apply a general purpose silicone-based lubricant. Slide the backup ring into the cage and into the groove. Slide the seal ring from the top into the cage over the backup ring.
3. Install a new cage O-ring (key 81) in the outer groove on the cage (see figure 10). Apply a general purpose silicone-based lubricant.
4. Before installing a new cage, thoroughly clean the threads in the valve body. Apply a suitable lubricant to the threads and to the radius surface of the cage (key 2). Screw the cage into the valve body. Using the cage tool, tighten the cage and torque according to the values in table 7. Remove all excess lubricant after tightening.

Figure 6. Seat Ring or Cage Removal and Installation Tool

GE02918-6

Table 6. Seat Ring or Cage Driver Dimensions

Valve Size		A	B	C	D	E	FØ
DN	NPS	mm					
Side-Port Common

25	1	36	20	2X 13.2	7.5	58	53
40	1-1/2	46	28	2X 13.2	7.5	63	63
50	2	60	36	2X 15.2	8.5	80	93
80	3	70	44	2X 17.2	9.5	105	113
100	4	70	44	2X 17.2	9.5	105	113

Table 7. Seat Ring and Cage Torque Requirements

VALVE SIZE		TORQUE	
DN	NPS	N•m	lbf•ft
25	1	320	234
40	1-1/2	460	337
50	2	1020	747
80 and 100	3 and 4	1520	1113

5. Clean the body/yoke gasket surfaces and install a new body/yoke gasket (key 5).
6. Remove any protective tape or covering from the valve plug/stem assembly.

CAUTION

Be careful when inserting the plug/stem assembly into the cage. Lower the plug into the cage slowly as this will seat the seal ring to the plug. Make sure the seal ring (key 37) or backup ring (key 38) does not become disengaged from the cage groove.

7. To insert the plug/stem assembly (key 3) into the cage (key 2), apply a general purpose silicone-based lubricant. Slowly insert the plug/stem assembly into the cage.

CAUTION

If the packing is to be reused and was not removed from the bonnet, perform the following step carefully to avoid damaging the packing with the stem threads.

8. Insert the bonnet and actuator yoke onto the valve body by completing the assembly according to steps 14 to 27 of the section Replacing Packing, omitting step 17 if new packing is not being installed.

Parts Ordering

Each valve is assigned a serial number which can be found on the valve or on the nameplate (figure 2 and key 35, not shown). The nameplate will normally be fitted to the actuator. Refer to this serial number when contacting your [Emerson sales office](#) or Local Business Partner for technical assistance. When ordering replacement parts refer to this serial number and give the part description from the following parts list.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts Kits

Packing Kits

PACKING KITS	Valve Size Stem Diameter	DN 25 and 40 (NPS 1 and 1-1/2) 10 mm	DN 50, 80 and 100 (NPS 2, 3 and 4) 14 mm
	ENVIRO-SEAL PTFE packing (Contains keys 32 and 33)	RGXPACX012	RGXPACX022
	ENVIRO-SEAL Graphite ULF packing (Contains keys 42, 43, and 44)	RGXPACX052	RGXPACX042

Actuator Kits

ACTUATOR KITS	Actuator Size	225	750
	Actuator (Contains keys 10, 15, 19, 109, and 20)	RGX225X0022	RGX750X0032

Bottom-Port Common Seal Kits

BOTTOM-PORT COMMON SEAL KITS ⁽¹⁾	Valve Size	DN 25 (NPS 1)	DN 40 (NPS 1-1/2)	DN 50 (NPS 2)	DN 80 and 100 (NPS 3 and 4)
	Nitrile (Contains keys 37 and 38)	RGX3WAYX012	RGX3WAYX042	RGX3WAYX072	RGX3WAYX102
	Ethylene Propylene (EPDM) (Contains keys 37 and 38)	RGX3WAYX022	RGX3WAYX052	RGX3WAYX082	RGX3WAYX112
	FKM Fluorocarbon (Contains keys 37 and 38)	RGX3WAYX032	RGX3WAYX062	RGX3WAYX092	RGX3WAYX122

1. A Gasket Kit is required when replacing the seals.

Bonnet and Cage O-Rings (not used on HT constructions)

BONNET AND CAGE O-RINGS ⁽¹⁾	Valve Size	DN 25 (NPS 1)	DN 40 (NPS 1-1/2)	DN 50 (NPS 2)	DN 80 and 100 (NPS 3 and 4)
	Nitrile O-ring (Contains key 81)	GE29466X012	GE29467X012	GE29468X012	GE29469X012
	Ethylene Propylene O-ring (EPDM) (Contains key 81)	GE29466X022	GE29467X022	GE29468X022	GE29469X022
	FKM Fluorocarbon O-ring (Contains key 81)	GE29466X032	GE29467X032	GE29468X032	GE29469X032

1. The bonnet O-ring applies to Side-Port Common trim. The cage O-ring applies to Bottom-Port Common trim.

Seal Rings (HT Construction Only)

SEAL RINGS	Valve Size	DN 25 (NPS 1)	DN 40 (NPS 1-1/2)	DN 50 (NPS 2)	DN 80 and 100 (NPS 3 and 4)
	Graphite Seal Ring (Contains key 107)	GE49062X012	GE49063X012	GE49064X012	GE49065X012

Gasket Kits

GASKET KITS	Valve Size	DN 25 (NPS 1)	DN 40 (NPS 1-1/2)	DN 50 (NPS 2)	DN 80 (NPS 3)	DN 100 (NPS 4)

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual includes installation, maintenance and parts information for the Fisher GX control valve and actuator system.

WARNING

Do not install, operate or maintain a GX valve without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

1.2 Description

The GX is a compact, state-of-the-art control valve and actuator system, designed to control a wide range of process gases, vapors and fluids.

The GX is rugged, reliable and easy to select. It requires no actuator sizing—the actuator selection is automatic once the valve body construction is selected.

The GX meets the requirements of both EN and ASME standards. It is available with a complete accessory package, including the Fisher FIELDVUE™ instruments.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

GX Valve and Actuator

July 2026

Instruction Manual

D103175X012

Table 1. Fisher GX Valve Specifications

Specifications	EN	ASME
Valve Body Size	DN 15, 20, 25, 40, 50, 80, 100, 150	NPS 1/2, 3/4, 1, 1-1/2, 2, 3, 4, 6
Pressure Rating	PN 10 / 16 / 25 / 40 per EN 1092-1	CL150 / 300 per ASME B16.34
End Connections	Flanged raised face per EN 1092-1	Flanged raised face per ASME B16.5
Valve Body/Bonnet Materials	1.0619 steel	ASME SA216 WCC steel
	1.4409 stainless steel	ASME SA351 CF3M stainless steel
	CW2M (sizes DN 25 through 100 only)	CW2M (NPS 1 through 4 only)
	ASME SA352 LCC	ASME SA352 LCC
	ASTM A990 CN3MCu/ASME SA351 CN7M (Cast Alloy 20) (sizes DN 25 through 100 only)	ASTM A990 CN3MCu/ASME SA351 CN7M (Cast Alloy 20) (NPS 1 through 4 only)
	CD3MN Duplex SST (sizes DN 25 through 100 only)	CD3MN Duplex SST (NPS 1 through 4 only)
	CF3 304L SST (sizes DN 25 through 100 only)	CF3 304L SST (NPS 1 through 4 only)
	- - -	M35-2 (NPS 1 through 4 only)
	- - -	N7M Alloy B2 (NPS 1 through 4 only)
Face-to-Face Dimensions	Consistent with EN 558-1 Series 1	Consistent with ANSI/ISA 75.08.01
Shutoff per IEC 60534-4 and ANSI/FCI 70-2	Metal seat - Class IV (standard)	
	Metal seat - Class V (optional)	
	PTFE seat - Class VI (optional) ⁽¹⁾	
Flow Direction	Flow-up (Cavitrol™ III trim, Flow down)	
Flow Control Characteristics	Equal Percentage and Linear	
Trim Style	Port Diameters	Trim Style Description
	4.8 mm	Micro-Flow trim (unbalanced)
	9.5, 14, 22 mm	Stem-Guided with Contoured Plug (unbalanced) or Port-Guided with Cavitrol III trim (unbalanced)
	36, 46 mm	Port-Guided Plug (unbalanced)
	70, 90, 136 mm	Balanced Trim with Contoured plug or Unbalanced Port-Guided Plug
Handwheel	Available as an option	
Travel Stop	Available as an option	
1. For 4.8 to 14 mm ports, Class VI shutoff is achieved without PTFE seat.

Section 2: Valve Installation

WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure or bursting of pressure retaining parts might result if service conditions exceed those for which the product was intended. To avoid injury or damage, provide a relief valve for over pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#). Provide the product serial number (shown on the nameplate, Figure 2) and all other pertinent information.

NOTE

The acronym of CWP may appear on the nameplate. CWP (Cold Working Pressure) denotes the pressure rating at normal ambient temperature. A normal ambient temperature range being -4 to +100°F / -20 to +38°C.

Figure 2. Fisher GX Nameplate Examples (Key 35)

**WARNING**

If you move or work on an actuator installed on a valve with loading pressure applied, keep your hands and tools away from the stem travel path to avoid personal injury. Be especially careful when removing the stem connector to release all loading on the actuator stem whether it be from air pressure on the diaphragm or compression in the actuator springs. Likewise take similar care when adjusting or removing any optional travel stop. Refer to the relevant actuator Maintenance Instructions.

NOTICE

Ensure the valve and adjacent pipelines are free of foreign material that could damage the valve seating surfaces.

1. Before installing the valve, inspect it to be certain that the valve body cavity is free of all foreign material. Clean out all pipelines to remove scale, welding slag and other foreign material.
2. The control valve assembly may be installed in any orientation unless limited by seismic criteria. However, the normal method is with the actuator vertical above the valve. Other positions may result in uneven trim wear and improper operation. With some valves, the actuator may also need to be supported when it is not vertical. For more information, consult your [Emerson sales office](#). Flow through the valve must be in the direction indicated by the arrow cast on the valve.

3. Use accepted piping practices when installing the valve in the pipeline. Use a suitable gasket between the valve and the pipeline flanges.
4. If continuous operation is required during inspection or maintenance, install isolating valves on either side of the control valve with a bypass valve to control the flow while the control valve is receiving maintenance.

WARNING

Personal injury could result from packing leakage. Valve packing is tightened before shipment; however the packing might require some readjustment to meet specific service conditions.

Section 3: Maintenance

WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- **Do not remove the actuator from the valve while the valve is still pressurized.**
- **Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.**
- **Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.**
- **Use bypass valves or completely shut off the process to isolate the valve from the process pressure. Relieve the process pressure from both sides of the valve.**
- **Depending on the actuator construction, it will be necessary to manage the pneumatic actuator loading pressure and any actuator spring pre-compression. It is essential to refer to the relevant actuator instructions in this manual to ensure safe removal of the actuator from the valve.**
- **Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.**
- **The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings or when loosening the packing box pipe plug.**
- **Check with your process or safety engineer for any additional measures that must be taken to protect against process media.**

NOTE

Whenever a gasket seal is disturbed by removing or shifting gasketed parts, install a new gasket during reassembly. This ensures a good gasket seal because the used gasket may not seal properly.

3.1 Actuator Maintenance

For electric actuators, see the supplier's instruction manual.

The following sections provide procedures for actuator maintenance. Refer to Figures 17, 18, 19 and 20.

The actuator soft parts may require periodic replacement. This includes the diaphragm (key 10), diaphragm O-ring (key 109), actuator rod bushing (key 19) and the actuator rod seal (key 20).

If the actuator stroking direction (air-to-open or air-to-close) is unknown, refer to the nameplate on top of the actuator casing and Figure 2.

There are several optional actuator constructions, depending on supply pressure. Refer to the nameplate on the top of the actuator to determine the construction installed. Refer to Figure 3 and Table 2 for proper spring configuration.

NOTE

Older GX actuator nameplates do not contain spring configuration information. If you require replacement springs or wish to switch to an optional actuator construction, consult your [Emerson sales office](#).

NOTE

When the Fisher GX actuator is equipped with a Fisher FIELDVUE instrument, additional considerations may be required. Refer to the appropriate FIELDVUE instrument quick start guide for mounting instructions:

- Fisher FIELDVUE DVC7K Digital Valve Controller quick start guide, [D104766X012](#)
 - Fisher FIELDVUE DVC2000 Digital Valve Controller quick start guide, [D103203X012](#)
 - Fisher FIELDVUE DVC6200 Digital Valve Controller quick start guide, [D103556X012](#)
-

Actuator Disassembly (For Air-to-Open Constructions - see Figure 17 or 18)

1. Connect a separate air supply to the lower diaphragm casing via the air supply connection on the yoke (as shown in Figure 17 or 18) and apply sufficient air pressure to raise the valve plug/stem off the seat to mid-travel.
2. Remove the stem connector nut half (key 23), stem connector bolt half (key 24) and travel indicator (key 26).
3. Push the valve plug/stem (key 3) down until it contacts the seat.
4. Loosen the locknut (key 28) and thread the stem adjuster nut (key 27) down until it clears the top of the valve plug/stem (key 3).
5. Shut off the air pressure and disconnect the separate air supply to the lower diaphragm casing (as shown in Figure 17 or 18).

⚠ WARNING

To avoid personal injury or property damage due to actuator springs (keys 12 and 82) being under compression, remove the long cap screws (key 16) last.

The upper actuator casing may remain fixed to the diaphragm and lower casing during disassembly, even if the casing cap screws have been loosened. If this happens, the actuator springs are still under compression. The upper casing could suddenly come loose and jump, due to the compressed energy of the springs. If the upper casing is stuck to the diaphragm and lower casing when you begin loosening the casing cap screws, pry the casings apart with a prying tool. Always ensure that the springs are dispersing energy and the upper casing is moving against the long bolts during disassembly.

Figure 3. Spring Configuration

ACTUATOR	TRAVEL	GX ACTUATOR - SPRING QUANTITY AND ARRANGEMENT				
225	20					
		6 - GE37264X012	4 - GE37264X012	3 - GE37264X012	2 - GE37264X012	
750	20					
		6 - GE00366X012	4 - GE00366X012			
750	40					
		6 - GE37344X012 AND 6 - GE40917X012	6 - GE37344X012 AND 2 - GE40917X012	6 - GE37344X012	4 - GE37344X012	3 - GE37344X012
1200	40 AND 60					
		8 - GE13551X012 AND 7 - GE13552X012				

NOTE:
CONCENTRIC CIRCLES INDICATE NESTED SPRINGS.
SPRING ARRANGEMENTS ARE SHOWN LOOKING DOWN AT LOWER CASING FROM ABOVE.

6. Remove the short actuator casing cap screws and hex nuts (keys 17 and 18) first. Once these have been removed from the actuator assembly, carefully remove the long actuator cap screws and hex nuts (keys 16 and 18), alternating between them to gradually release the spring energy (compression).
7. Remove the upper diaphragm casing (key 9) and the actuator springs (key 12 and/or 82).
8. Lift off the actuator stem/diaphragm assembly (includes keys 22, 11, 10, 14, 13, 109 and 15) and remove the cap screw (key 14), actuator spacer (key 13), actuator rod (key 22) and washer (key 15).
9. Replace the diaphragm (key 10), diaphragm O-ring (key 109), actuator rod bushing (key 19) and actuator rod seal (key 20), as needed.

Actuator Disassembly (For Air-to-Close Constructions - see Figure 19 or 20)

1. Remove the stem connector nut half (key 23), stem connector bolt half (key 24) and travel indicator (key 26).

WARNING

To avoid personal injury or property damage due to actuator springs (key 12) being under compression, remove the long cap screws (key 16) last.

The upper actuator casing may remain fixed to the diaphragm and lower casing during disassembly, even if the casing cap screws have been loosened. If this happens, the actuator springs are still under compression. The upper casing could suddenly come loose and jump, due to the compressed energy of the springs. If the upper casing is stuck to the diaphragm and lower casing when you begin loosening the casing cap screws, pry the casings apart with a prying tool. Always ensure that the springs are dispersing energy and the upper casing is moving against the long bolts during disassembly.

2. Remove the short actuator casing cap screws and hex nuts (keys 17 and 18) first. Once these have been removed from the actuator assembly, carefully remove the long actuator cap screws and hex nuts (keys 16 and 18), alternating between them to gradually release the spring energy (compression).
3. Remove the upper diaphragm casing (key 9).
4. Lift off the actuator stem/diaphragm assembly (includes keys 22, 11, 10, 14, 13, 109 and 15) and remove the cap screw (key 14), actuator spacer (key 13), actuator rod (key 22) and washer (key 15).
5. Remove the actuator springs (key 12 and/or 82).
6. Replace the diaphragm (key 10), diaphragm O-ring (key 109), actuator rod bushing (key 19) and actuator rod seal (key 20), as needed.

750	40	S31803, N10675, N06022	4 bar / 58 psi	C8	C6
			3 bar / 44 psi	C8	C3
			2 bar / 29 psi	C4	C3
1200	40 or 60	S20910, N05500 S31603	4 bar / 58 psi	D15	D15
			3 bar / 44 psi	D15	D15
			2 bar / 29 psi	N/A	N/A

1. Only applicable to actuators with spring information on the nameplate (see Figure 2).
2. Only applicable to Cavitrol III constructions.

Table 3. Fisher GX Maximum Rated Travel

ACTUATOR SIZE	NUMBER OF CASING BOLTS	TRAVEL
		mm
225	6	20
750	10	20 or 40
1200	16	40 or 60

Table 4. Body Nut (Key 7) Torque Requirements⁽¹⁾

VALVE SIZE	TORQUE	
	N•m	lbf•ft
DN 15, 20, 25 / NPS 1/2, 3/4, 1	45.5	33.5
DN 40 / NPS 1-1/2	79.8	58.9
DN 50 / NPS 2	79.8	58.9
DN 80 / NPS 3	163	120
DN 100 and 150 / NPS 4 and 6	282	208

1. Lubricate with anti-seize compound.

Table 5. Yoke/Extension Bonnet Nut (Key 46) Torque Requirements (used on Extension Bonnet and Bellows Bonnet Constructions)⁽¹⁾

VALVE SIZE	TORQUE	
	N•m	lbf•ft
DN 15, 20, 25, 40 and 50 / NPS 1/2, 3/4, 1, 1-1/2 and 2	79.8	58.9
DN 80 and 100 / NPS 3 and 4	163	120

1. Lubricate with anti-seize compound.

Actuator Assembly For Air-to-Open Constructions (or to Change Action to Air-to-Open - see Figure 17 or 18)

1. Install the diaphragm (key 10) on the diaphragm plate (key 11). Insert the cap screw (key 14) through the actuator spacer (key 13) and place this assembly through the diaphragm/diaphragm plate assembly.
2. Place the diaphragm O-ring (key 109) and the washer (key 15) over the center hole of the diaphragm, so that the convex part of the washer is facing down toward the diaphragm and contains the O-ring. Ensure the convex part of the washer is guided in the diaphragm center hole as shown in Figure 17 or 18.
3. Screw the actuator rod (key 22) onto the cap screw (key 14) and torque to 80 N•m / 59.1 lbf•ft. Install the actuator stem/diaphragm assembly back into the actuator yoke (key 8).
4. Place the actuator springs (key 12 and/or 82) onto the spring locators in the diaphragm plate (key 11). See Figure 3 and Table 2 for proper spring quantity and arrangement.
 - If the nameplate does not contain spring information, use the same quantity and arrangement as originally installed.
5. Install the upper diaphragm casing (key 9) so that the ribs on the top of the upper diaphragm casing are perpendicular with the yoke legs.
 - For Sizes 225 and 750 actuators, install the 2 long cap screws (key 16) and hex nuts (key 18) 180 degrees apart from each other and in line with the actuator yoke legs.
 - For Size 1200 actuators, install the 4 long cap screws (key 16) and hex nuts (key 18) 90 degrees from each other, with two of them in line with the actuator yoke legs.
6. Tighten the long cap screws (key 16) and hex nuts (key 18), alternating between them to gradually compress the springs, until the two casing halves and diaphragm touch.

7. Install the remaining short cap screws (key 17) and hex nuts (key 18) to the casing.
8. Tighten the actuator casing cap screws evenly using a cross-tightening procedure. Torque to 55 N•m / 40 lbf•ft.
9. If you had previously removed the actuator assembly from the valve, place the actuator assembly back onto the valve body (key 1). Install the four body nuts (key 7), but tighten them only finger-tight.
10. Connect a separate air supply to the actuator air supply connection (as shown on the yoke in Figure 17 or 18) and apply sufficient air pressure to raise the actuator rod (key 22) to the travel stop.

NOTE

If converting from air-to-close to air-to-open action, first move the vent cap (key 21) from the air supply connection on the yoke leg (see Figure 19 or 20) to the top of the casing (see Figure 17 or 18).

11. For standard bonnet constructions (Figures 17, 18, 19 and 20), tighten the body nuts (key 7) evenly using a cross-tightening procedure. See Table 4 for torque requirements.
For extension and bellows bonnet constructions (Figures 21 and 22), tighten the bonnet nuts (key 46) evenly using a cross-tightening procedure. See Table 5 for torque requirements.
12. With the valve plug/stem (key 3) on the seat, thread the stem adjuster nut (key 27) up until it is the rated travel distance specified in Table 3 from the actuator rod (key 22). Thread the locknut (key 28) up against the stem locknut and tighten per Table 6.

Table 6. Stem Connector Torque Values

PART	STEM MATERIAL	TORQUE	
		N•m	lbf•ft
M8 Stem Connector Cap Screws	All	35	26
M10 Stem Connector Jam Nut (Rie 4606 Coated)	S31603, S20910, N05500	48	35
	N06022, S31803, N10675	35	26
M14 Stem Connector Jam Nut	S31603, S20910, N05500	175	129
	N06022, S31803, N10675	138	102

13. Stroke the actuator rod until it contacts the stem adjuster nut (key 27) and install the stem connector halves and travel indicator (keys 23, 24 and 26) with the cap screws (key 25). Install the stem connector halves in the proper orientation so that when looking at the inside of the stem connector halves, the flats are down and the beveled surfaces are up.
14. Align the pointer of the travel indicator (key 26) with the appropriate mark on the travel scale.
15. Tighten the stem connector cap screws (key 25) to 35 N•m / 26 lbf•ft.
16. Release the actuator pressure.

NOTE

For air-to-open action, the air supply tubing must be connected to the actuator yoke at the air supply connection, see Figure 17 or 18. (If converting from air-to-close to air-to-open, the tubing will need to be re-routed to this location).

Actuator Assembly For Air-to-Close Constructions (or to Change Action to Air-to-Close - see Figure 19 or 20)

1. Position the upper diaphragm casing (key 9) upside down on the bench so that it lays flat and not off balance.

NOTE

If converting from air-to-open to air-to-close action, first move the vent cap (key 21) from the top of the casing (see Figure 17 or 18) and thread into the air supply connection on the yoke leg (see Figure 19 or 20).

2. Install the diaphragm (key 10) on the diaphragm plate (key 11). Place the diaphragm O-ring (key 109) and the washer (key 15) over the center hole of the diaphragm, so that the convex part of the washer is facing down toward the diaphragm and contains the O-ring. Ensure the convex part of the washer is guided in the diaphragm center hole as shown in Figure 19 or 20.
3. Insert the cap screw (key 14) through the washer and diaphragm, install the actuator spacer (key 13) and screw the actuator rod (key 22) onto the cap screw (key 14) finger-tight.
4. Radially align the spring locators in the diaphragm plate assembly (key 11) with the casing cap screw holes in the diaphragm (key 10). This will ensure that the springs do not cover the air path in the yoke.
5. Torque the cap screw (key 14) to the actuator rod (key 22) to 80 N•m / 59.1 lbf•ft and lay this assembly into the upper diaphragm casing (key 9).
6. Place the actuator springs (key 12 and/or 82) onto the spring locators in the diaphragm plate (key 11). See Figure 3 and Table 2 for proper spring quantity and arrangement.
 - If the nameplate does not contain spring information, use the same quantity and arrangement as originally installed.
7. Remove and replace the actuator rod bushing (key 19) and actuator rod seal (key 20) in the actuator yoke (key 8), if necessary.
8. Set the actuator yoke (key 8) down onto the assembly that is resting in the upper diaphragm casing (key 9) so that the yoke legs are perpendicular with the ribs on the top of the upper diaphragm casing (key 9).
 - For Sizes 225 and 750 actuators, install the 2 long cap screws (key 16) and hex nuts (key 18) 180 degrees apart from each other and in line with the actuator yoke legs.
 - For Size 1200 actuators, install the 4 long cap screws (key 16) and hex nuts (key 18) 90 degrees from each other, with two of them in line with the actuator yoke legs.
9. Tighten the long cap screws (key 16) and hex nuts (key 18), alternating between them to gradually compress the springs, until the two casing halves and diaphragm touch.

10. Install the remaining short cap screws (key 17) and hex nuts (key 18) to the casing.
 11. Tighten the actuator casing cap screws evenly using a cross-tightening procedure. Torque to 55 N•m / 40 lbf•ft.
 12. If you had previously removed the actuator assembly from the valve, place the actuator assembly back onto the valve body (key 1). For standard bonnet constructions (Figures 17, 18, 19 and 20), install the body nuts (key 7) and tighten evenly using a cross-tightening procedure. See Table 4 for torque requirements.

For extension and bellows bonnet constructions (Figures 21 and 22), install the bonnet nuts (key 46) and tighten evenly using a cross-tightening procedure. See Table 5 for torque requirements.
 13. With the valve plug/stem (key 3) in the closed position (on the seat), thread the stem adjuster nut (key 27) up until it is at the rated travel (see Table 3) from the actuator rod (key 22). Thread the locknut (key 28) up against the stem locknut and tighten per Table 6.
 14. Stroke the actuator rod until it contacts the stem adjuster nut (key 27) and install the stem connector halves and travel indicator (keys 23, 24 and 26) with the cap screws (key 25). Install the stem connector halves in the proper orientation so that when looking at the inside of the stem connector halves, the flats are down and the beveled surfaces are up.
 15. Align the pointer of the travel indicator (key 26) with the appropriate mark on the travel scale.
 16. Tighten the stem connector cap screws (key 25) to 35 N•m / 26 lbf•ft.
-

NOTE

For air-to-close action, the air supply tubing must be connected to the actuator upper casing at the air supply connection, see Figure 19 or 20. (If converting from air-to-open to air-to-close, the tubing will need to be re-routed to this location.)

3.2 Packing Maintenance

Key numbers refer to Figures 14, 17, 18, 19, 20, 21 and 22.

Packing Adjustment

For Fisher enhanced ENVIRO-SEAL™ spring-loaded single PTFE V-ring packing (Figure 14) or for Fisher enhanced ENVIRO-SEAL graphite ULF packing (Figure 15), the Belleville spring pack (key 34) maintains a sealing force on the packing. If leakage is detected around the packing follower (key 29) check to be sure that the packing follower (key 29) is tight. Using a wrench, tighten the packing follower (key 29) in 1/4 turn intervals until the leakage is stopped. If leakage cannot be stopped in this manner, proceed to the Replacing Packing section in this manual.

3.3 Replacing Packing (Pneumatic Actuators)

This section provides instruction on replacing packing in standard bonnets, extension bonnets and bellows extension bonnets.

Isolate the control valve from the line pressure, release pressure from both sides of the valve body and drain the process media from both sides of the valve. Shut off all pressure lines to the actuator and release all pressure from the actuator. Use lock-out procedures to ensure that the above measures stay in effect while you work on the equipment.

1. For air-to-open constructions:
 - a. Connect a separate air supply to the lower diaphragm casing via the air supply connection on the yoke (as shown in Figure 17 or 18) and apply sufficient air pressure to raise the valve plug/stem off the seat to mid travel.
 - b. Remove the stem connector nut half (key 23), stem connector bolt half (key 24) and travel indicator (key 26).
 - c. Push the valve plug stem (key 3) down until it contacts the seat.
 - d. Loosen the locknut (key 28) and thread the stem adjustor nut (key 27) down until it clears the top of the valve plug stem (key 3).
 - e. Shut off the air pressure and disconnect the separate air supply to the lower diaphragm casing (as shown in Figure 17 or 18).
2. For air-to-close constructions, as shown in Figure 19 or 20, remove the stem connector nut half (key 23), stem connector bolt half (key 24) and travel indicator (key 26).

**WARNING**

To avoid personal injury or property damage by uncontrolled movement of the actuator yoke (key 8), loosen the body/yoke nuts (Figures 17, 18, 19 and 20, key 7) or bonnet/yoke nuts (Figures 21 and 22, key 46) by following the instructions in the next step. Do not remove a stuck actuator yoke by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the actuator yoke.

NOTE

The following step also provides additional assurance that the valve body fluid pressure has been relieved.

3. For standard bonnet constructions (Figures 17, 18, 19 and 20), body nuts (key 7) attach the actuator yoke (key 8) to the valve body (key 1). Loosen these nuts approximately 3 mm / 1/8 in.
For extension and bellows bonnet constructions, bonnet nuts (key 46) attach the actuator yoke (key 8) to the extension bonnet (key 39). Loosen these nuts approximately 3 mm / 1/8 in.
4. Then loosen the valve-to-yoke gasketed joint by either rocking the actuator yoke or prying between the valve and actuator yoke. Work the prying tool around the actuator yoke until it loosens.

**WARNING**

If there is evidence of process fluid under pressure leaking from the joint, retighten the valve body/joint nuts and return to the Warning at the beginning of the Maintenance section to ensure proper steps have been taken to isolate the valve and relieve process pressure, thus avoiding property damage or personal injury.

5. If no fluid leaks from the joint, loosen the packing follower (key 29) two turns to relieve the packing compression load.
6. For standard bonnet constructions (Figures 17, 18, 19 and 20), remove the body nuts (key 7) completely. For extension and bellows bonnet constructions (Figures 21 and 22), remove the bonnet nuts (key 46) completely.

NOTICE

To avoid property damage, place the actuator yoke on a protective surface, as described in the following procedure.

7. Carefully lift off the actuator yoke and set it on a protective surface to prevent damage. For standard bonnet constructions, if the bonnet (key 4) together with the valve stem plug assembly has a tendency to lift with the actuator yoke, ensure it does not drop from the actuator. For extension and bellows constructions, ensure the bonnet (key 4) does not lift with the actuator yoke. For DN 150 balanced constructions, if the bonnet, guide sleeve or valve stem assembly have a tendency to lift with the actuator yoke, ensure they do not drop from the actuator.

NOTICE

For extension and bellows bonnet constructions, lifting the bonnet with the actuator yoke may cause possible damage to the valve plug and to the bellows.

8. Remove the stem adjuster nut (key 27) and locknut (key 28).
9. For standard bonnet constructions, remove the bonnet and the valve plug/stem assembly and set on a protective surface.
For extension and bellows bonnet constructions, remove only the bonnet (key 4).
For DN 150 balanced constructions, remove the guide sleeve, bonnet and valve plug stem assembly.

Table 7. Packing Follower Torque⁽¹⁾

Valve Size	Packing Style	Torque N•m / lbf•ft	Packing Style	Torque N•m / lbf•ft
DN 15, 20, 25, 40 and 50	Fisher enhanced ENVIRO-SEAL PTFE	10 / 7.4	Fisher enhanced ENVIRO-SEAL ULF	35 / 26
DN 80 and 100		23 / 17		50 / 37
DN 150		36 / 26		68 / 50

1. Lubricate with anti-seize compound.

10. Remove the valve/yoke gasket (Figures 17, 18, 19 and 20 key 5, Figures 21 and 22 key 47) and cover the opening of the valve to protect the gasket surface and prevent foreign matter from getting into the valve cavity.
11. Remove the packing follower (key 29) from the bonnet (key 4).
12. Remove the Belleville spring pack (key 34) and packing spacer (key 30) from the bonnet (key 4). Carefully push out the remaining packing box parts from the bonnet (key 4) using a rounded rod or other tool which will not scratch the packing box wall. Clean the packing box and the metal packing box parts.

**WARNING**

Inspect the valve stem, threads and packing box surfaces for any sharp edges that might cut the packing. Scratches or burrs could cause packing box leakage or damage the new packing.

13. Inspect the valve stem, threads and packing box surfaces for any sharp edges that might cut the packing. Scratches or burrs could cause packing box leakage or damage the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts.
14. Remove the covering protecting the valve cavity and install a new valve/yoke gasket (Figures 17, 18, 19 and 20 key 5, Figures 21 and 22 key 47) making sure that the gasket seating surfaces are clean and smooth.

For DN 150 balanced constructions, two gaskets are required; one between the valve body and guide sleeve and the other between the guide sleeve and bonnet. Ensure the gasket seating surfaces are clean and smooth for both gaskets.
15. Carefully install the bonnet (key 4) onto the valve stem.
16. Install the new packing and the metal packing box parts according to Figure 14 for Fisher enhanced ENVIRO-SEAL PTFE packing and according to Figure 15 for Fisher enhanced ENVIRO-SEAL graphite ULF packing. Place a smooth-edged pipe over the valve stem and gently tap each soft packing part into the packing box. Apply anti-seize lubricant to the threads and install the packing follower (key 29).
17. Install the locknut (key 28) and stem adjuster nut (key 27).

For standard bonnet constructions, install the valve plug/bonnet sub assembly into the valve body (key 1).
18. Mount the actuator onto the valve and install the body nuts (Figures 17, 18, 19 and 20 key 7, Figures 21 and 22 key 46), but tighten them only finger-tight.
19. For air-to-open, connect a separate air supply to the lower diaphragm casing air supply connection (as shown in Figure 17 or 18) and apply sufficient air pressure to raise the actuator rod (key 22) to the travel stop. Proceed to the next step.

For air-to-close, proceed to the next step.
20. For standard bonnet constructions, tighten the body nuts (key 7) evenly using a cross-tightening procedure. See Table 4 for torque requirements.

For extension and bellows bonnet constructions, tighten the bonnet nuts (key 46) evenly using a cross-tightening procedure. See Table 5 for torque requirements.
21. Thread the stem lock adjuster (key 27) up until it is the rated travel distance specified in Table 3 from the actuator rod (key 22). Thread the locknut (key 28) up against the stem locknut and tighten to the torque specified in Table 6.
22. Stroke the actuator rod until it contacts the stem adjuster nut (key 27) and install the stem connector halves and travel indicator (keys 23, 24 and 26) with the cap screws (key 25). Install the stem connector halves in the proper orientation so that when looking at the inside of the stem connector halves, the flats are down and the beveled surfaces are up.
23. Align the pointer of the travel indicator (key 26) with the appropriate mark on the travel scale.
24. Tighten the stem connector cap screws (key 25) to 35 N•m / 26 lbf•ft.

Table 8. Seat Ring / Cage Torque Requirements⁽¹⁾

VALVE SIZE		TORQUE	
DN	NPS	N•m	lbf•ft
15, 20, 25	1/2, 3/4, 1	170	124
40	1-1/2	320	234
50	2	460	337
80	3	1020	747
100	4	1520	1113
150	6	3400	2500

1. Lubricate with anti-seize compound.

Table 9. Stem Extension Torque Requirements

VALVE SIZE		TORQUE	
DN	NPS	N•m	lbf•ft
15, 20, 25, 40, 50	1/2, 3/4, 1, 1-1/2, 2	40	30
80, 100	3, 4	120	89

Table 10. Bellows Nut Torque Requirements⁽¹⁾

VALVE SIZE		TORQUE	
DN	NPS	N•m	lbf•ft
15, 20, 25, 40, 50	1/2, 3/4, 1, 1-1/2, 2	350	260
80, 100	3, 4	650	480

1. Lubricate with anti-seize compound.

25. Tighten the packing follower (key 29) to the torque specified in Table 7.
Alternately, the packing follower can be tightened by the following method:
- Tighten the packing follower until the Belleville springs are compressed 100% (or completely flat), as detected by a rapid increase in nut torque.
 - For DN 15 through 100 / NPS 1/2 through 4, loosen the packing follower 60° of rotation.
For DN 150 / NPS 6, loosen the packing follower 90° of rotation.
26. For air-to-open, release the actuator pressure.
27. For air-to-open, ensure the vent (key 21) is installed into the upper diaphragm casing (see Figure 17 or 18).
For air-to-close, ensure the vent (key 21) is installed into the actuator yoke air supply connection (see Figure 19 or 20).

3.4 Replacing Packing (Electric Actuators)

This section provides instruction on replacing packing in standard bonnets, extension bonnets and bellows extension bonnets.

Isolate the control valve from the line pressure, release pressure from both sides of the valve body and drain the process media from both sides of the valve. Use lock-out procedures to ensure that the above measures stay in effect while you work on the equipment.

1. Stroke the actuator so the valve plug/stem (key 3) is at mid travel.
2. Remove the stem connector nut half (key 23), stem connector bolt half (key 24) and travel indicator (key 26).
3. Use precaution to ensure the actuator is locked in position and cannot stroke.
4. Mark the position of the locknut (key 28) on the stem for reassembly.
5. Push the valve plug/stem (key 3) down until it contacts the seat.
6. Loosen the locknut (key 28) and thread the stem adjuster nut (key 27) down until it clears the top of the valve plug stem (key 3).

WARNING

To avoid personal injury or property damage by uncontrolled movement of the actuator yoke (key 8), loosen the body/yoke nuts (Figures 17, 18, 19 and 20, key 7) or bonnet/yoke nuts (Figures 21 and 22, key 46) by following the instructions in the following step 7 below. Do not remove a stuck actuator yoke by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the actuator yoke.

NOTE

The following step also provides additional assurance that the valve body fluid pressure has been relieved.

7. For standard bonnet constructions (Figures 17, 18, 19 and 20), body nuts (key 7) attach the actuator yoke (key 8) to the valve body (key 1). Loosen these nuts approximately 3 mm / 1/8 in.

For extension and bellows bonnet constructions, bonnet nuts (key 46) attach the actuator yoke (key 8) to the extension bonnet (key 39). Loosen these nuts approximately 3 mm / 1/8 in.
8. Then loosen the valve-to-yoke gasketed joint by either rocking the actuator yoke or prying between the valve and actuator yoke. Work the prying tool around the actuator yoke until it loosens.

WARNING

If there is evidence of process fluid under pressure leaking from the joint, retighten the valve body/joint nuts and return to the Warning at the beginning of the Maintenance section to ensure proper steps have been taken to isolate the valve and relieve process pressure, thus avoiding property damage or personal injury.

9. If no fluid leaks from the joint, loosen the packing follower (key 29) two turns to relieve the packing compression load.
10. For standard bonnet constructions (Figures 17, 18, 19 and 20), remove the body nuts (key 7) completely.
For extension and bellows bonnet constructions (Figures 21 and 22), remove the bonnet nuts (key 46) completely.

NOTICE

To avoid property damage, place the actuator yoke on a protective surface, as described in the following procedure.

11. Carefully lift off the actuator yoke and set it on a protective surface to prevent damage.
For standard bonnet constructions, if the bonnet (key 4) together with the valve stem plug assembly has a tendency to lift with the actuator yoke, ensure it does not drop from the actuator.
For extension and bellows constructions, ensure the bonnet (key 4) does not lift with the actuator yoke.

NOTICE

For extension and bellows bonnet constructions, lifting the bonnet with the actuator yoke may cause possible damage to the valve plug and to the bellows.

12. Remove the stem adjuster nut (key 27) and locknut (key 28).
13. For standard bonnet constructions, remove the bonnet and the valve plug/stem assembly and set on a protective surface.
For extension and bellows bonnet constructions, remove only the bonnet (key 4).
14. Remove the valve/yoke gasket (Figures 17, 18, 19 and 20 key 5, Figures 21 and 22 key 47) and cover the opening of the valve to protect the gasket surface and prevent foreign matter from getting into the valve cavity.
15. Remove the packing follower (key 29) from the bonnet (key 4).
16. Remove the Belleville spring pack (key 34) and packing spacer (key 30) from the bonnet (key 4). Carefully push out the remaining packing box parts from the bonnet (key 4) using a rounded rod or other tool which will not scratch the packing box wall. Clean the packing box and the metal packing box parts.

Table 11. GX Electric Actuator Maximum Allowable Thrust

VALVE SIZE	STEM DIAMETER	TRAVEL	BONNET STYLE	STEM MATERIAL STRENGTH	MAXIMUM THRUST	
	mm	mm			N	lbf
DN 25 to 50 / NPS 1 to 2	10	20	Plain	High ⁽¹⁾	17,000	3820
				Low ⁽²⁾	7600	1710
			Bellows/ Extension	High ⁽¹⁾	11,400	2560
				Low ⁽²⁾	6700	1500
DN 80 to 100 / NPS 3 to 4	14	20, 40	Plain	High ⁽¹⁾	20,000	4500
				Low ⁽²⁾	20,000	4500
			Bellows/ Extension	High ⁽¹⁾	20,000	4500
				Low ⁽²⁾	14,500	3260

1. High strength stem materials consist of S200910, N05500 and S31603.
2. Low strength materials consist of S31803, N10675 and N06022.

WARNING

Inspect the valve stem, threads and packing box surfaces for any sharp edges that might cut the packing. Scratches or burrs could cause packing box leakage or damage the new packing.

17. Inspect the valve stem, threads and packing box surfaces for any sharp edges that might cut the packing. Scratches or burrs could cause packing box leakage or damage the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts.
18. Remove the covering protecting the valve cavity and install a new valve/yoke gasket (Figures 17, 18, 19 and 20 key 5, Figures 21 and 22 key 47) making sure that the gasket seating surfaces are clean and smooth.
19. Carefully install the bonnet (key 4) onto the valve stem.
20. Install the new packing and the metal packing box parts according to Figure 14 for Fisher enhanced ENVIRO-SEAL PTFE packing and according to Figure 15 for Fisher enhanced ENVIRO-SEAL graphite ULF packing. Place a smooth-edged pipe over the valve stem and gently tap each soft packing part into the packing box. Apply anti-seize lubricant to the threads and install the packing follower (key 29).
21. Install the locknut (key 28) and stem adjustor nut (key 27). Ensure they are aligned with the mark made on the stem disassembly and tighten.
For standard bonnet constructions, install the valve plug/bonnet sub assembly into the valve body (key 1).
22. Mount the actuator onto the valve and install the body nuts (Figures 17, 18, 19 and 20 key 7, Figures 21 and 22 key 46), but tighten them only finger-tight.

23. For standard bonnet constructions, tighten the body nuts (key 7) evenly using a cross-tightening procedure. See Table 4 for torque requirements.
For extension and bellows bonnet constructions, tighten the bonnet nuts (key 46) evenly using a cross-tightening procedure. See Table 5 for torque requirements.
24. Push the valve plug/stem to the valve seat. Thread the stem adjuster nut (key 27) and locknut (key 28) to the previously marked position. Thread the locknut (key 28) up against the stem locknut and tighten to the torque specified in Table 6.
25. Stroke the actuator rod until it contacts the stem adjuster nut (key 27) and install the stem connector halves and travel indicator (keys 23, 24 and 26) with the cap screws (key 25). Install the stem connector halves in the proper orientation so that when looking at the inside of the stem connector halves, the flats are down and the beveled surfaces are up.
26. Align the pointer of the travel indicator (key 26) with the appropriate mark on the travel scale.
27. Tighten the stem connector cap screws (key 25) to 35 N•m / 26 lbf•ft.
28. Tighten the packing follower (key 29) to the torque specified in Table 7.
Alternately, the packing follower can be tightened by the following method:
 - a. Tighten the packing follower until the Belleville springs are compressed 100% (or completely flat), as detected by a rapid increase in nut torque.
 - b. For DN 15 through 100 / NPS 1/2 through 4, loosen the packing follower 60° of rotation.

NOTICE

Ensure that the electric actuator maximum thrust output does not exceed the values in Table 11. The up travel stop must be set in the electric actuator in order to prevent damage to the valve trim.

Valve Trim Maintenance

Key numbers in this section refer to Figures 17, 18, 19, 20, 21 and 22.

3.5 Valve Trim Disassembly

1. Remove the actuator and bonnet assembly as described in the Replacing Packing section (steps 1 through 10).
 - For standard bonnet constructions (Figures 17, 18, 19, 20 and 24), proceed to the Seat Ring / Cage Removal section.
 - For extension bonnet constructions (Figure 21), proceed to step 3.
 - For bellows bonnet constructions (Figure 22), proceed to step 2.

2. For bellows bonnet constructions (Figure 22), use a bellows nut tool made according to the dimensions in Figure 25 and Table 13 to remove the bellows nut (key 51) as follows:
 - a. Insert the bellows nut tool into the extension bonnet (key 39). Be certain the tool lugs are engaged in the corresponding recesses in the bellows nut.
 - b. Use a torque gun or driver having sufficient torque capabilities according to Table 10. Connect the gun to a socket that snugly fits the hex head on the bellows nut tool.
 - c. Insert the socket onto the hex head of the bellows nut tool.

**WARNING**

Be careful to hold the torque gun, attached socket and tool at right angles to the bellows nut when applying torque. Tilting the gun and socket while applying torque may cause the lugs on the bellows nut tool to suddenly disengage from the lugs on the bellows nut thus causing possible damage to the bellows nut and possible personal injury.

- d. Remove the bellows nut (key 51).
3. For both extension and bellows bonnet constructions: Body nuts (key 7) attach the extension bonnet (key 39) to the valve body (key 1). Loosen these nuts approximately 3 mm / 1/8 in. Then loosen the extension bonnet-to-body gasketed joint by either rocking the extension bonnet or prying between the body and extension bonnet. Work the prying tool around the extension bonnet until it loosens.
4. Remove the body nuts (key 7) completely and carefully lift the extension bonnet (key 39) and valve plug/stem extension assembly (keys 3, 40 and 48) or plug/bellows/stem extension assembly (keys 3, 49 and 48) from the top of the valve body.
5. Use a wrench to unscrew the plug/stem assembly (key 3) from the stem extension (key 40) or from bellows/stem assembly (key 49) as follows:
 - a. Insert the wrench onto the stem extension hex flats (see Figures 21 and 22).

NOTICE

In the following procedure, take precautions to ensure the valve plug and stem finish are not damaged.

- b. Clamp the plug/stem assembly (key 3) and holding it stable, unscrew the stem extension (key 40) or bellows/stem assembly (key 49). Take precautions to ensure the valve plug and stem finish are not damaged.

NOTE

There is a stem assembly locking insert (Figures 21 and 22, key 48) in the valve plug/stem extension assembly. It is possible this insert may drop out during stem disassembly. If this is the case, ensure it is retained for reassembly of the valve stem to the stem extension.

6. Remove the plug/stem assembly (key 3) and bellows/stem assembly (key 49) from the extension bonnet. Remove the bellows gasket (key 50).
7. Proceed to the seat ring removal section.

3.6 Seat Ring / Cage Removal

NOTICE

Use care to avoid damaging the gasket sealing surfaces.

The surface finish of the valve stem (key 3) is critical for making a good packing seal. The seating surfaces of the seat ring (key 2), cage (key 99) and the valve plug (key 3) are critical for tight shutoff and should therefore also be treated with care and properly protected.

1. Packing parts can be removed from the bonnet if desired. Replace these parts as described in the section on Packing Maintenance.
2. Use a seat ring tool made according to the dimensions in Figure 4 and Table 12 to remove the seat ring (key 2) as follows:
 - a. Insert the tool into the valve body. Be certain the tool lugs are engaged in the corresponding recesses in the seat ring.
 - b. Use a torque gun or driver having sufficient torque capabilities according to Table 8. Connect the gun to a socket that snugly fits the hex head on the seat ring tool.
 - c. Insert the socket onto the hex head of the seat ring tool.

WARNING

Be careful to hold the torque gun, attached socket and tool at right angles to the seat ring when applying torque. Tilting the gun and socket while applying torque may cause the lugs on the seat ring tool to suddenly disengage from the lugs on the seat ring thus causing possible damage to the seat ring and possible personal injury.

3. Remove the seat ring (key 2) from the valve body.
4. Inspect parts for wear or damage that would prevent proper operation of the valve body.
5. Replace trim parts as necessary.

3.7 Valve Trim Assembly

Assembly of Unbalanced Trim

Refer to Figures 11, 17, 18, 19, 20, 21, 22 and 24.

1. Before installing the new seat ring / cage, thoroughly clean the threads in the valve body port. Apply suitable lubricant to the threads and to the 60° surface of the new seat ring (key 4). Screw the seat ring into the valve body. Using the seat ring tool, tighten the seat ring and torque according to the values in Table 8. Remove all excess lubricant after tightening.
2. For standard bonnet constructions, perform the following. (Proceed to step 3 for extension and bellows bonnets.)
 - a. Clean the body/yoke gasket seating surfaces and install a new body/yoke gasket (key 5).
 - b. Remove any protective tape or covering from the valve plug/stem assembly.
 - c. Insert the valve plug/stem assembly into the seat ring.

NOTICE

If the packing is to be reused and was not removed from the bonnet, perform the following step carefully to avoid damaging the packing with the stem threads.

- d. Install bonnet and actuator yoke onto the valve body by completing the assembly according to steps 15 to 27 of the section Replacing Packing, omitting step 16 if new packing is not being installed.
3. For extension and bellows bonnet constructions, perform the following.
 - a. For bellows bonnet constructions, clean the extension bonnet/bellows gasket seating surfaces and install a new bellows gasket (key 50).
 - b. Remove any protective tape or covering from the valve plug/stem assembly (key 3). Then insert the plug/stem assembly (key 3) through the extension bonnet bushing (key 41).
 - c. Remove any protective tape or covering from the stem extension (key 40) or the bellows stem assembly (key 49). Screw the plug/stem assembly (key 3) into the stem extension or bellows/stem assembly. Note: Do not apply lubricant to the threads of the plug/stem assembly (key 3) or the bellows/stem assembly (key 49).

NOTE

Ensure the stem assembly locking insert (Figures 21 and 22, key 48) has been first inserted in the bottom of the threaded hole in the stem extension.

NOTICE

In the following procedure, take precautions to ensure the valve plug and stem finish are not damaged.

- d. Clamp the plug/stem assembly (key 3) and hold it stable. Using a box spanner tool tighten the plug/stem assembly (key 3) into the stem extension (key 40) or into the bellows/stem assembly (key 49) according to the stem extension torque requirements listed in Table 9. Take precautions to ensure the valve plug and stem finish are not damaged.
- e. For bellows bonnet constructions, if using a N10276/PTFE bellows gasket install PTFE washer (key 120) on top of the bellows flange. Apply suitable lubricant to the threads and to the bottom surface of the bellows nut (key 51). Screw the bellows nut into the extension bonnet. Using the bellows nut tool, a lathe or boring mill, tighten the bellows nut or torque according to the values in Table 10. Remove all excess lubricant.
- f. Clean the body/extension bonnet seating gasket surface and install the gasket (key 5).
- g. Install the extension bonnet and plug/stem assembly onto the valve body. Install the body/yoke nuts (key 7) and tighten evenly using a cross-tightening procedure. See Table 4 for torque requirements.

NOTICE

If the packing is to be reused and was not removed from the bonnet, perform the following step carefully to avoid damaging the packing with the stem threads.

- h. Install the bonnet and actuator yoke onto the extension bonnet by completing the assembly according to steps 15 to 27 of the section Replacing Packing, omitting step 16 if new packing is not being installed.

Assembly of Balanced Trim

(Available in DN 80, 100 and 150 / NPS 3, 4 and 6 only.)

Refer to Figure 9.

NOTICE

To protect the valve plug seal ring (key 37) and to ensure it seals properly, be careful not to scratch the surfaces of the ring groove in the valve plug or any of the surfaces of the replacement ring.

1. With the valve plug (key 3) removed according to the Disassembly portion of the Valve Trim Maintenance procedure, proceed as appropriate:

The seal ring (key 37) cannot be reused because it is a closed ring which must be pried and/or cut from the groove. Once the seal ring is removed, the elastomeric backup ring (key 38), which is also a closed ring, can be pried from the groove.

To install a new backup ring and seal ring onto the valve plug, apply a general purpose silicone-base lubricant to both rings (keys 38 and 37). Place the backup ring over the valve plug (key 3) and into the groove. Place the seal ring over the top edge of the valve plug (key 3) so that it enters the groove on one side of the valve plug. Slowly and gently stretch the seal ring and work it over the top edge of the valve plug. The PTFE material in the seal ring must be permitted time to cold-flow during the stretching procedure, so avoid jerking sharply on this ring. Stretching the seal ring over the valve plug may make it seem unduly loose when in the groove, but it will contract to its original size after insertion into the bonnet.

2. Install the seat ring, valve plug/stem, bonnet and actuator yoke into the valve body by completing the assembly according to steps 1 to 3 of the section Assembly of Unbalanced Trim.

3.8 Repair Nameplate

If required by the end-user, an optional repair nameplate is available for recording changes made to the valve trim during maintenance (see Figure 28). This nameplate can be ordered as a spare part and is easily mounted to the actuator casing using a casing bolt. (Reference the Parts Ordering section of this manual.)

As shown in Figure 28, the repair nameplate provides locations for maintenance personnel to record trim data, such as:

- Date of maintenance
- Trim material
- Port diameter
- Flow capacity (C_V / K_V)
- Flow characteristic
- Actuator Action ATO/ATC

Bellows Maintenance

This section provides instruction on the replacement of the bellows / stem assembly (see key 49 in Figure 22).

1. Remove the actuator, bonnet assembly as described in the Replacing Packing section (steps 1 through 10).
2. Remove the plug/stem assemblies as described in the Valve Trim Disassembly section (steps 2 through 6).
3. To install the new bellows / stem assembly (key 49), perform the Valve Trim Assembly (step 3).

Figure 5. Fisher GX Handwheel Assembly

Figure 6. Fisher GX Handwheel Orientation and Grease Zerk Location

Section 4: Handwheel Operation

NOTICE

This handwheel is designed only for use with Sizes 225 and 750 actuators with 20 mm travel. To avoid equipment damage, do not assemble this handwheel on Size 750 actuators with 40 mm travel or Size 1200 actuators.

4.1 Principle of Operation

The GX handwheel is designed to compress the actuator springs and override the actuator fail action. Turning the handwheel drives the screw, nut and levers. The levers push against the stem connector to transfer this motion. Reversing the direction of the handwheel will move the nut and levers in the opposite direction. Once the levers are no longer in contact with the stem connector, the locking screw should be used to secure the handwheel against undesired movement. To prevent damage due to overtravel, the handwheel should not be turned more than 2 full turns past the point at which the levers no longer contact the stem connector.

⚠ WARNING

To avoid personal injury or loss of process control due to equipment damage, ensure the levers are completely disengaged and the locking screw is tight while the valve is in normal pneumatic operation.

During normal pneumatic operation when the handwheel is not needed, a locking screw (see Figure 5) is provided on the side of the handwheel housing to lock the handwheel levers out of the way.

⚠ WARNING

To avoid personal injury or equipment damage due to possible sudden shifting or falling of the valve assembly, do not lift the valve assembly by the handwheel.

4.2 GX Handwheel Installation (for use with 20 mm travel only)

1. Note the orientation of the levers to the stem connector for either the air-to-close, spring-to-open configuration or for the air-to-open, spring-to-close configuration, as shown in Figure 6.
2. Adjust the handwheel to allow positioning the levers above the stem connector before installation.
3. Install the handwheel to the GX mounting pad with four studs and nuts, as shown in Figure 5. Torque to 24 N•m / 18 lbf•ft.
4. Apply lithium grease to the grease zerk and to the tip of the levers (where they contact the stem connector), as shown in Figure 6.

Section 5: Travel Stop Operation

5.1 Principle of Operation

NOTICE

This travel stop is designed only for use with Sizes 225 and 750 actuators with 20 mm travel. To avoid equipment damage, do not assemble this travel stop on Size 750 actuators with 40 mm travel or Size 1200 actuators.

The GX travel stop is designed to mechanically limit and stop the valve at a preset position in an emergency or upon loss of instrument air. This assembly is mounted on the yoke with four studs. The lever pushes against the stem connector to stop the travel. Travel position can be adjusted by two adjustable cap screws on the lever, as shown in Figure 7. A cover plate assembly is available to prevent pinch point damage caused by the lever, as shown in Figure 7.

⚠ WARNING

To avoid personal injury or equipment damage due to possible sudden shifting or falling of the valve assembly, do not lift the valve assembly by the travel stop.

To avoid personal injury or loss of process control due to equipment damage, screw the adjustable cap screws to ensure the lever is completely disengaged while the valve is in normal pneumatic operation.

Figure 7. Fisher GX Travel Stop Assembly

5.2 GX Travel Stop Installation

Downstop

1. Note the orientation of the lever to the stem connector for downstop positioning, as shown in Figure 8. Adjust the travel stop to allow positioning the lever below the stem connector before installation.
2. Install the travel stop to the GX mounting pad with four studs and nuts, as shown in Figure 7. Torque to 24.5 N•m / 18 lbf•ft.
3. Apply lithium grease to the tip of the lever (where it contacts the stem connector) and to the two adjustable cap screws, as shown in Figure 8.

Upstop

1. Note the orientation of the lever to the stem connector for upstop positioning, as shown in Figure 8. Adjust the travel stop to allow positioning the lever above the stem connector before installation.
2. Install the travel stop to the GX mounting pad with four studs and nuts, as shown in Figure 7. Torque to 24.5 N•m / 18 lbf•ft.
3. Apply lithium grease to the tip of the lever (where it contacts the stem connector) and to the two adjustable cap screws, as shown in Figure 8.

Figure 8. Fisher GX Travel Stop Orientation

5.3 Setting the Travel Stop Position

After sending the required position air signal to the actuator, screw the adjustable cap screws to assure the lever contacts with the stem connector tightly, then tighten the back nut. Check the actual stem position when giving the 100% air signal.

Standard Accuracy for the travel stop position is $\pm 10\%$ for 20 mm travel. For added precision, use the following procedure.

1. Send the desired position air signal to the actuator.
2. Set the travel stop, screw the adjustable cap screws to assure the lever contacts with the stem connector tightly, then tighten the back nut.
3. Send a 100% air signal.
4. Measure the difference between the actual stem position and the desired position.
5. Send the air signal for the desired position minus the differential position measured in step 4.
6. Reset the travel stop by adjusting the two cap screws and then tighten the back nut.

Section 6: Parts

6.1 Parts Ordering

Each valve is assigned a serial number which can be found on the valve or on the nameplate (Figure 2 and key 35, not shown). The nameplate will normally be fitted to the actuator. Refer to this serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts refer to this serial number and give the part description from the following parts list.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

6.2 Parts Kits

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual includes installation, maintenance and parts information for NPS 1 through 24 HP valves with CL900 and CL1500 ratings; NPS 1 through 14 HP with CL2500 ratings; NPS 1 through 8 HPA valves with CL900 and CL1500 ratings; NPS 1, 2, 6, 8 and 12 HPA valves with CL2500 ratings; NPS 8 through 12 HPD and HPT valves with CL3200 ratings. Refer to separate manuals for instructions covering the actuator, positioner and accessories.

WARNING

Do not install, operate or maintain HP series valves without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding. Unless otherwise noted, all NACE references are to NACE MR0175-2002 and MR0103.

Approximate Weights (valve body and bonnet assemblies)	Additional Specifications
See Table 2	For specifications such as materials, valve plug travels and port, yoke boss and stem diameters, see the Parts List section.
1. EN (or other) ratings and end connections can usually be supplied; consult your Emerson sales office. 2. CL900 and CL1500 globe valves are identical for NPS 1 and 2 valves. CL900 and CL1500 globe valves for NPS 3, 4, 6, 8, 10 and 12 valves, however, are not identical. 3. The centerline-to-face dimension for CL2500 NPS 1 and 2 HPA valves does not conform to ANSI/ISA S75.12. 4. The pressure or temperature limits in this manual and any applicable standard limitations should not be exceeded. 5. HPS and HPAS valves may be used flow down for on-off service only or where further limited by trim design. HPAS valves may be used flow down for erosive service. 6. NPS 16, 18, 20 and 24 valves for flow down only.	

1.2 Description

HP Series high-pressure globe and angle valves (Figure 1) have metal seats, cage guiding, quick change trim and push-down-to-close valve plug action. HPD, HPAD, HPT and HPAT valves use balanced valve plugs. HPS and HPAS valves use an unbalanced valve plug. To provide a seal between the cage and a balanced valve plug, the HPD and HPAD valves use piston rings; the HPT and HPAT valves use a pressure-assisted seal ring. A Whisper Trim or WhisperFlo cage can be used with an HPD, HPAD, HPS, HPAS, HPT or HPAT valve plug. A Cavitrol III cage can be used with an HPS, HPAS, HPT or HPAT valve plug.

C-seal or bore seal trims are available for HPD and for HPAD valves.

With C-seal trim and bore seal trim, a balanced valve can achieve high-temperature, Class V shutoff. Because the seal is formed from metal (N07718 nickel alloy) rather than an elastomer, a valve equipped with the C-seal trim or bore seal trim can be applied in processes with a fluid temperature of up to 593 °C / 1100 °F, provided other material limits are not exceeded.

HP Series globe valves are available in short (short) and or long (long) face-to-face designs depending on size and pressure class.

1.3 Specifications

Specifications for the HP Series valves are shown in Tables 1 through 7.

2-1/2	7990	5890
1. For other lubricants or bolting materials, contact your Emerson sales office for torques.		

Section 2: Installation

WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in Table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

WARNING

Some bonnet flanges have a tapped hole that was used to handle the bonnet during manufacture. Do not use this tapped hole to lift the valve assembly or personal injury may result.

⚠ WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop and controlled fluid conditions indicated when the valve was ordered. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Because some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

NOTICE

To avoid product damage, inspect the valve before installation for any damage or any foreign material that may have collected in the valve body. Also remove any pipe scale, welding slag or other foreign material from the pipeline.

1. Before installing the valve, inspect it to ensure that the valve body cavity is free of foreign material.
2. Clean out all pipelines to remove scale, welding slag, and other foreign materials before installing the valve.

NOTE

If the valve body being installed has small internal flow passages, such as with Whisper Trim III, WhisperFlo or Cavitrol III cages, consideration should be given to installing an upstream strainer to prevent the lodging of particles in these passages. This is especially important if the pipeline cannot be thoroughly cleaned or if the flowing medium is not clean.

3. Flow through the valve must be in the direction indicated by the flow arrow, which is stamped on or attached to the valve body.

NOTE

NPS 8 to 14 CL900, CL1500, CL2500 and CL3200 HPD and HPT valves contain a flow vane in the lower flow passage. This is critical to the proper function of the valve, and is not a defect.

NOTICE

Depending on valve body materials used, post-weld heat treating might be needed. Post-weld heat treatment can damage internal elastomeric, plastic and metal parts. Shrink-fit pieces and threaded connections might also loosen. In general, if post-weld heat treating is needed, remove all trim parts. Contact your [Emerson sales office](#) for additional information.

4. Use accepted piping and welding practices when installing the valve in the pipeline. For flanged valve bodies, use a suitable gasket between the body and pipeline flanges.
5. Install a three-valve bypass around the valve if continuous operation is required during maintenance.
6. If the actuator and valve body are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.
7. If the valve body was shipped without packing installed in the packing box, install the packing before putting the valve body into service. Refer to instructions given in the Packing Maintenance procedure.

**WARNING**

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions.

Valves with ENVIRO-SEAL™ live-loaded packing or HIGH-SEAL ULF live-loaded packing will not require this initial re-adjustment. See the instruction manuals titled ENVIRO-SEAL Packing System for Sliding-Stem Valves (D101642X012) or HIGH-SEAL ULF Live-Loaded Packing System (D101453X012) (as appropriate) for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the parts kit sub-section near the end of this manual.

2.1 Lifting Valve Assembly

**WARNING**

Failure to follow these lifting guidelines and accepted lifting and rigging practices could result in property damage and personal injury or death.

All lifting and rigging must be completed in accordance with federal/national/provincial, state and local regulations and applicable lifting and rigging equipment standards. Only personnel trained in proper lifting and rigging practices shall perform valve/actuator assembly lifting, rigging and installation. Because each lift will be unique, the method of lifting the valve assembly, the correct location for attaching and lifting the valve assembly and what the valve assembly will do when lifted shall be considered for each lift.

Lifting and rigging equipment used to lift, install or remove a valve assembly or component must be properly selected and sized for the weight and configuration of the valve assembly or component being lifted. The weight of the complete valve assembly, including attached accessories, must be taken in consideration for this purpose. The lifting and rigging equipment must be properly maintained and inspected for damage before each use.

If the valve is supplied with an actuator or handwheel, do not use the actuator or handwheel to lift the complete valve assembly. Lifting lugs attached to the actuator must not be used to lift the complete valve assembly unless clearly marked as being rated to support the complete valve assembly weight.

Lifting lugs or other lifting equipment attached to the valve or actuator must never be used to lift or support the weight of attached piping.

NOTICE

Care must be taken when lifting the valve/actuator assembly to ensure all accessories and tubing are not damaged in the process. Accessories and tubing may need to be removed prior to lifting to prevent damage and properly reinstalled before use. Protect valve flange faces, butt weld ends and other connection surfaces from damage during lifting.

Remove the valve/actuator assembly from its shipping container with appropriate lifting and rigging equipment for the valve/actuator assembly weight and configuration to be lifted. The valve and bonnet assembly weight is provided in Table 2. Consult the appropriate actuator and valve accessory instruction manuals for the weight of each additional component, then determine the total weight of the complete valve assembly. The location of the valve/actuator assemblies center of gravity must be considered during lifting, installation and removal. Additional slings or other lifting equipment, such as a load leveler, may be necessary to prevent toppling of the equipment during lifting or to rotate the valve assembly into a different orientation for installation.

For HP valve constructions that include lifting lugs cast integral to the body (NPS 16 through 24), use of properly sized shackles in each lifting lug eye is required. The correct shackle pin diameter is provided in Table 8. If the valve body includes attached lifting lugs, use all the lugs provided to lift the complete valve assembly. If lifting lugs are not provided on the valve body, lift the valve assembly with lifting straps secured around the valve body flanges, valve body neck and/or bonnet neck area.

Table 8. Fisher HP Lifting Lug Dimensions

VALVE SIZE	CLASS	LIFTING EYE ID		SHACKLE PIN DIAMETER	
		mm	in.	mm	in.

	1500	60.70	2.39	57.15	2.25

Section 3: Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing lubrication, packing maintenance and trim maintenance. All maintenance operations may be performed with the valve in the line.

⚠ WARNING

Avoid personal injury or damage to property from sudden release of pressure or uncontrolled process fluid. Before starting disassembly:

- **Do not remove the actuator from the valve while the valve is still pressurized.**
- **Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.**
- **Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.**
- **Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.**
- **Vent the power actuator loading pressure and relieve any actuator spring precompression.**
- **Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.**
- **The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings or when loosening the packing box pipe plug.**
- **Check with your process or safety engineer for any additional measures that must be taken to protect against process media.**

NOTE

The HP series valve uses spiral-wound gaskets which are crushed to provide their seal. A spiral-wound gasket should never be reused. Whenever a gasket seal is disturbed by removing or shifting gasketed parts, a new gasket must be installed upon reassembly. This is necessary to ensure a good gasket seal, since the used gasket will not seal properly.

NOTICE

The spiral-wound gaskets are of special design. Failure to use Fisher replacement parts may result in valve damage.

Figure 2. Lubricator and Lubricator/Isolating Valve**NOTE**

If the valve has ENVIRO-SEAL live-loaded packing installed (Figure 4), see the instruction manual entitled ENVIRO-SEAL Packing System for Sliding-Stem Valves (D101642X012) for packing instructions.

If the valve has HIGH-SEAL ULF live-loaded packing installed (Figure 4), see the instruction manual entitled HIGH-SEAL ULF Live-Loaded Packing System (D101453X012) for packing instructions.

3.1 Packing Lubrication

NOTE

Do not lubricate graphite packing. Graphite packing is self-lubricated. Additional lubrication may result in slip-stick movement of the valve.

NOTE

To avoid lubricants breaking down at elevated temperatures, do not lubricate packing used in processes with temperatures over 260 °C / 500 °F.

⚠ WARNING

Do not lubricate parts when used in oxygen service, or where the lubrication is incompatible with the process media. Any use of lubricant can lead to the sudden explosion of media due to the oil/oxygen mixture, causing personal injury or property damage.

If a lubricator or lubricator/isolating valve (Figure 2) is provided for PTFE/composition or other packings that require lubrication, it will be installed in place of the pipe plug (key 31, Figure 22, 23 or 24). Use a good quality silicon-base lubricant. Packing used in oxygen service or in processes with temperatures over 260 °C / 500 °F) should not be lubricated. To operate the lubricator, turn the cap screw clockwise to force the lubricant into the packing box. The lubricator/isolating valve operates the same way except the isolating valve must first be opened and then closed after lubrication is completed.

3.2 Packing Maintenance

If there is undesirable packing leakage in the spring-loaded PTFE V-ring packing shown in Figure 3, tighten the packing flange nuts (key 21, Figure 22, 23, 24, 26, 28, 30, 32, 34, 36 or 38) until the shoulder on the packing follower (key 28, Figure 22, 23, 24, 26, 28, 30, 32, 34, 36 or 38) contacts the bonnet (key 18, Figure 22, 23, 24, 26, 28, 30, 32, 34, 36 or 38). If leakage continues, replace the packing by following the numbered steps presented in the replacing packing procedure.

If there is undesirable packing leakage with other than spring-loaded PTFE V-ring packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts (key 21, Figure 22, 23, 24, 26, 28, 30, 32, 34, 36 or 38) to at least the minimum recommended torque in Table 6. However, do not exceed the maximum recommended torque in Table 6 or excessive friction may result. If leakage continues, replace the packing by following the numbered steps presented in the Replacing Packing procedure.

If the packing is relatively new and tight on the valve plug stem, and if tightening the packing flange nuts does not stop the leakage, it is possible that the stem is worn or nicked so that a seal cannot be made. The surface finish of a new stem is critical for making a good packing seal. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches around the packing box wall. While replacing the packing according to the Replacing Packing procedure, inspect the valve plug stem and packing box wall for nicks or scratches.

Figure 3. Packing Arrangements

C0747-1

NOTES:

1. 0.102 mm / 0.004 IN. THICK SACRIFICIAL ZINC WASHERS. USE ONLY ONE BELOW EACH GRAPHITE RIBBON RING.
2. HAS THE APPEARANCE OF A WOVEN OR BRAIDED RING.

Figure 4. Live-Loaded Packing

Adding Packing Rings

Key numbers referred to in this procedure are shown in Figure 22, 23, 24, 26, 28, 30, 32, 34, 36 or 38 unless otherwise indicated. When using packing with a lantern ring (key 24), it may be possible to add packing rings above the lantern ring as a temporary measure without removing the actuator from the valve body.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Remove the packing flange nuts (key 21) and lift the packing flange, upper wiper and packing follower (keys 19, 27 and 28) away from the valve body.
3. It may be possible to dig out the old packing rings on top of the lantern ring, but use care to avoid scratching the valve plug stem or packing box wall. Clean all metal parts to remove particles that would prevent the packing from sealing.
4. Remove the stem connector and slip the packing rings over the end of the valve plug stem.
5. Reassemble the packing follower, upper wiper, packing flange and packing flange nuts (keys 28, 27, 19 and 21).
6. Reconnect the body-actuator stem connection according to the appropriate actuator instruction manual.
7. Tighten the packing flange nuts only far enough to stop leakage under operating conditions. Check for leakage around the packing follower when the valve is being put into service. Retighten the packing flange nuts as required (see Table 6).

Replacing Packing

WARNING

Refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

Key numbers referred to in this procedure are shown in Figure 22, 23, 24, 26, 28, 30, 32, 34, 36 or 38 unless otherwise indicated.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Remove the cap screws in the stem connector, and separate the two halves of the stem connector. Then exhaust all actuator pressure, if any was applied, and disconnect the actuator supply and any leakoff piping.

3. Remove either the yoke locknut (key 32) or the hex nuts (key 30) and remove the actuator from the bonnet (key 18).
4. Loosen the packing flange nuts (key 21) so that the packing (keys 22, 23, 209 or 210, Figure 3) is not tight on the valve plug stem (key 6). Remove any travel indicator disk and stem locknuts from the valve plug stem threads.

NOTICE

When lifting the bonnet (key 18), be sure that the valve plug and stem assembly (keys 5 and 6) remains on the seat ring (key 4). This avoids damage to the seating surfaces as a result of the assembly dropping from the bonnet after being lifted part way out. The parts are also easier to handle separately.

Use care to avoid damaging gasket sealing surfaces.

The HPD and HPAD piston rings (key 8) are brittle and in two pieces. Avoid damaging the piston rings by dropping or rough handling.

WARNING

To avoid personal injury or property damage caused by uncontrolled movement of the bonnet, loosen the bonnet by following the instructions in the next step. Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet. If the cage sticks to the bonnet, proceed carefully with bonnet removal and support the cage so that it will not fall unexpectedly from the bonnet.

NOTE

The following step also provides additional assurance that the valve body fluid pressure has been relieved.

5. Hex nuts (key 14) attach the bonnet to the valve body. Loosen these nuts or cap screws approximately 3 mm / 1/8 in. Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and valve body. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, proceed to the next step.
6. Unscrew the hex nuts (key 14) and carefully lift the bonnet off the valve stem. If the valve plug and stem assembly starts to lift with the bonnet, use a brass or lead hammer on the end of the stem and tap it back down. Set the bonnet on a cardboard or wooden surface to prevent damage to the bonnet gasket surface.
7. Remove the valve plug (key 5), bonnet gasket (key 11), cage (key 2), seat ring (key 4) and the seat ring gasket (key 12).

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

HP and HPA Valves

August 2024

Instruction Manual

D101634X012

NOTE

Inspect the seat ring, cage, bonnet and body gasket surfaces. These surfaces must be in good condition, with all foreign material removed. Small burrs less than approximately 0.076 mm / 0.003 in. in height (the thickness of a human hair) can be ignored. Scratches or burrs that run across the serrations are not permitted under any conditions, since they will prevent the gaskets from sealing properly.

8. Clean all gasket surfaces with a good wire brush. Clean in the same direction as the surface serrations, not across them.
9. Cover the opening in the valve body to protect the gasket surface and to prevent foreign material from getting into the valve body cavity.
10. Remove the packing flange nuts (key 21), packing flange (key 19), upper wiper (key 27) and packing follower (key 28). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall. For extension bonnets, also remove the baffle (key 36) and retaining ring (key 37).
11. Clean the packing box and the following metal packing parts: packing follower, packing box ring (key 26), spring or lantern ring (key 24) and, for single arrangements of PTFE V-ring packing only, special washer (key 25).
12. Inspect the valve stem threads for any sharp edges that might cut the packing. A whetstone or emery cloth may be used to smooth the threads, if necessary.
13. Remove the protective covering from the valve body cavity, and install the seat ring, cage and cage retainer (as provided) using a new seat ring gasket (key 12) and bonnet gasket (key 11). Install the plug, then slide the bonnet over the stem and onto the studs (key 13). For a valve body with extension bonnet, also install the baffle and retaining rings (keys 36 and 37).

NOTE

The prelubricated hex nuts (key 14) referred to in step 14 can be identified by a black film coating on the nut threads. The proper bolting procedures in step 14 include—but are not limited to—ensuring that the bonnet stud threads are clean and that the hex nuts are evenly tightened to the specified torque values.

1. HPAS available in NPS2 only.
2. Lubricate with anti-seize lubricant.

NOTICE

Failure to comply with good bonnet-to-body bolting practices and the torque values shown in Table 7 may result in damage to the valve. Cheater bars or slug wrenches should not be used for this procedure.

Hot torquing is not recommended.

NOTE

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

**WARNING**

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson sales office immediately if a discrepancy between actual parts and approved parts is suspected.

14. Lubricate the stud threads, the faces of the hex nuts (key 14) and washer face with anti-seize lubricant (not necessary if new factory prelubricated hex nuts are used). Replace the hex nuts and tighten them finger-tight. Stroke the valve several times to center the trim. Torque the nuts in a crisscross pattern to no more than 1/4 of the nominal torque value specified in Table 7.

When all nuts are tightened to that torque value, increase the torque by 1/4 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.

NOTE

When installing packing rings, prevent entrapping air between the rings. Add the rings one at a time without forcing them below the chamfer of the packing box entrance chamber. As each successive ring is added, the stack should not be pushed down more than the thickness of the added ring (Figure 5).

15. Install new packing and the metal packing box parts according to the appropriate arrangement in Figure 3. If desired, packing parts may be pre-lubricated with a silicon base grease for easier installation. Slip a smooth-edged pipe over the valve stem, and gently tamp each soft packing part into the packing box, being sure that air is not trapped between adjacent soft parts.
16. Slide the packing follower, wiper and packing flange into position. Lubricate the packing flange studs (key 20) and the faces of the packing flange nuts (key 21). Replace the packing flange nuts.

For the spring-loaded PTFE V-ring packing shown in Figure 3, tighten the packing flange nuts until the shoulder on the packing follower (key 28) contacts the bonnet.

Figure 5. Installing Graphite Ribbon/Filament Packing Rings One at a Time

A2207-2

For graphite packing, tighten the packing flange nuts to the maximum recommended torque shown in Table 6. Then, loosen the packing flange nuts and retighten them to the recommended minimum torque shown in Table 6.

For other packing types, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in Table 6. Then, tighten the remaining flange nuts until the packing flange is level and at a 90-degree angle to the valve stem.

For ENVIRO-SEAL or HIGH-SEAL live-loaded packing, refer to the note at the beginning of the Maintenance section.

17. Mount the actuator on the valve body assembly, and reconnect the actuator and valve plug stems according to the procedures in the appropriate actuator instruction manual.

3.3 Trim Removal

For C-seal construction, see the appropriate C-seal sections in this manual.

For bore seal construction, see the appropriate bore seal sections in this manual.

Key numbers referenced in this procedure are shown in Figure 22, 23, 24, 26, 28, 30, 32, 34, 36 or 38 except where indicated.

1. Remove the actuator and bonnet by following steps 1 through 6 of the replacing packing procedure. Observe all warnings and cautions.
2. Lift the valve stem and attached valve plug out of the valve body. If the valve plug is to be reused, tape or otherwise protect the valve plug stem and the valve plug seating surface to prevent scratches.
3. Lift out the cage retainer (key 45) (as required), cage (key 2) and the bonnet gasket (key 11). For an NPS 2 valve body with a Cavitrol III two stage cage, also remove the bonnet spacer and two gaskets. For NPS 8 to 24 HPD and HPT, follow step 4 to lift the cage.
4. Remove the seal rings (key 42), as required, and retainer ring (key 37) and set aside.
5. Install threaded rods (about 6-in. long) in to the holes on the top of the cage vertically, as required. Install hoist rings, nuts or eye bolt on to the threaded rods. Lift the cage with the hoist nut from the valve body.

WARNING

Lifting of the cage must be done with a vertical, or straight, lift using the equipment shown in Figure 6. Lifting at an angle may damage the lifting equipment and cause property damage or personal injury.

6. Remove and discard all spiral wound gaskets (keys 43 and 11).

Figure 6. Removal of Cage with Hoist Rod and Nut

NOTE

The cage and cage retainer lifting holes are provided for ease of disassembly. To prevent damage to the cage lifting hole, fully engage the threaded rod into the cage hole, but do not overtighten the hoist rod. It only needs to be hand tight.

If it is hard to lift the cage, a piece of wood and a hammer can be used to strike on the top chamfer of the cage to loosen it from the body or seat ring gasket.

ASTM A193 B7 or comparable threaded rods are required for cage removal.

Contact your [Emerson sales office](#) for more information.

Constructions other than TSO Trim

1. Remove the seat ring (key 4) and the seat ring gasket (key 12).
2. Refer to the Valve Plug Maintenance procedure or to the Lapping Seats procedure.

TSO Trim

TSO Trim: 0.8125 In. Port Diameter (Figure 8)

1. Remove the pin that locks the inner plug to the stem.
2. Using a strap wrench or similar tool, unscrew the outer plug from the inner plug. Do not damage the outer plug guide surfaces.
3. Remove the protected soft seat seal.
4. Inspect the parts for damage and replace, if needed.
5. Refer to the Valve Plug Maintenance procedure or to the Lapping Seats procedure.

TSO Trim: 1.6875 In. Port Diameter (Figure 9)

1. Remove the retainer, backup ring, anti-extrusion rings and piston ring.
2. Remove the set screws that lock the outer plug to the stem.
3. Using a strap wrench or similar tool, unscrew the outer plug from the inner plug. Do not damage the outer plug guide surfaces.
4. Remove the protected soft seat seal.
5. Inspect the parts for damage and replace if needed.
6. Refer to the Valve Plug Maintenance procedure or to the Lapping Seats procedure.

TSO Trim: 2.6875 In. and Larger Port Diameters (Figure 10)

1. Remove the retainer, backup ring, anti-extrusion rings and piston ring.
2. Remove the set screws that lock the outer plug to the inner plug.
3. Using a strap wrench or similar tool, unscrew the outer plug from the inner plug. Do not damage the outer plug guide surfaces.
4. Remove the protected soft seat seal.
5. Inspect the parts for damage and replace, if needed.
6. Refer to the Valve Plug Maintenance procedure or to the Lapping Seats procedure.

3.4 Valve Plug Maintenance

Key numbers used in this procedure are shown in Figure 22, 23, 24, 26, 28, 30, 32, 34, 36 or 38 except where indicated.

1. With the valve plug (key 5) removed according to the trim removal procedure, proceed as appropriate:

For HPD and HPAD valves, the piston rings (key 8) are each in at least two sections; remove the sections from the grooves in the valve plug.

For HPS and HPAS valves, proceed to step 2.

For HPT and HPAT valves, work the retaining ring (key 10) off the valve plug with a screwdriver. Carefully slide the backup ring and seal ring (keys 9 and 8) off the valve plug.

2. To replace the valve plug stem (key 6), drive out the pin (key 7) and unscrew the stem from the valve plug.

NOTICE

Never reuse an old stem with a new valve plug. Using an old stem with a new plug requires drilling a new pin hole in the stem. This weakens the stem and may cause the stem to fail in service. If a new valve plug is required, always order a valve plug, stem and pin as an assembly. Specify the correct part number of each of the three parts, but state that the parts are being ordered as an assembly.

A used valve plug may be reused with a new stem.

Figure 7. Detail of Protected Soft Seat

A7039

3. Thread the new stem into the valve plug and tighten it to the appropriate torque value given in Table 9. Using the valve plug pin hole as a guide, drill the pin hole through the stem. Refer to Table 9 for drill sizes.
4. Drive in the pin to lock the assembly.
5. If it is necessary to lap the seating surfaces, complete the lapping seats procedure before installing the HPD/HPAD piston rings or the HPT/HPAT seal ring. The Trim Replacement procedure provides piston ring and seal ring installation instructions and valve reassembly instructions.

3.5 Lapping Seats

Key numbers referenced in this procedure are shown in Figure 22, 23, 24, 26, 28, 30, 32, 34, 36 or 38 except where indicated.

A certain amount of leakage should be expected with metal-to-metal seating in any valve body. If the leakage becomes excessive, however, the condition of the seating surfaces of the valve plug and seat ring can be improved by lapping. (Deep nicks should be machined out rather than ground out.) Use a good quality lapping compound of a mixture of 280 to 600-grit. Apply the compound to the bottom of the valve plug.

Figure 8. Typical Unbalanced TSO Trim Assembly, Small Port Designs (0.8125 In. Port Diameter)

NOTE

HP Series valves use spiral-wound gaskets. These gaskets provide their seal by being crushed and therefore should never be reused. This includes reusing a gasket after the lapping procedure has been performed.

An “old” gasket can be used to lap the seat, however the gasket must be replaced with a new gasket.

To preserve the effects of lapping, do not change either the position of the seat ring in the valve body cavity or the position of the cage on the seat ring after lapping the seating surfaces. When the parts are removed for cleaning and replacement of the “old” gaskets, return them to the original positions.

Figure 9. Typical Balanced TSO Trim (1.6875 In. Port Diameter)

Use the following procedure to lap the seating surfaces.

1. Install the following parts according to the instructions presented in the trim replacement procedure: “old” seat ring gasket (key 12), seat ring (key 4), cage (key 2) and “old” bonnet gasket (key 11).
2. Proceed as appropriate:
For an HPD, HPAD, HPT or HPAT valve, install the valve plug and stem assembly (keys 5 and 6)–without piston rings or seal ring (key 8) –into the cage.
For an HPS or HPAS valve, install the valve plug and stem assembly (keys 5 and 6) into the cage.
3. Install the bonnet (key 18) over the valve stem, and secure the bonnet with four of the hex nuts (key 14).
4. Attach a handle, such as a piece of strap iron secured by stem locknuts, to the valve stem. Rotate the handle alternately in each direction to lap the seats.
5. After lapping, disassemble as necessary (you may mark the position of the seat ring and cage with a soft tip marker). Clean the seating surfaces, replace the gaskets, reassemble (taking care to return the seat ring and cage to their original positions) and test for shutoff. Repeat the lapping procedure if necessary.

Figure 10. Typical Balanced TSO Trim, Large Port Designs (2.6875 In. and Larger Port Diameters)

Table 10. Actuator Groups by Type Number

Group 1 71 and 90 mm / 2-13/16 and 3-9/16 in. Yoke Boss	Group 100 127 mm / 5-in. Yoke Boss

3.6 Trim Replacement

WARNING

Observe the warning at the start of the Maintenance section.

After all trim maintenance has been completed, reassemble the valve body by following the numbered steps below. Be certain that all gasketed surfaces have been well cleaned. Key numbers referenced in this procedure are shown in Figure 22, 23, 24, 26, 28, 30, 32, 34, 36 or 38 except where indicated.

NOTE

Inspect the seat ring, cage, cage retainer (as provided), bonnet and body gasket surfaces. These surfaces must be in good condition, with all foreign material removed. Small burrs less than approximately 0.076 mm / 0.003 in. in height (the thickness of a human hair) can be ignored. Scratches or burrs that run across the serrations are not permitted under any conditions, since they will prevent the gaskets from sealing properly.

NOTE

The pressure balancing holes in the valve plug are necessary for the proper and safe operation of the valve. Inspect the balancing holes every time the valve is disassembled for service. Any build-up, blockage or clogging of the balance holes should be removed.

NPS 2 to 6 HPD (Long), HPT (Long) and NPS 2 to 8 CL1500 HPAD and HPAT

Constructions other than TSO Trim

NOTE

When installing the standard cage, align two of the holes in the cage with the centerline of the valve body. Refer to Figure 23.

1. Install the seat ring gasket (key 12) into the valve body. Install the seat ring (key 4).
2. Install the cage.
3. To install the piston rings and seal rings (key 8), proceed as appropriate:

For an HPD or HPAD valve, if it is necessary to install new piston rings, the replacement piston rings will arrive in one piece. Use a vise with smooth or taped jaws to break a replacement piston ring into halves. Place the new ring in the vise so that the jaws compress the ring into an oval. Compress the ring slowly until the ring snaps on both sides. If one side snaps first, do not try to tear or cut the other side. Instead, keep compressing until the other side snaps. The piston ring can also be fractured by scoring and snapping over a hard surface such as a table edge. Sawing or cutting is not recommended.

Remove any protective tape or covering from the valve plug and stem assembly, and set it on a protective surface. Then, place the piston rings in the piston ring grooves with the fractured ends matched.

For an HPT or HPAT valve, install the seal ring (key 8) onto the valve plug (key 5). Install the ring with the open side facing the seat ring end of the valve plug for flow-down applications (view A of Figure 25) or with the open side facing the valve plug stem end of the valve plug for flow-up applications (view B of Figure 25). Slide the backup ring (key 9) onto the valve plug. Secure with the retaining ring (key 10).

For an HPAS Micro-Flat valve, ensure the Micro-Flat valve plug and stem assembly is oriented as shown in Figure 11 when replacing the bonnet on the valve body. Then slide the bonnet over the stem and onto the stud bolts.

NOTE

Micro-flat plugs must be installed as shown in Figures 11 and 23. This proper plug orientation increases the guide support area for the plug and stem.

Figure 11. Micro-Flat Valve Plug Orientation

A5602

4. Install the valve plug into the cage.
5. Install the bonnet gasket (key 11) on the cage.
6. Install the bonnet over the valve stem and onto the valve body.

TSO Trim

TSO Trim: 0.8125 In. Port Diameter (Figure 8)

1. Thread the outer plug onto the inner plug until the parts seat metal to metal, using a strap wrench or similar tool that will not damage the outer plug guide surfaces.
2. Mark the inner plug and outer plug with alignment marks in the assembled position.
3. Disassemble the outer plug from the inner plug and install the seal over the inner plug, so that the seal rests below the threaded area.
4. Thread the outer plug onto the inner plug and tighten with a strap wrench or similar tool until the alignment marks line up. This will ensure that the plug parts are metal to metal and the seal is compressed properly. Do not damage the outer plug guide surfaces.
5. Drill through the inner plug with the proper size drill bit (same size as stem pinning) and install the pin.
6. Install the bonnet gasket (key 11) on the cage.
7. Install the bonnet over the valve stem and onto the valve body.

TSO Trim: 1.6875 In. Port Diameter (Figure 9)

1. Thread the outer plug onto the inner plug until the parts seat metal to metal, using a strap wrench or similar tool that will not damage the outer plug guide surfaces.
2. Mark the top of the outer plug and stem with alignment marks in the assembled position.
3. Disassemble the outer plug from the inner plug and install the seal over the inner plug, so that the seal rests below the threaded area.
4. Thread the outer plug onto the inner plug and tighten with a strap wrench or similar tool until the alignment marks line up. This will ensure that the plug parts are metal to metal and the seal is compressed properly. Do not damage the outer plug guide surfaces.
5. Install set screws centering the stem in the outer plug and torque to 11 N•m / 8 lbf•ft.
6. Assemble the piston ring, anti-extrusion rings, backup ring and retainer.
7. Install the bonnet gasket (key 11) on the cage.
8. Install the bonnet over the valve stem and onto the valve body.

TSO Trim: 2.6875 In. and Larger Port Diameters (Figure 10)

1. Thread the outer plug onto the inner plug until the parts seat metal to metal, using a strap wrench or similar tool that will not damage the outer plug guide surfaces.
2. Mark the top of the inner plug and outer plug with alignment marks in the assembled position.
3. Disassemble the outer plug from the inner plug and install the seal over the inner plug, so that the seal rests below the threaded area.
4. Thread the outer plug onto the inner plug and tighten with a strap wrench or similar tool until the alignment marks line up. This will ensure that the plug parts are metal to metal and the seal is compressed properly. Do not damage the outer plug guide surfaces.
5. Install set screws centering the inner plug in the outer plug and torque to 11 N•m / 8 lbf•ft.
6. Assemble the piston ring, anti-extrusion rings, backup ring and retainer.
7. Install the bonnet gasket (key 11) on the cage.
8. Install the bonnet over the valve stem and onto the valve body.

NPS 8 to 24 HPD and HPT and NPS 12 HPAD/HPAT Constructions (Figures 26, 27, 28, 29, 30, 31, 32, 33, 38, 39 and 40)

1. Install the seat ring flat sheet gasket (key 12) in the lower gasket groove in the valve body (key 1), making sure the gasket is centered in the groove and the bottom of the gasket is flush with the mating surface in the body.
2. If applicable, install the seat ring (key 4) into the valve body. Lift using hoist rings on threaded rods threaded into the lift holes provided. Take care to lower the seat ring evenly and ensure the seat ring will not damage the flat sheet gasket (key 12).
3. If required, slip quantity-1 seal ring (key 42) onto the lowest groove of cage with the open side of the seal ring facing the top or bottom of the seat ring, depending on flow direction. Make sure the anti-extrusion ring is on the closed side of the seal ring and the tapered face of anti-extrusion ring and the seal ring match correctly, see Figure 12.

Figure 12. Soft Seal Detail and Installed Orientation

NOTE

The anti-extrusion ring is NOT reversible. There is a flat face side and a tapered face side. The tapered face side of the anti-extrusion ring matches a tapered face on the seal ring. The seal will not function properly if it is not assembled correctly. The seal installation should be done prior to cage installed into the valve. When install a bore seal ring, refer to the bore seal Trim section.

4. Place the backup ring (key 9) into the seal groove until it touches the seal ring (key 42).
5. Install threaded rods (about 6 in. long) in to the holes on the top of the cage. Install hoist rings, nuts or eye bolt on to the threaded rod.

NOTE

To prevent damage to the cage/seat ring lifting holes, fully engage the threaded rod into the cage/seat ring hole, but do not overtighten the hoist rod. It only needs to be hand tight. ASTM A193 B7 or comparable threaded rods are required for cage/seat ring installation.

6. Install the cage (key 2) into the valve body, lift the cage using the hoist rings on the threaded rods. When installing the cage (key 2), take care to lower the cage evenly and ensure that cage (key 2) will not damage the flat sheet gasket (key 12) or the seat ring (key 4).

NOTE

If a drilled hole cage is used, blow out the cage and drilled holes before installing into the body to make sure the burrs and debris will not be trapped between cage and plug and cause damage.

7. For NPS 8 through 12 valves with skirted bonnet install quantity-3 cage spiral wound gaskets (key 43) for NPS 8 through 14 valves with cage retainer (key 45) install quantity-2, for NPS 16 through 24 valves with cage retainer (key 45) install quantity 3, making sure the gaskets sits flush on the surface of the groove.
8. If applicable, install the cage retainer (key 45) on top of the cage. For NPS 8 through 12 valves install a single spiral wound gasket (key 43) in the gasket groove on top of the cage retainer. For the NPS 14 valve install quantity-2 gaskets in the gasket groove on top of the cage retainer. For NPS 8 through 12 valves install a single spiral wound gasket (key 43) in the gasket groove on top of the cage retainer.
9. Install the bonnet gasket (key 11) in to the groove around the valve body trim opening.
10. Install quantity-2 piston rings (key 8) into the grooves on the plug (key 5).

NOTE

If it is necessary to install new piston rings, the replacement piston rings will arrive in one piece. Use a vise with smooth or taped jaws to break a replacement piston ring into halves. Place the new ring in the vise so that the jaws compress the ring into an oval. Compress the ring slowly until the ring snaps on both sides. If one side snaps first, do not try to tear or cut the other side. Instead, keep compressing until the other side snaps. The piston ring can also be fractured by scoring and snapping over a hard surface such as a table edge. Sawing or cutting is not recommended.

11. Place the plug/stem assembly into the bore of the cage (key 2) and gently rest the plug seating surface against the seating surface in the cage and make sure piston rings do not come out.
12. Lower the bonnet (key 18) over the valve plug stem, ensuring the valve stem is centered with the bonnet. This is important so that the top of the stem will engage the packing bore hole in the bonnet. Continue to lower the bonnet over the cage retainer.

NOTE

Be careful to prevent the bonnet from crushing the spiral wound gaskets as the bonnet is lowered on to the valve.

Damaging the gaskets will require that they are replaced.

The prelubricated hex nuts (key 14) referred to in step 13 can be identified by a black film coating on the nut threads.

The proper bolting procedures in step 13 include--but are not limited to--ensuring the bonnet stud threads are clean, and the hex nuts are evenly tightened to the specified torque values.

NOTICE

Failure to comply with good bonnet-to-body bolting practices and the torque values shown in Table 7 may result in damage to the valve. Cheater bars or slug wrenches should not be used for this procedure. Hot torquing is not recommended.

NOTE

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

**WARNING**

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) immediately if a discrepancy between actual parts and approved parts is suspected.

13. Lubricate the stud threads, the faces of the hex nuts (key 14), and washers (key 40) (if provided) with anti-seize lubricant (not necessary if new factory prelubricated hex nuts are used). Replace the hex nuts, but do not tighten them. Torque the nuts in a crisscross pattern to no more than 1/4 of the nominal torque value specified in Table 7. When all nuts are tightened to that torque value, increase the torque by 1/4 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.
14. Install new packing and packing box parts per steps 15 and 16 of the Replacing Packing procedure. Be certain to observe the note given prior to step 15 of that procedure.
15. Mount the actuator by following the procedures in the actuator instruction manual. Check for packing leakage as the valve is being put into service. Retorque the packing flange nuts as required (see Table 6).

NPS 3 to 6 HPD (Short), HPT (Short), HPS (Short) and NPS 6 and 8 CL2500 HPAD, HPAT (Figures 34, 35, 36 and 37)

1. Install the seat ring flat sheet gasket (key 12) in the lower gasket groove in the valve body (key 1), making sure the gasket is centered in the groove and the bottom of the gasket is flush with the mating surface in the body.
2. Install the seat ring (key 4) on top of the gasket in the body.
3. Install the cage (key 2) on top of the seat ring.
4. If applicable, install the backup ring (key 9) on cage groove.
5. For HPT constructions, slip quantity-1 seal ring (key 42) into the cage retainer (key 45) with the open side of the seal ring facing the top or bottom of the seat ring, depending on flow direction. For flow up the seal will need to be oriented with the opening toward the bonnet side of the retainer; for flow down the seal opening needs to be facing toward the cage side of the retainer. Make sure the anti-extrusion ring is on the closed side of the seal ring (see Figure 34).

NOTE

The anti-extrusion ring is NOT reversible. There is a flat face side and angle side. The angle face sides must be installed mating to each other. The seal will not function properly if it is not assembled correctly. The seal installation should be done prior to cage retainer installation into the valve. To hold the anti-extrusion ring in while lowering the cage, a dollop of grease can be used.

6. Install the cage retainer (key 45) on top of the cage.
7. For HPD and HPT constructions, install piston rings (key 39) into the grooves on the plug (key 6).

NOTE

If it is necessary to install new piston rings, the replacement piston rings will arrive in one piece. Use a vise with smooth or taped jaws to break a replacement piston ring into halves. Place the new ring in the vise so that the jaws compress the ring into an oval. Compress the ring slowly until the ring snaps on both sides. If one side snaps first, do not try to tear or cut the other side. Instead, keep compressing until the other side snaps. The piston ring can also be fractured by scoring and snapping over a hard surface such as a table edge. Sawing or cutting is not recommended.

8. Install the plug (key 6) into the assembly through the cage retainer. Lower until it contacts the seat.
9. Install quantity-2 spiral wound gaskets onto the gasket groove on the cage retainer.
10. Install the bonnet gasket (key 11) into the groove around the valve body trim opening.
11. Lower the bonnet (key 18) over the valve plug stem, ensuring the valve stem is centered with the bonnet. This is important so that the top of the stem will engage the packing bore hole in the bonnet. Continue to lower the bonnet over the cage retainer.

NOTE

Be careful to prevent the bonnet from crushing the spiral wound gaskets as the bonnet is lowered on to the valve. Damaging the gaskets will require that they are replaced.

The prelubricated hex nuts (key 14) referred to in step 12 can be identified by a black film coating on the nut threads.

The proper bolting procedures in step 12 include--but are not limited to--ensuring that the bonnet stud threads are clean and that the hex nuts are evenly tightened to the specified torque values.

Tapped holes are provided in the cage and cage retainer as lifting provisions should they be needed for installation.

Contact your [Emerson sales office](#) for additional information.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) immediately if a discrepancy between actual parts and approved parts is suspected.

NOTICE

Failure to comply with good bonnet-to-body bolting practices and the torque values shown in Table 7 may result in damage to the valve. Cheater bars or slug wrenches should not be used for this procedure. Hot torquing is not recommended.

NOTE

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

12. Lubricate the stud threads, the faces of the hex nuts (key 14) and washers (key 40) (if provided) with anti-seize lubricant (not necessary if new factory prelubricated hex nuts are used). Replace the hex nuts, but do not tighten them. Torque the nuts in a crisscross pattern to no more than 1/4 of the nominal torque value specified in Table 9. When all nuts are tightened to that torque value, increase the torque by 1/4 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.
13. Install new packing and packing box parts per steps 15 and 16 of the Replacing Packing procedure. Be certain to observe the note given prior to step 15 of that procedure.
14. Mount the actuator by following the procedures in the actuator instruction manual. Check for packing leakage as the valve is being put into service. Retorque the packing flange nuts as required (see Table 6).

3.7 Retrofit: Installing C-seal Trim

Apply to NPS 2 to 6 HPD (Long), HPT (Long) and NPS 2 to 8 CL1500 HPAD and HPAT Constructions

NOTE

Additional actuator thrust is required for a valve with C-seal trim. When installing C-seal trim in an existing valve, contact your [Emerson sales office](#) for assistance in determining new actuator thrust requirements.

Assemble the new valve plug/retainer assembly (with C-seal plug seal) using the following instructions:

NOTICE

To avoid leakage when the valve is returned to service, use appropriate methods and materials to protect all sealing surfaces of the new trim parts while assembling the individual parts and during installation in the valve body.

1. Apply a suitable high-temperature lubricant to the inside diameter of the C-seal plug seal. Also, lubricate the outside diameter of the valve plug where the C-seal plug seal must be pressed into the proper sealing position (Figure 13).
 2. Orient the C-seal plug seal for correct sealing action based on the process fluid flow direction through the valve.
 - The open interior of the C-seal plug seal must face up in a valve with flow-up construction (Figure 13).
 - The open interior of the C-seal plug seal must face down in a valve with flow-down construction (Figure 13).
-

NOTE

An installation tool must be used to properly position the C-seal plug seal on the valve plug. A tool is available as a Fisher spare part or a tool could be manufactured following the dimensions given in Figure 14.

3. Place the C-seal plug seal over the top of the valve plug and press the C-seal plug seal onto the plug using the C-seal installation tool. Carefully press the C-seal plug seal onto the plug until the installation tool contacts the horizontal reference surface of the valve plug (Figure 15).
4. Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the C-seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
5. Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place (Figure 16) to secure the C-seal retainer.
6. Install the new plug/retainer assembly with C-seal plug seal on the new stem following the appropriate instructions in the Trim Replacement section in this manual.
7. Install piston rings by following instructions in the Trim Replacement section in this manual.
8. Remove the existing valve actuator and bonnet following the appropriate instructions in the Replacing Packing section in this manual.

August 2024

37B1399-A

Technical drawing of a shaft-hub assembly. The drawing shows a shaft with diameter $\varnothing A$ and a hub with inner diameter $\varnothing B$. The shaft has a length of $45^\circ \times 1.524 / 0.06$. The hub has a length of $45^\circ \times 0.508 / 0.02$. The shaft has a diameter of $\varnothing C$ and $\varnothing D$. The hub has a diameter of $\varnothing B$. The shaft has a taper of $8^\circ - 9^\circ$. The hub has a break sharp corner with a radius of $45^\circ \times 0.254 / 0.01$ MAX. The drawing includes a scale of mm / in. and a reference number A6777.

NOTICE

Do not remove the existing valve stem from the valve plug unless you are planning to replace the valve stem.

Never reuse an old valve stem with a new plug or reinstall a valve stem after it has been removed. Replacing a valve stem requires drilling a new pin hole in the stem. This drilling weakens the stem and may cause failure in service. However, a used valve plug may be reused with a new valve stem.

9. Remove the existing valve stem and plug, cage and seat ring from the valve body following the appropriate instructions in the Trim Removal section in this manual.
10. Replace all gaskets according to appropriate instructions in the Trim Replacement section in this manual.
11. Install the new seat ring, cage, valve plug/retainer assembly and stem into the valve body and completely reassemble the valve package following the appropriate instructions in the Trim Replacement section in this manual.

Figure 15. Installing the C-seal Plug Seal Using the Installation Tool

NOTE:

PRESS THE INSTALLATION TOOL OVER THE VALVE PLUG UNTIL THE TOOL CONTACTS THE HORIZONTAL REFERENCE SURFACE OF THE VALVE PLUG.

Figure 16. Stake the Threads of the C-seal Retainer

NOTICE

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the C-seal plug seal and contact the seat ring. You can correctly seat the valve plug by using the same force calculated for full load when sizing your actuator. With no pressure drop through the valve, this force will adequately drive the valve plug to the seat ring, thus giving the C-seal plug seal a predetermined permanent set. Once this is done, the plug/retainer assembly, the cage and the seat ring become a matched set.

12. With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

3.8 Replacement of Installed C-seal Trim

Apply to NPS 2 to 6 HPD (Long), HPT (Long) and NPS 2 to 8 HPAD (Long) and HPAT (Long) Constructions

Trim Removal (C-seal Constructions)

1. Remove the valve actuator and bonnet following the appropriate instructions in the Replacing Packing section in this manual.

NOTICE

To avoid leakage when the valve is returned to service, use appropriate methods and materials to protect all sealing surfaces of the trim parts during maintenance.

Use caution when removing piston ring(s) and C-seal plug seal to avoid scratching any sealing surface.

NOTICE

Do not remove the valve stem from the plug/retainer assembly unless you are planning to replace the valve stem.

Never reuse an old valve stem with a new plug or reinstall a valve stem after it has been removed. Replacing a valve stem requires drilling a new pin hole in the stem. This drilling weakens the stem and may cause failure in service. However, a used valve plug may be reused with a new valve stem.

2. Remove the plug/retainer assembly (with C-seal plug seal), cage and seat ring from the valve body following the appropriate instructions in the Trim Removal section in this manual.
3. Locate the staked thread on top of the valve plug (Figure 16). The staked thread secures the retainer. Use a drill with a 1/8 inch bit to drill out the staked area of the thread. Drill approximately 1/8-in. into the metal to remove the staking.
4. Locate the break between sections of the piston ring(s). Using an appropriate tool such as a flat-blade screwdriver, carefully pry out the piston ring(s) from the groove(s) in the C-seal retainer.
5. After removing the piston ring(s), locate the 1/4-inch diameter hole in the groove. In a retainer with two piston ring grooves, the hole will be found in the upper groove.
6. Select an appropriate tool such as a punch and place the tip of the tool into the hole with the body of the tool held tangent to the outside diameter of the retainer. Strike the tool with a hammer to rotate the retainer and free it from the valve plug. Remove the retainer from the plug.
7. Use an appropriate tool such as a flat-blade screwdriver to pry the C-seal plug seal off the plug. Use caution to avoid scratches or other damage to the sealing surfaces where the C-seal plug seal makes contact with the valve plug (Figure 17).
8. Inspect the lower seating surface where the valve plug contacts the seat ring for wear or damage which would prevent proper operation of the valve. Also, inspect the upper seating surface inside the cage where the C-seal plug seal contacts the cage and inspect the sealing surface where the C-seal plug seal makes contact with the plug (Figure 17).
9. Replace or repair trim parts according to the following procedure for Lapping Metal Seats, Remachining Metal Seats or other valve plug maintenance procedures as appropriate.

Lapping Metal Seats (C-seal Constructions)

Before installing a new C-seal plug seal, lap the lower seating surface (valve plug to seat ring, Figure 17) following appropriate procedures in the Lapping Seats section in this manual.

Remachining Metal Seats (C-seal Constructions)

See Figure 18. A valve plug with a C-seal metal plug seal features two seating surfaces. One seating surface is found where the valve plug contacts the seat ring. The second seating surface is found where the C-seal plug seal contacts the upper seating surface in the cage. If you machine the seats on the seat ring and/or plug, you must machine an equal dimension from the seating area in the cage.

NOTICE

If metal is removed from the seat ring and plug and a corresponding amount is not removed from the cage seating area, the C-seal plug seal will be crushed as the valve closes and the C-seal retainer will strike the seating area of the cage, preventing the valve from closing.

Figure 17. Lower (Valve Plug to Seat Ring) and Upper (C-seal Plug Seal to Cage) Seating Surfaces

A6780

NOTE:

1. UPPER SEATING SURFACE IS THE AREA OF CONTACT BETWEEN THE C-seal METAL PLUG SEAL AND THE CAGE.

Trim Replacement (C-seal Constructions)

1. Apply a suitable high-temperature lubricant to the inside diameter of the C-seal plug seal. Also, lubricate the outside diameter of the valve plug where the C-seal plug seal must be pressed into the proper sealing position (Figure 13).
2. Orient the C-seal plug seal for correct sealing action based on the process fluid flow direction through the valve.
 - The open interior of the C-seal plug seal must face up in a valve with flow-up construction (Figure 13).
 - The open interior of the C-seal plug seal must face down in a valve with flow-down construction (Figure 13).

NOTE

An installation tool must be used to properly position the C-seal plug seal on the valve plug. A tool is available as a Fisher spare part or a tool could be manufactured following the dimensions given in Figure 14.

3. Place the C-seal plug seal over the top of the valve plug and press it onto the plug using the installation tool. Carefully press the C-seal plug seal onto the plug until the installation tool contacts the horizontal reference surface of the valve plug (Figure 15).
4. Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the C-seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.

Figure 18. Example of Machining the Lower (Valve Plug to Seat Ring) and Upper (C-seal Plug Seal to Cage) Seating Surfaces

NOTE:

1. REMOVAL OF 0.254 mm / 0.010 in. FROM THE VALVE PLUG
2. REMOVAL OF 0.254 mm / 0.010 in. FROM THE SEAT RING
3. REMOVAL OF 0.508 mm / 0.020 in. FROM THE UPPER SEATING SURFACE IN THE CAGE
4. THESE VALUES ARE FOR EXAMPLE ONLY. REMOVE ONLY THE MINIMUM AMOUNT OF MATERIAL REQUIRED TO REFURBISH THE SEATS.

5. Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place (Figure 16) to secure the C-seal retainer.
6. Replace the piston rings following instructions in the Trim Replacement section in this manual.
7. Return the seat ring, cage, plug/retainer assembly and stem to the valve body and completely reassemble the valve package following the appropriate instructions in the Trim Replacement section in this manual.

NOTICE

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the C-seal plug seal and contact the seat ring. You can correctly seat the valve plug by using the same force calculated for full load when sizing your actuator. With no pressure drop through the valve, this force will adequately drive the valve plug to the seat ring, thus giving the C-seal plug seal a predetermined permanent set. Once this is done, the plug/retainer assembly, the cage and the seat ring become a matched set.

8. With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

3.9 Replacement of Installed Bore Seal Trim

Apply to NPS 8 to 14 HPD, HPT and NPS 12 HPAD

Trim Removal (Bore Seal Constructions)

1. Remove the valve actuator and bonnet following the appropriate instructions in the Replacing Packing section in this manual.

NOTICE

To avoid leakage when the valve is returned to service, use appropriate methods and materials to protect all sealing surfaces of the trim parts during maintenance.

Use caution when removing piston ring(s) and bore seal plug seal to avoid scratching any sealing surface.

NOTICE

Do not remove the valve stem from the plug/retainer assembly unless you are planning to replace the valve stem.

Never reuse an old valve stem with a new plug or reinstall a valve stem after it has been removed. Replacing a valve stem requires drilling a new pin hole in the stem. This drilling weakens the stem and may cause failure in service. However, a used valve plug may be reused with a new valve stem.

2. Remove the plug assembly, cage retainer (key 45) (as required) and cage (key 5) (with bore seal) from the valve body following the appropriate instructions in the Trim Removal section in this manual.
3. Remove the piston rings from the grooves on plug.
4. Remove cage gaskets (key 43) and discard.
5. Inspect the lower seating surface where the valve plug contacts the seat ring for wear or damage which would prevent proper operation of the valve.
6. Replace or repair trim parts according to the following procedure of valve plug maintenance procedures as appropriate.

Trim Replacement (Bore Seal Constructions)

1. Unless the order does not allow lubrication in contact with the process media, apply a suitable high-temperature lubricant to the outside diameter of the bore seal (key 42). Also, lubricate the inside diameter of the cage where the bore seal must be pressed into the proper sealing position.
2. Orient the bore seal (key 42) for correct sealing action based on the process fluid flow direction through the valve.
 - The open interior of the bore seal must face up in a valve with flow-up construction (Figure 19).
 - The open interior of the bore seal must face down in a valve with flow-down construction (Figure 20).

Figure 19. Bore Seal Installed Orientation

3. Place the bore seal (key 42) at the top of the seal groove in cage. The seal will not fit completely into the groove with hand force alone. Forcing the seal in by hand may damage the seal.

Figure 20. Bore Seal Installation with Tool

4. Use the installation tool to help press the seal ring evenly on to the cage and make sure the seal ring is centered until the installation tool and cage come to metal-to-metal. See Figure 22 for tool dimensions and part numbers.
5. Place the backup ring (key 9) into the seal groove until it touches the seal ring (key 42).
6. Install the new cage, gaskets, valve plug/stem assembly and bonnet into the valve body and completely reassemble the valve package following the appropriate instructions in the Trim Replacement section in this manual.

NOTICE

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the bore seal plug seal and contact the seat ring. You can correctly seat the valve plug by using the same force calculated for full load when sizing your actuator. With no pressure drop through the valve, this force will adequately drive the valve plug to the seat ring, thus giving the bore seal a predetermined permanent set. Once this is done, the plug assembly, the cage and the seat ring become a matched set.

7. With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

Section 4: Parts Ordering

Each body-bonnet assembly is assigned a serial number, which can be found on the valve body. This same number also appears on the actuator nameplate when the valve body is shipped from the factory as part of a control valve assembly. Refer to the number when contacting your [Emerson sales office](#) for technical assistance or when ordering replacement parts.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for Fisher HPS-C and HPT-C valves. Refer to separate manuals for instructions covering the actuator and accessories.

Do not install, operate, or maintain HPS-C or HPT-C series valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

HPS-C and HPT-C Valves

February 2024

Instruction Manual

D104208X012

Table 1. Specifications

Valve Sizes HPS-C: NPS ■ 1 to 3 (CL900 and CL1500) and ■ 1 to 2 (CL2500) HPT-C: NPS ■ 4 through 12 (CL900 and CL1500)	Material Temperature Capability⁽¹⁾ HPT-C: -198 to 66°C (-325 to 150°F) HPS-C: -198 to 316°C (-325 to 600°F)
End Connection Styles⁽¹⁾ CL900, 1500, and 2500 raised-face and ring type joint flanges per ASME B16.5 Butt weld end connection per ASME B16.25 PN160 and PN250 flanges per EN1092-1	Cryogenic Leak Test per SPE 77/306 Class C (optional)
Maximum Inlet Pressure⁽¹⁾ CL900 and 1500—Valves are consistent with pressure-temperature ratings per ASME B16.34 CL2500—Valves are consistent with pressure-temperature ratings per ASME B16.34	Maximum Actuator Thrust See table 2
Shutoff Classifications per ANSI/FCI 70-2 and IEC 60534-4 HPT-C and HPS-C: Metal Seat: ■ Class IV is standard ■ Class V air test is optional (test will be at 50 PSID air) ⁽²⁾	Flow Characteristics HPT-C and HPS-C: Equal percentage, linear, and modified equal percentage
	Flow Directions HPT-C: Normally down for linear and equal percentage trims. Flow up for Whisper Trim HPS-C: Normally up
	Approximate Weights See table 3

1. Do not exceed the pressure/temperature limits in this manual and any applicable code limitation.

2. Class V shutoff cannot be performed with water. This residual trapped moisture from testing with water can cause valve and trim damages from the ice crystals formed at below freezing service temperature.

Description

HPS-C has single-port, globe-style control valve with cage-guiding, unbalanced valve plug, and push-down-to-close valve plug action.

HPT-C has single-port, globe-style control valve with cage guiding, balanced valve plug, and push-down-to-close valve plug action.

These valves feature stainless steel construction materials and fabricated or one-piece extension bonnets. HP-C series globe valves are available in short and long face-to-face designs depending on size and pressure class.

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media. If installing into an existing application, also refer to the warning at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Because some valve body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

⚠ WARNING

Some bonnet flanges have a tapped hole that was used to handle the bonnet during manufacture. Do not use this tapped hole to lift the valve assembly or personal injury may result.

NOTICE

To avoid product damage, inspect the valve before installation for any damage or any foreign material that may have collected in the valve body. Also remove any pipe scale, welding slag, or other foreign material from the pipeline.

1. Before installing the valve, inspect the valve and associated equipment for any damage and any foreign material.
2. Make certain the valve body interior is clean, that pipelines are free of foreign material, and the valve is oriented so that pipeline flow is in the same direction as the arrow on the side of the valve.

Note

NPS 8 to 12 CL900 and CL1500 HPT-C valves contain a flow vane in the lower flow passage. This is critical to proper function of the valve and is not a defect.

3. **Gas Service:** The normal method of mounting for gas service is with the actuator vertical above the valve body. However, the control valve assembly may be installed in any orientation unless limited by seismic criteria. Other positions may result in uneven valve plug and cage wear that could result in improper operation. For mounting assistance, consult your [Emerson sales office](#).

NOTICE

To avoid possible damage to the packing, do not allow the installed actuator angle to be so flat as to allow liquid inside the bonnet to come in contact with the packing.

Liquid Service: The preferred method of mounting for liquid service is with the actuator vertical above the valve body. This will allow a vapor layer to form between the liquid and the packing. If there are piping constraints, the actuator can be angled slightly from vertical. However, in no case should the angle be so flat as to allow liquid inside the bonnet to come in contact with the packing. For mounting assistance, consult your [Emerson sales office](#).

4. If insulation is applied, make sure it is applied only to the body/bonnet joint. Do not let the insulation run up the extension bonnet.
5. Use accepted piping and welding practices when installing the valve in the line. For flanged valve bodies, use a suitable gasket between the valve body and pipeline flanges.
6. If the actuator and valve are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.
7. If the valve body was shipped without packing installed in the packing box, install the packing before putting the valve body into service. Refer to instructions given in the Packing Maintenance procedure.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions.

Valves with ENVIRO-SEAL™ live-loaded packing will not require this initial readjustment. See the Fisher instruction manual ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)) for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the parts kit sub-section near the end of this manual.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing maintenance and trim maintenance. All maintenance operations may be performed with the valve in the line.

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

NOTICE

Follow instructions carefully to avoid damaging the product surfaces, which could result in damage to the product.

Note

The HPS-C/HPT-C valves use spiral-wound gaskets which are crushed to provide their seal. A spiral-wound gasket should never be reused. Whenever a gasket seal is disturbed by removing or shifting parts, a new gasket should be installed upon reassembly. This is necessary to ensure a good gasket seal because the used gasket may not seal properly.

Packing Maintenance

This section covers PTFE V-ring, double PTFE, and graphite packing used in extension bonnets (figure 2).

Note

If the valve has ENVIRO-SEAL live-loaded packing installed, refer to the instruction manual ENVIRO-SEAL Packing System for Sliding Stem Valves ([D101642X012](#)) for packing instructions. Figure 4 shows typical ENVIRO-SEAL arrangements.

Standard packing key numbers are shown in figure 2. ENVIRO-SEAL packing key numbers are shown in figure 4. Bonnet and valve key numbers are shown in figures 5, 6, 7, and 8.

For spring-loaded single PTFE V-ring packing, the spring (key 24) maintains a sealing force on the packing. If leakage is noted around the packing follower (key 28), check to be sure the shoulder on the packing follower is touching the bonnet. If the shoulder is not touching the bonnet, tighten the packing flange nuts (key 20), until the shoulder is against the bonnet. If leakage cannot be stopped in this manner, proceed with replacing packing procedures.

If there is undesirable packing leakage with other than spring-loaded packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts.

If the packing is relatively new and tight on the stem, and if tightening the packing flange nuts does not stop the leakage, it is possible that the valve stem is worn or nicked so that a seal cannot be made. The surface finish of a new valve stem is critical for making a good packing seal. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches around the packing box wall. If performing any of the following procedures, inspect the valve stem and packing box wall for nicks and scratches. If leakage continues, replace the packing by following the numbered steps presented in the replacing packing procedure.

Adding Packing Rings

Key numbers referred to in this procedure are shown in figures 2, 5, and 6 unless otherwise noted.

When using packing with a lantern ring (key 24) it may be possible to add packing rings above the lantern ring as a temporary measure without removing the actuator from the valve body.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Remove the packing flange nuts (key 20) and lift the packing flange, upper wiper, and packing follower (keys 18, 27, and 28) away from the valve body.
3. It may be possible to dig out the old packing rings on top of the lantern ring, but use care to avoid scratching the valve plug stem or packing box wall. Clean all metal parts to remove particles that would prevent the packing from sealing.
4. Remove the stem connector and slip the packing rings over the end of the valve plug stem.
5. Reassemble the packing follower, upper wiper, packing flange, and packing flange nuts (keys 28, 27, 18, and 20).
6. Reconnect the body-actuator stem connection according to the appropriate actuator instruction manual.
7. Tighten the packing flange nuts only far enough to stop leakage under operating conditions. Check for leakage around the packing follower when the valve is being put into service. Retighten the packing flange nuts as required (see table 3).

Figure 2. Packing Arrangements

NOTES:

- 1 0.102 mm (0.004 INCH) THICK SACRIFICIAL ZINC WASHERS. USE ONLY ONE BELOW EACH GRAPHITE RIBBON RING.
- 2 HAS THE APPEARANCE OF A WOVEN OR BRAIDED RING.

C0747-1

Replacing Packing

⚠ WARNING

Refer to the warning at the beginning of the Maintenance section in this instruction manual.

Key numbers and sequence of assembly of packing parts are shown in figure 2. Bonnet and valve key number locations are shown in figures 5, 6, 7, and 8, unless otherwise noted.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment. Observe the warnings at the start of the Maintenance section.
2. Disconnect the operating lines from the actuator and any leak-off piping from the bonnet. Disconnect the stem connector and remove the actuator from the valve by unscrewing the yoke locknut (key 32) or hex nuts (key 30).

- Loosen the packing flange nuts (key 20) so that the packing is not tight on the valve stem. Remove any travel indicator parts and stem locknuts from the valve stem threads.

⚠ WARNING

To avoid personal injury or property damage caused by uncontrolled movement of the bonnet, loosen the bonnet by following the instructions in the next steps.

Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet. If the cage sticks to the bonnet, proceed carefully with bonnet removal and support the cage so that it will not fall unexpectedly from the bonnet.

- When lifting the bonnet, be sure the plug and stem assembly (key 4 and 5), cage (key 2), and cage retainer (key 45), if applicable, remain in the valve body. This avoids damage to the seating surfaces as a result of the assembly dropping from the bonnet after being lifted part way out. The parts are also easier to handle separately.

⚠ WARNING

To avoid possible personal injury, review your process shutdown procedures to be sure process pressure is not applied to the valve for the following procedure.

- Hex nuts (key 13) attach the bonnet to the valve body (key 1). Loosen these nuts or cap screws approximately 3 mm (1/8 inch). Then, loosen the body-to-bonnet joint by either rocking the bonnet or prying between the bonnet and valve body. Work with a prying tool around the bonnet until the bonnet loosens.
 - If fluid leaks from the joint, it may indicate that process pressure is applied to the valve. Review your process shutdown procedures, and be sure process pressure is not applied to the valve.
 - If no fluid leaks from the joint, proceed to the next step.
- Unscrew the hex nuts (key 13) and carefully lift the bonnet off the valve stem. If the valve plug and stem assembly starts to lift with the bonnet, use a brass or lead hammer on the end of the stem and tap it back down. Set the bonnet on a cardboard or wooden surface to prevent damage to the bonnet gasket surface.

Table 4. Recommended Torque for Packing Flange Nuts

STEM DIAMETER		PRESSURE RATING ⁽¹⁾	TORQUE ⁽²⁾			
			N•m		lbf•ft	
mm	Inches		Min	Max	Min	Max
12.7	1/2	CL900	12	18	9	13
		CL1500	15	22	11	16
		CL2500	18	24	13	18
19.1	3/4	CL900	27	41	20	30
		CL1500	34	50	25	37
		CL2500	41	61	30	45
25.4	1	CL900	42	62	31	46
		CL1500	52	77	38	57
		CL2500	61	91	45	67
31.8	1-1/4	CL900	56	83	41	61
		CL1500	68	102	50	75
50.8	2	CL1500	98	146	72	108

1. For intermediate class ratings, use the same torque as the next lower standard class.
2. Lubricate with anti-seize compound.

- If it is necessary to remove and inspect the valve trim, refer to the following Trim Maintenance section.
- Remove the bonnet gasket (key 10) and cover the opening in the valve to protect the gasket surface and prevent foreign material from getting into the valve body cavity.

9. Remove the packing flange nuts, packing flange, upper wiper, and packing follower (keys 20, 18, 27, and 28). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall. Clean the packing box and metal packing parts.

Table 5. Torque for Body-to-Bonnet Bolting Using Anti-Seize Lubricant⁽¹⁾

STUD SIZE	TORQUE	
	N•m	lbf•ft
	B8M, B8M2, S20910 Studs	
3/4	260	190
7/8	370	275
1-1/8	710	525
1-1/4	940	695
1-3/8	1270	935
1-1/2	1650	1220
1-5/8	2130	1570
1-3/4	2670	1970

1. For other lubricants or bolting materials, contact your [Emerson sales office](#) for torques.

10. Inspect the valve stem threads and packing box surfaces for any sharp edges which might cut the packing. Scratches or burrs in the packing box surfaces could cause leakage or damage to the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts.
11. If necessary, go to the Trim Maintenance procedures to remove, inspect or replace trim parts. Return to this section when installing the bonnet on the valve body.

Installing the Fabricated Bonnet

1. Remove the covering protecting the valve body cavity and install a new bonnet gasket (key 10), making sure the gasket seating surfaces are clean and smooth. Then slide the bonnet over the stem and onto the stud bolts (key 12).

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) immediately if a discrepancy between actual parts and approved parts is suspected.

2. Lubricate the stud threads and the faces of the hex nuts (key 13) with anti-seize lubricant (not necessary if new factory pre lubricated hex nuts are used). Replace the hex nuts and tighten them finger-tight. Stroke the valve several times to center the trim.

Torque the nuts in a crisscross pattern to no more than 1/4 of the nominal torque value specified in table 4. When all nuts are tightened to that torque value, increase the torque by 1/4 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again

3. Install new packing and the metal packing box parts according to the appropriate arrangement in figure 2. Place a smooth-edged pipe over the valve stem and gently tap each soft packing part into the packing box.

4. Slide the packing follower, upper wiper, and packing flange (keys 28, 27, and 18) into position. Lubricate the packing flange studs (key 19) and faces of the packing flange nuts (key 20). Install the packing flange nuts.
5. Tightening packing flange nuts (key 20):
 - For spring-loaded PTFE V-ring packing, tighten the packing flange nuts until the shoulder on the packing follower (key 28) contacts the bonnet.
 - For graphite packing, tighten the packing flange nuts to the maximum recommended torque shown in table 3. Then, loosen the packing flange nuts, and retighten them to the recommended minimum torque shown in table 3.
 - For other packing types, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in table 3. Then, tighten the remaining nut until the packing flange is level and at a 90 degree angle to the valve stem.
 - For ENVIRO-SEAL live-loaded packing; refer to the Fisher instruction manual ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)).
6. Mount the actuator on the valve assembly and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual.

Installing the One-Piece Bonnet

1. Before install bonnet to body, first install bushing spacer (key 46) to bonnet.
2. Install 1/4"-20 eye bolts into the two equally spaced tapped holes on the bottom of bushing spacer. Lift the bushing spacer with eye bolts and put it into the bottom cavity of bonnet, turn the spacer clockwise into bonnet until tight. Afterward, remove the two eye bolts.
3. There are two options to secure bushing spacer.
 - Option 1: Tack weld the bushing spacer to the bonnet using minimal heat. Two welds, 6 mm (1/4-inch) long and 180° apart, are required.
 - Option 2: Use an appropriate tool such as a center punch, stake the threads on the bonnet in one place.
4. The rest of installation procedure refer to step 1 through 6 of Installing the Fabricated Bonnet section.

Trim Maintenance

This procedure describes how the valve trim can be completely disassembled. When inspection or repairs are required, perform only those steps necessary to accomplish the task.

Key number locations are shown in figures 5 and 6 for NPS 1 through 6 (long), and figures 7 and 8 for NPS 4 through 12 (short), unless otherwise noted.

⚠ WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

To avoid personal injury due to leaking fluids, avoid damaging gasket sealing surfaces. The surface finish of the valve stem (key 5) is critical for making a good packing seal.

NOTICE

The inside surface of the cage (key 2) is critical for tight shutoff and smooth operation of the valve plug. The seating surfaces of the valve plug (key 4) and seat ring (key 3) are critical for proper shutoff. Protect these surfaces accordingly.

Trim Disassembly NPS 1 through 6 (Long)

1. Remove the actuator and the bonnet according to steps 1 through 6 of the Replacing Packing procedures in the Maintenance section.
2. Lift the valve stem and attached valve plug out of the valve body. If the valve plug is to be reused, tape or otherwise protect the valve plug stem and the valve plug seating surface to prevent scratches.
3. Lift out the cage (key 2) and the bonnet gasket (key 10).
4. Remove the seat ring (key 3) and seat ring gasket (key 11).
5. Clean, inspect, and if necessary obtain replacement parts.

Trim Disassembly NPS 4 through 12 (Short)

1. Remove the actuator and the bonnet according to steps 1 through 6 of the Replacing Packing procedures in the Maintenance section.
2. Lift the valve stem and attached valve plug out of the valve body. If the valve plug is to be reused, tape or otherwise protect the valve plug stem and the valve plug seating surface to prevent scratches.
3. Lift out the cage retainer (key 45), cage gaskets (key 43), and the bonnet gasket (key 10).

⚠ WARNING

Lifting of the cage must be done with a vertical or straight lift using the equipment shown in figure 3. Lifting at angle may damage the lifting equipment and cause property damage or personal injury.

4. Install threaded rods (about 6 inches long) into the holes on top of the cage vertically. Install hoist rings, nuts or eye bolt on to the threaded rods (see figure 3). Lift out the cage with the hoist nut from the valve body.

Figure 3. Removal of Cage with Hoist Rod and Nut

Note

The cage and cage retainer lifting holes are provided for ease of disassembly. To prevent damage to the cage lifting hole, fully engage the threaded rod into the cage hole, but do not overtighten the hoist rod. It only needs to be hand tight.

If it is hard to lift the cage, a piece of wood and a hammer can be used to strike on the top chamfer of the cage to loosen it from the body or seat ring gasket.

ASTM A193 B7 or comparable threaded rods are required for cage removal. Contact your [Emerson sales office](#) for more information.

5. Remove the seat ring gasket (key 11).
6. Clean, inspect, and if necessary obtain replacement parts.

Valve Plug Maintenance

NOTICE

To avoid the valve plug seal ring (key 7) not sealing properly and affecting valve performance, be careful not to scratch the surfaces of the ring groove on the valve plug or any of the surfaces of the replacement ring.

1. With the valve plug (key 4) removed, according to the disassembly portion of the Trim Maintenance procedure, proceed as follows: For HPS-C valves, proceed to step 5:
2. For HPT-C valves, the spring-loaded seal ring may be removed by first working the retaining ring (key 9) off with a screwdriver. Then carefully slide the metal backup ring (key 8) and seal ring (key 7) off the valve plug (key 4).
3. A spring-loaded seal ring must be installed so that its open side faces toward the valve stem, or toward the seat of the plug depending on flow direction. To install a spring-loaded seal ring, slide the seal ring (key 7) onto the valve plug followed by the metal backup ring (key 8).
4. Then install the retaining ring (key 9) by inserting one end in the groove and, while turning the plug, press the ring into the groove. Again, be careful not to scratch any surfaces of the ring or plug.

NOTICE

To avoid weakening the stem that may cause failure in service, never reuse an old stem with a new valve plug. Using an old stem with a new plug requires drilling a new pin hole in the stem, which will weaken the stem. However, a used valve plug may be reused with a new stem.

5. To replace the valve stem (key 5), drive or drill out the pin (key 6). Unscrew the valve plug from the stem.
6. Screw the new stem into the valve plug. Tighten to the torque value given in table 5. Also, use this table to select the proper drill size. Drill through the stem using the hole in the valve plug as a guide. Remove any chips or burrs and drive in a new pin to lock the assembly.

Trim Assembly NPS 1 through 6 (Long)

Key number locations are shown in figure 5 and 6, unless otherwise noted.

1. Install the seat ring gasket (key 11), and seat ring (key 3).
2. Install the cage (key 2). Any rotational orientation of the cage with respect to the valve body is acceptable.
3. Lower the valve plug (key 4) and stem assembly into the cage. Make sure the seal ring (key 7) is evenly engaged in the entrance chamfer at the top of the cage (key 2) to avoid damaging the ring.
4. Place the gaskets (keys 10) on top of the cage.
5. Mount the bonnet on the valve body and complete assembly using the Replacing Packing procedures in the Maintenance section. Torque guidelines for body-to-bonnet bolting are shown in table 4.
6. If the valve has soft metal-to-metal seats, refer to the Coining Soft Metal-to-Metal Seats section, below.

Trim Assembly NPS 4 through 12 (Short)

Key number locations are shown in figures 7 and 8 unless otherwise noted.

1. Install the seat ring gasket (key 11) in the lower gasket groove in the valve body (key 1), making sure the gasket is centered in the groove and the bottom of the gasket is flush with the mating surface in the body.
2. Install threaded rods (about 6" long) into the holes on top of the cage vertically. Install hoist rings, nuts or eye bolt on to the threaded rods.

Note

The cage and seat ring lifting holes are 1/4"-20. To prevent damage to the cage/seat ring lifting holes, fully engage the threaded rod into the cage/seat ring hole, but do not overtighten the hoist rod. It only needs to be hand tight.

ASTM A193 B7 or comparable threaded rods are required for cage/seat ring installation.

3. Lift the cage (key 2) using the hoist rings on the threaded rods and install the cage into the valve body (see figure 3). Any rotational orientation of the cage with respect to the valve body is acceptable. When installing the cage, take care to lower the cage evenly and ensure the cage will not damage the flat sheet gasket (key 11).
4. For NPS 8 through 12, install quantity-2 cage gaskets (key 43) and make sure the gaskets sit flush on the surface of the groove.
5. Install the cage retainer (key 45) on top of the cage and a single cage gasket (key 43) on top of the cage retainer.
6. Install the bonnet gasket (key 10) into the groove around the valve body trim opening.
7. Lower the valve plug (key 4) and stem assembly through the bore of the cage retainer (key 45) and into the bore of the cage (key 2) and gently rest the plug seating surface against the seating surface in the cage. Make sure the seal ring (key 7) is evenly engaged in the entrance chamfer at the top of the cage retainer (key 45) to avoid damaging the ring.
8. Mount the bonnet on the valve body and complete assembly using the Replacing Packing procedures in the Maintenance section. Torque guidelines for body-to-bonnet bolting are shown in table 4.
9. If the valve has soft metal-to-metal seats, refer to the Coining Soft Metal-to-Metal Seats section.

Note

Be careful to prevent the bonnet from crushing the spiral wound gaskets as the bonnet is lowered on to the valve.

Damaging the gaskets will require that they are replaced.

Table 6. Valve Stem Connection Torque and Drill Size for Pin Hole

VALVE STEM DIAMETER		VALVE STEM CONNECTION TORQUE ⁽¹⁾ (MINIMUM-MAXIMUM)		DRILL SIZE FOR PIN
mm	Inches	N•m	Lbf•ft	Inches
12.7	1/2	81 - 115	60 - 85	1/8
19.1	3/4	237 - 339	175 - 250	3/16
25.4	1	420 - 481	310 - 355	1/4
31.8	1-1/4	827 - 908	610 - 670	1/4
50.8	2	3515-3885	2600 - 2880	3/8

1. Lubricate with anti-seize compound.

Coining Soft Metal-to-Metal Seats

Soft metal-to-metal seat constructions consist of a valve plug with hardfaced CoCr-A seat and a non-hardfaced S31600 seat ring or cage seating surface. For optimum shutoff performance of these constructions, coin seats by stroking the valve plug into the seat ring at least three times with maximum actuator force.

NOTICE

To avoid possible product damage which may affect performance, do not lap soft metal-to-metal seats.

Parts Ordering

Each body-bonnet assembly is assigned a serial number which can be found on the valve. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly.

Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts, refer to the serial number and to the eleven-character part number for each part required from the following parts kit or parts list information.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

ENVIRO-SEAL Packing Retrofit Kits

Retrofit kits include parts to convert valves with existing standard bonnets to the ENVIRO-SEAL packing box construction. Refer to figure 4 for key numbers for PTFE and Graphite ULF packing.

Stems and packing box constructions that do not meet Fisher stem finish specifications, dimensional tolerances, and design specifications, may adversely alter the performance of this packing kit.

ENVIRO-SEAL Packing Retrofit Kits

ENVIRO-SEAL Packing Repair Kits

Repair kits include parts to replace the “soft” packing materials in valves that already have ENVIRO-SEAL packing arrangements installed or in valves that have been upgraded with ENVIRO-SEAL retrofit kits. Refer to figure 4 for key numbers for PTFE and Graphite ULF packing.

Stems and packing box constructions that do not meet Fisher stem finish specifications, dimensional tolerances, and design specifications, may adversely alter the performance of this packing kit.

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual includes installation, maintenance and parts information for Fisher IC2 valve (see Figure 1). Refer to separate manuals for instructions covering the actuator and accessories.

WARNING

Do not install, operate or maintain IC2 valves without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

1.2 Description

The IC2 is a globe and angle style, single-port, unbalanced valve with integral end connections, body guiding, metal-to-metal seating, quick-change trim and stainless steel and aluminum construction materials.

Construction Materials	Additional Options
Body and Bonnet: ■ Stainless Steel (316/CF8M) ■ Aluminum (5083-H112) Body Bolting: ■ SA-193-B8M Class 2 studs with SA194-8M nuts ■ SA193-B8 Class 1 studs with SA194-8 nuts Bellows Seal Assembly: ■ S31603	■ Drip plate ■ Drilled and tapped connection in bonnet for leak off service ■ Displacer
1. Do not exceed the pressure or temperature limits in this manual or any applicable code or standard limitations. 2. Class V shutoff cannot be performed with water. The residual trapped moisture from testing with water can cause valve and trim damage from the ice crystals formed at below freezing service temperatures. 3. Certain restrictions apply. Contact your Emerson sales office for more information.

Email: education@emerson.com

emerson.com/en/final-control/services/valve-training

Section 2: Installation

WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in Table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Because some valve/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

NOTICE

Before installing the valve, inspect the valve and pipelines for any damage and any foreign material which may cause product damage.

1. Make certain the valve body interior is clean, that pipelines are free of foreign material and that the valve is oriented so that pipeline flow is in the same direction as the arrow on the side of the valve.
2. The recommended method of mounting for gas or liquid service is with the actuator vertical above the valve body. The actuator can be mounted 15 degrees or more above the horizontal with the proper supporting structure in place unless limited by seismic criteria. Mounting positions other than actuator vertical above the valve may result in uneven valve plug and guide wear that could result in reduced service life. However, in no case should the angle be so flat as to allow liquid inside the bonnet to come in contact with the packing. For mounting assistance, consult your [Emerson sales office](#).

NOTICE

To avoid possible damage to the packing, do not allow the installed actuator angle to be so flat as to allow liquid inside the bonnet to come in contact with the packing.

3. Use accepted piping and welding practices when installing the valve in the line.
4. If the actuator and valve are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.

WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions.

Valves with enhanced ENVIRO-SEAL™ live-loaded packing will not require this initial readjustment. See the Fisher instruction manual titled ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)) for packing instructions.

Section 3: Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing maintenance and trim and bellows maintenance. All maintenance operations may be performed with the valve in the line.

WARNING

Avoid personal injury or property damage from sudden release of process pressure. Before performing any maintenance operations:

- **Do not remove the actuator from the valve while the valve is still pressurized.**
- **Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.**
- **Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.**
- **Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.**
- **Vent the pneumatic actuator loading pressure and relieve any actuator spring precompression.**
- **Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.**
- **The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings or when loosening the packing box pipe plug.**
- **Check with your process or safety engineer for any additional measures that must be taken to protect against process media.**

NOTICE

Follow instructions carefully to avoid damaging the product surfaces.

NOTE

Whenever a gasket seal is disturbed by removing or shifting parts, a new gasket should be installed upon reassembly. This is necessary to ensure a good gasket seal since the used gasket may not seal properly.

3.1 Packing Maintenance

This section covers packing used in standard IC2 bonnets and bellows bonnets (Figures 2, 3 and 4).

NOTE

If the valve has enhanced ENVIRO-SEAL live-loaded packing installed, refer to the ENVIRO-SEAL Packing System for Sliding Stem Valves Instruction Manual, [D101642X012](#) for packing instructions. Figures 2, 3 and 4 show typical enhanced ENVIRO-SEAL arrangements.

Enhanced ENVIRO-SEAL packing systems are designed for quality performance over extended periods. This longevity allows for packing maintenance to be performed at regularly scheduled plant outages or turnarounds.

Use the following instructions when inspecting or replacing enhanced ENVIRO SEAL packing. Additional information can be found in the ENVIRO-SEAL Sliding-Stem Valves Instruction Manual ([D101642X012](#)).

If changing the packing system material to a different material, such as PTFE to Graphite ULF, it is good practice to review the actuator sizing, as packing friction will change.

NOTICE

To prevent product damage caused by scratching or damaging the packing box wall, take care when removing the old packing parts from the packing box.

Replacing Packing

1. Isolate the control valve from the line pressure.
2. Release pressure and drain process media from both sides of the control valve.
3. If using a power actuator, also shut off all pressure lines to the power actuator and release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while working on the equipment.
4. Disconnect the operating lines from the actuator and any leak-off piping from the bonnet.
5. Disconnect the stem connector and then remove the actuator from the valve by unscrewing the yoke locknut.
6. Remove any travel indicator parts and stem locknuts from the valve stem threads.
7. Remove the packing nut (key 3, Figures 2, 3 or 4) from bonnet.
8. Remove packing parts from bore using a packing extraction tool and check for damage to valve stem or packing box bore.
9. Install the enhanced ENVIRO-SEAL packing parts into the packing box. Use Figures 2, 3 and 4 to ensure the packing parts and spring pack are assembled in correct order.

10. Install the spring pack assembly with the attached springs, onto the stem, ensuring the Belleville springs are stacked properly and packing box parts are assembled in the correct order (Figures 2, 3 and 4). Packing parts cannot function properly if the Belleville springs or other packing parts are not stacked correctly.
11. Lubricate the packing nut (key 3, Figures 2, 3 or 4) with anti-seize lubricant and install hand tight.

3.2 Tightening Procedures - Packing Nut

1. To achieve maximum benefit from the enhanced ENVIRO-SEAL packing system, the packing nut must compress the Belleville springs to their “target load.” The target load is the point where the Belleville springs are designed for optimum performance, when compressed to 85% of their maximum deflection or nearly flat. (Maximum deflection is when the springs are 100% compressed or completely flat). To obtain the target load of 85% compression of maximum deflection, perform the following:
 - Tighten the packing nut until the Belleville springs are compressed 100% (or completely flat), as detected by a rapid increase in nut torque.
 - For PTFE or Duplex packing, loosen packing flange nut 1/2 turn (180° of rotation).
 - For Graphite ULF packing, loosen packing flange nut 1/4 turn (90° of rotation).

The “target load” of 85% compression has now been reached.

Refer to the appropriate valve and actuator instruction manuals when connecting the valve to the actuator. Under normal conditions, the packing nut should not require retightening.

2. However, when servicing, if the springs do not remain at the target load of 85% compression, retighten the packing box nut according to step 1 above.

3.3 Other Considerations

When repacking a valve with enhanced ENVIRO-SEAL packing that has been in service, check the condition of the packing bore after the packing has been removed. A good guideline to use in checking the condition of the packing bore is the 20/20 rule. If less than 20% of the surface area of the bore is pitted and if there are no pits deeper than 0.020 in., then the packing should work as designed. This does not need to be an exact measurement; visual inspection is adequate. If the packing bore does not meet these criteria, the unit should be replaced.

Figure 2. Enhanced ENVIRO-SEAL PTFE Packing Arrangement

GH10958

Figure 3. Enhanced ENVIRO-SEAL Duplex Packing Arrangement

GH10958

Figure 4. Enhanced ENVIRO-SEAL Graphite ULF Packing Arrangement

GH10958

⚠ WARNING

To avoid personal injury or property damage caused by uncontrolled movement of the bonnet, loosen the bonnet by following the instructions in the next steps.

Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet.

To avoid personal injury or damage to the seating surface caused by the valve plug and stem assembly dropping from the bonnet after being lifted out of the valve body, observe the following instructions.

3.4 Bonnet Maintenance

Key number locations are shown in Figure 6, unless noted. This section covers IC2 standard bonnets and bellows bonnets.

1. When lifting a bonnet, temporarily install a valve stem locknut on the valve stem. This locknut will prevent the valve plug and stem assembly from dropping out of the bonnet.

⚠ WARNING

To avoid possible personal injury, review your process shutdown procedures to be sure process pressure is not applied to the valve for the following procedure.

2. Hex nuts (key 13) attach the bonnet to the valve body (key 1). Loosen these nuts or cap screws approximately 3 mm / 1/8 in. Then, loosen the body-to-bonnet joint by either rocking the bonnet or prying between the bonnet and valve body. Work with a prying tool around the bonnet until the bonnet loosens.

Table 3. Body-to-Bonnet Torque Guidelines⁽²⁾

VALVE SIZE, NPS	BOLT TORQUES ⁽¹⁾	
	Bolt Material ⁽²⁾	
	B8	
	N•m	Lbf•ft
1	91	67
1-1/2 or 2	163	120
3	373	275
4	502	370
VALVE SIZE, NPS	B8M ⁽³⁾	
	N•m	Lbf•ft
1	87	64
1-1/2 or 2	163	120
3	373	275
4	502	370

1. Determined from laboratory testing.
 2. Lubricate with anti-seize compound compatible with cryogenic service temperatures. For other lubricants or bolting materials not listed in Table 3, contact your [Emerson sales office](#) for torque information.
 3. SA193-B8M strain hardened.

- If fluid leaks from the joint, it may indicate that process pressure is applied to the valve. Review your process shutdown procedures and be sure process pressure is not applied to the valve.
 - If no fluid leaks from the joint, remove the nuts completely and carefully lift the bonnet off the valve body.
3. Remove the stem locknut. Separate the valve plug and stem from the bonnet and set the parts on a protective surface to prevent damage to gasket or seating surfaces.
 4. Remove the bonnet gasket (key 9) and cover the opening in the valve to protect the gasket surface and prevent foreign material from getting into the valve body cavity.
 5. Remove the packing as described in steps 1 through 8 of the Replacing Packing section. Clean the packing box and metal packing parts.
 6. Inspect the valve stem threads and packing box surfaces for any sharp edges which might cut the packing. Scratches or burrs in the packing box surfaces could cause leakage or damage to the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts.
 7. If necessary, go to the Trim Maintenance procedures to remove, inspect or replace trim parts. Return to this section when installing the bonnet on the valve body.

Installing the Bonnet

1. Remove the covering protecting the valve body cavity and install a new bonnet gasket (key 9), making sure the gasket seating surfaces are clean and smooth. Then slide the bonnet over the stem and onto the stud bolts (key 12).

NOTE

Proper performance of the bolting procedures in step 12 compresses the bonnet gasket (key 9) to seal the body-to-bonnet joint.

The proper bolting procedures in step 12 include, but are not limited to, ensuring that bolting threads are clean and evenly tightening the cap screws or nuts onto the studs in a crisscross pattern. Tightening one cap screw or nut may loosen an adjacent cap screw or nut. Repeat the crisscross tightening pattern several times until each cap screw or nut is tight and the body-to-bonnet seal is made.

NOTE

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

-
2. Lubricate the bolting with anti-seize lubricant and install the bonnet nuts (key 13), using accepted bolting procedures during tightening, so that the body-to-bonnet joint will withstand test pressures and application service conditions. Use the bolt torques in Table 3 as guidelines.
 3. Follow steps 9 through 11 under Replacing Packing procedure section.
 4. Adjust packing by tightening packing nut (key 3, Figures 2, 3 and 4) as described in Tightening Procedures - Packing Nut section.
 5. Mount the actuator on the valve assembly and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual.

3.5 Trim Maintenance

⚠ WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

This procedure describes how the valve trim can be completely disassembled. When inspection or repairs are required, perform only those steps necessary to accomplish the task. Observe the Warning at the start of the Maintenance section.

Key number locations are shown in Figure 6, unless otherwise noted.

Trim Disassembly

Key number locations are shown in Figure 6, unless otherwise noted.

1. Remove the actuator and the bonnet according to steps 1 through 9 of the Replacing Packing procedures in the Maintenance section.

⚠ WARNING

To avoid personal injury due to leaking fluids, avoid damaging gasket sealing surfaces. The surface finish of the packing stem (key 10) is critical for making a good packing seal.

The seating surfaces of the valve plug (key 3) and seat ring (key 2) are critical for proper shutoff.

Protect these surfaces accordingly.

Figure 5. Fisher IC2 Valve Stem Torque and Pin Replacement

Table 4. Fisher IC2 Valve Stem Torque and Pin Replacement

VALVE STEM DIAMETER		TORQUE, MINIMUM TO MAXIMUM		DRILL SIZE, IN.
mm	in.	N•m	Lbf•ft	
9.5	3/8	40 to 47	25 to 35	3/32
12.7	1/2	81 to 115	60 to 85	1/8
19.1	3/4	238 to 339	175 to 250	3/16
25.4	1	421 to 482	310 to 355	1/4

Perform the following steps to remove the valve trim for standard bonnet constructions:

2. Lift stem stack and bonnet spacer with valve plug attached (keys 10, 7, 6, 3, 4 and 5 in Figure 6) together and gasket (key 9) out of the valve body and set them on a protective surface.
3. To disassemble the bonnet stem, middle stem and pin, drive or drill out the pin (key 14) and unscrew the bonnet stem (key 10) from the middle stem (key 6).
4. Remove displacer (key 5).
5. To disassemble the middle stem, plug stem and pin, drive or drill out the pin (key 16) and unscrew the middle stem (key 6) from the plug stem (key 4).
6. To disassemble the plug stem, plug and pin, drive or drill out the pin (key 17) and unscrew the plug stem (key 4) from the valve plug (key 3).
7. Remove seat ring using seat ring tool.
8. Inspect parts for wear or damage that could prevent proper operation of the valve. Clean, inspect and obtain replacement parts as necessary for reassembly.

Valves with Bellows Assembly

Perform the following steps to remove the valve trim:

1. Lift stem stack and stem/bellows assembly with valve plug attached (keys 10, 7, 6, 3, 4 and 5 in Figure 6) together and gasket (key 9) out of the valve body and set them on a protective surface.
2. Do not remove bonnet stem pin (key 14) due to no space to drill out pin.
3. To disassemble the bellows stem, plug stem and pin: place the stem/bellows assembly and valve plug in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating or guiding surface. Drive out the pin (key 16). Then unscrew the bellows stem (key 6) from the plug stem (key 4). If the bellows assembly with bonnet stem is to be reused, protect them to prevent damage.

NOTICE

Do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

4. Remove displacer (key 5).
5. To disassemble the plug stem, plug and pin, drive or drill out the pin (key 17) and unscrew the plug stem (key 4) from the valve plug (key 3).
6. Remove seat ring (key 2) using seat ring tool.
7. Inspect parts for wear or damage that could prevent proper operation of the valve. Clean, inspect and obtain replacement parts as necessary for reassembly.

Trim Assembly

This procedure assumes that all the trim and associated gaskets were removed from the valve body. If these parts were not all removed, start the assembly procedure at the appropriate step.

NOTICE

To avoid weakening the plug stem or bonnet stem that may cause failure in service, never reuse an old stem with a new valve plug. Using an old stem with a new plug requires drilling a new pin hole in the stem, which will weaken the stem. However, a used valve plug may be reused with a new stem.

Key number locations are shown in Figure 6, unless otherwise noted.

1. Install seat ring using seat ring tool and torque from Table 6.
2. Screw the plug stem (key 4) into the valve plug (key 3). Tighten to the torque value given in Table 6. Refer to Figure 4 to select the proper drill size. Drill through the stem using the hole in the valve plug as a guide. Remove any chips or burrs and drive in a new pin (key 17) to lock the assembly.
3. Slide displacer (key 5) down plug stem (key 4).
4. Screw the middle stem (key 6) into the plug stem (key 4). Tighten to the torque value given in Table 6. Refer to Figure 4 to select the proper drill size. Drill through the stem using one of the holes in the middle stem as a guide. Remove any chips or burrs and drive in a new pin (key 16) to lock the assembly.
5. Screw the middle stem (key 6) into the bonnet stem (key 10). Tighten to the torque value given in Table 6. Refer to Figure 4 to select the proper drill size. Drill through the stem using the hole in the top of the middle stem as a guide. Remove any chips or burrs and drive in a new pin (key 14) to lock the assembly.
6. Mount the bonnet on the valve body and complete reassembly using the Replacing Packing and Installing the Bonnet procedures in the Maintenance section.
7. Mount the actuator on the valve assembly and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual.

Valves with Bellows Assembly

Perform the following steps to assemble and install the trim

1. Replace and install seat ring using seat ring tool and torque from Table 6.
2. Screw the plug stem (key 4) into the valve plug (key 3). Tighten to the torque valve given in Table 6. Refer to Figure 4 to select the proper drill size. Drill through the stem using the hole in the valve plug as a guide. Remove any chips or burrs and drive in a new pin (key 17) to lock the assembly.
3. Slide displacer (key 5) down plug stem (key 4).
4. If bellows assembly with bonnet stem can be used, proceed as follows:
 - a. Secure the valve plug in a soft-jaw chuck or other type of vise. Do not grip the plug on any seating surface. Position the plug in the chuck or vise for easy threading of the bellows stem. Screw the bellows stem (key 6) into the plug stem (key 4), which include bellows assembly and bonnet stem. Tighten to the torque valve given in Table 6. Refer to Figure 4 to select the proper drill size. Drill through the stem using one of the holes in the bellows stem as a guide. Remove any chips or burrs and drive in a new pin (key 16) to lock the assembly.
5. If bellows assembly with bonnet stem cannot be used, proceed as follows:
 - a. Screw a new bonnet stem (key 10) into bellows stem (key 6). Tighten to the torque valve given in Table 6. Refer to Figure 4 to select the proper drill size. Drill through the stem using the hole in the top of the middle stem as a guide. Remove any chips or burrs and drive in a new pin (key 14) to lock the assembly.
 - b. Slide bellows stem into bellows assembly and weld them together according to stem and bellows welding drawings.
 - c. To assembly bellows assembly and plug stem, as described in above step 4a.

NOTICE

When installing a valve plug on the ENVIRO-SEAL stem/bellows assembly, the valve stem must not be rotated. Damage to the bellows may result.

Do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

6. Place a new gasket (key 9) on the shoulder of body, slide stem stack into body and then put another new gasket (key 9).
7. Mount the bonnet on the valve body and complete reassembly using the Replacing Packing and Installing the Bonnet procedures in the Maintenance section.
8. Mount the actuator on the valve assembly and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual.

3.6 Bellows Maintenance

Key number locations are shown in Figure 6, unless otherwise noted.

Replacing a Non-Bellows Valve with a Bellows Assembly

1. Remove the actuator, bonnet assembly as described in the Replacing Packing section (steps 1 through 10).
2. Remove the stem stack assemblies as described in the Valve Trim Disassembly Valves without Bellows Assembly section (steps 1 through 7).
3. To install the new bellows/stem assembly, perform the Valve Trim Assembly Valves with Bellows Assembly Section (steps 1 through 6).
4. To install the new bellows bonnet and packing as described in the Replacing Packing and Installing the Bonnet procedures in the Maintenance section.
5. Mount the actuator on the valve assembly and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual.

Replacing an Installed Bellows Assembly Valve

1. Remove the actuator, bonnet assembly as described in the Replacing Packing section (steps 1 through 10).
2. Remove the stem stack and bellows/stem assemblies as described in the Valve Trim Disassembly Valves with Bellows Assembly section (steps 1 through 7).
3. To install the new bellows/stem assembly, perform the Valve Trim Assembly Valves with Bellows Assembly Section (steps 1 through 6).
4. Inspect the bellows bonnet. Replace, if necessary.
5. Mount the bonnet on the valve body and complete reassembly using the Replacing Packing and Installing the Bonnet procedures in the Maintenance section.
6. Mount the actuator on the valve assembly and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual.

Purging Bellows Bonnet

The bellows bonnet has been designed so that it can be purged or leak tested. Refer to Figure 6 for an illustration of a bellows bonnet and perform the following steps for purging or leak testing.

1. Remove the pipe plugs (key 18).
2. Connect a purging fluid to one of the pipe plug connections.
3. Install appropriate piping or tubing in the other pipe plug connection to pipe away the purging fluid or to make a connection to an analyzer for leak testing.
4. When purging or leak testing has been completed, remove the piping or tubing and reinstall the pipe plugs (key 18).

Section 4: Parts

4.1 Parts Ordering

Each body-bonnet assembly is assigned a serial number which can be found on the valve. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly.

Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts, refer to the serial number and to the eleven-character part number for each part required from the following parts kit or parts list information.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

4.2 Parts Kits

Gasket Kits

Includes key 9.

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for NPS 12 through 30 Fisher ET/EWT and ED/EWD valves, through CL600 ratings.

Refer to separate manuals for instructions covering the actuator and accessories.

Do not install, operate, or maintain ET/EWT or ED/EWD valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Educational Services

For information on available courses for Fisher Large ET/EWT and ED/EWD valves, as well as a variety of other products, contact:

Emerson Automation Solutions

Description

Fisher NPS 12 through 30 CL150 through CL600 ET/EWT and ED/EWD series control valves are used for either throttling or on/off control of a wide variety of liquids and gasses.

ET/EWT series valves utilize a hanging cage and a seat ring that is threaded into the cage. These valves have two spring loaded seal rings, one between the cage and plug and another between the seat ring and valve body, which provide up to a Class V standard shutoff. They are used for low to medium temperature applications between -46°C (-50°F) and 232°C (450°F). This temperature range can be extended to 316°C (600°F) for non-oxidizing service and to 260°C (500°F) for oxidizing service by using the High Temperature (HTS1) seal.

The temperature range of the ET/EWT series can be extended to cryogenic temperatures as low as -198° (-325°F) with the ET-C and EWT-C specialized versions of these valves. The specialized valves feature unique trim, seals, and a longer extension bonnet to tolerate the extreme cold.

ED/EWD series valves utilize a hanging cage and a seat ring that is bolted into the body. These valves have two graphite piston rings between the cage and plug, which provide up to a Class IV standard shutoff. They are used for high temperature applications between 316°C (600°F) and 593°C (1100°F). Shutoff can be improved to Class V by using the Bore seal.

A range of severe service trims are available for noise abatement or cavitation control. Noise abatement trims help with aerodynamic noise attenuation in gas services and feature a Whisper Trim III or WhisperFlo cage. Cavitation control trims help prevent the damaging effects of liquid cavitation and include either a Cavitrol III cage (for services without entrained particulate) or Dirty Service Trim (DST) set (for services with entrained particulate).

Specifications

Typical specifications for these valves are shown in table 1.

Table 1. Specifications

Valve Sizes ED, ET, and ET-C: ■ NPS 12, ■ 14, ■ 16, ■ 18, ■ 20, and ■ 30 EWD, EWT, and EWT-C⁽²⁾: ■ NPS 16x12, ■ 20x16, ■ 24x16, and ■ 24x20 End Connection Styles Flanged: CL150, 300, and 600 raised-face or ring-type joint flanges per ASME B16.5. NPS 30 valve size has series A or B flanges, per ASME B16.47 Buttwelding: All ASME B16.25 schedules through schedule 120 that are compatible with the ASME B16.34 valve body rating For other end connections, contact your Emerson sales office for details. Maximum Inlet Pressure⁽¹⁾ Flanged: Consistent with CL150, 300, and 600 pressure-temperature ratings per ASME B16.34 Buttwelding: Consistent with CL600 pressure-temperature ratings per ASME B16.34 Shutoff Classifications per ANSI/FCI 70-2 and IEC 60534-4 ET, ET-C, EWT, and EWT-C: Standard: Class V Optional (for all cages except Cavitrol III): Class IV ED and EWD: Standard: Class IV Optional: Class V	Flow Characteristics Standard Cages: ■ Linear or ■ Equal percentage Whisper Trim III and WhisperFlo Cages: Linear Cavitrol III Cages: Linear For other characteristics, contact your Emerson sales office for details. Flow Direction Standard Cages: Down Whisper Trim III and WhisperFlo Cages: Up Cavitrol III Cages: Down Yoke Boss and Stem Diameters ■ 127 mm (5H-inch) diameter yoke boss, with 31.8 mm (1.25 inch) diameter valve stem for all valves except NPS 30 ■ 179 mm (7-inch) diameter yoke boss, with 50.8 mm (2 inch) diameter valve stem for NPS 30 valve Bonnet Style ED, EWD, ET, and EWT: Style 1 extension ET-C and EWT-C: Style 3 extension Approximate Weights See table 2
--	--

1. Do not exceed the pressure or temperature limits in this manual, on the equipment nameplate, and any applicable code limitations.

2. Size designations are "end connection size" x "nominal trim size".

1. Contact your [Emerson sales office](#) for these weights.

2. Dependent on valve travel, refer to product bulletin 51.1:ET/ED (Large) ([D103554X012](#)) for addition details.

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by the sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some valve body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

Before installing the valve, inspect the valve and pipelines for any damage and any foreign material which may cause product damage.

1. Before installing the valve, inspect the valve and associated equipment for any damage and any foreign material.
2. Make certain that the valve body interior is clean, that pipelines are free of foreign material, and the valve is oriented so that pipeline flow is in the same direction as the arrow on the side of the valve.
3. The control valve assembly may be installed in any orientation unless limited by seismic criteria. However, the normal method is with the actuator vertical above the valve. Other positions may result in uneven valve plug and cage wear and improper operation. Support the actuator if it is not installed in the vertical position. For more information, consult your Emerson sales office.
4. Use accepted piping and welding practices when installing the valve in the line. For flanged valves, use a suitable gasket between the valve and pipeline flanges.

CAUTION

Depending on valve body materials used, post weld heat treating may be required. If so, damage to internal elastomeric and plastic parts, as well as internal metal parts is possible. In general, if post weld heat treating is to be performed, all trim parts should be removed. Contact your Emerson sales office for additional information.

5. With a leak-off bonnet construction, remove the pipe plugs (key 46) to hook up the leak-off piping. If continuous operation is required during inspection or maintenance, install a three-valve bypass around the control valve assembly.
6. If the actuator and valve are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Valves with ENVIRO-SEAL™ live-loaded packing or HIGH-SEAL ULF live-loaded packing will not require this initial readjustment. See the Fisher instruction manuals titled ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)) or HIGH-SEAL ULF Live-Loaded Packing System ([D101453X012](#)) (as appropriate) for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the Parts Kits section.

Maintenance

Unless otherwise noted, refer to the following figures for key numbers: figure 5: ED/EWD Valves, figure 6: ET/EWT Valves, figure 7: ET/EWT Valves with HTS1 Seals, or figure 8: ET-C/EWT-C Valves.

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing lubrication, packing maintenance, and trim maintenance. All maintenance operations may be performed with the valve in the line.

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Note

Whenever a gasket seal is disturbed by removing or shifting gasketed parts, a new gasket should be installed upon reassembly. This is necessary to ensure a good gasket seal because the used gasket might not seal properly.

Packing Lubrication

Note

ENVIRO-SEAL and HIGH-SEAL packing do not require lubrication.

⚠ WARNING

To avoid personal injury or property damage resulting from fire or explosion, do not lubricate packing used in oxygen service or in processes with temperatures over 260°C (500°F).

If a lubricator or lubricator/isolating valve is provided for PTFE/composition or other packings that require lubrication, it will be installed in place of the pipe plug (key 46). Use a good quality silicon-base lubricant. To operate the lubricator, simply turn the cap screw clockwise to force the lubricant into the packing box. The lubricator/isolating valve operates the same way except open the isolating valve before turning the cap screw and then close the isolating valve after lubrication is completed.

Packing Maintenance

Note

For valves with ENVIRO-SEAL packing, see the Fisher instruction manual, ENVIRO-SEAL Packing System for Sliding-Stem Valves, [D101642X012](#), for packing instructions.

For valves with HIGH-SEAL packing, see the Fisher instruction manual, HIGH-SEAL ULF Live-Loaded Packing System, [D101453X012](#), for packing instructions.

For spring-loaded single PTFE V-ring packing, the spring (key 8, figure 2) maintains a sealing force on the packing. If leakage is noted around the packing follower (key 13, figure 2), check to be sure the shoulder on the packing follower is touching the bonnet (key 35). If the shoulder is not touching the bonnet, tighten the packing flange nuts (key 5) until the shoulder is against the bonnet. If leakage cannot be stopped in this manner, proceed to the Replacing Packing section.

If there is undesirable packing leakage with other than spring-loaded packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts.

If the packing is relatively new and tight on the valve stem (key 2B) and if tightening the packing flange nuts does not stop the leakage, it is possible that the valve stem is worn or nicked so that a seal cannot be made. The surface finish of a new valve stem is critical for making a good packing seal. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches around the packing box wall. If performing any of the following procedures, inspect the valve stem and packing box wall for nicks and scratches.

Replacing Packing

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve, and drain the process media from both sides of the valve. If using a power actuator, also shut off all pressure lines to the power actuator, release all pressure from the actuator, and use lock-out procedures to prevent injury while you work on the equipment.
2. Remove the actuator from the valve body by following the appropriate Actuator Removal procedure from the actuator instruction manual.
3. Loosen the packing flange nuts (key 5) so that the packing is not tight on the valve stem (key 2B). Remove any travel indicator parts and locknuts from the valve stem threads.

WARNING

To avoid personal injury or property damage caused by uncontrolled movement of the bonnet, loosen the bonnet by following the instructions in the next step. Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet.

CAUTION

Avoid damage to the seating surfaces caused by the valve plug and stem assembly dropping from the bonnet after being lifted part way out. When lifting the bonnet, temporarily install a locknut on the valve stem. This locknut will prevent the valve plug and stem assembly (key 2) from dropping out of the bonnet.

If the cage (key 3) starts to lift with the bonnet, tap it with a plastic mallet, or other soft material, to be sure it stays in the valve body.

Note

The following step also provides additional assurance that the valve body fluid pressure has been relieved.

4. Hex nuts (key 16) attach the bonnet (key 35) to the valve body. Loosen these nuts or cap screws approximately 3 mm (1/8 inch). Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and valve body. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, remove the nuts completely and carefully lift the bonnet.
5. Remove the locknut from the valve stem and separate the valve plug and stem assembly from the bonnet. Set the parts on a protective surface to prevent damage to gasket or seating surfaces.
6. Remove the bonnet gasket (key 11) and cover the opening in the valve to protect the gasket surface and prevent foreign material from getting into the valve body cavity.

CAUTION

To prevent possible product damage, cover the opening in the valve in the following procedure to prevent foreign material from getting into the valve body cavity.

7. Remove the packing flange nuts (key 5), packing flange (key 37), upper wiper (key 12, figure 2), and packing follower (key 13, figure 2). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall. Clean the packing box and the metal packing parts.
8. Inspect the valve stem threads and packing box surfaces for any sharp edges that might cut the packing. Scratches or burrs could cause packing box leakage or damage to the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts by following the appropriate steps in the Trim Maintenance section.
9. Remove the cover protecting the valve body cavity.
10. Install a new bonnet gasket (key 11), making sure the gasket seating surfaces are clean and smooth. Place the valve plug and stem assembly into the valve body, making sure it is properly centered on the seat ring (key 9). Also make sure the valve plug (key 2A) sealing parts are evenly engaged by the chamfer in the top inside diameter of the cage (key 3) to avoid damaging the parts. Then slide the bonnet over the valve stem (key 2B) and onto the studs (key 15).

Note

Proper performance of the bolting procedures in step 11 compresses the bonnet and cage gaskets (key 11) enough to seal the body-to-bonnet joint.

The proper bolting procedures in step 11 include--but are not limited to--ensuring that bolting threads are clean and evenly tightening the hex nuts onto the studs in a crisscross pattern. Tightening one nut may loosen an adjacent nut. Repeat the crisscross tightening pattern several times until each nut is tight and the body-to-bonnet seal is made.

Studs and hex nuts should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) if a discrepancy between actual parts and approved parts is suspected.

11. Lubricate the studs (key 15) and install hex nuts (key 16), using accepted bolting procedures during tightening, so that the body-to-bonnet joint will withstand test pressures and application service conditions. Use the bolt torques in table 4 as guidelines.
12. Install new packing and the metal packing box parts according to the appropriate arrangement in figure 2. Place a smooth-edged pipe over the valve stem, and gently tap each soft packing part into the packing box one piece at a time, being sure that air is not trapped between adjacent soft parts.
13. Slide the packing follower (key 13, figure 2), upper wiper (key 12, figure 2), and packing flange (key 37) into position. Lubricate the packing flange studs (key 4) and the faces of the packing flange nuts (key 5). Replace the packing flange nuts.
14. For spring-loaded PTFE V-ring packing, tighten the packing flange nuts until the shoulder on the packing follower (key 13, figure 2) contacts the bonnet.

For graphite packing, tighten the packing flange nuts to the maximum recommended torque shown in table 3. Then, loosen the packing flange nuts and retighten them to the recommended minimum torque shown in table 3.

For other packing types, tighten the packing flange nuts alternately in small, equal increments until one of the nuts reaches the minimum recommended torque shown in table 3. Then, tighten the remaining flange nut until the packing flange (key 3, figure 2) is at a 90-degree angle to the valve stem.

15. Mount the actuator on the valve assembly, and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual.

Trim Maintenance

WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

Disassembly

1. Complete steps 1 through 5 of the Replace Packing section to remove the actuator, bonnet, and plug and stem from the valve body. Remove the bonnet gasket (key 11).

WARNING

To avoid personal injury due to leaking fluid, avoid damaging gasket sealing surfaces. The surface finish of the valve stem (key 2B) is critical for making a good packing seal. The inside surface of the cage (key 3) is critical for smooth operation of the valve plug. The seating surfaces of the valve plug (key 2A) and seat ring (key 9) are critical for proper shutoff. Unless inspection reveals otherwise, assume all these parts are in good condition and protect them accordingly.

2. Packing parts can be removed if desired. Replace these parts as described in the Replace Packing section.
3. Install 3/8"-16 UNC-2A eye bolts with a minimum threaded length of 13 mm (0.5 inches) into the tapped holes in the top of the cage (key 3) and carefully lift it out of the valve body. For ET/EWT valves, the seat ring (key 9) will be removed with the cage as an assembly due to the seat ring being screwed into the bottom of the cage and secured with tack welds. If the cage is stuck in the valve, use a rubber mallet to strike the exposed portion of the cage at several points around its circumference. Set the part(s) on a protective surface to prevent damage to gasket or seating surfaces.
4. Remove the cage gasket (key 11).
5. Proceed as appropriate:

Table 3. Packing Flange Nut Torque for Packing Without a Spring

VALVE STEM DIAMETER		PRESSURE RATING	GRAPHITE-TYPE PACKING				PTFE-TYPE PACKING			
			Minimum Torque		Maximum Torque		Minimum Torque		Maximum Torque	
			N•m	Lbf•ft	N•m	Lbf•ft	N•m	Lbf•ft	N•m	Lbf•ft
31.8	1-1/4	CL150 & 300	33	24.3	49	36.1	16	11.8	25	18.4
		CL600	45	33.2	67	49.4	21	15.5	33	24.3
50.8	2	CL300	43	32	65	48	20	15	31	23
		CL600	61	45	91	67	27	20	41	30

Table 4. Body-to-Bonnet Bolt Torque

BOLT SIZE, INCH	THREADS PER INCH	BOLTING TORQUE ⁽¹⁾	
		N•m	Lbf•ft
1-1/4	8	990	730
1-1/2	8	1750	1290
1-3/4	8	2806	2070
2	8	4244	3130

1. Torque values listed apply to the following stud and nut materials lubricated with Lubriplate MAG-1.

- SA-193-B7 studs with SA-194-2H nuts
- SA-193-B7M studs with SA-194-2HM nuts
- SA-193-B16 studs with SA-194-7 nuts
- SA-193-B8M Class 2 studs with SA-194-8M nuts
- SA-193-B8M2 Class 2B studs with SA-194-8M nuts
- N07718 HT studs with N07718 HT chrome coat nuts
- SA-453 Gr 660A studs with SA-453 Gr 660A nuts
- SA479 S20910 chrome coat studs with SA479 S20910 nuts

For ET/EWT Valves, using the below procedure, disassemble the seat ring from the cage:

- Grind or file off the two tack welds that prevent the seat ring from unscrewing from the cage.
- Install 3/8"-16 UNC-2A bolts or cap screws into the two equally spaced tapped holes in the bottom of the seat ring. These bolts or cap screws will need to have a minimum of 0.5 inches of thread engagement and the length will be determined by the pry bar diameter used in this step.
- Using a pry bar to pry against the cap screws, turn the seat ring counter-clockwise to unscrew it from the cage.

- d. Set the seat ring on a protective surface taking care not to damage the seat ring seal ring (key 223).

For ED/EWD and ET-C/EWT-C Valves, using the below procedure, disassemble the seat ring from the valve body:

- a. Unscrew the seat ring cap screws (key 49).
 - b. Install 3/8"-16 eye bolts with a minimum threaded length of 0.5 inches into the two equally spaced tapped holes in the top of the seat ring (key 9).
 - c. Carefully lift the seat ring out of the valve body using the eye bolts as lifting points.
 - d. Set the seat ring on a protective surface.
 - e. Remove the seat ring gasket (key 13) from the valve body.
6. Cover the opening in the valve to protect the gasket surface and prevent foreign material from getting into the valve body cavity. Inspect parts for wear and damage which would prevent proper operation of the valve. If the cage requires replacement take note that for ET/EWT valves a replacement is available individually (key 3 only) or as a cage and seat ring assembly (key 3 and 9). The valve plug and seat ring, along with their respective sealing parts, will be inspected in the Valve Plug and Seat Ring maintenance procedures.

Valve Plug Maintenance

With the valve plug and stem assembly (key 2) removed according to the Disassembly procedure, proceed as appropriate:

CAUTION

Be careful not to scratch the surfaces of the seal ring grooves in the valve plug (key 2A) or any surfaces of the replacement parts.

For ET/EWT Valves

1. Carefully pry or cut out the plug seal ring (key 28) from its groove in the valve plug (key 2A). Discard the old plug seal ring.
2. Inspect the valve plug (key 2A) and stem (key 2B) for nicks, scratches, or other damage that would prevent proper operation of the valve. If replacement of either is necessary, replace as a complete valve plug and stem assembly (key 2).

CAUTION

To avoid damaging the seal ring, slowly and gently stretch it for the following procedure. Avoid jerking sharply on the ring.

3. Install the replacement plug seal ring (key 28) with the open side facing the top or bottom of the valve plug, depending on flow direction. The open side of the seal ring should face up (toward the actuator) in flow-up installations and down in flow-down installations.

To install the seal ring on the valve plug, first lubricate it with a general purpose silicone-base lubricant. Then gently stretch the seal ring and work it over the top edge of the valve plug. The PTFE material in the seal ring must be permitted time to cold-flow during the stretching procedure, so avoid jerking sharply on the ring. Stretching the seal

ring over the valve plug may make it seem unduly loose when in the groove, but it will contract to its original size after insertion into the cage.

For ET/EWT Valves Equipped with HTS1 Seals

1. Carefully pry the plug retaining ring (key 27) from its groove in the valve plug (key 2A). Then remove the plug seal ring (key 28), backup ring (key 29), and anti-extrusion ring (key 63). Inspect the retaining ring and backup ring for damage and replace as needed. Discard the old plug seal ring and anti-extrusion ring.
2. Inspect the valve plug (key 2A) and stem (key 2B) for nicks, scratches, or other damage that would prevent proper operation of the valve. If replacement of either is necessary, replace as a complete valve plug and stem assembly (key 2).
3. Install the replacement plug seal ring (key 28) and anti-extrusion ring (key 63) with the open side of the seal ring facing the top or bottom of the valve plug, depending on flow direction. The open side of the seal ring should face up (toward the actuator) in flow-up installations and down in flow-down installations. Make sure the anti-extrusion ring is adjacent to the closed side of the seal ring. Then install the plug backup ring (key 29) and retaining ring (key 27).

To install the parts on the valve plug, first lubricate each with a general purpose silicone-base lubricant. Then gently slide each over the top edge of the valve plug.

For ET-C/EWT-C Valves

1. Carefully pry the plug retaining ring (key 27) from its groove in the valve plug (key 2A). Then remove the plug seal ring (key 28) and backup ring (key 29). Inspect the retaining ring and backup ring for damage and replace as needed. Discard the old plug seal ring.
2. Inspect the valve plug (key 2A) and stem (key 2B) for nicks, scratches, or other damage that would prevent proper operation of the valve. If replacement of either is necessary, replace as a complete valve plug and stem assembly (key 2).
3. Install the replacement plug seal ring (key 28) with the open side of the seal ring facing the top or bottom of the valve plug, depending on flow direction. The open side of the seal ring should face up (toward the actuator) in flow-up installations and down in flow-down installations. Then install the plug backup ring (key 29) and retaining ring (key 27).

To install the parts on the valve plug, first lubricate each with a general purpose silicone-base lubricant. Then gently slide each over the top edge of the valve plug.

For ED/EWD Valves

1. Remove and discard the piston rings (key 6). The rings can be easily removed since each is in two pieces.
2. Inspect the valve plug (key 2A) and stem (key 2B) for nicks, scratches, or other damage that would prevent proper operation of the valve. If replacement of either is necessary replace as a complete valve plug and stem assembly (key 2).
3. Each new piston ring (key 6) is furnished as a complete ring, and each must be broken into two approximately equal portions. Do this by placing the ring on edge on a smooth, hard surface and striking the ring squarely with a hammer.
4. Install the replacement piston ring(s) into the groove(s) in the valve plug (key 2A). Be sure to match the broken ends when installing the ring sections in the groove(s).

For ED/EWD Valves Equipped with the Bore Seal

1. Remove and discard the piston ring (key 6). The ring can be easily removed since it is in two pieces. Also inspect the bore seal (key 64) and retainer (key 2C) for nicks, scratches, or other damage that would prevent proper operation of the valve. If replacement of the bore seal is necessary complete steps 2 – 12, otherwise proceed directly to step 13.
2. Referring to figure 3, locate the staked thread on top of the valve plug (key 2A). The staked thread secures the retainer (key 2C). Use a drill with a 1/8 inch bit to drill out the staked area of the thread. Drill approximately 1/8 inch into the metal to remove the staking.

3. Referring to figure 3, locate the 1/4-inch diameter hole in the groove where the piston ring was installed.
4. Select an appropriate tool such as a punch and place the tip of the tool into the hole with the body of the tool held tangent to the outside diameter of the retainer. Strike the tool with a hammer to rotate the retainer and free it from the valve plug. Remove the retainer from the valve plug.
5. Use an appropriate tool such as a flat-blade screwdriver to pry the bore seal (key 64) off the valve plug. Use caution to avoid scratches or other damage to the seating surfaces where the bore seal makes contact with the valve plug (see figure 3).

Figure 3. Fisher ED/EWD Valve Equipped with the Bore Seal

6. Apply a suitable high-temperature lubricant to the inside diameter of the bore seal. Also, lubricate the outside diameter of the valve plug where the bore seal must be pressed into the proper seating position (see figure 3).
7. Referring to figure 3, orient the bore seal for correct sealing action based on the process fluid flow direction through the valve.
 - The open interior of the bore seal must face up in a valve with flow-up construction.
 - The open interior of the bore seal must face down in a valve with flow-down construction.
8. Place the bore seal over the top of the valve plug. The retainer will help guide the bore seal down onto the valve plug. Do not force the bore seal over the valve plug. For flow down constructions, skip to step 10.
9. An installation tool (see figure 4 and table 5) must be inserted into the bore seal prior to using the retainer to guide it down the valve plug.
10. Apply a suitable high-temperature lubricant to the threads on the valve plug. Then, place the retainer onto the valve plug and tighten the retainer using an appropriate tool such as a strap wrench. For flow-down constructions, skip to step 12.
11. Remove the retainer and then the installation tool. Place the retainer back onto the valve plug and tighten the retainer using an appropriate tool such as a strap wrench.
12. Using an appropriate tool such as a center punch, stake the threads on top of the valve plug in one place to secure the retainer (see figure 3).
13. Inspect the valve plug (key 2A) and stem (key 2B) for nicks, scratches, or other damage that would prevent proper operation of the valve. If replacement of either is necessary replace as a complete valve plug and stem assembly (key 2).

14. Each new piston ring (key 6) is furnished as a complete ring, and each must be broken into two approximately equal portions. Do this by placing the ring on edge on a smooth, hard surface and striking the ring squarely with a hammer.
15. Install the piston ring into the groove in the retainer (key 2C). Be sure to match the broken ends when installing the ring sections in the groove.

CAUTION

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the Bore Seal and contact the seat ring. You can correctly seat the valve plug by using the same force calculated for full load when sizing your actuator. With no pressure drop across the valve, this force will adequately drive the valve plug to the seat ring, thus giving the Bore Seal a predetermined permanent set.

With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

Seat Ring Maintenance

With the seat ring (key 9) removed, according to the Disassembly procedure, proceed as appropriate:

CAUTION

Be careful not to scratch the surfaces of the seating surface or groove in the seat ring or the surfaces of the replacement parts.

24.00	(1)								(1)

1. Contact your [Emerson sales office](#) for this tool and dimensions.

For ET/EWT Valves

1. Carefully pry or cut out the seat ring seal ring (key 223) from its groove in the seat ring (key 9). Discard the old seat ring seal ring.
2. Then inspect the seat ring (key 9) for nicks, scratches, or other damage that would prevent proper operation of the valve. Replace the seat ring if necessary. A replacement seat ring is available individually (key 9 only) or as a seat ring and cage assembly (key 9 and 3). If replacing individually proceed to step 3, otherwise proceed directly to step 7.
3. Make sure the bolts or cap screws that were installed in the seat ring during the Disassembly procedure are still installed.
4. Orient the cage (key 3) and seat ring so that the threads on each are facing one another for assembly. The bottom of the cage should be facing the top of the seat ring.
5. Using a pry bar to pry against the bolts or cap screws, turn the seat ring clockwise into the cage until tight. Afterwards remove the two bolts or cap screws.

6. Tack weld the seat ring to the cage using minimal heat. Two welds, 6 mm (1/4-inch) long and 180 degrees apart, are required.

CAUTION

To avoid damaging the seal ring, slowly and gently stretch it for the following procedure. Avoid jerking sharply on the ring.

7. Install the replacement seat ring seal ring (key 223) with the open side facing the top or bottom of the seat ring, depending on flow direction. The open side of the seal ring should face down (toward the bottom of the valve body) in flow-up installations and up in flow-down installations.

To install the seal ring on the seat ring, first lubricate it with a general purpose silicone-base lubricant. Then gently stretch the seal ring and work it over the bottom edge of the seat ring. The PTFE material in the seal ring must be permitted time to cold-flow during the stretching procedure, so avoid jerking sharply on the ring. Stretching the seal ring over the seat ring may make it seem unduly loose when in the groove, but it will contract to its original size after insertion into the valve body.

For ET/EWT Valves Equipped with HTS1 Seals

1. Carefully pry the seat ring retaining ring (key 221) from its groove in the seat ring (key 9). Then remove the seat ring seal ring (key 223), backup ring (key 220), and anti-extrusion ring (key 219). Inspect the retaining ring and backup ring for damage and replace as needed. Discard the old seat ring seal ring and anti-extrusion ring.
2. Then inspect the seat ring (key 9) for nicks, scratches, or other damage that would prevent proper operation of the valve. Replace the seat ring if necessary. A replacement seat ring is available individually (key 9 only) or as a seat ring and cage assembly (key 9 and 3). If replacing individually proceed to step 3, otherwise proceed directly to step 7.
3. Make sure the bolts or cap screws that were installed in the seat ring during the Disassembly procedure are still installed.
4. Orient the cage and seat ring so that the threads on each are facing one another for assembly. The bottom of the cage should be facing the top of the seat ring.
5. Using a pry bar to pry against the bolts or cap screws, turn the seat ring clockwise into the cage until tight. Afterwards remove the two bolts or cap screws.
6. Tack weld the seat ring to the cage using minimal heat. Two welds, 6 mm (1/4-inch) long and 180 degrees apart, are required.
7. Install the replacement seat ring seal ring (key 223) and anti-extrusion ring (key 219) with the open side of the seal ring facing the top or bottom of the seat ring, depending on flow direction. The open side of the seal ring should face down (toward the bottom of the valve body) in flow-up installations and up in flow-down installations. Make sure the anti-extrusion ring is adjacent to closed side of the seal ring. Then install the seat ring backup ring (key 220) and retaining ring (key 221).

To install the parts on the seat ring, first lubricate each with a general purpose silicone-base lubricant. Then gently slide each over the bottom edge of the seat ring.

For ET/EWT Valves Equipped with Grid Seat Ring

1. Please contact your [Emerson sales office](#) or refer to FGS12A38 for grid seat ring lifting methods during seat ring/cage assembly process. Other procedures except lifting the grid seat ring still stay the same as standard seat ring.

For ED/EWD and ET-C/EWT-C Valves

1. Inspect the seat ring (key 9) for nicks, scratches, or other damage that would prevent proper operation of the valve. Replace if necessary.

Bore Seal Retrofit

Note

Additional actuator thrust is required for a valve equipped with the bore seal. When installing the bore seal in an existing valve, contact your [Emerson sales office](#) for assistance in determining new actuator thrust requirements.

The bore seal retrofit will require a new valve plug and stem assembly (key 2), bore seal (key 64), and piston ring (key 6). The following steps will guide you in the assembly of these parts. Final installation into the valve body will be per the Assembly procedure.

CAUTION

To avoid leakage when the valve is returned to service, use appropriate methods and materials to protect all sealing surfaces of the new trim parts while assembling the individual parts and during installation in the valve body.

1. Apply a suitable high-temperature lubricant to the inside diameter of the bore seal. Also, lubricate the outside diameter of the valve plug where the bore seal must be pressed into the proper seating position (see figure 3).
2. Referring to figure 3, orient the bore seal for correct sealing action based on the process fluid flow direction through the valve.
 - The open interior of the bore seal must face up in a valve with flow-up construction.
 - The open interior of the bore seal must face down in a valve with flow-down construction.
3. Place the bore seal over the top of the valve plug. The retainer will help guide the bore seal down onto the valve plug. Do not force the bore seal over the plug. For flow-down constructions, skip to step 5.
4. An installation tool (see figure 4 and table 5) must be inserted into the bore seal prior to using the retainer to guide it down the valve plug.
5. Apply a suitable high-temperature lubricant to the threads on the valve plug. Then, place the retainer onto the valve plug and tighten the retainer using an appropriate tool such as a strap wrench. For flow-down constructions, skip to step 7.
6. Remove the retainer and then the installation tool. Place the retainer back onto the valve plug and tighten the retainer using an appropriate tool such as a strap wrench.
7. Using an appropriate tool such as a center punch, stake the threads on top of the valve plug in one place to secure the retainer (see figure 3).
8. Each new piston ring (key 6) is furnished as a complete ring, and each must be broken into two approximately equal portions. Do this by placing the ring on edge on a smooth, hard surface and striking the ring squarely with a hammer.
9. Install the piston ring into the groove in the retainer (key 2C). Be sure to match the broken ends when installing the ring sections in the groove.

CAUTION

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the Bore Seal and contact the seat ring. You can correctly seat the valve plug by using the same force calculated for full load when sizing your actuator. With no pressure drop across the valve, this force will adequately drive the valve plug to the seat ring, giving the Bore Seal a predetermined permanent set.

With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

Assembly

After completing Packing Maintenance and/or Trim Maintenance procedures, the following steps will guide you through reassembly of the valve.

For ED/EWD and ET-C/EWT-C Valves only

1. Remove the cover protecting the valve body cavity.
2. Install a new seat ring gasket (key 13) into the valve body. Make sure the eye bolts that were installed in the seat ring (key 9) during the Disassembly procedure are still installed. Then using the eye bolts as lifting points, carefully lower the seat ring into the valve body. Make sure that the cap screw holes in the seat ring are lined up with their mating holes in the valve body. Remove the two eye bolts from the seat ring.

CAUTION

Uneven tightening of the cap screws (key 49) will result in the seat ring seating surface being askew from the valve plug seating surface, thereby preventing the valve from attaining its rated shutoff class. This is especially critical in ED/EWD valves equipped with the bore seal. If after assembly the rated shutoff class is not attained your [Emerson sales office](#) can provide further assistance.

3. Secure the seat ring to the valve body using the cap screws (key 49). Tighten the cap screws in a criss-cross pattern working up to the final torque in four equal increments as specified in table 6.
4. Install a new cage gasket (key 11) into the valve body.
5. Make sure the eye bolts that were installed in the cage (key 3) or cage assembly during the Disassembly procedure are still installed. Then using the eye bolts as lifting points, carefully lower the cage into the valve body. Any rotational orientation of the cage with respect to the valve is acceptable.
6. Complete reassembly according to steps 10 through 15 of the Replace Packing section.

Table 6. Seat Ring Cap Screw Torque

VALVE SIZE, NPS	FIRST INCREMENT		SECOND INCREMENT		THIRD INCREMENT		FOURTH INCREMENT FINAL TORQUE	
	N • m	Lbf • ft	N • m	Lbf • ft	N • m	Lbf • ft	N • m	Lbf • ft
12, 14, and 16x12	9.75	7	19.5	14	29.25	21	39	28
16, 18, 20x16, 24x16, 20, 24x20, and 30	23	17	46	34	69	51	92	68

For ET/EWT Valves only

1. Remove the cover protecting the valve body cavity.
2. Install a new cage gasket (key 11) into the valve body.
3. Make sure the eye bolts that were installed in the cage (key 3) or cage assembly during the Disassembly procedure are still installed. Then using the eye bolts as lifting points, carefully lower the cage into the valve body. Any rotational orientation of the cage with respect to the valve is acceptable. Use care to avoid damaging the seat ring seal ring (key 223) while handling the heavy parts. To help insert the cage assembly into the valve, lubricate the outside diameter of the seat ring seal ring with general purpose silicone-base lubricant.
4. Complete reassembly according to steps 10 through 15 of the Replace Packing section.

Parts Ordering

Each body-bonnet assembly is assigned a serial number, which can be found on the valve. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts Kits

Seal Ring and Piston Ring Kits

Repair kits include parts to replace the seal rings and piston rings for the valve plug and seat ring.

Introduction

The product covered in this document is no longer in production. This document, which includes the latest published version of the instruction manual, is made available to provide updates of newer safety procedures. Be sure to follow the safety procedures in this supplement as well as the specific instructions in the included instruction manual.

Part numbers in the included instruction manual should not be relied on to order replacement parts. For replacement parts, contact your [Emerson sales office](#).

For more than 30 years, Fisher products have been manufactured with asbestos-free components. The included manual might mention asbestos containing parts. Since 1988, any gasket or packing which may have contained some asbestos, has been replaced by a suitable non-asbestos material. Replacement parts in other materials are available from your sales office.

Safety Instructions

Please read these safety warnings, cautions, and instructions carefully before using the product.

These instructions cannot cover every installation and situation. Do not install, operate, or maintain this product without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage it is important to carefully read, understand, and follow all of the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your Emerson sales office before proceeding.

Specifications

This product was intended for a specific range of service conditions--pressure, pressure drop, process and ambient temperature, temperature variations, process fluid, and possibly other specifications. **Do not expose the product to service conditions or variables other than those for which the product was intended.** If you are not sure what these conditions or variables are, contact your [Emerson sales office](#) for assistance. Provide the product serial number and all other pertinent information that you have available.

Inspection and Maintenance Schedules

All products must be inspected periodically and maintained as needed. The schedule for inspection can only be determined based on the severity of your service conditions. Your installation might also be subject to inspection schedules set by applicable governmental codes and regulations, industry standards, company standards, or plant standards.

In order to avoid increasing dust explosion risk, periodically clean dust deposits from all equipment.

When equipment is installed in a hazardous area location (potentially explosive atmosphere), prevent sparks by proper tool selection and avoiding other types of impact energy.

Parts Ordering

Whenever ordering parts for older products, always specify the serial number of the product and provide all other pertinent information that you can, such as product size, part material, age of the product, and general service conditions. If you have modified the product since it was originally purchased, include that information with your request.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher product, because they may void your warranty, might adversely affect the performance of the product, and could cause personal injury and property damage.

Installation

⚠ WARNING

- Personal injury or equipment damage caused by sudden release of pressure or bursting of parts may result if the valve assembly is installed where service conditions could exceed the limits given in the applicable product literature, the limits on the appropriate nameplates, or the mating pipe flange rating. Use pressure-relieving devices as required by government or relevant industry codes and good engineering practices. If you cannot determine the ratings and limits for this product, contact your [Emerson sales office](#) before proceeding.
- To avoid personal injury, always wear protective gloves, clothing, and eyewear when performing any installation operations.
- To avoid personal injury or property damage, use proper lifting and rigging practices while lifting, installing or removing the valve assembly. Be sure to use lifting and rigging equipment properly sized and selected for the weight and configuration of the valve assembly or component being lifted.
- Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions.
- Many rotary shaft valves are not necessarily grounded to the pipeline when installed in a flammable, hazardous, oxygen service, or explosive atmospheres. An explosion is possible, due to the discharge of static electricity from the valve components. To avoid personal injury or property damage, make sure that the valve is grounded to the pipeline before placing the control valve assembly into service. Use and maintain alternate shaft-to-body bonding, such as a shaft-to-body bonding strap assembly.
- Rotary shaft valves are designed and intended for installation between flanges. Personal injury or property damage may result from improper installation. To avoid personal injury or property damage caused by the sudden release of pressure or bursting of parts, do not use or install rotary shaft valves (including single lug constructions) for dead-end service.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
- If installing into an existing application, also refer to the WARNING in the Maintenance section.
- When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. To avoid possible personal injury and because some valve/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your Emerson sales office.

CAUTION

- Ensure that the valve and adjacent pipelines are free of foreign material that could damage the valve seating surfaces.

Maintenance

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Always wear protective gloves, clothing, and eyewear.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure.
- Do not remove the actuator while the valve is pressurized.
- Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring pre-compression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box might contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids might spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug. Cautiously remove parts so that fluid escapes slowly and safely.
- Many valve parts that are moving can injure you by pinching, cutting, or shearing. To help prevent such injury, stay clear of any moving part.
- Never apply pressure to a partially assembled valve.
- To avoid personal injury or property damage caused by uncontrolled movement of a valve bonnet, loosen the bonnet by following these instructions: Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet. Loosen bonnet nuts approximately 3 mm (0.125 inch). Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and body. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, proceed with bonnet removal.
- As you remove parts, such as valve shafts, other parts, such as disks can fall from the valve body or suddenly move to another position in the valve. To avoid injury from falling or moving parts, be sure to support parts and be sure they are in a stable position as you disassemble the valve.
- Personal injury could result from packing leakage. Do not scratch the drive shaft or packing box wall while removing packing parts.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Neither Emerson, nor any of its affiliated entities assume responsibility for the selection, use or maintenance of any product. Responsibility for proper selection, use, and maintenance of any product remains solely with the purchaser and end user.

Figure 1. Fisher Lever-Lock Handlever Actuator Mounted on Valve

W9585

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for the Fisher Lever-Lock handlever actuator (figure 1). Refer to separate instruction manuals for information covering the control valves.

Do not install, operate, or maintain a Lever-Lock actuator without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

The Lever-Lock handlever is used for reliable manual operation of DN 50 through 150 (NPS 2 through 6) Fisher A81 high-performance butterfly valves. Spring-loading secures the handlever in the notched quadrant plate (figure 2), allowing the valve disk to be locked in intermediate positions. Additionally, the handlever can be locked with a user-supplied padlock with 4.8 to 5.2 mm (3/16 to 13/64 inch) shackle to prevent accidental or unauthorized adjustment (see figures 3 and 4).

Table 1. Specifications

Lever-Lock Handlever Actuator Sizes See table 2	Handlever Length Maximum of 432 mm (17 inches). See figure 2 and table 4
Valve Compatibility Mounts on A81 valves per table 2	Construction Materials Handle, quadrant plate, lever, and mounting bracket are all steel materials. Spring, set screws, and fasteners are stainless steel
Maximum torque Output See table 3	Dimension and Approximate Weights See figure 2 and table 4

1. The pressure/temperature limits in this manual, and any applicable code or standard limitation, should not be exceeded.

Table 2. Fisher A81 Valve / Lever-Lock Handlever Compatibility

HANDLEVER ACTUATOR SIZE	VALVE SIZE		SHAFT SIZE		SQUARE SIZE
	DN	NPS	mm	Inches	mm
I	50	2	12.7	1/2	9
	80	3	15.9	5/8	11
II	100	4	19.1	3/4	14
	150	6	25.4	1	17

Table 3. Maximum Allowable Torques and Handlever Force Requirements

VALVE DISK POSITION	MAXIMUM TORQUE				HANDLEVER FORCE REQUIRED	
	Size I		Size II			
	N•m	In•Lb	N•m	In•Lb	N	Lbf
0 Degrees (Breakout Torque)	119	1050	164	1450	423	95
All Other Angles (Dynamic Torque)	47	420	70	620	178	40

Installation

The Lever-Lock handlever actuator is normally shipped mounted on the valve at the factory. If the handlever was ordered separately, install the handlever on the valve by following the instructions in this section.

WARNING

Sudden or unexpected movement of the handle can result from unbalanced flow forces. Firmly grip the handlever and ensure stable footing when operating the handlever to avoid personal injury or property damage.

Installing the Handlever

Orientation

Mount the Lever-Lock bracket assembly, less the handle, to the valve body. The handle is perpendicular to the pipeline when the valve is in the shut position. Rotation of the lever/valve shaft in the counter-clockwise direction will open the valve. Attach the Lever-Lock Handlever actuator to the valve in this orientation but do not fully tighten (torque) the bracket to valve bolting until after the zeroing process below.

Handle assembly

Place the handle and lever assembly on the valve shaft with the valve closed. Squeeze the lever to compress the spring, position the lever over the notch indicating the closed position, and slide the square cutout portion of the handle over the valve shaft as far as it will go. Maintain at least a 0.8 mm (1/32 inch) gap between the handle and the plate, so the handle doesn't rub on the plate during operation. Torque the two hex socket set screws against the shaft to 2.7 N•m (24 in•lbf).

Zeroing

After tightening the set screws, check the orientation of the disk relative to the body seal retainer. Place a straight edge on the seal retainer which spans the valve opening. Visually check to ensure there is equal space (within 0.8 mm [1/32 inch]) between this straight edge and the top and bottom of the disk to ensure the valve is fully engaged in the seal. To adjust this position, rotate the bracket within the clearance of the mounting bolt holes between the valve body and bracket. Once there is equal distance between the disk and the straight edge, tighten the mounting bolts to 115 N•m (88 ft•lbf). After tightening, recheck disk position at shutoff to ensure nothing shifted during the tightening process.

Figure 2. Fisher Lever-Lock Handlever Actuator for A81 Valve (Open/Closed Marks)

Maintenance

Handlever parts are subject to normal wear/corrosion and must be inspected and replaced when necessary. The frequency of inspection and replacement depends on the severity of service conditions.

⚠ WARNING

Avoid personal injury or damage to property from sudden release of pressure or uncontrolled process fluid. Before starting disassembly:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from either side of the valve.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Ordering Replacements

When corresponding with your [Emerson sales office](#) or Local Business Partner about this equipment, always mention the valve serial number. It is recommended that complete assemblies are considered for replacements to ensure the latest version of the product is supplied.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Figure 1. Fisher NotchFlo DST Control Valve

W9050-2

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for the Fisher NotchFlo DST control valve. Refer to separate manuals for instructions covering the actuator, positioner, and accessories.

Do not install, operate, or maintain NotchFlo DST valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The NotchFlo DST globe (figure 1) and angle valves have metal seats, cage guiding, quick change trim, and push-down-to-close valve plug action. All available valve sizes and pressure ratings use balanced valve plugs with the exception of CL900 and CL1500 (NPS 1 and 1-1/2 valves) which use an unbalanced valve plug. To provide a seal between the cage and a balanced valve plug, the balanced valve plugs use a pressure-assisted spring-loaded seal ring.

A properly sized NotchFlo DST valve with 3-, 4-, or 6-stage dirty service anti-cavitation trim (figure 2) offers excellent control of high pressure drop liquids with entrained solids, while avoiding the damaging effects of cavitation and erosive solids.

Table 1. Specifications

Available Valves CL600 3-Stage: Level C only CL900 and CL1500 ≤ NPS 4, 4-Stage: Levels A, B, and C⁽¹⁾ CL1500 ≥ NPS 6, 4-Stage: Level C only CL1500 6-Stage: Level C only CL2500 6-Stage: Level C only End Connection Styles and Ratings⁽²⁾ Flanged: Consistent with CL600, 900, 1500, and 2500 per ASME B16.34 Socket Welding: Consistent with CL600, 900, 1500, and 2500 per ASME B16.34 Buttwelding: Consistent with CL600, 900, 1500, and 2500 per ASME B16.34 Also see table 2	Shutoff Classification Class V: $[5 \times 10^{-12} \text{ m}^3/\text{sec}/\text{bar}/\text{mm}$ of port diameter (0.0005 mL/min/psid/in) of water at service pressure drop] per ANSI/FCI 70-2 and IEC 60534-4 Flow Characteristic Linear Flow Direction Flow up Approximate Weights See table 2
---	---

1. Levels A, B, and C provide for varied pressure drops and capacity.

2. The pressure/temperature limits in this manual and any applicable standard or code limitation for valve should not be exceeded.

Figure 2. Fisher NotchFlo DST Trim

W8538-1

NotchFlo DST control valves utilize a high resistance, multi-stage, axial flow path (or passage) where fluid flow is parallel to the axis of the plug and cage.

Pressure reduction occurs throughout the length of the plug; thus individual stages aren't exposed to the full pressure differential. Therefore, trim life is enhanced.

NotchFlo DST trim utilizes a series of notched flow restrictions and expansions to control the pressure drop of the fluid. The amount of pressure drop per stage is controlled to prevent cavitation problems and minimize erosion issues.

Flow passage configuration provided by the multi-stage plug and cage design make the NotchFlo DST valves well-suited for applications involving fluids with entrained particles. This is a potentially serious problem for other anti-cavitation valve designs which are subject to clogged flow passages. Design of the trim allows for high rangeability.

Specifications

Specifications for NotchFlo DST valves are shown in table 1.

Installation

WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or property damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

Some bonnet flanges have a tapped hole that was used to handle the bonnet during manufacture. Since this tapped hole was not designed or intended to support the weight of the valve/bonnet assembly, do not use this tapped hole to lift the valve assembly or personal injury may result from the assembly falling.

CAUTION

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Since some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first checking with your [Emerson sales office](#).

1. Before installing the valve, inspect it to ensure that the valve body cavity is free of foreign material.
2. Clean out all pipelines to remove scale, welding slag, and other foreign materials before installing the valve.
3. Flow through the valve must be in the direction indicated by the flow arrow, which is cast on or attached to the valve body.
4. Use accepted piping practices when installing the valve in the pipeline. For flanged valve bodies, use a suitable gasket between the body and pipeline flanges.
5. Install a three-valve bypass around the valve if continuous operation is required during maintenance.
6. If the actuator and valve body are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.
7. If the valve body was shipped without packing installed in the packing box, install the packing before putting the valve body into service. Refer to instructions given in the Packing Maintenance procedure.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Maintenance

Refer to figure 10 through 19.

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing maintenance and trim maintenance. All maintenance operations may be performed with the valve in the line.

⚠ WARNING

Avoid personal injury or damage to property from sudden release of pressure or uncontrolled process fluid. Before starting disassembly:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.

- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

		CL2500	18	24	13	18
19.1	3/4	CL900	27	41	20	30
		CL1500	34	50	25	37
		CL2500	41	61	30	45
25.4	1	CL900	42	62	31	46
		CL1500	52	77	38	57
		CL2500	61	91	45	67
31.8	1-1/4	CL900	56	83	41	61
		CL1500	68	102	50	75

CAUTION

The NotchFlo DST valve uses spiral-wound gaskets which are crushed to provide their seal. A spiral-wound gasket should never be reused. Whenever a gasket seal is disturbed by removing or shifting gasketed parts, a new gasket must be installed upon reassembly. This is necessary to ensure a good gasket seal, since the used gasket will not seal properly.

The spiral-wound gaskets are of special design. Failure to use genuine Fisher replacement parts may result in valve damage and/or failure.

Packing Maintenance

Key numbers refer to figure 3 for PTFE V-ring packing and to figure 4 and 5 for graphite ribbon/filament and graphite ULF packing, unless otherwise indicated.

⚠ WARNING

To avoid personal injury or equipment damage resulting from packing leakage, inspect the valve plug stem and packing box wall for nicks or scratches while performing the following procedures.

Use care to avoid damaging these surfaces.

For spring-loaded single PTFE V-ring packing, the spring (key 24) maintains a sealing force on the packing. If leakage is noted around the packing follower (key 28), check to be sure the shoulder on the packing follower is touching the bonnet. If the shoulder is not touching the bonnet, tighten the packing flange nuts (key 21, figure 10 through 19) until the shoulder is against the bonnet. If leakage cannot be stopped in this manner, proceed to the Replacing Packing procedure.

Table 8. Valve Stem Connection Torque and Hole Size for Pin

VALVE STEM DIAMETER		TORQUE, MINIMUM TO MAXIMUM		HOLE SIZE	
mm	Inches	N•m	Lbf•ft	mm	Inch
12.7	1/2	81-115	60-85	3.20 - 3.25	0.126 - 0.128
19.1	3/4	237-339	175-250	4.80 - 4.88	0.189 - 0.192
25.4	1	420-481	310-355	6.38 - 6.45	0.251 - 0.254
31.8	1-1/4	827-908	610-670	6.38 - 6.45	0.251 - 0.254

If there is undesirable packing leakage with other than spring-loaded PTFE V-ring packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts (key 21, figure 10 through 19) to at least the minimum recommended torque in table 3 or 4. However, do not exceed the maximum recommended torque in table 3 or 4, or excessive friction may result. If leakage continues, replace the packing by following the numbered steps presented in the Replacing Packing procedure.

If the packing is relatively new and tight on the valve plug stem, and if tightening the packing flange nuts does not stop the leakage, it is possible that the stem is worn or nicked so that a seal cannot be made. The surface finish of a new stem is critical for making a good packing seal. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches around the packing box wall. While replacing the packing according to the Replacing Packing procedure, inspect the valve plug stem and packing box wall for nicks or scratches.

Adding Packing Rings

⚠ WARNING

Refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

To avoid personal injury or equipment damage resulting from packing leakage, inspect the valve plug stem and packing box wall for nicks or scratches while performing the following procedures. Use care to avoid damaging these surfaces.

Key numbers referred to in this procedure are shown in figures 10 through 19, unless otherwise indicated.

When using packing with a lantern ring (key 24) it may be possible to add packing rings above the lantern ring as a temporary measure without removing the actuator from the valve body.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Remove the packing flange nuts (key 21) and lift the packing flange, upper wiper, and packing follower (keys 19, 27, and 28) away from the valve body.
3. It may be possible to dig out the old packing rings on top of the lantern ring, but use care to avoid scratching the valve plug stem or packing box wall. Clean all metal parts to remove particles that would prevent the packing from sealing.

4. Remove the stem connector and slip the packing rings over the end of the valve plug stem.
5. Reassemble the packing follower, upper wiper, packing flange, and packing flange nuts (keys 28, 27, 19, and 21).
6. Reconnect the body-actuator stem connection according to the appropriate actuator instruction manual.
7. Tighten the packing flange nuts only far enough to stop leakage under operating conditions. Check for leakage around the packing follower when the valve is being put into service. Retighten the packing flange nuts as required (see table 3 or 4).

Replacing Packing

WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

To avoid personal injury or equipment damage resulting from packing leakage, inspect the valve plug stem and packing box wall for nicks or scratches while performing the following procedures. Use care to avoid damaging these surfaces.

Key numbers referred to in this procedure are shown in figures 10 through 19, unless otherwise indicated.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Remove the cap screws in the stem connector, and separate the two halves of the stem connector. Then exhaust all actuator pressure, if any was applied, and disconnect the actuator supply and any leakoff piping.
3. Remove either the yoke locknut (key 32) or the hex nuts (key 30), and remove the actuator from the bonnet (key 18).
4. Loosen the packing flange nuts (key 21) so that the packing (keys 22, 23, 209, or 210, figures 3, 4, or 5) is not tight on the valve plug stem (key 6). Remove any travel indicator disk and stem locknuts from the valve plug stem threads.

CAUTION

When lifting the bonnet (key 18), be sure that the valve plug and stem assembly (keys 5 and 6) remains on the seat ring (key 4). This avoids damage to the seating surfaces as a result of the assembly dropping from the bonnet after being lifted part way out. The parts are also easier to handle separately.

Use care to avoid damaging gasket sealing surfaces.

WARNING

To avoid personal injury or property damage caused by uncontrolled movement of the bonnet, loosen the bonnet by following the instructions in the next step. Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet. If the cage sticks to the bonnet, proceed carefully with bonnet removal and support the cage so that it will not fall unexpectedly from the bonnet.

Note

The following step also provides additional assurance that the valve body fluid pressure has been relieved.

5. Hex nuts (key 14) attach the bonnet to the valve body. Loosen these nuts approximately 3 mm (1/8 inch). Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and valve body. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, proceed to the next step. If fluid leaks from the joint, the process pressure was not relieved from the valve as noted in the Warning at the beginning of the Maintenance section in this manual.
6. Unscrew the hex nuts (key 14) and carefully lift the bonnet off the valve stem. If the valve plug and stem assembly starts to lift with the bonnet, use a brass or lead hammer on the end of the stem and tap it back down. Set the bonnet on a cardboard or wooden surface to prevent damage to the bonnet gasket surface.
7. Remove the valve plug (key 5), bonnet gasket (key 11), cage (key 2), cage gaskets (if applicable) (key 65), seat ring (key 4), and the seat ring gasket(s) (key 12).

CAUTION

Inspect the seat ring, cage, bonnet, and body gasket surfaces. These surfaces must be in good condition, with all foreign material removed. Small burrs less than approximately 0.076 mm (0.003 inch) in height (the thickness of a human hair) can be ignored. Scratches or burrs that run across the serrations are not permitted under any conditions, because they will prevent the gaskets from sealing properly.

8. Clean all gasket surfaces with a good wire brush. Clean in the same direction as the surface serrations, not across them.
9. Cover the opening in the valve body to protect the gasket surface and to prevent foreign material from getting into the valve body cavity.
10. Remove the packing flange nuts (key 21), packing flange (key 19), upper wiper (key 27), and packing follower (key 28). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall.
11. Clean the packing box and the following metal packing parts: packing follower, packing box ring (key 26), spring or lantern ring (key 24), and, for single arrangements of PTFE V-ring packing only, special washer (key 25).
12. Inspect the valve stem threads for any sharp edges that might cut the packing. A whetstone or emery cloth may be used to smooth the threads if necessary.
13. Remove the protective covering from the valve body cavity, and install the seat ring and cage using new seat ring gasket(s) (key 12), bonnet gasket (key 11), and cage gaskets (if applicable) (key 65). Install the plug, then slide the bonnet over the stem and onto the studs (key 13).

Figure 6. Installing Graphite Ribbon/Filament Packing Rings One at a Time

A2207-2

Note

The prelubricated hex nuts (key 14) referred to in step 14 can be identified by a black film coating on the nut threads.

The proper bolting procedures in step 14 include--but are not limited to--ensuring that the bonnet stud threads are clean, and that the hex nuts are evenly tightened to the specified torque values.

CAUTION

Failure to comply with good bonnet-to-body bolting practices and the torque values shown in tables 5, 6, and 7 may result in damage to the valve. Cheater bars or slug wrenches should not be used for this procedure.

Hot torquing is not recommended on CL900, CL1500, and CL2500 valves. When operating temperature has been reached, perform this torquing procedure once again on CL600 valves.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

14. Lubricate the stud threads and the faces of the hex nuts (key 14) with anti-seize lubricant (not necessary if new factory prelubricated hex nuts are used). Install the hex nuts and tighten them finger-tight. Stroke the valve several times to center the trim. Torque the nuts in a crisscross pattern to no more than 1/4 of the nominal torque value specified in tables 5, 6, and 7.

When all nuts are tightened to that torque value, increase the torque by 1/4 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.

Note

When installing packing rings, prevent entrapping air between the rings. Add the rings one at a time without forcing them below the chamfer of the packing box entrance chamber. As each successive ring is added, the stack should not be pushed down more than the thickness of the added ring (figure 6).

15. Install new packing and the metal packing box parts according to the appropriate arrangement in figures 3, 4, or 5. If desired, packing parts may be pre-lubricated with a silicon base grease for easier installation. Slip a smooth-edged pipe over the valve stem, and gently tap each soft packing part into the packing box, being sure that air is not trapped between adjacent soft parts.

16. Slide the packing follower, wiper, and packing flange into position. Lubricate the packing flange studs (key 20) and the faces of the packing flange nuts (key 21). Install the packing flange nuts.

For the spring-loaded PTFE V-ring packing shown in figure 3, tighten the packing flange nuts until the shoulder on the packing follower (key 28) contacts the bonnet.

Note

Lubrication is not recommended on graphite packing.

For graphite packing, tighten the packing flange nuts to the maximum recommended torque shown in table 3 or 4. Then, loosen the packing flange nuts, and retighten them to the recommended minimum torque shown in table 3 or 4.

For other packing types, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in table 3 or 4. Then, tighten the remaining flange nuts until the packing flange is level and at a 90-degree angle to the valve stem.

17. Mount the actuator on the valve body assembly, and reconnect the actuator and valve plug stems according to the procedures in the appropriate actuator instruction manual.

Trim Removal

Key numbers referenced in this procedure are shown in figures 10 through 19, except where indicated.

1. Remove the actuator and bonnet by following steps 1 through 6 of the replacing packing procedure. Observe all warnings and cautions in that procedure.
2. Lift the valve stem and attached valve plug out of the valve body. If the valve plug is to be reused, tape or otherwise protect the valve plug stem and the valve plug seating surface to prevent scratches.
3. Lift out the cage (key 2), the bonnet gasket (key 11), and (if applicable) the cage gaskets (key 65).
4. Remove the seat ring (key 4) and the seat ring gasket(s) (key 12).
5. Inspect the parts for wear or damage and replace if needed.
6. Refer to the Valve Plug Maintenance procedure or to the Lapping Seats procedure.

Valve Plug Maintenance

Key numbers used in this procedure are shown in figures 10 through 19, except where indicated.

1. With the valve plug (key 5) removed according to the trim removal procedure, proceed as appropriate:

For the NPS 1 and 1-1/2 CL900 or 1500 and NPS 1 CL2500 NotchFlo DST valves, proceed to step 2.

For all other NotchFlo DST valves, work the retaining ring (key 10) off the valve plug with a screwdriver. Carefully slide the backup ring, seal ring, and anti-extrusion rings (keys 9, 8, and 63) off the valve plug.

2. To replace the valve plug stem (key 6), drive out the pin (key 7), and unscrew the stem from the valve plug.

CAUTION

Never reuse an old stem with a new valve plug. Using an old stem with a new plug requires drilling a new pin hole in the stem. This weakens the stem and may cause the stem to fail in service. If a new valve plug is required, always order a valve plug, stem, and pin as an assembly. Specify the correct part number of each of the three parts, but state that the parts are being ordered as an assembly.

A used valve plug may be reused with a new stem.

3. Thread the new stem into the valve plug and tighten it to the appropriate torque value given in table 8. Using the valve plug pin hole as a guide, drill the pin hole through the stem. Refer to table 8 for drill sizes.
4. Drive in the pin to lock the assembly.
5. If it is necessary to lap the seating surfaces, complete the lapping seats procedure before installing the seal ring. The Trim Replacement procedure provides seal ring installation instructions and valve reassembly instructions.

Lapping Seats

Key numbers referenced in this procedure are shown in figures 10 through 19, except where indicated.

With metal-seat constructions, lapping seating surfaces of the valve plug and seat ring (keys 5 and 4) can improve shutoff. (Deep nicks should be machined out rather than ground out.) Use a good quality lapping compound of a mixture of 280 to 600-grit. Apply the compound to the bottom of the valve plug.

Note

NotchFlo DST valves use spiral-wound gaskets. These gaskets provide their seal by being crushed and therefore should never be reused. This includes reusing a gasket after the lapping procedure has been performed.

An “old” gasket can be used to lap the seat, however the gasket must be replaced with a new gasket.

To preserve the effects of lapping, do not change either the position of the seat ring in the valve body cavity or the position of the cage on the seat ring after lapping the seating surfaces. When the parts are removed for cleaning and replacement of the “old” gaskets, return them to the original positions.

Use the following procedure to lap the seating surfaces.

1. Install the following parts according to the instructions presented in the trim replacement procedure: “old” seat ring gasket(s) (key 12), seat ring (key 4), cage (key 2), “old” bonnet gasket(key 11), and (if applicable) the “old” cage gaskets (key 65).
2. Proceed as appropriate:

For a NotchFlo DST balanced valve, install the valve plug and stem assembly (keys 5 and 6)--without seal ring (key 8)--into the cage.

For a NotchFlo DST unbalanced valve, install the valve plug and stem assembly (keys 5 and 6) into the cage.

3. Install the bonnet (key 18) over the valve stem, and secure the bonnet with four of the hex nuts (key 14).
4. Attach a handle, such as a piece of strap iron secured by stem locknuts, to the valve stem. Rotate the handle alternately in each direction to lap the seats.
5. After lapping, disassemble as necessary (you may mark the position of the seat ring and cage with a soft tip marker). Clean the seating surfaces, replace the gaskets, reassemble (taking care to return the seat ring and cage to their original positions), and test for shutoff. Repeat the lapping procedure if necessary.

Trim Replacement

⚠ WARNING

Observe the warning at the start of the Maintenance section.

After all trim maintenance has been completed, reassemble the valve body by following the numbered steps below. Be certain that all gasketed surfaces have been well cleaned. Key numbers referenced in this procedure are shown in figures 10 through 19, except where indicated.

CAUTION

Inspect the seat ring, cage, bonnet, and body gasket surfaces. These surfaces must be in good condition, with all foreign material removed. Small burrs less than approximately 0.076 mm (0.003 inches) in height (the thickness of a human hair) can be ignored. Scratches or burrs that run across the serrations are not permitted under any conditions, since they will prevent the gaskets from sealing properly.

1. Install the seat ring gasket (key 12) into the valve body. Install the seat ring (key 4).
2. For CL600, CL900, CL1500 4-Stage ≤ NPS 4, CL1500 6-Stage ≤ NPS 3 and CL2500 ≤ NPS 3 valves, install the second seat ring gasket (key 12) onto the seat ring.
For CL1500 4-Stage ≥ NPS 6, install the first cage gasket (key 65) onto the seat ring.
For CL1500 6-Stage ≥ NPS4 and CL2500 ≥ NPS 4 valves, install the gasket (key 68) onto the seat ring.
3. Install the cage.
4. For a NotchFlo DST balanced valve, install the anti-extrusion rings (key 63) onto the valve plug (key 5). Install the seal ring (key 8) onto the valve plug (key 5). Install the ring with the open side facing the valve plug stem end of the valve plug for flow-up applications (view A of figures 10 through 19). Slide the backup ring (key 9) onto the valve plug. Secure with the retaining ring (key 10).
5. Install the valve plug into the cage.
6. Install the bonnet gasket (key 11). For CL1500 4-Stage ≥ NPS 6, CL1500 6-Stage ≥ NPS4 and CL2500 ≥ NPS4 valves, install the second cage gasket (key 65) onto the cage.
7. Install the bonnet over the valve stem and onto the valve body.

Note

The prelubricated hex nuts (key 14) referred to in step 8 can be identified by a black film coating on the nut threads.

The proper bolting procedures in step 8 include--but are not limited to--ensuring that the bonnet stud threads are clean, and that the hex nuts are evenly tightened to the specified torque values.

Table 9. Actuator Groups by Type Number

Group 1 71 & 90 mm (2-13/16 and 3-9/16 Inch) Yoke Boss	Group 100 127 mm (5-Inch) Yoke Boss
585C 657 & 667 1008	585C 657
	Group 101 127 mm (5-Inch) Yoke Boss
	667

CAUTION

Failure to comply with good bonnet-to-body bolting practices and the torque values shown in tables 5, 6, and 7 may result in damage to the valve. Cheater bars or slug wrenches should not be used for this procedure.

Hot torquing is not recommended on CL900, CL1500, and CL2500 valves. When operating temperature has been reached, perform this torquing procedure once again on CL600 valves.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

8. Lubricate the stud threads and the faces of the hex nuts (key 14) with anti-seize lubricant (not necessary if new factory prelubricated hex nuts are used). Install the hex nuts, but do not tighten them. Torque the nuts in a crisscross pattern to no more than 1/4 of the nominal torque value specified in table 5, 6, or 7. When all nuts are tightened to that torque value, increase the torque by 1/4 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.
9. Install new packing and packing box parts per steps 15 and 16 of the Replacing Packing procedure. Be certain to observe the note given prior to step 15 of that procedure.
10. Mount the actuator by following the procedures in the actuator instruction manual. Check for packing leakage as the valve is being put into service. Retorque the packing flange nuts as required. See tables 3 and 4.

Parts Ordering

Each valve body-bonnet assembly is assigned a serial number which can be found on the valve. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts, reference the valve serial number to obtain the correct eleven-character part number for each part; the following Parts Kit and Parts List is for information only.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts Kits

Standard Packing Repair Kits (Non Live-Loaded)

Stem Diameter, mm (Inches) Yoke Boss Diameter, mm (Inches)	12.7 (1/2) 71 (2-13/16)	19.1 (3/4) 90 (3-9/16)	25.4 (1) 127 (5)	31.8 (1-1/4) 127 (5, 5H)

ENVIRO-SEAL™ Packing Retrofit Kits

Retrofit kits include parts to convert valves with existing standard bonnets to the ENVIRO-SEAL packing box construction.

Refer to figure 7 for key numbers for PTFE packing, to figure 8 for key numbers for Graphite ULF packing, and to figure 9 for key numbers for duplex packing.

PTFE kits include keys 200, 201, 211, 212, 214, 215, 217, 218, tag, and cable tie. Graphite ULF kits include keys 200, 201, 207, 208, 209, 210, 211, 212, 214, 216, 217, tag, and cable tie. Duplex kits include keys 200, 201, 207, 209, 211, 212, 214, 215, 216, 217, tag, and cable tie.

Stems and packing box constructions that do not meet Fisher stem finish specifications, dimensional tolerances, and design specifications may adversely alter the performance of this packing kit.

For part numbers of individual components in the ENVIRO-SEAL packing kits, refer to instruction manual ENVIRO-SEAL Packing System for Sliding-Stem Valves, [D101642X012](#).

ENVIRO-SEAL Packing Retrofit Kits

PACKING MATERIAL	STEM DIAMETER AND YOKE BOSS DIAMETER, mm (INCH)			
	12.7 (1/2) 71 (2-13/16)	19.1 (3/4) 90 (3-9/16)	25.4 (1) 127 (5)	31.8 (1-1/4) 127 (5, 5H)

Graphite ULF	RPACKXRT272	RPACKXRT282	RPACKXRT292	RPACKXRT302
Duplex	RPACKXRT222	RPACKXRT232	RPACKXRT242	RPACKXRT252

ENVIRO-SEAL Packing Repair Kits

Repair kits include parts to replace the “soft” packing materials in valves that already have ENVIRO-SEAL packing arrangements installed or in valves that have been upgraded with ENVIRO-SEAL retrofit kits.

Refer to figure 7 for key numbers for PTFE packing, to figure 8 for key numbers for Graphite ULF packing, and to figure 9 for key numbers for duplex packing.

PTFE repair kits include keys 214, 215, and 218. Graphite ULF repair kits include keys 207, 208, 209, 210, and 214. Duplex repair kits include keys 207, 209, 214, and 215.

Stems and packing box constructions that do not meet Fisher stem finish specifications, dimensional tolerances, and design specifications may adversely alter the performance of this packing kit.

For part numbers of individual components in the ENVIRO-SEAL packing kits, refer to instruction manual ENVIRO-SEAL Packing System for Sliding-Stem Valves, [D101642X012](#).

ENVIRO-SEAL Packing Repair Kits

Stem Diameter, mm (Inches) Yoke Boss Diameter, mm (Inches)	12.7 (1/2) 71 (2-13/16)	19.1 (3/4) 90 (3-9/16)	25.4 (1) 127 (5)	31.8 (1-1/4) 127 (5, 5H)

Parts List

Numerous available combinations of valve parts make selection of some parts difficult; when ordering valve parts for which a part number is not listed, provide the valve serial number with the order, permitting proper selection of replacement parts to be made at the factory.

Note

For part numbers not shown, contact your [Emerson sales office](#).

Key Description

- 1 Valve Body
If you need a valve body as a replacement part, order by valve size, serial number, and desired material.
- 2* Cage
- 4* Seat Ring
- 5* Valve Plug or Plug/Stem Assembly
- 6* Valve Stem
- 7* Pin
- 8* Seal Ring
- 9* Back Up Ring
- 10* Retaining Ring
- 11* Bonnet Gasket
- 12* Seat Ring Gasket
- 13 Stud, Cont Thd
- 14 Hex Nut
- 15 Anti-Seize Lubricant

Key Description

- 16 Nameplate (not shown)
- 17 Wire (not shown)
- 18 Bonnet---
- If you need a bonnet as a replacement part, order by valve size and stem diameter, serial number, and desired material.
- 19 Packing Flange
- 20 Stud Bolt
- 21 Hex Nut
- 22* Packing Set
- 23* Packing Ring
- 24 Spring or Lantern Ring
- 25 Washer, Special
- 26* Packing Box Ring
- 27* Upper Wiper
- 28 Follower
- 29 Stud Bolt
- 30 Hex Nut
- 32 Yoke Locknut
- 38 Drive Screw
- 41 Flow Arrow
- 63* Anti-Extrusion Ring
- 65* Cage Gasket

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for the Fisher CHP control valve. Refer to separate manuals for instructions covering the actuator, positioner, and accessories.

Do not install, operate, or maintain CHP valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Table 1. Specifications

Size/Pressure Class/Body Materials NPS 8 / CL2500 / WCC, WC9 Maximum Inlet Pressure and Temperature⁽¹⁾ Consistent with ASME B16.34 except CHPT PEEK anti-extrusion seal ring construction. Maximum temperature limit is 380°C (716°F). End Connection Style Buttweld Ends : All butt welding end schedules per ASME B16.25 Bonnet and Body-to-Bonnet Bolting Plain Bonnet: 5 inch H Yoke Boss Studs: Steel A 193-B7/NCF2 Nuts: Steel A 194-2H/NCF2	Flow Coefficient Maximum Cv: 514 Km: 0.74 Fl: 0.86 Modified Equal Percentage Flow Direction Flow down and up Stem Diameter 1-1/4 inch VSC (Valve Stem Connection) Shutoff Classification per ANSI/FCI 70-2 and IEC 60534-4⁽²⁾ CHPT: Class IV (standard), Class V (optional) CHPD: Class V with Bore seal (standard) Weight Estimated Valve Body and Bonnet Assemblies 810 kg Please consult Singapore SD&S for any queries
---	---

1. The pressure/temperature limits in this manual and any applicable standard or code limitation for valve should not be exceeded.

2. For Boiler feedwater application, proper use of a block valve during closing of the control valve is recommended to minimize control valve trim damage.

Description

The CHP globe valve (figure 1) has a metal seat, cage guiding, quick change trim, and push-down-to-close valve plug action. The valve uses a balanced valve plug. To provide a seal between the cage and a balanced valve plug, the balanced valve plug uses a PEEK (Poly Ether Ether Ketone) anti-extrusion ring with a pressure-assisted spring-loaded seal ring.

Educational Services

For information on available courses for the Fisher CHP valve, as well as a variety of other products, contact:

Specifications

Specifications for the CHP valves are shown in table 1.

Installation

WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or property damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Because some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first checking with your [Emerson sales office](#) or Local Business Partner.

1. Before installing the valve, inspect it to ensure that the valve body cavity is free of foreign material.
2. Clean out all pipelines to remove scale, welding slag, and other foreign materials before installing the valve.
3. Flow through the valve must be in the direction indicated by the flow arrow, which is attached to the valve body.
4. Use accepted piping practices when installing the valve in the pipeline.
5. Install a three-valve bypass around the valve if continuous operation is required during maintenance.
6. If the actuator and valve body are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.
7. If the valve body was shipped without packing installed in the packing box, install the packing before putting the valve body into service. Refer to instructions given in the Packing Maintenance procedure.

WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Lifting Guidelines

CAUTION

Care must be taken when lifting the valve/actuator assembly to ensure the accessories and tubing are not damaged in the process. The entire assembly with accessories weighs approximately 1500 kg (3310 lb). Make sure to use appropriate lifting straps/hoist rings capable of lifting this weight.

⚠ WARNING

Avoid personal injury or damage caused by uncontrolled movement or dropping of the assembly valve:

- Swivel hoist rings are sized to lift only the valve and actuator. Do not attached piping or other structures to the valve and actuator assembly when lifting swivel hoist rings.
- Take appropriate precautions to avoid unbalanced loading which may result in sudden swinging or movement of the assembled unit, including additional lifting and/or support methods when necessary.
- Do not use eyebolts when lifting the valve or valve actuator assembly due to variable loading angles inherent to valve maintenance and installation.
- Failure to utilize safe lifting practices may result in equipment damage and/or personal injury.

Lifting Valve/Actuator Assembly

To lift the assembly, insert swivel hoist rings (recommend 3/4-10 UNC) into the four lifting hole locations on the outside diameter of the bonnet flange. The lifting point must be high enough away from the top of the accessory mountings to prevent damage to accessories or piping. When lifting the valve and actuator assembly, a strap around the actuator may be required to ensure lifting stability. Lifting the assembly without using the hoist rings is not preferred.

Lifting Bonnet Only

To lift the bonnet, insert swivel hoist rings (recommend 3/4-10 UNC) into the four lifting hole locations on the outside diameter of the bonnet flange. Use proper length, or adjustable chains to ensure the bonnet and valve body mating surfaces remain parallel when hoisted.

Maintenance

Refer to figure 4.

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing maintenance and trim maintenance. All maintenance operations may be performed with the valve in the line.

⚠ WARNING

Avoid personal injury or damage to property from sudden release of pressure or uncontrolled process fluid. Before starting disassembly:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.

	N•m	lbf•ft
CL2500	4240	3130

Table 4. Valve Stem Connection Torque and Hole Size for Pin

VALVE STEM DIAMETER		TORQUE, MINIMUM TO MAXIMUM		HOLE SIZE ⁽¹⁾	
mm	Inches	N•m	Lbf•ft	mm	Inch
31.8	1-1/4	735-993	544-736	6.38-6.45	0.251-0.254

1. VSC (Valve Stem Connection) size is 1 1/4-inch.

CAUTION

The CHP valve uses spiral-wound gaskets which are crushed to provide their seal. A spiral-wound gasket should never be reused. Whenever a gasket seal is disturbed by removing or shifting gasketed parts, a new gasket must be installed upon reassembly. This is necessary to ensure a good gasket seal, since the used gasket will not seal properly.

The spiral-wound gaskets are of special design. Failure to use genuine Fisher replacement parts may result in valve damage and/or failure.

Packing Maintenance

Key numbers refer to figure 2 for PTFE V-ring packing and graphite ribbon/filament, unless otherwise indicated.

⚠ WARNING

To avoid personal injury or equipment damage resulting from packing leakage, inspect the valve plug stem and packing box wall for nicks or scratches while performing the following procedures. Use care to avoid damaging these surfaces.

For spring-loaded single PTFE V-ring packing, the spring maintains a sealing force on the packing. If leakage is noted around the packing follower, check to be sure the shoulder on the packing follower is touching the bonnet. If the shoulder is not touching the bonnet, tighten the packing flange nuts until the shoulder is against the bonnet. If leakage cannot be stopped in this manner, proceed to the Replacing Packing procedure.

If there is undesirable packing leakage with other than spring-loaded PTFE V-ring packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts to at least the minimum recommended torque in table 2. However, do not exceed the maximum recommended torque in table 2 or excessive friction may result. If leakage continues, replace the packing by following the numbered steps presented in the Replacing Packing procedure.

If the packing is relatively new and tight on the valve plug stem, and if tightening the packing flange nuts does not stop the leakage, it is possible that the stem is worn or nicked so that a seal cannot be made. The surface finish of a new stem is critical for making a good packing seal. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches around the packing box wall. While replacing the packing according to the Replacing Packing procedure, inspect the valve plug stem and packing box wall for nicks or scratches.

Adding Packing Rings

⚠ WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

To avoid personal injury or equipment damage resulting from packing leakage, inspect the valve plug stem and packing box wall for nicks or scratches while performing the following procedures.

Use care to avoid damaging these surfaces.

Key numbers referred to in this procedure are shown in figure 4, unless otherwise indicated.

When using packing with a lantern ring it may be possible to add packing rings above the lantern ring as a temporary measure without removing the actuator from the valve body.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Remove the packing flange nuts and lift the packing flange, upper wiper, and packing follower away from the valve body.
3. It may be possible to dig out the old packing rings on top of the lantern ring, but use care to avoid scratching the valve plug stem or packing box wall. Clean all metal parts to remove particles that would prevent the packing from sealing.
4. Remove the stem connector and slip the packing rings over the end of the valve plug stem.
5. Reassemble the packing follower, upper wiper, packing flange, and packing flange nuts.
6. Reconnect the body-actuator stem connection according to the appropriate actuator instruction manual.
7. Tighten the packing flange nuts only far enough to stop leakage under operating conditions. Check for leakage around the packing follower when the valve is being put into service. Retighten the packing flange nuts as required (see table 2).

Replacing Packing

⚠ WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

To avoid personal injury or equipment damage resulting from packing leakage, inspect the valve plug stem and packing box wall for nicks or scratches while performing the following procedures.

Use care to avoid damaging these surfaces.

Key numbers referred to in this procedure are shown in figure 4, unless otherwise indicated.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Remove the cap screws in the stem connector, and separate the two halves of the stem connector. Then exhaust all actuator pressure, if any was applied, and disconnect the actuator supply and any leakoff piping.
3. Remove the hex nuts (key 11), and remove the actuator from the bonnet (key 14).
4. Loosen the packing flange nuts so that the packing is not tight on the valve plug stem (key 4). Remove the stem locknuts from the valve plug stem threads.

CAUTION

When lifting the bonnet (key 14), be sure that the valve plug and stem assembly (keys 3 and 4) remains on the seat ring (key 7). This avoids damage to the seating surfaces as a result of the assembly dropping from the bonnet after being lifted part way out. The parts are also easier to handle separately. Use care to avoid damaging gasket sealing surfaces.

⚠ WARNING

To avoid personal injury or property damage caused by uncontrolled movement of the bonnet, loosen the bonnet by following the instructions in the next step. Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet. If the cage sticks to the bonnet, proceed carefully with bonnet removal and support the cage so that it will not fall unexpectedly from the bonnet.

Note

The following step also provides additional assurance that the valve body fluid pressure has been relieved.

5. Hex nuts (key 12) attach the bonnet to the valve body. Loosen these nuts approximately 3 mm (1/8 inch). Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and valve body. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, proceed to the next step. If fluid leaks from the joint, the process pressure was not relieved from the valve as noted in the Warning at the beginning of the Maintenance section in this manual.
6. Unscrew the hex nuts (key 12) and carefully lift the bonnet off the valve stem. If the valve plug and stem assembly starts to lift with the bonnet, use a brass or lead hammer on the end of the stem and tap it back down. Set the bonnet on a cardboard or wooden surface to prevent damage to the bonnet gasket surface.
7. Remove the valve plug (key 3), bonnet gasket (key 16) and three cage gaskets (key 15), seat ring (key 2), and the seat ring gasket (key 17).

CAUTION

Inspect the seat ring, cage, bonnet, and body gasket surfaces. These surfaces must be in good condition, with all foreign material removed. Small burrs less than approximately 0.076 mm (0.003 inch) in height (the thickness of a human hair) can be ignored. Scratches or burrs that run across the serrations are not permitted under any conditions, as they will prevent the gaskets from sealing properly.

8. Clean all gasket surfaces with a good wire brush. Clean in the same direction as the surface serrations, not across them.
9. Cover the opening in the valve body to protect the gasket surface and to prevent foreign material from getting into the valve body cavity.
10. Remove the packing flange nuts, packing flange, upper wiper, and packing follower. Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall.
11. Clean the packing box and the following metal packing parts: packing follower, packing box ring, spring or lantern ring, and, for single arrangements of PTFE V-ring packing only, special washer.
12. Inspect the valve stem threads for any sharp edges that might cut the packing. A whetstone or emery cloth may be used to smooth the threads if necessary.
13. Remove the protective covering from the valve body cavity, and install the seat ring and cage using a new seat ring gasket (key 17), bonnet gasket (key 16) and three cage gaskets (key 15). Install the plug, then slide the bonnet over the stem and onto the studs (key 11).

Figure 3. Installing Graphite Ribbon/Filament Packing Rings One at a Time

Note

The prelubricated hex nuts (key 12) referred to in step 14 can be identified by a black film coating on the nut threads.

The proper bolting procedures in step 14 include -- but are not limited to -- ensuring that the bonnet stud threads are clean, and that the hex nuts are evenly tightened to the specified torque values.

CAUTION

Failure to comply with good bonnet-to-body bolting practices and the torque values shown in table 3 may result in damage to the valve. Cheater bars or slug wrenches should not be used for this procedure. Hot torquing is not recommended.

14. Lubricate the stud threads and the faces of the hex nuts (key 12) with anti-seize lubricant (not necessary if new factory prelubricated hex nuts are used). Install the hex nuts and tighten them finger-tight. Stroke the valve several times to center the trim. Torque the nuts in a crisscross pattern to no more than 1/4 of the nominal torque value specified in table 3.

When all nuts are tightened to that torque value, increase the torque by 1/4 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.

Note

When installing packing rings, prevent entrapping air between the rings. Add the rings one at a time without forcing them below the chamfer of the packing box entrance chamber. As each successive ring is added, the stack should not be pushed down more than the thickness of the added ring (figure 3).

15. Install new packing and the metal packing box parts according to the appropriate arrangement in figure 2. If desired, packing parts may be pre-lubricated with a silicon base grease for easier installation. Slip a smooth-edged pipe over the valve stem, and gently tap each soft packing part into the packing box, being sure that air is not trapped between adjacent soft parts.
16. Slide the packing follower, wiper, and packing flange into position. Lubricate the packing flange studs and the faces of the packing flange nuts. Install the packing flange nuts.

For the spring-loaded PTFE V-ring packing shown in figure 2, tighten the packing flange nuts until the shoulder on the packing follower contacts the bonnet.

For graphite packing, tighten the packing flange nuts to the maximum recommended torque shown in table 2. Then, loosen the packing flange nuts, and retighten them to the recommended minimum torque shown in table 2.

For other packing types, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in table 2. Then, tighten the remaining flange nuts until the packing flange is level and at a 90-degree angle to the valve stem.

17. Mount the actuator on the valve body assembly, and reconnect the actuator and valve plug stems according to the procedures in the appropriate actuator instruction manual.

Trim Removal

Note

Avoid personal injury by supporting the valve properly while removing the trim or while servicing the trim or internal body.

Key numbers referenced in this procedure are shown in figure 4, except where indicated.

1. Remove the actuator and bonnet by following steps 1 through 6 of the replacing packing procedure. Observe all warnings and cautions in that procedure.
2. Lift the valve stem and attached valve plug out of the valve body. If the valve plug is to be reused, tape or otherwise protect the valve plug stem and the valve plug seating surface to prevent scratches.
3. Lift out the cage (key 2) and the bonnet gasket (key 16) and three cage gaskets (key 15).
4. Remove the seat ring (key 6) and the seat ring gasket (key 17).
5. Inspect the parts for wear or damage and replace if needed.
6. Refer to the Valve Plug Maintenance procedure or to the Lapping Seats procedure.

Valve Plug Maintenance

Key numbers used in this procedure are shown in figure 4, except where indicated.

1. With the valve plug (key 3) removed according to the trim removal procedure, proceed as appropriate:

For the CHPT valve, work the retaining ring (key 9) off the valve plug with a screwdriver. Carefully slide the backup ring, anti-extrusion rings (keys 8 and 10), and seal ring (key 7) off the valve plug.

2. To replace the valve plug stem (key 4), drive out the pin (key 5), and unscrew the stem from the valve plug.

CAUTION

Never reuse an old stem with a new valve plug. Using an old stem with a new plug requires drilling a new pin hole in the stem. This weakens the stem and may cause the stem to fail in service. If a new valve plug is required, always order a valve plug, stem, and pin as an assembly. Specify the correct part number of each of the three parts, but state that the parts are being ordered as an assembly. A used valve plug may be reused with a new stem.

3. Thread the new stem into the valve plug and tighten it to the appropriate torque value given in table 4. Using the valve plug pin hole as a guide, drill the pin hole through the stem. Refer to table 4 for drill sizes.

4. Drive in the pin to lock the assembly.
5. If it is necessary to lap the seating surfaces, complete the lapping seats procedure before installing the seal ring. The Trim Replacement procedure provides seal ring installation instructions and valve reassembly instructions.

Lapping Seats

Key numbers referenced in this procedure are shown in figure 4, except where indicated.

With metal-seat constructions, lapping seating surfaces of the valve plug and seat ring (keys 3 and 6) can improve shutoff. (Deep nicks should be machined out rather than ground out.) Use a good quality lapping compound of a mixture of 280 to 600-grit. Apply the compound to the bottom of the valve plug.

Note

The CHP valve uses spiral-wound gaskets. These gaskets provide their seal by being crushed and therefore should never be reused. This includes reusing a gasket after the lapping procedure has been performed.

An “old” gasket can be used to lap the seat, however the gasket must be replaced with a new gasket.

To preserve the effects of lapping, do not change either the position of the seat ring in the valve body cavity or the position of the cage on the seat ring after lapping the seating surfaces. When the parts are removed for cleaning and replacement of the “old” gaskets, return them to the original positions.

Use the following procedure to lap the seating surfaces.

1. Install the following parts according to the instructions presented in the trim replacement procedure: “old” seat ring gasket (key 17), seat ring (key 6), cage (key 2) and “old” bonnet gasket (key 16) and three cage gaskets (key 15).
2. Install the valve plug and stem assembly (keys 3 and 4) into the cage.
3. Install the bonnet (key 14) over the valve stem, and secure the bonnet with four of the hex nuts (key 12).
4. Attach a handle, such as a piece of strap iron secured by stem locknuts, to the valve stem. Rotate the handle alternately in each direction to lap the seats.
5. After lapping, disassemble as necessary (you may mark the position of the seat ring and cage with a soft tip marker). Clean the seating surfaces, replace the gaskets, reassemble (taking care to return the seat ring and cage to their original positions), and test for shutoff. Repeat the lapping procedure if necessary.

Trim Replacement

WARNING

Observe the warning at the start of the Maintenance section.

After all trim maintenance has been completed, reassemble the valve body by following the numbered steps below. Be certain that all gasketed surfaces have been well cleaned. Key numbers referenced in this procedure are shown in figure 4, except where indicated.

CAUTION

Inspect the seat ring, cage, bonnet, and body gasket surfaces. These surfaces must be in good condition, with all foreign material removed. Small burrs less than approximately 0.076 mm (0.003 inches) in height (the thickness of a human hair)

can be ignored. Scratches or burrs that run across the serrations are not permitted under any conditions, because they will prevent the gaskets from sealing properly.

1. Install the seat ring gasket (key 17) into the valve body. Install the seat ring (key 6).
2. Install the cage (key 2).
3. Install the seal ring (key 7) onto the valve plug (key 3). Install the anti-extrusion rings (key 10) onto the valve plug (key 3). Install the ring with the open side facing the seat end of the valve plug for flow-down applications (view A of figure 4). Slide the backup ring (key 8) onto the valve plug. Secure with the retaining ring (key 9).
4. Install the valve plug into the cage.
5. Install the bonnet gasket (key 16) and three cage gaskets (key 15).
6. Install the bonnet over the valve stem and onto the valve body.

Note

The prelubricated hex nuts (key 12) referred to in step 7 can be identified by a black film coating on the nut threads.

The proper bolting procedures in step 7 include -- but are not limited to -- ensuring that the bonnet stud threads are clean, and that the hex nuts are evenly tightened to the specified torque values.

CAUTION

Failure to comply with good bonnet-to-body bolting practices and the torque values shown in table 3 may result in damage to the valve. Cheater bars or slug wrenches should not be used for this procedure. Hot torquing is not recommended.

7. Lubricate the stud threads and the faces of the hex nuts (key 12) with anti-seize lubricant (not necessary if new factory prelubricated hex nuts are used). Install the hex nuts, but do not tighten them. Torque the nuts in a crisscross pattern to no more than 1/4 of the nominal torque value specified in table 3. When all nuts are tightened to that torque value, increase the torque by 1/4 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.
8. Install new packing and packing box parts per steps 15 and 16 of the Replacing Packing procedure. Be certain to observe the note given prior to step 15 of that procedure.
9. Mount the actuator by following the procedures in the actuator instruction manual. Check for packing leakage as the valve is being put into service. Retorque the packing flange nuts as required. See table 2.

Parts Ordering

Each valve body-bonnet assembly is assigned a serial number which can be found on the valve. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Refer to the serial number when contacting your [Emerson sales office](#) or Local Business Partner for technical assistance. When ordering replacement parts, reference the valve serial number to obtain the correct eleven-character part number for each part; the following Parts Kit and Parts List is for information only.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts Kit

Standard Packing Repair Kits (Non Live-Loaded)

Stem Diameter, mm (Inches)	Yoke Boss Diameter, mm (Inches)	Kits Packing Material	
		Single PTFE Graphite	Single PTFE Graphite
31.8 (1-1/4)	127 (5H)	RPACKX00352	RPACKX00542

Parts List

Numerous available combinations of valve parts make selection of some parts difficult; when ordering valve parts for which a part number is not listed, provide the valve serial number with the order, permitting proper selection of replacement parts to be made at the factory.

Note

Contact your [Emerson sales office](#) or Local Business Partner for Part Ordering information.

W9164-2

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for NPS 1 through NPS 4 Fisher RSS lined globe valves. Refer to separate manuals for instructions covering the actuator, positioner, and accessories.

Description

The RSS lined globe-style valve (figure 1) has pure-modified PTFE trim parts, push-down-to-close action, and positive shutoff. This valve is intended for applications involving severely corrosive and toxic flowing media, and is well-suited for pure media applications, as well. The RSS valve body provides an economical alternative to alloy valve bodies in a wide variety of applications.

Do not install, operate, or maintain an RSS valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Specifications

Specifications for the RSS valve are shown in table 1. If the valve is shipped with the actuator, some of the valve specifications are on the valve nameplate, which is attached to the actuator. If the valve is shipped without the actuator, the valve nameplate is wired to the valve.

Installation

WARNING

Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure can result if the valve is installed where service conditions could exceed the limits given on the nameplate or in table 1 or 2, or figure 3 or 4. To avoid such injury or damage, use pressure-limiting or pressure-relieving devices to prevent service conditions from exceeding these limits.

Check with your process or safety engineer for any other hazards that may be present from exposure to process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

When ordered, the valve configuration and construction materials are selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Since some valve body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

CAUTION

Before installing the valve, inspect it to be certain that the valve cavity is free of foreign material. Use extra care in handling to avoid damage to the exposed lining on the flanges. Clean out all pipelines to remove scale, welding slag, and any other foreign materials that could cause erosion of the valve body lining.

Use accepted piping practices when installing the valve in the pipeline. To minimize valve damage caused by expansion of PTFE lined pipe, use a line flange gasket (figure 2). This gasket evenly distributes the piping loads across the valve flange face and minimizes the potential for cutting or indenting the lined face on the valve flange.

1. The control valve assembly should be installed in a horizontal pipeline with the valve stem in a vertical position. Before installing in any other orientation, consult your [Emerson sales office](#).
Flow through the valve must be in the direction indicated by the arrow cast on the valve (figure 7).
2. With a leak-off bonnet construction, remove the pipe plug (key 20, not shown) and install the leak-off piping into the tapping in the bonnet (key 2, figure 10).
3. If continuous operation is required during inspection or maintenance, install a three-way bypass around the control valve assembly.
4. For a valve used with a fail-closed actuator, remove the shim (key 24, not shown) from between the bonnet and the travel stop. Discard the shim.
5. If the actuator and valve are shipped separately, refer to the appropriate actuator instruction manual for the actuator mounting procedure.

Note

Bench sets for Fisher 657 and 667 actuators must be adjusted after installation on the RSS valve. The heavy duty bellows on the RSS valve has a significant spring rate that must be included in the bench set for proper operation.

Figure 2. Typical Line Flange Gasket (Key 17)

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing and trim replacement. All these maintenance operations may be performed with the valve in the line.

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any other hazards that may be present from exposure to process media.

Note

Whenever a line flange gasket (figure 2) seal is disturbed by removing the valve from the line, install a new gasket on reassembly. This is necessary to ensure a good gasket seal.

Figure 3. Downstream/Outlet Pressure Ratings (Positive Pressure Service)

NOTE: THE LINER DOES NOT LIMIT THE DOWNSTREAM PRESSURE RATING IN POSITIVE PRESSURE SERVICES.

Figure 4. Downstream/Outlet Pressure Ratings (Vacuum Service)

Figure 5. Bonnet, Travel Stop, and Seat Ring Installation Detail

Packing Maintenance

Key numbers are shown in figure 10.

The packing consists of braided packing rings (key 13). The packing box is only a safety measure in case of a leak through the bellows (key 6). Therefore, the packing follower (key 11) is tightened to 1.13 N•m (10 lbf•in) of torque and then loosened one half turn. To detect a leak through the bellows (key 6), the bonnet (key 2) can be provided with a connection for leak-off piping.

Replacing Packing and Bushing Inserts

Key numbers are shown in figure 10.

1. Isolate the control valve from the line pressure. Release pressure from both sides of the valve and drain the process media from both sides of the valve.
2. Exhaust all actuator pressure, and disconnect the operating lines from the actuator and any leak-off piping from the bonnet (key 2). Disconnect the actuator stem connector, and then remove the actuator from the valve by unscrewing the yoke locknut (key 14).
3. Remove any travel indicator parts, the locknut (key 10), and the travel stop (key 16) from the valve stem (key 5) threads.

CAUTION

Follow the procedures as described in the next steps to prevent damage to the bonnet sealing surface and to prevent packing box leakage.

4. Remove the packing follower (key 11). Unscrew the cap screws (key 7) and hex nuts (key 8) that secure the bonnet (key 2) to the valve (key 1). Then, carefully lift the bonnet off and set it on a protective surface to prevent damage to the bonnet sealing surface. If the valve stem, bellows, and valve plug (keys 5, 6, and 3) come out with the bonnet, remove these parts from the bonnet.
5. Remove bushing inserts, packing rings, and packing box ring (keys 13, 12, 28, and 29).
6. Clean the packing box, packing box ring, and packing follower.
7. Inspect the valve stem and packing box surfaces for any sharp edges that might cut the packing. Scratches or burrs could damage new packing or cause packing box leakage. If the surface condition cannot be improved by light sanding, replace the damaged parts.
8. Install bushing inserts (keys 28 and 29).
9. Install the bonnet (key 2) over the valve stem (key 5). Slide the bonnet down until it properly engages the bonnet locating diameter (figure 5) of the valve.

Note

In order to ensure accurate positioning of the valve plug (key 3) and seat ring (key 4), clearance between the valve and bonnet at all bolting locations (figure 5) must be equal and approximately 2.0 mm (0.080 inches) for NPS 1 through 4 valves. Be sure to measure the clearance in the next step.

10. Tighten the cap screws and hex nuts (keys 7 and 8) in a crisscross pattern to a maximum torque value of 50 N•m (37 lbf•ft). To ensure accurate positioning of the valve plug (key 3) into the seat ring (key 4), check the gap between the valve and bonnet with a feeler gauge (figure 5). At all bolting locations, the gap must be equal and approximately 2.0 mm (0.080 inches) for NPS 1 through 4 valves. In order to keep the gap equal, the individual bolts may have to be tightened to different torque levels.

Note

Due to the cold flowing tendency of the valve liner, this procedure should be repeated upon installation and after the first thermal cycle of the valve.

11. Install the packing rings, packing box ring, and packing follower (keys 13, 12, and 11) over the valve stem. Tighten the packing follower to 1.13 N•m (10 lbf•in) of torque to ensure the packing rings are seated. After the packing rings are seated, loosen the packing follower one half turn.
12. Manually press the valve stem (key 5) into the valve until the valve plug contacts the seat ring.

CAUTION

Improper adjustment in step 13 might cause damage to trim parts. Perform this step carefully.

13. Thread the travel stop (key 16) onto the valve stem until there is a 0.5 mm (0.020 inch) gap between the bottom surface of the travel stop legs and the top of the bonnet (figure 5).
14. Thread the locknut (key 10) onto the stem and tighten it against the travel stop.
15. Mount the actuator and secure it with the yoke locknut (key 14). Connect the actuator stem and valve stem according to the procedure in the appropriate actuator instruction manual.

Trim Maintenance

Key numbers are shown in figure 10.

Disassembly

1. Remove the actuator and the bonnet as described in steps 1 through 4 of the Replacing Packing and Bushing Inserts section.
2. Inspect parts for wear or damage that would prevent proper operation of the valve.
3. To replace the bellows (key 6), unscrew the valve stem (key 5) in a counterclockwise rotation. Install the valve stem into the new bellows with a clockwise rotation by hand. Do not overtighten.
4. To remove the valve plug (key 3), use pliers to remove the locking rope (key 9) that locks the valve plug to the bellows (key 6) as shown in figure 6. Then unscrew the plug from the bellows.

Note

To avoid cold flow of the valve liner and deforming of the valve body seat ring threads and seat ring contact surfaces, promptly install a replacement seat ring according to step 1 of the Assembly procedures.

5. To remove the seat ring (key 4), use the seat ring tool (figure 7 or 8) that can be ordered from the Parts List section or made according to the dimensions in figure 8 and table 3. To avoid cold flow of the valve liner and deforming of the valve body seat ring threads and seat ring contact surfaces, promptly install a replacement seat ring according to step 1 of the Assembly procedures.

Figure 9. Dimensions and Weights

ANSI/ISA CL150 FACE-TO-FACE DIMENSIONS MATING WITH CL150 FLANGES					
Valve Size	Dimensions				Approximate Weight
	A	B	D	EØ	
NPS	mm				kg
1	184.0	83.0	185.0	108.0	10
1-1/2	222.0	97.0	225.0	127.0	17
2	254.0	107.0	230.0	152.4	20
3	298.0	121.0	340.0	190.5	39
4	350.0	176.0	350.0	220.0	42
NPS	Inches				Pounds
1	7.25	3.27	7.28	4.25	23
1-1/2	8.75	3.82	8.86	5.00	36
2	10.00	4.21	9.06	6.00	43
3	11.75	4.76	13.39	7.50	86
4	13.78	6.94	13.78	8.66	92

Assembly

CAUTION

To avoid damage to the seat ring sealing surface and/or threads in the valve body liner, make or order the seat ring tool shown in figures 7 and 8. Installing the seat ring using other tools might cause permanent damage to the seat ring sealing surface and/or threads allowing excessive leakage of the valve.

1. Install the seat ring (key 4) with the seat ring tool (figure 7 or 8) that can be ordered from the Parts List or made according to the dimensions in table 3 and figure 8. Tighten the seat ring until contact is felt between the sealing ledge of the seat ring and its mating surface in the valve (figure 5). At this point, tighten the seat ring one quarter turn or to the torque values listed in table 4.
2. To install the valve plug (key 3), screw the valve plug onto the bellows and insert the locking rope with pliers (figure 6).
3. Install the assembled valve plug, bellows, and valve stem (keys 3, 6, and 5). For metal bellows, install the gasket (key 27).
4. Install the bonnet according to steps 9 and 10 of the Replacing Packing and Bushing Inserts procedure.
5. Tighten the packing follower (key 11) to 1.13 N•m (10 lbf•in) of torque to ensure the packing rings are seated. After the packing rings are seated loosen the packing follower one half turn.
6. Perform steps 12 through 15 of the Replacing Packing and Bushing Inserts section.

Parts Ordering

Each valve body-bonnet assembly is assigned a serial number, which can be found on the valve nameplate. Refer to this serial number when contacting your [Emerson sales office](#) for technical assistance. If the valve is shipped with the actuator, the valve nameplate is attached to the actuator. If the valve is shipped without the actuator, the valve nameplate is wired to the valve. When ordering replacement parts, refer to this serial number and to the part number from the following Parts List.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts List

Note

Contact your [Emerson sales office](#) for Part Ordering information.

Key	Description
1	Valve Body or Valve Body/Ring Assembly If you need a valve body as a replacement part, order by valve size, serial number, and desired material
2	Bonnet/Bushing Assembly If you need a bonnet/bushing assembly as a replacement part, order by valve size and stem diameter, serial number, and desired material
3*	Valve Plug
4*	Seat Ring
5*	Valve Stem
6*	Bellows
7	Cap Screw
7	Stud
8	Hex Nut
9*	Locking Rope

Fisher™ SS-138B and SS-252B Rotary Ball Valves

Introduction

This special instruction manual is an addendum to the Fisher Vee-Ball™ V150, V200, and V300 Rotary Control Valves NPS 1 through 12 Instruction Manual ([D101554X012](#)). Observe all **Warnings**, **Cautions**, and **Notes** provided in the instruction manual. A copy of the manual is attached to this special instruction manual for your reference.

Scope

This special instruction manual provides the assembly, disassembly, and parts information of the seal shims and seal assembly for the SS-252B, and of the seal shims and flow ring construction for the SS-138B. For other procedures, refer to the Fisher Vee-Ball V150, V200, and V300 Rotary Control Valves NPS 1 through 12 Instruction Manual (D101554X012).

Do not install, operate, or maintain SS-138B and SS-252B rotary ball valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. **To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings.** If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The SS-138B valve, a modified V200 or V300, has a metal flow ring construction with a V-notch ball adjusted by shimming to the center of the valve body cavity to hold the flow ring 0.254 to 0.508 mm (0.010 to 0.020 inch) away from the ball.

The SS-252B valve, a modified V300, has a stellite metal seal with a V-notch ball adjusted by shimming to the center of the valve body cavity to obtain zero ball seal deflection. The maximum allowable leakage rates (scfh) for this valve are 400 for NPS 2, 500 for NPS 3, 800 for NPS 4, and 1100 for NPS 6.

Educational Services

Figure 1. Detail of Fisher SS-252B Metal Seal with Multiple Springs

Assembly of Metal Ball Seal with Multiple Spring Seals for SS-252B

⚠ WARNING

When the actuator is removed from the valve, the Vee-Ball/shaft assembly may suddenly rotate, resulting in personal injury. To avoid injury, carefully rotate the ball to the bottom of the valve body cavity. Make sure the ball will not rotate.

1. Install the seal shims in the valve, and install the seal on top of the seal shims. Add or remove shims under the seal as necessary to obtain zero ball seal deflection.

Note

Zero ball seal deflection is the point at which the addition of one 0.13 millimeter (0.005-inch) thick shim causes contact between the ball and ball seal to be broken. Hold the parts tightly together when determining zero deflection, or improper zero deflection might result.

2. Add five spring seals on top of the metal seal, then install the seal protector ring.

Note

Make the following measurement before compressing the spring seals for the first time.

3. Measure the distance at point "A" (figure 1 in this special manual) between the seal protector ring and the valve body.
 - a. Add a spring seal at point "B" if the measurement is less than 0.635 mm (0.025 inch) at point "A".
 - b. If necessary, add additional spring seals at point "B" until the measurement is 0.635 to 1.27 mm (0.025 to 0.050 inch).

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D102231X012

SS-138B and SS-252B Valves

April 2019

4. Remove the seal protector ring, and add the flexible graphite gasket between the valve body and seal protector ring.
5. Install the seal protector clips, or washers, and seal protector screws (keys 21 and 22) to secure the seal protector ring to the valve body.
6. Refer to the Fisher Vee-Ball V150, V200, and V300 NPS 1 through 12 Instruction Manual ([D101554X012](#)) to continue the reassembly of the valve.

Figure 2. Fisher SS-138B Seal Details

Removing the Flow Ring Construction for SS-138B

⚠ WARNING

When the actuator is removed from the valve, the Vee-Ball/shaft assembly may suddenly rotate, resulting in personal injury. To avoid injury, carefully rotate the ball to the bottom of the valve body cavity. Make sure the ball will not rotate.

Please observe all the Warnings, Cautions, and Notes in the Maintenance section of the Fisher Vee-Ball V150, V200, and V300 Instruction Manual ([D101554X012](#)).

1. Isolate the control valve from the line pressure, release pressure and drain the process media from both sides of the valve. If using a power actuator, shut off all pressure/power lines to the power actuator and release all pressure from the actuator.
2. If not already accomplished, remove the line bolting, remove the valve from the pipeline, and place the actuator/valve assembly on a protected flat surface with the seal protector ring facing up. Provide a method of rotating the ball to the open position.
3. Remove the cap screws and spring clips (keys 21 and 22) that hold the retainer ring (key 3) in place. Carefully lift the ring out of the valve body.
4. Remove the spring seal, flow ring, and shim seals (keys 13, 42, and 12). Check all parts for damage and replace parts, if necessary.
5. If no further disassembly is required, continue with the assembly steps below.

Replacing the Flow Ring Construction for SS-138B

⚠ WARNING

When the actuator is removed from the valve, the Vee-Ball/shaft assembly may suddenly rotate, resulting in personal injury. To avoid injury, carefully rotate the ball to the bottom of the valve body cavity. Make sure the ball will not rotate.

1. If not already accomplished, place the valve/actuator assembly on a protected surface with the flow ring side facing up. Provide a means of rotating the ball to the closed position.
2. Install 12 seal shims (key 12) at the seal ledge (see figure 3).
3. Install the flow ring (key 42), making certain it is centered and does not contact the ball.
4. Secure with the retainer ring (key 3) with cap screws and retainer clip (keys 21 and 22) and tighten the cap screws. Measure the clearance between the flow ring and the ball with a wire gauge.
5. Add or subtract seal shims until obtaining the minimum clearance between the ball and flow ring. The clearance should be between 0.254 to 0.508 mm (0.010 to 0.020 inch)

Installing the Bearing Shims

The bearing shims should be installed after the drive shaft and ball have been installed. Please observe all the **Warnings, Cautions, and Notes** in the Replacing the Ball Seal portion of the Maintenance section of the Fisher Vee-Ball V150, V200, and V300 Instruction Manual ([D101554X012](#)).

1. Insert the follower shaft into the ball ear only until it reaches the far side of the ball ear.
2. Install one shim (key 43) between the thrust washer (applicable for NPS 1, 1-1/2, and 2) and the ball ear right where the follower shaft will exit the ball.
3. Push the follower shaft through the shim and into the bearing, making sure to line up the taper key holes.

Repeat this process until ball movement is less than 0.10 mm (0.004 inch) (within one shim).

Parts List

The following list only covers the seal assembly for these valves. For all other parts please refer to the Fisher Vee-Ball V150, V200, and V300 Instruction Manual ([D101554X012](#)).

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Figure 1. Fisher SS-263 Volume Booster

X0206-1

Introduction

Scope of Manual

This instruction manual provides installation, operation, maintenance, and parts information for the SS-263 volume booster (figure 1). Refer to separate instruction manuals for information regarding the valve body, actuator, and other accessories.

Do not install, operate, or maintain an SS-263 volume booster without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. **To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings.** If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The SS-263 volume booster is used exclusively in Fisher Optimized Digital Valve (ODV) packages. The booster amplifies the output signal from the FIELDVUE™ digital valve controller to increase the stroking speed of pneumatic actuators. It has fixed deadband and incorporates soft-seat construction for use with the Fisher 377 Trip Valve.

The booster features dynamically stabilized trim and integral bypass restriction for use with the digital valve controller. The SS-263 volume booster delivers high-volume output for fast stroking speeds when responding to large input signal changes. However, it also delivers smooth, stable, low-volume output when responding to small input signal changes. This allows stable, accurate throttling control which is often necessary during the startup or commissioning of process control equipment.

Table 1. Specifications

Installation

⚠ WARNING

Always wear protective clothing, gloves, and eyewear when performing any installation procedures to avoid personal injury.

System damage may result if a volume booster is installed in a way that it can be physically damaged.

Personal injury or system damage may result when service conditions exceed booster or other equipment ratings. Exceeding the pressure specifications in table 1 may cause leakage, parts damage, or personal injury due to bursting of pressure-containing parts or explosion of accumulated gas.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Note

Do not use separate pressure supplies for the volume booster and associated positioner.

The volume booster may not exhaust immediately upon loss of a separate pressure supply. However, if the system is in a transient state at the time of pressure supply loss or if changes to the booster's input signal are sufficient to overcome the deadband, the booster will exhaust.

A high-capacity regulator is required to provide sufficient capacity to supply both components. A high-capacity filter should be installed in the supply line to the regulator.

Figure 3. Volume Booster Sectional View

Mounting

The volume booster is mounted to the actuator using the provided mounting adaptor (figure 3) that attaches to the top or bottom of the piston cylinder using a 1 NPT or 1-1/4 NPT connection and to the SS-263 using a flange-type connection. For mounting to an ATI piston actuator, a 1-1/4 NPT pipe elbow (key 34) is installed between the mounting adaptor and piston cylinder. Mounting of the SS-263 to the actuator is typically performed at the factory; however the following instructions can be used to mount the SS-263 to a Fisher 785C, 685, or ATI piston actuator.

Mounting to a Fisher 785C Piston Actuator

1. Apply a suitable thread sealant to the threads of the mounting adaptor (key 29) and thread into the appropriate 1 NPT or 1-1/4 NPT connection port on the actuator with or without pipe elbow.
2. Install O-ring (key 30) into the groove in the mounting adaptor (key 29).
3. Using studs (key 31), lock washers (key 33) and hex nuts (key 32) mount the SS-263 onto the actuator. Tighten hex nuts (key 32) to 68 N • m (50 ft • lbs).

Mounting to a Fisher 685 Piston Actuator

1. Apply a suitable thread sealant to the threads of the mounting adaptor (key 29) and thread into the appropriate 1 NPT or 1-1/4 NPT connection port on the actuator.
2. Install O-ring (key 30) into the groove in the mounting adaptor (key 29).
3. Using studs (key 31), lock washers (key 33) and hex nuts (key 32) mount the SS-263 onto the actuator. Tighten hex nuts (key 32) to 68 N • m (50 ft • lbs).

Mounting to an ATI Piston Actuator

1. Apply a suitable thread sealant to the threads of the 1-1/4 NPT pipe elbow (key 34) and thread into the appropriate 1-1/4 NPT connection port on the actuator.
2. Apply a suitable thread sealant to the threads of the mounting adaptor (key 29) and thread into the 1-1/4 NPT pipe elbow (key 34).
3. Install O-ring (key 30) into the groove in the mounting adaptor (key 29).
4. Using studs (key 31), lock washers (key 33) and hex nuts (key 32) mount the SS-263 onto the actuator. Tighten hex nuts (key 32) to 68 N • m (50 ft • lbs).

Pressure Connections

The input signal connection is 1/4 NPT, the supply connection is 1 NPT, and the output connection is 1 NPT or 1-1/4 NPT depending on application. Ensure that the piping is of proper size to meet the capacity demands of the booster and that the actuator is equipped with properly sized input connections.

The SS-263 includes two 1/4 NPT auxiliary supply connections that allow additional accessories, such as a Fisher 377 trip valve, to be connected to supply pressure. The 3 in 1 connection provides either a 1/4 NPT diagnostic connection, 1/4 NPT actuator bypass assembly connection (for use on an actuator with a handwheel), or a 3/4 NPT dump valve connection. Consult the appropriate actuator instruction manual for the assembly of the actuator bypass connection.

Supply Pressure

Supply pressure must be filtered clean dry air or noncorrosive gas.

⚠ WARNING

If a flammable or hazardous gas is to be used as the supply pressure medium, personal injury, property damage or equipment damage could result from fire or explosion of accumulated gas or from contact with hazardous gas. The volume booster has no provision for piping away the vented exhaust gas. Therefore, do not use flammable or otherwise hazardous gas as a supply medium unless the unit is in a well-ventilated area and all ignition sources have been removed.

Exhaust Passages

Exhaust to the atmosphere is through exhaust passages located on the perimeter of the diaphragm spacer assembly. Keep the exhaust passages free of any obstructions or foreign materials that might clog them.

Operating Information

Proper installation of the SS-263 and adjustment of the bypass restriction and tuning of the digital valve controller are required for stable actuator performance. Installation and adjustments are typically performed at the factory.

Retain original piping configuration when replacing an SS-263 volume booster that was originally installed at the factory.

To calibrate and tune the volume booster, turn the bypass restriction adjusting screw (figure 3) two turns counterclockwise from the fully closed position. With the actuator in operation, slowly turn the restriction clockwise until the booster operates in response to large changes in the input signal, yet allows small changes to move the actuator without initiating booster operation. When additional capacity is required, multiple boosters can be used in parallel. The minimum required adjustment for each bypass restriction adjustment screw is 1/6 turn, regardless of configuration.

Principle of Operation

Refer to figure 3.

Because of the restriction, large input signal changes register on the booster input diaphragm sooner than in the actuator. A large, sudden change in the input signal causes a pressure differential to exist between the input signal and the feedback diaphragm of the booster. When this occurs, the diaphragms move to open either the supply port or the exhaust port, whichever action is required to reduce the pressure differential. The port remains open until the difference between the booster input and output pressures returns to within the deadband limits of the booster.

With the bypass restriction adjusted for stable operation, signals having small magnitude and rate changes pass through the bypass restriction and into the actuator without initiating booster operation. Both the supply and exhaust ports remain closed, allowing the output of the digital valve controller to act directly on the actuator piston.

Maintenance

WARNING

Always wear protective clothing, gloves, and eyewear when performing any maintenance procedures to avoid personal injury.

Maintenance requires taking the volume booster out of service periodically. To avoid personal injury or equipment damage, disconnect or bypass any pressure lines to the booster, and vent any pressure locked in the unit before you begin maintenance.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Diaphragm Assembly Replacement

Key numbers refer to figures 4 and 6.

Figure 4. Diaphragm Assembly Drawing

1. Remove the six cap screws (key 10) from the perimeter of the spring case assembly (key 3), and lift off the assembly, taking care you do not lose the upper spring (key 6).
2. Remove the diaphragm assembly (key 4) and diaphragm spacer assembly (key 2) as a unit. The two small O-rings (key 22) will stay attached to the diaphragm spacer assembly (key 2).
3. Separate the diaphragm assembly (key 4) from the diaphragm spacer assembly (key 2). Inspect the upper diaphragm (key 4C) and the lower diaphragm (key 4B) for damage and replace if necessary.

Note

The diaphragms are not individually replaceable, but must be ordered as a diaphragm assembly (key 4).

4. Replace the two O-rings (key 22).
5. Carefully install the diaphragm assembly (key 4) into the diaphragm spacer assembly (key 2) by folding the upper diaphragm (key 4C) inward. Rotate the diaphragm assembly (key 4) until the oversized hole in each diaphragm aligns with the flow passage in the diaphragm spacer assembly (key 2).
6. Install the diaphragm assembly (key 4) and the diaphragm spacer assembly (key 2) onto the body (key 1) while making sure the lower diaphragm (key 4B) is flat and not folded or pinched. Orient the parts to form the bypass restriction passage as shown in figure 6.
7. Apply lubricant (key 18) to the O-ring (4H) and the outside diameter of the spring seat (4F).
8. Install the upper spring (key 6) and the spring case assembly (key 3) on the upper diaphragm (key 4C).

CAUTION

To avoid damage to the diaphragms, do not overtighten the screws.

9. Replace the six cap screws (key 10) and tighten them in a crisscross manner using multiple patterns working up to a final torque of 15.8 N • m (140 lbf • in).

Valve Assembly Replacement

For key numbers refer to figures 5 and 6.

Figure 5. Valve Assembly Drawing

APPLY THREAD LOCKING ADHESIVE (MILD STRENGTH) TO
THREAD WHEN REPLACING INDIVIDUAL COMPONENTS

CE476000-A

APPLY LUB/SEALANT

1. Remove the six cap screws (key 10) from the perimeter of the spring case assembly (key 3), and lift off the assembly, taking care you do not lose the upper spring (key 6).
2. Remove the diaphragm assembly (key 4) and diaphragm spacer assembly (key 2) as a unit. The two small O-rings (key 22) will stay attached to the diaphragm spacer assembly (key 2).
3. Unscrew the valve assembly (key 5) from the body, using the 2-inch hex located on the seat ring (key 5A).
4. If you are replacing a complete valve assembly (key 5), proceed to step 10.
5. If you are replacing an upper valve (key 5C) and a lower valve and stem (key 5B), loosen the hex nut (key 5E), and remove the upper valve. Remove the hex nut (key 5E). Remove the lower guide (key 5F) and the lower spring (key 5J). Remove the lower valve and stem (key 5B) from the seat ring (key 5A).
6. Insert the replacement lower valve and stem (key 5B) into the seat ring (key 5A) and install the hex nut (key 5E) on the stem.
7. Replace the O-ring (key 5H) and apply lubricant (key 18) to both the O-ring (key 5H) and the guide bore of the lower guide (key 5F).
8. Install the lower spring (key 5J) and the lower guide (key 5F). Tighten to 61 N•m (45 lbf•ft).
9. Apply threadlock adhesive (mild strength) or equivalent to the threads of the lower valve and stem (key 5B) and install the upper valve (key 5C). Tighten the hex nut (key 5E) to 4.5 N•m (40 lbf•in) with the lower surface of the upper valve (key 5C) aligned with the upper surface of the seat ring (key 5A) as shown in figure 5.
10. Apply lubricant (key 18) to the O-ring (key 5D) and apply sealant (key 17) to the thread of the seat ring (key 5A).
11. Install the valve assembly (key 5) into the body (key 1). Torque to 102 N•m (75 lbf•ft).
12. Replace the O-rings (key 22).
13. Install the diaphragm assembly (key 4) and the diaphragm spacer assembly (key 2) onto the body (key 1) while making sure the lower diaphragm (key 4B) is flat and not folded or pinched. Orient the parts to form the bypass restriction passage as shown in figure 6.

14. Apply lubricant (key 18) to the O-ring (4H) and the outside diameter of the spring seat (4F).
15. Install the upper spring (key 6) and the spring case assembly (key 3) on the upper diaphragm (key 4C).

CAUTION

To avoid damage to the diaphragms, do not overtighten the screws.

16. Replace the six cap screws (key 10) and tighten them in a crisscross manner using multiple patterns working up to a final torque of 15.8 N • m (140 lbf • in).

Parts Ordering

Whenever corresponding with your [Emerson sales office](#) about this equipment, mention the serial number of the valve assembly. This serial number can be found on the actuator nameplate. It may also be helpful to mention the date and other information on the volume booster nameplate as shown in figure 2.

When ordering replacement parts, state the complete eleven-digit part number of each part required as found in the following parts list.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher instrument, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Figure 1. Fisher TBX Constructions

Introduction

Scope of Manual

This instruction manual includes installation and operation information for the Fisher TBX Blowdown Fixture for flow up and flow down TBX valves. Piping blowdown is very important to successful plant startup and trouble free operation. The plan for piping blowdown should be undertaken by professionals familiar with all aspects of blowdown operation. This manual is not intended to cover all details required for successful piping system cleaning.

Some instructions are different between the TBX flow up and TBX flow down valve constructions. Figure 1 can be used to help identify which instructions apply. Inlet steam flow is perpendicular to the valve stem and actuator on a TBX flow down and parallel to the valve stem and actuator on a TBX flow up.

Key numbers identified for valve disassembly are shown in the specific valve instruction manual. Refer to separate instruction manuals for instructions covering the exact valve, actuator, and accessories associated with the blowdown fixture.

Do not install, operate, or maintain a TBX Blowdown Fixture without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

The TBX Blowdown Fixture provides a convenient way to clean piping upstream of the valve while taking care not to damage internal valve parts.

Educational Services

For information on available courses for the Fisher TBX Blowdown Fixture, as well as a variety of other products, contact:

Emerson Automation Solutions
Educational Services - Registration
Phone: 1-641-754-3771 or 1-800-338-8158
E-mail: education@emerson.com
emerson.com/fishervalvetraining

Principle of Operation

The Blowdown Fixture replaces the valve plug and cage and allows steam flow from the upstream piping to be directed through the valve body and out the valve outlet and downstream piping.

Maintenance

WARNING

To avoid personal injury or property damage from release of pressurized process media, ensure that the system is completely depressurized and appropriate safety measures have been taken prior to carrying out any of the following maintenance procedures. Only trained competent individuals with the proper equipment should attempt to disassemble and install a Blowdown Fixture, and reassemble a TBX valve.

- Do not remove the actuator from the desuperheater while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.

- Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Valve Disassembly

The following valve disassembly steps are intended as a quick reference only. Refer to the TBX instruction manual, [D103172X012](#), for key numbers and further detail regarding valve disassembly.

Actuator Removal

The following actuator disassembly steps are intended as a quick reference only. Refer to the appropriate actuator instruction manual for further detail on actuator removal.

1. Release the actuator seat load by either manually stroking the valve or applying the appropriate instrument signal. The stem connector may be removed once the plug is off of the valve seat.
2. If an instrument signal has been used to stroke the plug off the seat, remove the signal only after removing the stem connector.
3. Isolate and disconnect the operating lines from the actuator.
4. Loosen the yoke fasteners and remove the actuator from the valve.

Packing Box

Unbolt the packing stud nuts, (key 68), and remove the packing flange (key 66) and packing follower, (key 65) (reference the appropriate instruction manual for key numbers). Remove as much packing as possible from the packing box.

CAUTION

Extreme care should be taken to avoid scratching the stem or the packing box.

Bonnet and Trim

1. Loosen the bonnet stud nuts, (key 55) using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the bonnet studs, which may cause binding.

Individual nuts should not be completely loosened while the remaining nuts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs.

2. Remove the bonnet (key 6) from the valve with uni-axial pull. If the bonnet seems to bind in the valve body, check the alignment of the hoist or pulling mechanism. Deviation from an axial pull of the parts may result in galling or bending of the stem (key 23). The bonnet may be lightly tapped back into alignment with a soft face mallet. The stem and plug should be pushed back into the valve body while the bonnet is being removed. Once the bonnet is removed, dislodge any remaining packing rings from the packing box.

CAUTION

Do not attempt to overpower any binding, as damage to the guide surfaces may result.

3. Remove the packing ring (key 63) from the bottom of the packing box. Lightly sand the inside of the packing box with 60 or 80 grit paper to remove any adherent packing material. Final cleanup should be made with 160 grit or finer paper.
4. Inspect the bonnet guiding surfaces and gasket mating surfaces. Light damage on the guiding surface may be repaired with an emery cloth or other suitable material. Damage to the gasket mating surface may require bonnet replacement to avoid leakage.
5. Remove the plug assembly (key 22, 23, and 53) as a single unit by grasping the valve stem (key 23) and pulling the assembly from the body cavity. The plug assembly contains sensitive guiding and sealing surfaces on its outside diameter and care must be taken in its handling. The plug should be temporarily stored on a clean wooden or cloth surface.
6. Remove the cage (key 21) from the valve body. Remove and discard the upper and lower cage gaskets (key 43). Reference the TBX valve instruction manual for guidance in performing this disassembly. The cage contains sensitive guiding surfaces on its outside diameter and care must be taken during handling. The cage should be temporarily stored on a clean wooden or cloth surface.
7. Clean and inspect the guiding and sealing surfaces of the plug assembly. For balanced plug designs, inspect the piston ring (key 45) and Bore Seal ring (key 46) for signs of excess wear or damage and replace if necessary. The piston ring is a two piece design with an outer seal ring and an inner expander ring. The outer ring diameter should be expanded beyond the diameter of the plug in its free state. It can be shifted within its groove to inspect for uneven wear around its circumference. The piston ring should require some compression when installing the plug into the cage. Lack of required compression indicates that the piston ring has worn or relaxed and should be replaced. Vertical marks in the axial orientation also indicates wear that requires replacement of the ring. The Bore Seal ring has a C-shaped cross section with the open portion of the C-shape facing the stem side of the plug for flow-up designs and the open portion of the C-shape facing the seating surface of the plug for flow-down designs. Any uneven marks around the circumference of the ring or any flattening of the ring shape at its outside diameter are indications of wear and require replacement. Contact your [Emerson sales office](#) or Local Business Partner for Bore Seal ring replacement.
8. Clean and inspect the inside diameter surfaces of the cage. The entire length of the cage inside diameter is either a sealing and/or guiding surface and any measurable wear requires that the cage be replaced.
9. **Flow up construction only:** The seat ring remains retained inside the valve body. Clean and inspect the angled seating surface. Any detectable damage around the circumference of the seating surface is an indication of wear and requires reconditioning to ensure seating performance. Contact your Emerson sales office or Local Business Partner for specific instructions on reconditioning the seating surface.
10. **Flow down construction only:** The bolted seat ring and lower cage must be removed. Loosen the seat ring bolts, (key 76) using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the seat ring studs, which may cause binding. Individual bolts should not be completely loosened while the remaining bolts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs. Reference the TBX instruction manual ([D103172X012](#)) for instructions on removing the bolted seat ring and lower cage (key 79). Discard lower cage gaskets (key 75). The bolted seat ring and lower cage contain sensitive guiding and gasket surfaces on its outside diameter and care must be taken in their handling. The seat ring and lower cage should be temporarily stored on a clean wooden or cloth surface.

11. Remove all used gaskets and foreign matter from the interior of the valve and from the inlet and outlet openings. Remove any foreign matter that may be in the valve trim. Inspect all valve body guiding and sealing surfaces for any signs of wear.

Visual Inspection

Visually inspect the interior of the valve for abnormal wear, signs of erosion, or scoring if the valve has been in service. All scores and scratches should be removed by grinding or filing to remove any interference of the clearance zones between the internal bores and the mating parts. The affected area should be sanded with 100 grit or finer paper. Do not attempt to completely remove the score, only the interference should be removed and sanded.

The gasket surfaces of the valve body and bonnet should be inspected to verify that they are not damaged and are free of imbedded gasket material.

Installation of the Blowdown Plug

Inspect the valve to ensure that all parts and gaskets have been removed and the valve body is free from foreign debris. For TBX flow up constructions, lubricate the inside and outside of the seat lip and the upper valve body bore and counterbore. For TBX flow down constructions, lubricate the lower body bore where the bolted seat and lower cage guide are located and the upper valve body bore and counterbore. Install the trim as noted below and illustrated in the Blowdown Fixture drawings, figures 2, 3, and 4.

1. Place the lower cage gasket (key 43) into the valve body.
2. Insert the Blowdown Plug (key 3) into the valve body, making sure that the gasket remains properly placed. Note that the Blowdown Plug must extend to and engage with the seat ring. If there is any question regarding the proper seating of the Blowdown Plug inside the valve body, the following measurements can be taken for confirmation. Measure the thickness of the Blowdown Plug flange at its largest diameter. Measure the depth of the mating counterbore where the Blowdown Plug flange engages into the valve body. When assembled with a new cage gasket, the resulting depth from the top of the valve body to the top of the Blowdown Plug flange should be the difference in these two measured values, minus an additional 0.045 inch to allow for the uncompressed gasket.
3. Flow down construction only: Insert the Blowdown Plug (key 3) into the valve body, making sure the gasket remains properly placed.

Table 1. Recommended Bonnet Stud Torque⁽¹⁾

Bolt Size, Inch	Threads Per Inch	Recommended Bolt Torque, lbf•ft ⁽²⁾
1	8	405
1-1/8	8	550
1-1/4	8	730
1-3/8	8	980
1-1/2	8	1290
1-5/8	8	1650
1-3/4	8	2070
1-7/8	8	2560
2	8	3130
2-1/4	8	4490

1. Torque values for lubricated threads.
2. Torques for studs with heavy hex nuts.

4. Place the upper cage gasket (key 43) on top of the flange of the Blowdown Plug.
5. Lubricate the bonnet studs (key 54) and lower the bonnet (key 6) onto the valve body, making sure that the upper cage gasket remains in the gasket containment groove.
6. Lubricate and tighten the bonnet fasteners as recommended in the TBX valve instruction manual. Torque values are also shown in table 1 of this document.

CAUTION

Failure to comply with good body-to-bonnet bolting practices and the torque values shown in table 1 or in the appropriate valve instruction manual may result in damage to the valve.

Piping Blowdown with the Blowdown Fixture Installed

WARNING

To avoid personal injury or property damage from blown out debris, take appropriate measures to stay clear of the outlet of the blowdown piping during the following procedure.

Note

The following steps are not intended to be complete instructions for performing a proper system blowdown. They are intended only to address the basic issues required for proper piping blowdown.

1. Perform piping blowdown according to plant startup procedures. Normal blowdown procedures should incorporate piping velocities in excess of those anticipated during maximum system operation. Piping should be blown down until two subsequent checks of a target placed at the outlet of the blowdown piping indicate that all debris has been removed from the piping.
2. At the completion of the blowdown procedure, secure and depressurize the system.

Disassembly of the Blowdown Fixture

1. Loosen the bonnet nuts, (key 55) using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the bonnet flange studs which may cause binding.

Individual nuts should not be completely loosened while the remaining nuts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs.

2. Remove the bonnet (key 6) from the valve with uni-axial pull. If the bonnet seems to bind in the valve body, check the alignment of the hoist or pulling mechanism. Deviation from an axial pull of the parts may result in galling or bending of the stem.

CAUTION

Do not attempt to over-power any binding, as damage to the guide surfaces may result.

3. Remove and discard the upper cage gasket (key 43).
4. Remove the Blowdown Plug (key 3) from the valve body cavity using the integral eyebolt holes in the blowdown plug.
5. Remove and discard the lower cage gasket (key 43).

CAUTION

To avoid compromising the service life of the TBX valve body and/or trim, do not reuse the Blowdown Fixture gaskets for valve reassembly.

Cleaning

After removal of the Blowdown Plug, the interior of the valve body should be rinsed with clean water or repeatedly wiped with clean towels until the surfaces are clean to the touch. All internal parts should be cleaned prior to reassembly.

Reassembly

Refer to the TBX valve instruction manual for guidance in reassembling the valve.

Ordering Information

Information required to order a TBX Blowdown Fixture.

- Valve Serial Number
- Valve Tag Number
- Customer Order Number
- Valve Model Number

Blowdown Fixture Design Conditions

- Flushing Fluid
- Flushing Fluid Pressure
- Flushing Fluid Temperature
- Material (carbon steel unless otherwise specified)

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Introduction

Scope of Manual

This instruction manual includes installation and operation information for the Fisher TBX Blowout Fixture for flow up and flow down TBX valves. Piping blowdown is very important to successful plant startup and trouble free operation. The plan for piping blowdown should be undertaken by professionals familiar with all aspects of blowdown operation. This manual is not intended to cover all details required for successful piping system cleaning.

Some instructions are different between the TBX flow up and TBX flow down valve constructions. Figure 1 can be used to help identify which instructions apply. Steam flow is perpendicular to the valve stem and actuator on a TBX flow down and parallel to the valve stem and actuator on a TBX flow up.

Key numbers identified for valve disassembly are shown in the specific valve instruction manual. Refer to separate instruction manuals for instructions covering the exact valve, actuator, and accessories associated with the blowout fixture.

Do not install, operate, or maintain a TBX Blowout Fixture without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. **To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings.** If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

The TBX Blowout Fixture provides a convenient way to clean piping upstream of the valve while taking care not to damage internal valve parts.

Educational Services

For information on available courses for the Fisher TBX Blowout Fixture, as well as a variety of other products, contact:

Emerson Automation Solutions
Educational Services - Registration
Phone: 1-641-754-3771 or 1-800-338-8158
E-mail: education@emerson.com
emerson.com/fishervalvetraining

Principle of Operation

The Blowout Fixture replaces the valve cage and plug, as well as the valve bonnet. The fixture allows steam flow from the inlet or outlet piping to be directed through the valve, out the blowout fixture, and through temporary piping.

Maintenance

WARNING

To avoid personal injury or property damage from the release of pressurized process media, ensure that the system is completely depressurized and appropriate safety measures have been taken prior to carrying out any of the following procedures. Only trained competent individuals with the proper equipment should attempt to disassemble and install a Blowout Fixture, and reassemble a TBX valve.

- Do not remove the actuator from the desuperheater while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Valve Disassembly

The following valve disassembly steps are intended as a quick reference only. Refer to the TBX instruction manual, D103172X012, for key numbers and further detail regarding valve disassembly.

Actuator Removal

The following actuator disassembly steps are intended as a quick reference only. Refer to the appropriate actuator instruction manual for further detail regarding actuator removal.

1. Release the actuator seat load by either manually stroking the valve or applying the appropriate instrument signal. The stem connector may be removed once the plug is off of the valve seat.
2. If an instrument signal has been used to stroke the plug off the seat, remove the signal only after removing the stem connector.
3. Isolate and disconnect the operating lines from the actuator.
4. Loosen the yoke fasteners, as appropriate, and remove the actuator from the valve.

Packing Box

Unbolt the packing stud nuts, (key 68), and remove the packing flange (key 66) and packing follower, (key 65) (reference the appropriate instruction manual for key numbers). Remove as much packing as possible from the packing box.

CAUTION

Extreme care should be taken to avoid scratching the stem or the packing box.

Bonnet and Trim

1. Loosen the bonnet stud nuts, (key 55) using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the bonnet studs which may cause binding.

Individual nuts should not be completely loosened while the remaining nuts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs.

2. Remove the bonnet (key 6) from the valve with uni-axial pull. If the bonnet seems to bind in the valve body, check the alignment of the hoist or pulling mechanism. Deviation from an axial pull of the parts may result in galling or bending of the stem (key 23).

CAUTION

Do not attempt to over-power any binding, as damage to the guide surfaces may result.

The bonnet may be lightly tapped back into alignment with a soft face mallet. The stem and plug should be pushed back into the valve body while the bonnet is being removed. Once the bonnet is removed, dislodge any remaining packing rings from the packing box.

3. Remove the packing ring (key 63) from the bottom of the packing box. Lightly sand the inside of the packing box with 60 or 80 grit paper to remove any adherent packing material. Final cleanup should be made with 160 grit or higher paper.
4. Inspect the bonnet guiding surfaces and gasket mating surfaces. Light damage on the guiding surface may be repaired with an emery cloth or other suitable material. Damage to the gasket mating surface may require bonnet replacement to avoid leakage.
5. Remove the plug assembly (key 22, 23, and 53) as a single unit by grasping the valve stem (key 23) and pulling the assembly from the body cavity. The plug assembly contains sensitive guiding and sealing surfaces on its outside diameter and care must be taken in its handling. The plug should be temporarily stored on a clean wooden or cloth surface.
6. Remove the cage (key 21) from the valve body. Remove and discard the upper and lower cage gaskets (key 43). Reference the TBX valve instruction manual for guidance in performing this disassembly. The cage contains sensitive guiding surfaces on its outside diameter and care must be taken during handling. The cage should be temporarily stored on a clean wooden or cloth surface.
7. Clean and inspect the guiding and sealing surfaces of the plug assembly. For balanced plug designs, inspect the piston ring (key 45) and Bore Seal ring (key 46) for signs of excess wear or damage and replace if necessary. The piston ring is a two piece design with an outer seal ring and an inner expander ring. The outer ring diameter should

be expanded beyond the diameter of the plug in its free state. It can be shifted within its groove to inspect for uneven wear around its circumference. The piston ring should require some compression when installing the plug into the cage. Lack of required compression indicates that the piston ring has worn or relaxed and should be replaced. Vertical marks in the axial orientation also indicates wear that requires replacement of the ring. The Bore Seal ring has a C-shaped cross section with the open portion of the C-shape facing the stem side of the plug for flow-up designs and the open portion of the C-shape facing the seating surface of the plug for flow-down designs. Any uneven marks around the circumference of the ring or any flattening of the ring shape at its outside diameter are indications of wear and require replacement. Contact your [Emerson sales office](#) or Local Business Partner for Bore Seal ring replacement.

8. Clean and inspect the inside diameter surfaces of the cage. The entire length of the cage inside diameter is either a sealing and/or guiding surface and any measurable wear requires that the cage be replaced.
9. **Flow up construction only:** The seat ring remains retained inside the valve body regardless if it is bolted or welded. Clean and inspect the angled seating surface. Any detectable damage around the circumference of the seating surface is an indication of wear and requires reconditioning to ensure seating performance. Contact your Emerson sales office or Local Business Partner for specific instructions on reconditioning the seating surface.
10. **Flow down construction only:** The bolted seat ring and lower cage must be removed. Loosen the seat ring bolts, (key 76) using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the seat ring studs, which may cause binding. Individual bolts should not be completely loosened while the remaining bolts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs. Reference the TBX instruction manual (D103172X012) for instructions on removing the bolted seat ring and lower cage (key 79). Discard the lower cage gaskets (key 75). The bolted seat ring and lower cage contain sensitive guiding and gasket surfaces on its outside diameter and care must be taken in their handling. The seat ring and lower cage should be temporarily stored on a clean wooden or cloth surface.
11. Remove all used gaskets and foreign matter from the interior of the valve and from the inlet and outlet openings. Remove any foreign matter that may be in the valve body or trim. Inspect all valve body guiding and sealing surfaces for any signs of wear.

Visual Inspection

Visually inspect the interior of the valve for abnormal wear, signs of erosion, or scoring if the valve has been in service. All scores and scratches should be removed by grinding or filing to remove any interference of the clearance zones between the internal bores and the mating parts. The affected area should be sanded with 100 grit or finer paper. Do not attempt to completely remove the score, only the interference should be removed and sanded.

The gasket surfaces of the valve body and bonnet should be inspected to verify that they are not damaged and are free of imbedded gasket material.

Table 1. Recommended Bonnet Bolt Torque

Bolt Size, Inch	Threads per Inch	Recommended Bolt Torque, lbf•ft ⁽¹⁾
1	8	405
1-1/8	8	550
1-1/4	8	730
1-3/8	8	980
1-1/2	8	1290
1-5/8	8	1650
1-3/4	8	2070
1-7/8	8	2560
2	8	3130
2-1/4	8	4490

1. Torques for studs with heavy hex nuts.

Installation of the Blowout Fixture

Inspect the valve to ensure that all parts and gaskets have been removed and the valve body is free from foreign debris. For TBX flow up constructions, lubricate the inside and outside of the seat lip and the upper valve body bore and counterbore. For TBX flow down constructions, lubricate the lower body bore where the bolted seat and lower cage guide and the upper valve body bore and counterbore. Install the trim as noted below and illustrated in the Blowout Fixture drawings, figures 2-13.

1. Place the lower cage gasket (key 43) in the valve body.
2. **Flow up construction only:** Insert the blowout plug (key 5) in the valve body making sure that the gasket remains properly placed. Note that the Blowout Plug must extend to and engage with the seat ring. If there is any question regarding the proper seating of the Blowout Plug inside the valve body, the following measurements can be taken for confirmation. Measure the thickness of the Blowout Plug flange at its largest diameter. Measure the depth of the mating counterbore where the Blowout Plug flange engages into the valve body. When assembled with a new cage gasket, the resulting depth from the top of the valve body to the top of the Blowout Plug flange should be the difference in these two measured values, minus an additional 0.045 inch to allow for the uncompressed gasket.
3. **Flow down construction only:** Insert the Blowout Plug (key 4 or 5) into the valve body, making sure that the gasket remains properly placed.
4. Place the upper cage gasket (key 43) on top of the Blowout Plug flange.
5. Lubricate the bonnet studs (key 54) and lower the blowout bonnet (key 10) onto the valve body, making sure that the upper cage gasket remains located in the gasket containment groove.
6. Lubricate and tighten the bonnet fasteners as recommended in the TBX valve instruction manual. Torque values are also shown in table 1 of this document.

CAUTION

Failure to comply with good body-to-bonnet bolting practices and the torque values shown in table 1 or in the appropriate valve instruction manual may result in damage to the valve.

Piping Blowdown with the Blowout Fixture Installed

⚠ WARNING

To avoid personal injury or property damage from sudden release of process pressure or bursting of parts, do not exceed the pressure class rating of the blowout fixture when performing the piping blowdown.

Note

The following steps are not intended to be complete instructions for performing a proper system blowdown. They are intended only to address the basic issues required for proper piping blowdown.

1. Connect temporary piping to the Blowout Bonnet connection taking care not to impose excessive piping loads on the valve-to-bonnet connection.
2. Perform piping blowdown according to plant startup procedures. Normal blowdown procedures should incorporate piping velocities in excess of those anticipated during maximum system operation. Piping should be blown down until two subsequent checks of a target placed at the outlet of the blowdown piping indicate that all debris has been removed from the piping.

3. At the completion of the blowdown procedure, secure and depressurize the system.

Disassembly of the Blowout Fixture

1. Disconnect the temporary piping connection from the Blowout Bonnet.
2. Loosen the Blowout Bonnet nuts, (key 55) using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the bonnet flange studs which may cause binding.

Individual nuts should not be completely loosened while the remaining nuts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs.

3. Remove the Blowout Bonnet (key 10) from the valve with uni-axial pull. If the Blowout Bonnet seems to bind in the valve body, check the alignment of the hoist or pulling mechanism. Deviation from an axial pull of the parts may result in galling or bending of the stem.

CAUTION

Do not attempt to over-power any binding, as damage to the guide surfaces may result.

4. Remove and discard the upper cage gasket (key 43).
5. Remove the Blowout Plug (key 5) from the valve body cavity using the integral eyebolt holes in the Blowout Plug.
6. Remove and discard the lower cage gasket (key 43).

CAUTION

To avoid compromising the service life of the TBX valve body and/or trim, do not reuse the Blowout Fixture gaskets for valve reassembly.

Cleaning

After removal of the blowout trim, the interior of the valve body should be rinsed with clean water or repeatedly wiped with clean towels until the surfaces are clean to the touch. All internal parts should be thoroughly cleaned prior to reassembly of the valve.

Reassembly

Refer to the TBX valve instruction manual for guidance in reassembling the valve.

Ordering Information for Flanged Fixture

Information required for specifying and ordering the TBX Blowout Fixture. See figures 2 and 3.

Valve Information

- Valve Serial Number
- Valve Tag Number
- Customer Order Number
- Valve Model Number

Blow Fixture Design Conditions

- Flushing Fluid
- Flushing Fluid Pressure
- Flushing Fluid Temperature
- Material (carbon steel unless otherwise noted)
- Blow Fixture Pressure Class: CL300 (this is the default class if not otherwise specified)

Ordering Information for BWE Fixture

Information required for specifying and ordering the TBX Blowout Fixture. See figures 4 and 5.

Valve Information

- Valve Serial Number
- Valve Tag Number
- Customer Order Number
- Valve Model Number

Blow Fixture Design Conditions

- Flushing Fluid
- Flushing Fluid Pressure
- Flushing Fluid Temperature
- Material (carbon steel unless otherwise noted)
- Blow Fixture Pressure Class: CL300 (this is the default class if not otherwise specified)
- Blow Fixture Outlet Pipe Schedule (Schedule XS unless otherwise noted)

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Figure 1. Fisher TBX Constructions

Introduction

Scope of Manual

This instruction manual includes installation and operation information for the Fisher TBX Hydro-Plug Fixture for flow up and flow down TBX valves. The TBX Hydro-Plug Fixture can be very useful in establishing hydro test boundaries since most TBX valves are split class valves. This manual is not intended to cover all details required for successful hydro testing.

Some instructions are different between the TBX flow up and TBX flow down valve constructions. Figure 1 can be used to help identify which instructions apply. Inlet steam flow is perpendicular to the valve stem and actuator on a TBX flow down and parallel to the valve stem and actuator on a TBX flow up.

Key numbers identified for valve disassembly are shown in the specific valve instruction manual. Refer to separate instruction manuals for instructions covering the exact valve, actuator, and accessories associated with the Hydro-Plug.

Do not install, operate, or maintain a TBX Hydro-Plug Fixture without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

The TBX Hydro-Plug fixture provides a convenient way to establish hydrotest boundaries associated with using a split class valve typical of the TBX. The Hydro-Plug fixture is intended to be used so that the upstream piping can be tested at the required pressure for body and inlet piping pressure class without overpressurizing the lower pressure class outlet and outlet piping.

Educational Services

For information on available courses for the Fisher TBX Hydro-Plug Fixture, as well as a variety of other products, contact:

Emerson Automation Solutions
Educational Services - Registration
Phone: 1-641-754-3771 or 1-800-338-8158
E-mail: education@emerson.com
emerson.com/fishervalvetraining

Principle of Operation

The Hydro-Plug replaces the valve plug and cage and allows pressurization of the valve inlet, valve body, and inlet piping to the appropriate hydro pressure without overpressurizing the lower pressure class valve outlet and outlet piping.

CAUTION

The Hydro-Plug Fixture employs a rubber O-ring to create a positive seal at the valve seat. The sealing integrity of this O-ring will be compromised if the Hydro-Plug is installed when welding the valve body inline, or during welding preheat or post weld heat treatment.

Maintenance

⚠ WARNING

To avoid personal injury or property damage from pressurized escape of process media, ensure that the system is completely depressurized and appropriate safety measures have been taken prior to carrying out any of the following

procedures. Only trained competent individuals with the proper equipment should attempt to disassemble and install a Hydro-Plug Fixture, and reassemble a TBX valve.

- Do not remove the actuator from the desuperheater while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Valve Disassembly

The following valve disassembly steps are intended as a quick reference only. Refer to the TBX instruction manual, [D103172X012](#), for further detail regarding valve disassembly.

Actuator Removal

The following actuator disassembly steps are intended as a quick reference only. Refer to the appropriate actuator instruction manual for further detail regarding actuator removal.

1. Release the actuator seat load by either manually stroking the valve or applying the appropriate instrument signal. The stem connector may be removed once the plug is off the valve seat.
2. If an instrument signal has been used to stroke the plug off the seat, remove the signal only after removing the stem connector.
3. Isolate and disconnect the operating lines from the actuator.
4. Loosen the yoke locknut or the fasteners and remove the actuator from the valve.

Packing Box

Unbolt the packing stud nuts, (key 68), and remove the packing flange (key 66) and packing follower, (key 65) (reference appropriate instruction manual for key numbers). Remove as much packing as possible from the packing box.

CAUTION

Extreme care should be taken to avoid scratching the stem or the packing box.

Bonnet and Trim

1. Loosen the bonnet stud nuts (key 55), using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the bonnet studs which may cause binding.

Individual nuts should not be completely loosened while the remaining nuts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs.

2. Remove the bonnet (key 6) from the valve with uni-axial pull. If the bonnet seems to bind in the valve body, check the alignment of the hoist or pulling mechanism. Deviation from an axial pull of the parts may result in galling or bending of the stem (key 23).

CAUTION

Do not attempt to over-power any binding, as damage to the guide surfaces may result.

The bonnet may be lightly tapped back into alignment with a soft face mallet. The stem and plug should be pushed back into the valve body while the bonnet is being removed. Once the bonnet is removed, dislodge any remaining packing rings from the packing box.

3. Remove the packing ring (key 63) from the bottom of the packing box. Lightly sand the inside of the packing box with 60 or 80 grit paper to remove any adherent packing material. Final cleanup should be made with 160 grit or higher paper.
4. Inspect the bonnet guiding surfaces and gasket mating surfaces. Light damage on the guiding surface may be repaired with an emery cloth or other suitable material. Damage to the gasket mating surface may require bonnet replacement to avoid leakage.
5. Remove the plug assembly (key 22, 23, and 53) as a single unit by grasping the valve stem (key 23) and pulling the assembly from the body cavity. The plug assembly contains sensitive guiding and sealing surfaces on its outside diameter and care must be taken in its handling. The plug should be temporarily stored on a clean wooden or cloth surface.
6. Remove the cage (key 21) from the valve body. Remove and discard the upper and lower cage gaskets (key 43). Reference the TBX valve instruction manual for guidance in performing this disassembly. The cage contains sensitive guiding surfaces on its outside diameter and care must be taken during handling. The cage should be temporarily stored on a clean wooden or cloth surface.
7. Clean and inspect the guiding and sealing surfaces of the plug assembly. For balanced plug designs, inspect the piston ring (key 45) and Bore Seal ring (key 46) for signs of excess wear or damage and replace if necessary. The piston ring is a two piece design with an outer seal ring and an inner expander ring. The outer ring diameter should be expanded beyond the diameter of the plug in its free state. It can be shifted within its groove to inspect for uneven wear around its circumference. The piston ring should require some compression when installing the plug into the cage. Lack of required compression indicates that the piston ring has worn or relaxed and should be replaced. Vertical marks in the axial orientation also indicates wear that requires replacement of the ring. The Bore Seal ring has a C-shaped cross section with the open portion of the C-shape facing the stem side of the plug for flow-up designs and the open portion of the C-shape facing the seating surface of the plug for flow-down designs. Any uneven marks around the circumference of the ring or any flattening of the ring shape at its outside diameter are indications of wear and require replacement. Contact your [Emerson sales office](#) or Local Business Partner for Bore Seal ring replacement.

Table 1. Recommended Bonnet Bolt Torque

Bolt Size, Inch	Threads per Inch	Recommended Bolt Torque, lbf•ft ⁽¹⁾
1	8	405
1-1/8	8	550
1-1/4	8	730
1-3/8	8	980
1-1/2	8	1290
1-5/8	8	1650
1-3/4	8	2070
1-7/8	8	2560
2	8	3130
2-1/4	8	4490

1. Torques for studs with heavy hex nuts.

8. Clean and inspect the inside diameter surfaces of the cage. The entire length of the cage inside diameter is either a sealing and/or guiding surface and any measurable wear requires that the cage be replaced.
9. **Flow up construction only:** The seat ring remains retained inside the valve body. Clean and inspect the angled seating surface. Any detectable damage around the circumference of the seating surface is an indication of wear and requires reconditioning to ensure seating performance. Contact your [Emerson sales office](#) or Local Business Partner for specific instructions on reconditioning the seating surface.
10. **Flow down construction only:** The bolted seat ring and lower cage must be removed. Loosen the seat ring bolts, (key 76) using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the seat ring studs, which may cause binding. Individual bolts should not be completely loosened while the remaining bolts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs. Reference the TBX instruction manual ([D103172X012](#)) for instructions on removing the bolted seat ring and lower cage (key 79). Discard lower cage gaskets (key 75). The bolted seat ring and lower cage contain sensitive guiding and gasket surfaces on its outside diameter and care must be taken in their handling. The seat ring and lower cage should be temporarily stored on a clean wooden or cloth surface.
11. Remove all used gaskets and foreign matter from the interior of the valve and from the inlet and outlet openings. Remove any foreign matter that may be in the valve trim. Inspect all valve body guiding and sealing surfaces for any signs of wear.

Visual Inspection

Visually inspect the interior of the valve for abnormal wear, signs of erosion, or scoring if the valve has been in service. All scores and scratches should be removed by grinding or filing to remove any interference of the clearance zones between the internal bores and the mating parts. The affected area should be sanded with 100 grit or finer paper. Do not attempt to completely remove the score, only the interference should be removed and sanded.

The gasket surfaces of the valve body and bonnet should be inspected to verify that they are not damaged and are free of imbedded gasket material.

Installation of the Hydro-Plug

Inspect the valve to ensure that all parts and gaskets have been removed and the valve body is free from foreign debris. For TBX flow up constructions, lubricate the inside and outside of the seat lip and the upper valve body bore and counterbore. For TBX flow down constructions, lubricate the lower body bore where the bolted seat and lower cage guide are located and the upper valve body bore and counterbore. Install the trim as noted below and illustrated in the Hydro-Plug Fixture drawings, (figures 2 to 4).

1. Place the lower cage gasket (key 43) in the valve body.
2. Insert the Hydro-Plug (key 2) in the valve body, making sure that the gasket remains properly placed. Note that the Hydro-Plug must extend to and engage with the seat ring. If there is any question regarding the proper seating of

the Hydro-Plug inside the valve body, the following measurements can be taken for confirmation. Measure the thickness of the Hydro-Plug flange at its largest diameter. Measure the depth of the mating counterbore where the Hydro-Plug flange engages into the valve body. When assembled with a new cage gasket, the resulting depth from the top of the valve body to the top of the Hydro-Plug flange should be the difference in these two measured valves, minus an additional 0.045 inch to allow for the uncompressed gasket.

3. **Flow down construction only:** Insert the Hydro-Plug (key 2) into the valve body, making sure that the gasket remains properly placed.
4. Place the upper cage gasket (key 43) on the Hydro-Plug.
5. Lubricate the bonnet studs (key 54) and lower the bonnet (key 6) onto the valve body, making sure that the upper cage gasket remains in the gasket containment groove.
6. Lubricate and tighten the bonnet fasteners as recommended in the appropriate valve instruction manual. Torque values are also shown in table 1 of this document.

CAUTION

Failure to comply with good body-to-bonnet bolting practices and the torque values shown in table 1 or in the appropriate valve instruction manual may result in damage to the valve.

Piping Hydro Test with Hydro-Plug Fixture Installed

⚠ WARNING

To avoid personal injury or property damage from pressurized escape of process media, ensure that the system is completely depressurized and appropriate safety measures have been taken prior to carrying out any of the following procedures. Only trained competent individuals with the proper equipment should attempt to perform the following procedure.

- **Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.**
- **Check with your process or safety engineer for any additional measures that must be taken to protect against process media.**

Note

The following steps are not intended to be complete instructions for performing a safe and complete hydrotest. They are intended only to address the basic issues required for hydrotesting.

1. Establish hydrotest boundaries to ensure that all required components are tested without overpressurizing the lower pressure class piping and components. After following all safety precautions and venting the system of air, raise the system to the required hydrotest pressure.
2. At the completion of the hydrotest procedure, secure and depressurize the system.

Disassembly of the Hydro-Plug Fixture

1. Loosen the bonnet nuts, (key 55) using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the bonnet flange studs which may cause binding.

Individual nuts should not be completely loosened while the remaining nuts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs.

2. Remove the bonnet (key 6) from the valve with uni-axial pull. If the bonnet seems to bind in the valve body, check the alignment of the hoist or pulling mechanism. Deviation from an axial pull of the parts may result in galling or bending of the stem.

CAUTION

Do not attempt to over-power any binding, as damage to the guide surfaces may result.

3. Remove and discard the upper cage gasket (key 43).
4. Remove the Hydro-Plug (key 2) from the valve body cavity using the integral eyebolt holes in the Hydro-Plug.
5. Remove and discard the lower cage gasket (key 43).

CAUTION

To avoid compromising the service life of the TBX valve body and/or trim, do not reuse the blowout gaskets for valve reassembly.

Cleaning

After removal of the hydro-plug, the interior of the valve body should be rinsed with clean water or repeatedly wiped with clean towels until the surfaces are clean to the touch. All internal parts should be cleaned prior to reassembly.

Reassembly

Refer to the appropriate valve instruction manual for guidance in reassembling the valve.

Ordering Information for Hydro-Plug Fixture

Information required for specifying and ordering the TBX Hydro-Plug Fixture.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual includes installation, maintenance and operation information for the Fisher TBX control valve. Refer to separate instruction manuals for instructions covering the actuator and accessories.

WARNING

Do not install, operate or maintain a TBX valve without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Figure 1. Fisher TBX Steam Conditioning Valve

X0165

1.3 Description

The TBX Steam Conditioning Valve (see Figure 1) provides a convenient and efficient way to reduce steam pressure and temperature within a single device. Typical installations include steam backpressure control, turbine bypass, boiler start-up service, auxiliary steam letdown for drying rolls, kettles, equipment drives, plant heating and other loads requiring dependable and accurate control of steam pressure and temperature.

The TBX Steam Conditioning Valve (Figure 1) is designed to handle the most severe applications in today's cycling power plants as well as provide precise pressure and temperature control for process applications. The TBX incorporates over 20 years of steam conditioning experience and product development. The valve body is designed with the latest finite element analysis (FEA) and computational fluid dynamics (CFD) tools to optimize performance and reliability for demanding steam systems.

The TBX is a flow-up or flow-down design providing the ultimate combination of performance and maintainability. The flow-down TBX incorporates Emerson's low noise Whisper Trim III technology. The flow-up TBX incorporates the same Whisper Trim III technology as the flow-down design, but can also be outfitted with WhisperFlo Trim technology. The simplified trim configuration is thermally compensated to handle the rapid changes in temperatures expected during a turbine trip.

Water atomization and vaporization are key elements in any steam conditioning application. The TBX incorporates a spraywater manifold consisting of variable geometry Type AF nozzles producing a spray pattern suitable for high rangeability applications. These nozzles are strategically placed to achieve complete mixing and quick vaporization at all flowing conditions. Years of research in spray atomization and vaporization were key to optimizing the water injection system. Extensive use of CFD analysis, in addition to field performance feedback, was used to validate spray system enhancements.

Table 1. Specifications for Standard Designs (Physical Specifications)

End Connection Sizes ⁽¹⁾	Construction Materials (continued)
Valve Inlet: NPS 4 through 24 Valve Outlet: NPS 8 through 60	Bonnet Bolting ■ SA193 Grade B7 ■ SA193 Grade B16 ■ SB637 N07718
End Connection Types	Seat Ring Welded Seat Ring (flow-up only) ■ Steel with Alloy 6 ■ 2-1/4 Cr-1 Mo with Alloy 6 ■ 9 Cr-1 Mo-V with Alloy 6 ■ 9 Cr-2 W-V with Alloy 6 Bolted Seat Ring ■ 2-1/4 Cr-1 Mo with Alloy 6 and N07718 Bolting ■ N06625 with Alloy 6 and N07718 Bolting ■ N07718 with Alloy 6 and N07718 Bolting
Valve Configuration	Plug: Control Plug ■ 2-1/4 Cr-1 Mo with Alloy 6 Guiding Surfaces ■ 9 Cr-1 Mo-V with Alloy 6 Guiding Surfaces
Valve Body Ratings ⁽²⁾⁽⁴⁾	Stem ■ SA479 Type S20910 ■ N07718
ASME: CL150 to CL2500	Cage: Control Cage ■ 2-1/4 Cr-1 Mo Nitrided ■ 9 Cr-1 Mo-V Nitrided ■ S41000 Cage with F22 Retainer⁽⁵⁾ ■ S41000 Cage with F91 Retainer⁽⁵⁾ Lower Cage (flow-down only) ■ 2-1/4 Cr-1 Mo Nitrided ■ 9 Cr-1 Mo-V Nitrided
Bonnet Type	Piston Rings ■ Alloy 6B with N07750 Expander
Bolted	Bore Seal ■ N07718
Shutoff Classifications per ANSI/FCI 70-2 and IEC 60534-4	Gaskets ■ Bonnet: N07750/Graphite ■ All Others: N06600/Graphite
Standard: Class V Optional: Class IV	Packing ■ Graphite/Flexible Graphite
Flow Characteristics ⁽³⁾	Nozzles ■ S41000 Stainless steel ■ N07718
Whisper Trim™ III: Linear WhisperFlo™ (flow-up only): Linear	
Flow Direction	
Whisper Trim III: Flow-up or down WhisperFlo: Flow-up	
Construction Materials	
Body/Bonnet ■ SA105 Carbon steel ■ SA182 Grade F22 (2-1/4 Cr-1 Mo) ■ SA182 Grade F91 (9 Cr-1 Mo-V) ■ SA182 Grade F92 (9 Cr-2 W-V)	

1. Consult your [Emerson sales office](#) for additional options.
2. Not all valve sizes are available in all valve body ratings.
3. Contact your [Emerson sales office](#) for other flow characteristics.
4. Intermediate classes above CL2500 are available upon request. Consult your [Emerson sales office](#) for additional information. PN pressure ratings available per pressure requirements of EN1092-1.
5. Whisperflo constructions only.

Section 2: Installation

WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the TBX valve is installed where service conditions could exceed the limits of the pressure rating noted on the nameplate. To avoid such injury or damage, provide a relief valve for over pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

WARNING

This valve is intended for a specific range of service conditions (see Table 1). Applying different conditions to the valve could result in parts damage, malfunction of the valve or loss of control of the process. Do not expose this valve to service conditions or variables other than those for which this valve is intended. If you are not sure what these conditions are, you should contact Emerson for more complete specifications. Provide the product serial number (shown on the nameplate) and all other pertinent information.

NOTICE

Check that the TBX valve is properly orientated with respect to the flow direction of the valve (either flow-up or flow-down). Incorrect installation can result in damage to the valve and poor performance.

1. Before installation, all piping upstream of the valve must be blown clean so that no loose materials such as welding slag, dirt or other foreign matter, are left in the pipe. Use care to keep foreign matter out of the line openings while preparing the valve installation.
2. If possible, before fitting in the line, connect the actuator to a temporary air supply and operate to verify positioning. Disconnect the instrument lines (if applicable).

WARNING

Do not lift the valve by its actuator yoke or cooler manifold piping. Lifting lugs attached to the actuator must not be used to lift the complete valve assembly unless clearly marked as being rated to support the complete valve assembly weight. Personal injury or damage to equipment could occur if the valve is improperly lifted into place.

All lifting and rigging must be completed in accordance with federal/national/provincial, state and local regulations and applicable lifting and rigging equipment standards. Only personnel trained in proper lifting and rigging practices shall perform valve/actuator assembly lifting, rigging and installation. Because each lift will be unique, the method of lifting the valve assembly, the correct location for attaching and lifting the valve assembly and what the valve assembly will do when lifted shall be considered for each lift.

Lifting and rigging equipment used to lift, install or remove a valve assembly or component must be properly selected and sized for the weight and configuration of the valve assembly or component being lifted. The weight of the complete valve assembly, including attached accessories, must be taken in consideration for this purpose. The lifting and rigging equipment must be properly maintained and inspected for damage before each use.

Lifting lugs or other lifting equipment attached to the valve or actuator must never be used to lift or support the weight of attached piping.

If the TBX is equipped with butt weld ends, the valve body must be supported using a lifting sling or other method that does not place a load or force onto the finished surface of the butt weld ends. The TBX does not have a stable resting condition. The valve inlet and outlet must be fully supported until fully welded (butt weld end connections) or bolted (flanged end connections) into the piping.

NOTICE

Care must be taken when lifting the valve/actuator assembly to ensure all accessories and tubing are not damaged in the process. Accessories and tubing may need to be removed prior to lifting to prevent damage and properly reinstalled before use. Protect valve flange faces, butt weld ends and other connection surfaces from damage during lifting.

3. Arrange lifting slings or other lifting and rigging equipment appropriate for the valve weight and configuration around the main valve body to safely lift the valve to the pipe opening.

WARNING

Do not expose the valve to undue stresses by installing it in bent pipes or flanges. Personal injury and equipment damage could result from flange sealing failure due to improper installation.

4. **Flanged Connections**—Lubricate the flange connection bolts with a high temperature thread lubricant. Install flange gaskets and connection bolts per accepted practices and tighten securely.
5. **Welded Connections**—Welding procedures should be in accordance with the applicable codes and the base materials. For preheat, welding electrodes and postweld heat treatment, refer to the applicable codes and practices applicable for the specific facility. Materials are specified on the customer specification sheet. Emerson recommends the valve be disassembled for welding, however if the valve inlet and outlet connections are to be welded with the valve assembled, the valve plug should be maintained off the valve seat during all associated operations. If the valve is to be welded by Shielded Metal Arc Welding (SMAW) process, the valve must be disassembled for welding to ensure that any weld slag is removed from the valve.

NOTICE

Depending on valve body materials used, post weld heat treating may be required. If so, damage to internal parts is possible. In general, if post weld heat treating is to be performed, all trim parts and nozzles should be removed. Contact your Emerson sales office for additional information.

6. Remove the spraywater control valve and flush the cooling water line until all debris is removed from the line prior to connecting it to the TBX valve. Use only clean sources of cooling water to reduce the possibility of nozzle clogging. A strainer should be installed in the water line as close to the TBX valve as possible. To determine appropriate mesh size, refer to valve sizing and specification document or contact your [Emerson sales office](#). Review strainer manufacturer's pressure drop curves to determine appropriate strainer body size. You may need to use a strainer that is larger than the water line size.

WARNING

Failure to use a strainer could result in nozzle clogging and subsequent property damage or loss. Uncontrolled temperatures resulting from clogged nozzles may result in equipment or process temperature limits being exceeded. Exceeding system temperature limits could result in property damage or personal injury.

7. A length of straight pipe is required downstream of the TBX valve to ensure complete vaporization of cooling water. An example of a typical installation appears in Figure 2. Consult the TBX cooler sizing sheet for the required distance of straight pipe. This is unique for each application and is supplied by Emerson.
8. Typically, a temperature sensor should be mounted a minimum distance of 9.1 m / 30 feet downstream of the TBX valve. This distance will vary depending on a number of factors including steam velocity and percentage of spraywater. Consult the cooler sizing sheet provided with the unit for this temperature sensor distance. The steam line should not have any branch lines dividing the steam flow between the TBX valve and the temperature sensor. If you have any questions, contact your [Emerson sales office](#).

9. A typical installation is illustrated in Figure 2. A pressure transmitter senses the pressure downstream (or upstream in backpressure control applications). The pressure controller sends a signal to the actuator positioner opening or closing the TBX valve as required to maintain pressure. A rising stem opens the TBX valve to allow additional steam flow. A temperature sensor (TE) measures changes in temperature and a temperature transmitter (TT) transmits the signal to the temperature control device. The output signal from the controller is sent to the positioner on the cooling water (spraywater) control valve (SWCV). The positioner's output signal strokes the SWCV open, increasing water pressure on the nozzles. Increasing water pressure upstream of the nozzles increases water flow through the nozzles.

NOTICE

Pneumatic lines (where applicable) should be thoroughly blown clean with dry air before connection. Check to make sure wiring connections are made per the equipment manufacturer's instructions and in accordance with local, regional and national codes.

10. If foreign debris has been introduced into the valve or upstream piping during installation, it must be removed prior to using the valve for the first time. A Blowout or Blowdown tool can be purchased to match the TBX valve and facilitate piping blowdown without removal of the valve from the line. Contact your Emerson sales office for pricing and availability of fixtures. Review Fisher instruction manuals, TBX Blowout Fixture (D103206X012) and Fisher Blowdown Fixture (D103207X012) prior to use.
11. After cleanliness of the piping system has been assured, connect instrumentation and power supply to the TBX valve actuator and associated equipment.
12. Monitor the TBX valve as the system is brought on line. Some visible vapors may be seen as the lubricants are heated. If you see any steam leaks after startup, follow isolation and disassembly procedures and disassemble the valve and replace the gaskets (key 43). If the packing box leaks, tighten hex nuts (key 68). If leakage continues, replace the packing (key 64). Be sure to properly isolate the TBX valve prior to disassembly of valve or packing.

WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Section 3: Maintenance

It is recommended that diagnostic tests be performed on the valve 3 to 6 months prior to scheduled maintenance shutdowns. Complete valve disassembly is recommended if tests performed on the valve indicate leakage, sticking or substandard operation. If diagnostics indicate normal valve operation, complete disassembly and inspection of the TBX is recommended during every other regularly scheduled outage or after 24 to 36 months, whichever comes first. Table 2 identifies the recommended inspection tips and diagnostics that can be performed with corresponding repair and replacement information.

WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- **Do not remove the actuator from the valve while the valve is still pressurized.**
- **Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.**
- **Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.**
- **Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.**
- **Vent the power actuator loading pressure and relieve any actuator spring precompression.**
- **Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.**
- **The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings or when loosening the packing box pipe plug.**
- **Check with your process or safety engineer for any additional measures that must be taken to protect against process media.**

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D103172X012

TBX Valve

August 2025

Table 2. Inspection Summary

Key	Part Description	Inspection Tips and Diagnostics	Repair	Replacement
1	Valve Body	Inspect for erosion, thermal fatigue and other damage.	Consult your local Emerson Service Center for a recommendation on necessary weld repair or replacement if damage exists.	
6	Bonnet	Inspect gasket surfaces for damage that could indicate gasket leakage. Inspect packing box to ensure no galling, scoring or particulate is present.	If damage exists consult your local Emerson Service Center for a recommendation on necessary weld repair or replacement.	
20	Nozzle Body Flange	Inspect gasket surfaces for damage that could indicate gasket leakage when spray nozzles are replaced.	Replacement only	As needed
21	Cage	Inspect cage bore for excessive wear, galling damage, particulate damage and flow passage damage or clogging.	Consult your local Emerson Service Center for a recommendation on necessary repair or replacement if damage exists.	As needed for optimal performance
22	Plug	Inspect for seat erosion, excessive wear, galling damage and particulate damage, paying close attention to the seating and guiding surfaces.	Re-cutting/machining of seating surfaces can be performed by your local Emerson Service Center.	As needed for optimal performance
23, 53	Stem and Stem Pin	Inspect stem for dings, scoring and galling. Inspect valve stem connection for tightness.	Valve stem connection can be repaired by your local Emerson Service Center.	As needed
24	Seat	Inspect for seat erosion, particulate damage, galling and proper bolt torque (if applicable, refer to Table 5).	Re-cutting/machining of seating surfaces can be performed by your local Emerson Service Center.	As needed to maintain proper shutoff
25	Plug Retainer	Inspect for excessive wear, galling and other damage.	Repair can be performed by your local Emerson Service Center.	As needed
30	Spray Nozzle	Refer to Nozzle Maintenance Section.		Replacement every 24 to 36 months for optimal performance
37	Nozzle Sleeve	Inspect for particulate or magnetite buildup when spray nozzles are replaced.	Clean if necessary.	As needed
43, 47, 48, 75	All Gaskets	Every valve disassembly requires replacement of gaskets.	Replacement only	Every valve disassembly

- continued -

Table 2. Inspection Summary (continued)

Key	Part Description	Inspection Tips and Diagnostics	Repair	Replacement
45	Piston Ring	Inspect for particulate buildup, scoring and excessive wear. Ensure piston ring is free to expand and contract in the groove.	Replacement only	As needed
46	Bore Seal Ring	Inspect for excessive wear, galling, signs of leakage and other damage.	Replacement only	Every 36 months for optimal performance
63	Packing Box Ring	Inspect for scoring, galling and other damage.	Replacement only	As needed
64	Packing Set	Every valve disassembly requires replacement of the packing set.	Replacement only	Every valve disassembly
65	Packing Follower	Inspect for scoring, galling and other damage.	Replacement only	As needed
66	Packing Flange	Inspect for scoring, galling and other damage.	Replacement only	As needed

3.1 Servicing

Shut off water and steam flow and vent all system pressure before breaking any pressure boundaries.

WARNING

Residual system pressure may be released during the following steps if the system was improperly isolated or vented. Use extreme care to prevent personal injury while loosening any fasteners in the pressure boundary.

3.2 Removal of Valve Bonnet and Trim

1. For ANSI/FCI 70-2 Class V constructions, stroke the actuator to unseat the plug and bore seal from the bore seal landing. Slowly bleed the actuator until there is no remaining air pressure. The plug will settle to a resting position while not being fully seated. This will allow for an easier disassembly.
2. Disconnect all external connections to the positioner and actuator and remove the actuator from the valve. Consult the actuator manufacturer's documentation for assistance in actuator removal.

3. Loosen and remove the hex nuts (key 68) along with the packing follower (key 65). If possible, remove packing set (key 64) from the packing box.
4. Loosen bonnet stud nuts (key 55) using an even pattern to avoid uneven expansion of the gaskets. Remove the entire bonnet assembly (key 6), pulling evenly in line with the valve stem (key 23) centerline. Uneven bonnet removal can result in galling or bending of the valve stem. If difficulty is encountered in removing the bonnet, check the bonnet for alignment and straighten the bonnet before making further attempts to remove it from the valve body.

WARNING

The bonnet must be handled with care while being removed from the body. Damage to the bonnet can result in gasket leakage while the valve is in service. Protect the bonnet by placing it on clean cloth or wood while the valve is disassembled.

5. Dislodge any remaining packing (key 64) from the packing box and discard. Remove the packing box ring (key 63) from the bottom of the packing box. Inspect all parts: packing box, packing box ring (key 63), packing follower (key 65), valve stem (key 23), hex nuts (key 68) and studs (key 69) for signs of wear. Replace parts that are damaged or show excessive wear.
6. Inspect the bonnet guiding surfaces and gasket mating surfaces. Light damage on the guiding surface may be repaired with an emery cloth or other suitable material. Damage to the gasket mating surface may require bonnet replacement to avoid leakage.
7. Remove the plug assembly (flow-up and flow-down: keys 22, 23, 25 and 53) as a single unit by lifting the valve stem (key 23) with appropriate rigging and lifting equipment and pulling the assembly from the body cavity. The plug assembly contains sensitive guiding and sealing surfaces on its outside diameter and care must be taken in its handling. Protect the plug by placing it on clean cloth or wood while the valve is disassembled.
8. Flow-Up Construction only: If the TBX has a magnetite catcher (key 79) and excess magnetite buildup is present, remove the magnetite catcher located in the bore of the plug (key 22) by cutting the tackwelds at the base of the part and unscrewing from the plug. Clean as necessary to remove magnetite buildup.
9. Remove the cage (key 21) from the valve body. Remove and discard two (2) cage gaskets (key 43). Reference Figures 11, 12 and 13 for guidance in performing this disassembly. The cage contains sensitive guiding surfaces on its inside and outside diameter and care must be taken during handling. Protect the cage by placing it on clean cloth or wood while the valve is disassembled.

10. ANSI/FCI 70-2 Class V constructions only: Clean and inspect the guiding and sealing surfaces of the plug assembly. Inspect the piston ring (key 45) and Bore Seal ring (key 46) for signs of excess wear or damage and replace if necessary. The piston ring is a two-piece design with an outer seal ring and an inner expander ring. The outer ring diameter should be expanded beyond the diameter of the plug in its free state. It can be shifted within its groove to inspect for uneven wear around its circumference. The piston ring should require some compression when installing the plug into the cage. Lack of required compression indicates that the piston ring has worn or relaxed and should be replaced. Vertical marks in the axial orientation also indicate wear that requires replacement of the ring. The Bore Seal ring has a C-shaped cross section. The open portion of the C-shape faces the stem side of the plug on flow-up valves. The open portion of the C-shape faces the seating surface of the plug on flow-down valves. See Figure 5 for proper orientation. Any uneven marks around the circumference of the ring or any flattening of the ring shape at its outside diameter are indications of wear and require replacement. Contact your [Emerson sales office](#) for Bore Seal ring replacement.

- ANSI/FCI 70-2 Class IV constructions only: Clean and inspect the guiding and sealing surfaces of the plug assembly. Inspect the two piston rings (key 45) for signs of wear or damage and replace if necessary. The piston ring is a two piece design with an outer seal ring and an inner expander ring. The outer ring diameter should be expanded beyond the diameter of the plug in its free state. It can be shifted within its groove to inspect for uneven wear around its circumference. The piston ring should require some compression when installing the plug into the cage. Lack of required compression indicates that the piston ring has worn or relaxed and should be replaced. Vertical marks in the axial orientation also indicate wear that requires replacement of the ring.
11. Clean and inspect the cage bore for excessive wear. The entire length of the cage bore is either a sealing and/or guiding surface and any measurable wear requires that the cage be replaced.
 12. Welded seat rings remain retained inside the valve body. Clean and inspect the seating surface. Any detectable damage around the circumference of the seating surface is an indication of wear and requires reconditioning to ensure seating performance. Contact your [Emerson sales office](#) for specific instructions on reconditioning the seating surface. If the TBX has a bolted seat ring, remove the cap screws (key 76) and discard the gasket(s) (key 75) that sit between the valve body and seat ring. Inspect cap screws for damage and excessive wear; replace as necessary.
 13. Flow-down construction only. Remove the lower cage (key 78); reference Figure 11 for guidance in performing this disassembly. The cage contains sensitive guiding surfaces on its inside and outside diameter and care must be taken during handling. Protect the cage by placing it on clean cloth or wood while the valve is disassembled.
 14. Remove all used gaskets and foreign material from the interior of the valve and from the inlet and outlet openings. Remove any foreign material that may be in the valve body or trim. Inspect all valve body guiding and sealing surfaces for any signs of wear.
 15. If the valve has been in service, visually inspect the interior of the valve for abnormal wear, erosion or thermal fatigue. The gasket surfaces of the valve body and bonnet should be inspected to verify that they are not damaged and are free of imbedded gasket material. All scratches should be removed by grinding or filing to remove any interference of the clearance zones between the internal bores and the mating parts. All signs of thermal fatigue should be carefully evaluated to determine if repair or replacement is necessary. Your local Emerson Service Center can help determine the severity of damage, if present and recommend a course of action.

Figure 3. Fisher AF Nozzle Cross Section

3.3 Nozzle Maintenance and Replacement

When subjected to normal operating conditions, it is possible that wear, blockage and/or weld fatigue will occur to the valve body or nozzle assembly. During regularly scheduled maintenance, visually inspect the nozzles for wear and blockage. Your local Emerson Service Center can help to determine the extent of weld fatigue and the correct course of action. Poor performing nozzles or nozzle failure is typically caused by wear, corrosion, erosion and/or blockage.

The following instruction will help to determine if any of these problems are present and provide a recommended course of action for each.

NOTE

For optimal performance, nozzles should be inspected every 18 to 24 months and replaced every 24 to 36 months.

1. OPTIONAL: Figure 3 shows the spray pattern that will need to be present during operation of the AF nozzles. Testing can be performed by attaching the existing or an alternate, similar pressure, water line to the spray water input connection. If this spray pattern is not present, replacement is recommended.
2. Loosen and remove the nozzle body flange stud nuts (key 58) and washers (key 59). Then, remove the nozzle body flange (key 20). Inspect the nozzle body flange gasket surfaces for damage. If damage is present replacement is necessary.
3. Remove the nozzle sleeve (key 37) with attached spray nozzle (key 30), nozzle sleeve gasket (key 47) and nozzle body flange gasket (key 48). Inspect the nozzle sleeve for particulate or magnetite buildup and clean if necessary.

4. Inspect the spray annulus surface, the area between the plug stem and spray head, for excessive wear, erosion/corrosion or blockage due to particulate. Wear is defined as any nicks, cuts or gouges on or immediately around the spray annulus. Erosion/corrosion is defined as any form of rust or erosion of the metal on the plug stem or spray head. Blockages are defined when small particulate becomes trapped between the plug stem and spray head or spring casing and spray head. Replacement of the nozzle is recommended if any of the preceding problems are present.
5. Grind off the tack welds holding the nozzle (key 30) in place. Apply a penetrant type thread lubricant and allow to soak prior to unscrewing the nozzle. Using the provided flats on the side of the spray head, unscrew the nozzle from the nozzle sleeve (key 37).
6. Grind excess tack weld material off both the nozzle (key 30) and nozzle sleeve (key 37).
7. In the absence of external forces, the nozzle must be fully closed. If the nozzle is not fully closed, it will need to be replaced.
8. Inspect the water injection holes for reduced or non-circular shape due to erosion. Every hole must be the same size and shape. If any are oversized or non-circular in shape, the nozzle will need to be replaced.
9. Inspect the interior of the water injection holes for buildup of particulate or magnetite. Nozzle replacement will be needed if any buildup is present.

NOTE

Complete disassembly of the nozzle is strongly discouraged, due to individual spare parts not being available.

10. OPTIONAL: To further check the nozzle for buildup of particulate or magnetite, the nozzle can be disassembled. If disassembled, take great care not to damage the sharp edges of the spray annulus on the plug stem and the sprayhead, as this will greatly affect the spray pattern. Do not compress a removed spring by hand or with a tool, as compression beyond its normal operating range will damage the spring.

To disassemble the nozzle, first remove the pin using a small punch and unscrew the spring casing from the plug stem. The nozzle can be reassembled by following a reverse order of disassembly, taking care to line the hole in the plug stem up with the hole in the spring casing, then pressing the pin back into place through the two parts.

11. The internal spring may relax over time and not provide the tensile force required to shut off and control flow. If the nozzle spring is suspected of being too relaxed, then the nozzle should be replaced.
12. The travel can be determined by using a feeler gauge to measure the distance between the spray head near the water injection ports to the side of the spring casing, as outlined in Figure 3. This measurement must match the factory set plug stem travel for the corresponding nozzle type as shown in Table 3.

Table 3. AF Nozzle Specifications

NOZZLE TYPE	PLUG TRAVEL, IN.
AF7	0.014
AF10	0.028
AF14	0.029
AF17	0.034
AF20	0.036
AF24	0.042
AF28	0.048
AF32	0.056
AF35	0.065
AF40	0.063
AF44	0.069

13. Inspect nozzle threads for damage and clean if needed. If damage is present, nozzle replacement will be necessary.
14. Rinse both the nozzle (key 30) and nozzle sleeve (key 37) to remove particulate.
15. Screw nozzle into the nozzle sleeve (key 37) and tighten just until the spray head is flat and tight against the nozzle sleeve.
16. Tack-weld a small piece of welding wire onto the nozzle sleeve (key 37) next to either of the spray head flats to prevent rotation during service; refer to Figure 4. Maintain low heat to prevent distortion of the nozzle.

Figure 4. Spray Nozzle Tack Weld Location

17. Reassemble in the following order: nozzle sleeve gasket (key 47), nozzle body flange gasket (key 48), spray nozzle/sleeve assembly (keys 30 and 37), nozzle body flange (key 20), washers (key 59) and stud nuts (key 58). It is required to replace the nozzle sleeve gasket (key 47) and nozzle body flange gasket (key 48) with new gaskets each time the nozzle body flange (key 20) is removed.

NOTE

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

**WARNING**

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

18. Lubricate the nozzle body studs (key 57) and all surfaces the studs and nuts come into contact with. Tighten the nozzle body flange nuts (key 58) in a uniform, multistage cross pattern. You may need to torque multiple times at each torque to ensure that the nozzle body flange is torqued evenly. Required nozzle body flange bolting torque can be found in Table 4.

Table 4. Recommended Nozzle Body Flange Bolting Torque with Nickel Anti-Seize Lubricant⁽¹⁾

BOLT SIZE	THREADS PER INCH	LUBRICATION	RECOMMENDED BOLT TORQUE ⁽²⁾	
In.			N·m	Lbf·ft
5/8	11	Nickel Anti-Seize	163	120
3/4	10		258	190
7/8	9		373	275
1	8		522	385
1-1/8	8		712	525
1-1/4	8		942	695
1-3/8	8		1268	935
1-1/2	8		1654	1220
1. For other lubricants, contact your Emerson sales office for recommended bolt torque.				
2. Torques for lubricated studs with heavy hex nuts.				

3.4 Valve Assembly

1. Cleaning—Make certain that all interior surfaces of the valve body and bonnet (including the packing box) are clean and free of dirt, including the inlet and outlet openings. All surfaces of the valve interior that receive mating parts should be given special attention when cleaning. All sliding fit surfaces should be coated with a copper-based high temperature anti-seize lubricant prior to reassembly. Refer to Figures 11, 12 and 13 for reference.

If the TBX has a bolted seat ring or is flow-down orientation, proceed with steps 2 through 4; otherwise, proceed directly to step 5.

- Place one gasket (key 75) into the valve body. If the TBX is a flow-up construction: Install the seat ring (key 24) onto this gasket surface. If the TBX is a flow-down construction: install the lower cage (key 78) onto the gasket surface, ensuring the bolt holes in the cage flange are positioned with the bolt holes in the valve body. Then place another gasket (key 75) onto the diameter of the lower cage and install the seat ring (key 24) onto this second gasket surface.

NOTE

Horizontal actuator only: TBX valves positioned in the process pipeline with a horizontal actuator/trim may require special attention to ensure that the spiral wound gaskets are maintained in the proper location during the valve assembly procedures without falling out of the gasket groove. A gasket manufacturer recommends spray adhesive 3M #77 Super Spray Adhesive to temporarily hold gaskets in place until they are fully contained by the TBX valve body and trim components. Please note special spiral wound gasket-positioning techniques may be recommended. To use the adhesive, lightly spray the gasket groove that the gasket will be installed in. Also lightly spray one side of the spiral wound gasket that will be contacting the previously coated gasket groove. Let the spray adhesive set for one minute and then lightly press the spiral wound gasket into the gasket groove.

Other Considerations: Ensure the spiral wound gasket is located in the correct location when contact is made. Trying to remove the gasket after contact will damage the gasket by pulling out or removing the soft filler/facing material. If the gasket is incorrectly positioned after applying the spray adhesive it must be removed and discarded. The gasket groove will then need to be cleaned and a new gasket will need to be installed.

- Lubricate the seat ring cap screws (key 76) and all surfaces that contact the screws, including the valve body and seat ring.
- Torque the cap screws in a crisscross pattern, using no more than 1/4 of the specified torque as indicated in Table 5. Repeat the crisscross pattern, working up to the specified torque in 1/4 increments until the final torque is achieved. Wait a minimum of 1 minute to allow for gasket/screw relaxation and recheck the torque, adjusting as necessary.

Table 5. TBX (Flow-Up and Flow-Down) Bolted Seat Ring Torque with Nickel Anti-Seize Lubricant⁽¹⁾

BOLT SIZE	THREADS PER INCH	LUBRICATION	RECOMMENDED BOLT TORQUE	
In.			N·m	Lbf·ft
3/8	16	Nickel Anti-Seize	38	28
7/16	14		60	44
1/2	13		87	64
5/8	11		156	115
1. For other lubricants, contact your Emerson sales office for recommended bolt torque.				

- Install one cage gasket (key 43) into the groove in the valve body. If the valve has a horizontal stem orientation, ensure that the gasket remains in the groove and does not get pinched during cage installation.

NOTE

Horizontal actuator only: Follow the note in Step 2 above to ensure the gasket are in the proper location during valve assembly.

6. Lubricate the inside of the cage as completely as possible. Insert the lubricated cage (key 21) into the valve body. Ensure the lower cage diameter slides over the outside diameter of the seat ring. If there is any question regarding the proper seating of the cage inside the valve body, the following measurements can be taken for confirmation. Measure the thickness of the cage flange at its largest diameter. Measure the depth of the mating counterbore where the cage flange engages into the valve body. When assembled with a new cage gasket, the resulting depth from the top of the valve body to the top of the cage flange should be the difference in these two measured values, minus an additional 0.045 in. to allow for the uncompressed gasket.
7. Flow-Up Construction only: If applicable, install the magnetite catcher (key 79) by threading into the bore of the plug (key 22). Apply four tackwelds equally spaced along the circumference of the plug to prevent rotation during service.

If the TBX is an ANSI/FCI 702 Class V construction, proceed with steps 8 to 15; otherwise proceed directly to step 16 for Class IV constructions.

8. The plug assembly includes a plug (key 22), stem (key 23), stem pin (key 53), retainer (key 25), piston ring (key 45) and Bore Seal ring (key 46). Lubricate the plug assembly at all raised outside diameter surfaces and lubricate the piston ring(s) and Bore Seal ring.
9. Orient the Bore Seal for correct sealing action based on the process fluid flow direction through the valve, refer to Figure 5 to complete this step.

Figure 5. Fisher Bore Seal Construction

10. Place the Bore Seal plug seal over the top of the valve plug. The retainer will help guide the Bore Seal down onto the plug. Do not force the Bore Seal over the plug (Figure 6).
11. For the Flow-up design, the Bore Seal installation tool (Figure 10) must be inserted into the Bore Seal prior to using the retainer to guide it down the plug.
12. Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the Bore Seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
13. If applicable, remove the retainer and then the installation tool. Place the Bore Seal retainer back onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.

14. Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place to secure the Bore Seal retainer.

Figure 6. Retainer Guiding Fisher Bore Seal Onto the Plug

15. Install the lubricated plug assembly into the cage. The piston ring(s) should require some radial compression to collapse into the cage diameter. Do not use a metallic tool to create this piston ring compression as this could damage the outer sealing diameter of the ring. The plug(s) should slide into the cage(s) smoothly with little effort until the Bore Seal ring reaches its mating cage diameter. The extra load required to seat the Bore Seal trim seal will be applied during actuator set up.
16. ANSI/FCI 702 Class IV constructions only: The plug assembly includes a plug (key 22), stem (key 23), stem pin (key 53) and two piston rings (key 45). Lubricate the plug assembly at all raised outside diameter surfaces and lubricate the piston rings. Install the lubricated plug assembly into the cage. The piston rings should require some radial compression to collapse into the cage diameter(s). Do not use a metallic tool to create this piston ring compression, as this could damage the outer sealing diameter of the ring. The plug(s) should slide into the cage(s) smoothly with little effort. Refer to Figures 7 and 9.
17. Install the second cage gasket (key 43) over the cage boss where it will be self-centering for the mating bonnet groove.

NOTE

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

18. Apply appropriate high-temperature anti-seize lubricant to the bonnet studs (key 54) and screw them into the valve body. Back the studs out 1/2 to 1 turns after bottoming the stud in the valve body.
19. Lubricate the bonnet locating surfaces and carefully install the bonnet (key 6). Use care to avoid bending the stem.
20. Install bonnet stud washers (key 52) and nuts (key 55) and hand tighten.
21. Tighten the bonnet nuts (key 55) in a uniform, multistage cross pattern. Monitor the distance between the bonnet and body and keep it even to ensure that the bonnet is being torqued evenly. It is recommended that torquing be performed in a minimum of four torque levels until the final torque level is achieved. You may need to torque multiple times at each torque level to ensure that the bonnet is torqued evenly. Required torque can be found in Table 6 for the appropriate body/bonnet bolting material. After final torquing, ensure there is an even gap and that the metal-to-metal contact between the valve body and bonnet is achieved around the entire circumference of the body-bonnet joint.

Table 6. Recommended Body/Bonnet Bolting Torque with Nickel Anti-Seize Lubricant⁽¹⁾

BOLT SIZE	THREADS PER INCH	LUBRICATION	RECOMMENDED BOLT TORQUE ⁽²⁾	
In.			N·m	Lbf·ft
1	8	Nickel Anti-Seize	522	385
1-1/8			712	525
1-1/4			942	695
1-3/8			1268	935
1-1/2			1654	1220
1-5/8			2129	1570
1-3/4			2671	1970
1-7/8			3308	2440
2			4027	2970
2-1/4			5776	4260

1. For other lubricants, contact your [Emerson sales office](#) for recommended bolt torque.

2. Torques for lubricated studs with heavy hex nuts.

22. After the body/bonnet studs have been torqued to the required level, check the plug movement to ensure that the plug still moves freely.
23. Recheck cleanliness of the packing box. Insert the packing box ring (key 63) over the stem and into the packing box. Measure the depth of the packing box before and after ring insertion to be certain that it has traveled to the bottom of the packing box. Insert packing rings (key 64), after lubricating with high temperature grease, into the packing box and staggering the gaps on adjacent rings. The packing follower (key 65) can be used to ensure that each packing ring is pushed down before installing the next packing ring.

TBX Valve

August 2025

24. After all packing rings are installed, thoroughly lubricate the studs (key 69) and insert the packing follower (key 65) and the packing flange (key 66). Tighten the hex nuts (key 68) tight enough to block leakage but not so tight that stem travel is hindered. Consult Table 7, Recommended Packing Nut Torque for recommended torque levels. Evenly tighten the nuts to the maximum level, then loosen and retighten to the minimum torque level. After operating, further tightening may be required to prevent leakage.
25. Install the actuator on the valve in accordance with manufacturer's standard procedure. If this is an ANSI/FCI 702 Class V construction, the plug assembly will require an additional load and travel to seat the Bore Seal ring (refer to Figures 8 and 9 for details). After calibration of the actuator, the valve should be ready to return to service.

Section 4: Parts

4.1 Parts Ordering

Each TBX valve is assigned a serial number that can be found on the bonnet flange. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts, refer to the serial number and key numbers for each part required. The key numbers in the Parts List and the assembly drawing in Figures 11, 12 and 13 can be used to help in part identification.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

4.2 Parts List

NOTE

Contact your [Emerson sales office](#) for part numbers.

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and operation information for the Fisher TBX control valve. Refer to separate instruction manuals for instructions covering the actuator and accessories.

Do not install, operate, or maintain a TBX-P valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

TBX-P steam pressure control valves (see figure 1) are balanced-plug angle valves that are custom built for each application. Typical installations include steam pressure control, vent to atmosphere, auxiliary steam and other applications requiring dependable and accurate control of steam pressure.

The TBX-P steam pressure control valve (see figure 1) is designed to handle the most severe applications in today's cycling power plants as well as provide precise pressure control for process applications. The TBX-P incorporates more than 30 years of steam pressure control experience and product development. The valve body is designed with the latest finite element analysis (FEA) and computational fluid dynamics (CFD) tools to optimize performance and reliability for demanding steam systems.

The TBX-P is a flow up or flow down design providing the ultimate combination of performance and maintainability. The flow down TBX-P incorporates Emerson's low noise Whisper Trim III technology. The flow up TBX-P incorporates the same Whisper Trim III technology as the flow down design, but can also be outfitted with WhisperFlo Trim technology.

Figure 2. Typical Fisher TBX-P

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the TBX-P valve is installed where service conditions could exceed the limits of the pressure rating noted on the nameplate. To avoid such injury or damage, provide a relief valve for over pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

This valve is intended for a specific range of service conditions (see table 1). Applying different conditions to the valve could result in parts damage, malfunction of the valve, or loss of control of the process. *Do not expose this valve to service conditions or variables other than those for which this valve is intended.* If you are not sure what these conditions are, you should contact Emerson for more complete specifications. Provide the product serial number (shown on the nameplate) and all other pertinent information.

Check that the TBX-P valve is properly orientated with respect to the flow direction of the valve (either flow up or flow down). Incorrect installation can result in damage to the valve and poor performance.

1. Before installation, all piping upstream of the valve must be blown clean so that no loose materials such as welding slag, dirt or other foreign matter, are left in the pipe. Use care to keep foreign matter out of the line openings while preparing the valve installation.
2. If possible, before fitting in the line, connect the actuator to a temporary air supply and operate to verify positioning. Disconnect the instrument lines (if applicable).

⚠ WARNING

Do not lift the valve by its actuator yoke. Lifting lugs attached to the actuator must not be used to lift the complete valve assembly unless clearly marked as being rated to support the complete valve assembly weight. Personal injury or damage to equipment could occur if the valve is improperly lifted into place.

All lifting and rigging must be completed in accordance with federal/national/provincial, state and local regulations and applicable lifting and rigging equipment standards. Only personnel trained in proper lifting and rigging practices shall perform valve/actuator assembly lifting, rigging and installation. Because each lift will be unique, the method of lifting the valve assembly, the correct location for attaching and lifting the valve assembly, and what the valve assembly will do when lifted shall be considered for each lift.

Lifting and rigging equipment used to lift, install or remove a valve assembly or component must be properly selected and sized for the weight and configuration of the valve assembly or component being lifted. The weight of the complete valve assembly, including attached accessories, must be taken in consideration for this purpose. The lifting and rigging equipment must be properly maintained and inspected for damage before each use.

Lifting lugs or other lifting equipment attached to the valve or actuator must never be used to lift or support the weight of attached piping.

If the TBX-P is equipped with butt weld ends, the valve body must be supported using a lifting sling or other method that does not place a load or force onto the finished surface of the butt weld ends. The TBX-P does not have a stable resting condition. The valve inlet and outlet must be fully supported until fully welded (butt weld end connections) or bolted (flanged end connections) into the piping.

CAUTION

Care must be taken when lifting the valve/actuator assembly to ensure all accessories and tubing are not damaged in the process. Accessories and tubing may need to be removed prior to lifting to prevent damage and properly reinstalled before use. Protect valve flange faces, butt weld ends, and other connection surfaces from damage during lifting.

3. Arrange lifting slings, or other lifting and rigging equipment appropriate for the valve weight and configuration to safely lift the valve to the pipe opening.

⚠ WARNING

Do not expose the valve to undue stresses by installing it in bent pipes or flanges. Personal injury and equipment damage could result from flange sealing failure due to improper installation.

4. **Flanged Connections**—Lubricate the flange connection bolts with a high temperature thread lubricant. Install flange gaskets and connection bolts per accepted practices and tighten securely.
5. **Welded Connections**—Welding procedures should be in accordance with the applicable codes and the base materials. For preheat, welding electrodes, and postweld heat treatment, refer to the applicable codes and practices applicable for the specific facility. Materials are specified on the customer specification sheet. Emerson recommends the valve be disassembled for welding, however if the valve inlet and outlet connections are to be welded with the valve assembled, the valve plug should be maintained off the valve seat during all associated operations. If the valve is to be welded by SMAW process, the valve must be disassembled for welding to ensure that any weld slag is removed from the valve.

CAUTION

Depending on valve body materials used, post weld heat treating may be required. If so, damage to internal parts is possible. In general, if post weld heat treating is to be performed, all trim parts should be removed. Contact your [Emerson sales office](#) for additional information.

Pneumatic lines (where applicable) should be thoroughly blown clean with dry air before connection. Check electronic lines for correct connection.

6. If foreign debris has been introduced into the valve or upstream piping during installation, it must be removed prior to using the valve for the first time. A blowout or blowdown tool can be purchased to match the TBX-P valve and facilitate piping blowdown without removal of the valve from the line. Contact your Emerson sales office for pricing and availability of fixtures. Review Fisher instruction manuals, TBX-P Blowout Fixture ([D103206X012](#)) and Fisher Blowdown Fixture ([D103207X012](#)) prior to use.
7. After cleanliness of the piping system has been assured, connect instrumentation and power supply to the TBX-P valve actuator and associated equipment.
8. Monitor the TBX-P valve as the system is brought online. Some visible vapors may be seen while the lubricants are heated. If you see any steam leaks after startup, follow isolation and disassembly procedures and disassemble the valve and replace the gaskets (key 43). If the packing box leaks, tighten hex nuts (key 68). If leakage continues, replace the packing (key 64). Be sure to properly isolate the TBX-P valve prior to disassembly of valve or packing.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Maintenance

It is recommended that diagnostic tests be performed on the valve 3 to 6 months prior to scheduled maintenance shutdowns. Complete valve disassembly is recommended if tests performed on the valve indicate leakage, sticking, or substandard operation. If diagnostics indicate normal valve operation, complete disassembly and inspection of the TBX-P is recommended during every other regularly scheduled outage or after 24 to 36 months, whichever comes first. Table 2 identifies the recommended inspection tips and diagnostics that can be performed with corresponding repair and replacement information.

Table 2. Inspection Summary

Key	Part Description	Inspection Tips and Diagnostics	Repair	Replacement
1	Valve Body	Inspect for erosion, thermal fatigue, and other damage.	Consult your local Emerson Service Center for a recommendation on necessary weld repair or replacement if damage exists.	
6	Bonnet	Inspect gasket surfaces for damage that could indicate gasket leakage. Inspect packing box to ensure no galling, scoring, or particulate is present.	If damage exists consult your local Emerson Service Center for a recommendation on necessary weld repair or replacement.	
21	Cage	Inspect cage bore for excessive wear, galling damage, particulate damage, and flow passage damage or clogging.	Consult your local Emerson Service Center for a recommendation on necessary repair or replacement if damage exists.	As needed for optimal performance
22	Plug	Inspect for seat erosion, excessive wear, galling damage, and particulate damage, paying close attention to the seating and guiding surfaces.	Re-cutting/machining of seating surfaces can be performed by your local Emerson Service Center.	As needed for optimal performance
23, 53	Stem and Stem Pin	Inspect stem for dings, scoring, and galling. Inspect valve stem connection for tightness.	Valve stem connection can be repaired by your local Emerson Service Center.	As needed
24	Seat	Inspect for seat erosion, particulate damage, galling, and proper bolt torque (if applicable, refer to table 3).	Re-cutting/machining of seating surfaces can be performed by your local Emerson Service Center.	As needed to maintain proper shutoff
25	Plug Retainer	Inspect for excessive wear, galling, and other damage.	Repair can be performed by your local Emerson Service Center.	As needed
43, 75	All Gaskets	Every valve disassembly requires replacement of gaskets.	Replacement Only	Every valve disassembly
45	Piston Ring	Inspect for particulate buildup, scoring, and excessive wear. Ensure piston ring is free to expand and contract in the groove.	Replacement Only	As needed
46	Bore Seal Ring	Inspect for excessive wear, galling, signs of leakage, and other damage.	Replacement Only	Every 36 months for optimal performance
63	Packing Box Ring	Inspect for scoring, galling, and other damage.	Replacement Only	As needed
64	Packing Set	Every valve disassembly requires replacement of the packing set.	Replacement Only	Every valve disassembly
65	Packing Follower	Inspect for scoring, galling, and other damage.	Replacement Only	As needed
66	Packing Flange	Inspect for scoring, galling, and other damage.	Replacement Only	As needed

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Servicing

Shut off steam flow and vent all system pressure before breaking any pressure boundaries.

⚠ WARNING

Residual system pressure may be released during the following steps if the system was improperly isolated or vented.

Use extreme care to prevent personal injury while loosening any fasteners in the pressure boundary.

Removal of Valve Bonnet and Trim

1. Disconnect all external connections to the positioner and actuator and remove the actuator from the valve. Consult the actuator manufacturer's documentation for assistance in actuator removal.
2. Loosen and remove the hex nuts (key 68) along with the packing follower (key 65). If possible, remove packing set (key 64) from the packing box.
3. Loosen bonnet stud nuts (key 55) using an even pattern to avoid uneven expansion of the gaskets. Remove the entire bonnet assembly (key 6), pulling evenly in line with the valve stem (key 23) centerline. Uneven bonnet removal can result in galling or bending of the valve stem. If difficulty is encountered in removing the bonnet, check the bonnet for alignment and straighten the bonnet before making further attempts to remove it from the valve body.

CAUTION

The bonnet must be handled with care while being removed from the body. Damage to the bonnet can result in gasket leakage while the valve is in service.

Protect the bonnet by placing it on clean cloth or wood while the valve is disassembled.

4. Dislodge any remaining packing (key 64) from the packing box and discard. Remove the packing box ring (key 63) from the bottom of the packing box. Inspect all parts: packing box, packing box ring (key 63), packing follower (key 65), valve stem (key 23), hex nuts (key 68) and studs (key 69) for signs of wear. Replace parts that are damaged or show excessive wear.
5. Inspect the bonnet guiding surfaces and gasket mating surfaces. Light damage on the guiding surface may be repaired with an emery cloth or other suitable material. Damage to the gasket mating surface may require bonnet replacement to avoid leakage.
6. Remove the plug assembly (flow up and flow down: keys 22, 23, 25, and 53) as a single unit by lifting the valve stem (key 23) with appropriate rigging and lifting equipment and pulling the assembly from the body cavity. The plug assembly contains sensitive guiding and sealing surfaces on its outside diameter and care must be taken in its handling. Protect the plug by placing it on clean cloth or wood while the valve is disassembled.
7. **Flow Up Construction only:** If the TBX-P has a magnetite catcher (key 79) and excess magnetite buildup is present, remove the magnetite catcher located in the bore of the plug (key 22) by cutting the tackwelds at the base of the part and unscrewing from the plug. Clean as necessary to remove magnetite buildup.
8. Remove the cage (key 21) from the valve body. Remove and discard two (2) cage gaskets (key 43). Reference figures 9, 10, and 11 for guidance in performing this disassembly. The cage contains sensitive guiding surfaces on its inside and outside diameter and care must be taken during handling. Protect the cage by placing it on clean cloth or wood while the valve is disassembled.
9. **ANSI/FCI 70-2 Class V constructions only:** Clean and inspect the guiding and sealing surfaces of the plug assembly. Inspect the piston ring (key 45) and Bore Seal ring (key 46) for signs of excess wear or damage and replace if necessary. The piston ring is a two-piece design with an outer seal ring and an inner expander ring. The outer ring diameter should be expanded beyond the diameter of the plug in its free state. It can be shifted within its groove to inspect for uneven wear around its circumference. The piston ring should require some compression when installing the plug into the cage. Lack of required compression indicates that the piston ring has worn or relaxed and should be replaced. Vertical marks in the axial orientation also indicate wear that requires replacement of the ring. The Bore Seal ring has a C-shaped cross section. The open portion of the C-shape faces the stem side of the plug on flow up valves. The open portion of the C-shape faces the seating surface of the plug for flow down valves. See figure 3 for proper orientation. Any uneven marks around the circumference of the ring or any flattening of the ring shape at its outside diameter are indications of wear and require replacement. Contact your [Emerson sales office](#) for Bore Seal ring replacement.

ANSI/FCI 70-2 Class IV constructions only: Clean and inspect the guiding and sealing surfaces of the plug assembly. Inspect the two piston rings (key 45) for signs of wear or damage and replace if necessary. The piston ring is a two piece design with an outer seal ring and an inner expander ring. The outer ring diameter should be expanded beyond the diameter of the plug in its free state. It can be shifted within its groove to inspect for uneven wear around its circumference. The piston ring should require some compression when installing the plug into the cage. Lack of required compression indicates that the piston ring has worn or relaxed and should be replaced. Vertical marks in the axial orientation also indicate wear that requires replacement of the ring.

10. Clean and inspect the cage bore for excessive wear. The entire length of the cage bore is either a sealing and/or guiding surface and any measurable wear requires that the cage be replaced.
11. Welded seat rings remain retained inside the valve body. Clean and inspect the seating surface. Any detectable damage around the circumference of the seating surface is an indication of wear and requires reconditioning to ensure seating performance. Contact your Emerson sales office for specific instructions on reconditioning the seating surface. If the TBX-P has a bolted seat ring, remove the cap screws (key 76) and discard the gasket(s) (key 75) that sit between the valve body and seat ring. Inspect cap screws for damage and excessive wear; replace as necessary.

12. **Flow down construction only.** Remove the lower cage (key 78); reference figure 9 for guidance in performing this disassembly. The cage contains sensitive guiding surfaces on its inside and outside diameter and care must be taken during handling. Protect the cage by placing it on clean cloth or wood while the valve is disassembled.
13. Remove all used gaskets and foreign material from the interior of the valve and from the inlet and outlet openings. Remove any foreign material that may be in the valve body or trim. Inspect all valve body guiding and sealing surfaces for any signs of wear.
14. If the valve has been in service, visually inspect the interior of the valve for abnormal wear, erosion, or thermal fatigue. The gasket surfaces of the valve body and bonnet should be inspected to verify that they are not damaged and are free of imbedded gasket material. All scratches should be removed by grinding or filing to remove any interference of the clearance zones between the internal bores and the mating parts. All signs of thermal fatigue should be carefully evaluated to determine if repair or replacement is necessary. Your local Emerson Service Center can help determine the severity of damage, if present, and recommend a course of action.

Valve Assembly

1. **Cleaning**--Make certain that all interior surfaces of the valve body and bonnet (including the packing box) are clean and free of dirt, including the inlet and outlet openings. All surfaces of the valve interior that receive mating parts should be given special attention when cleaning. All sliding fit surfaces should be coated with a copper-based high temperature anti-seize lubricant prior to reassembly. Refer to figures 9, 10, and 11 for reference.

If the TBX-P has a bolted seat ring or is flow down orientation, proceed with steps 2 through 4; otherwise, proceed directly to step 5.

2. Place one gasket (key 75) into the valve body. **If the TBX-P is a flow up construction:** Install the seat ring (key 24) onto this gasket surface. **If the TBX-P is a flow down construction:** Install the lower cage (key 78) onto the gasket surface ensuring the bolt holes in the cage flange are positioned with the bolt holes in the valve body. Then place another gasket (key 75) onto the diameter of the lower cage, and install the seat ring (key 24) onto this second gasket surface.

Note

Horizontal actuator only: TBX-P valves positioned in the process pipeline with a horizontal actuator/trim may require special attention to ensure that the spiral wound gaskets are maintained in the proper location during the valve assembly procedures without falling out of the gasket groove. A gasket manufacturer recommends spray adhesive 3M #77 Super Spray Adhesive to temporarily hold gaskets in place until they are fully contained by the TBX-P valve body and trim components. Please note special spiral wound gasket-positioning techniques may be recommended. To use the adhesive, lightly spray the gasket groove that the gasket will be installed in. Also lightly spray one side of the spiral wound gasket that will be contacting the previously coated gasket groove. Let the spray adhesive set for one minute and then lightly press the spiral wound gasket into the gasket groove.

Other Considerations: Ensure the spiral wound gasket is located in the correct location when contact is made. Trying to remove the gasket after contact will damage the gasket by pulling out or removing the soft filler/facing material. If the gasket is incorrectly positioned after applying the spray adhesive it must be removed and discarded. The gasket groove will then need to be cleaned and a new gasket will need to be installed.

3. Lubricate the seat ring cap screws (key 76) and all surfaces that contact the screws, including the valve body and seat ring.
4. Torque the cap screws in a crisscross pattern, using no more than 1/4 of the specified torque as indicated in table 3. Repeat the crisscross pattern, working up to the specified torque in 1/4 increments until the final torque is achieved. Wait a minimum of 1 minute to allow for gasket/screw relaxation and recheck the torque, adjusting as necessary.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D10455X012

TBX-P Valve

August 2020

Table 3. TBX-P (Flow Up and Flow Down) Bolted Seat Ring Torque with Nickel Anti-Seize Lubricant⁽¹⁾

CAP SCREW SIZE, Inch	THREADS PER INCH	LUBRICATION	RECOMMENDED BOLT TORQUE	
			N • m	lbf • ft
3/8	16	Nickel Anti-Seize	41	30
1/2	13		91	67
5/8	11		163	120

1. For other lubricants, contact your [Emerson sales office](#) for recommended bolt torque.

5. Install one cage gasket (key 43) into the groove in the valve body. If the valve has a horizontal stem orientation, ensure that the gasket remains in the groove and does not get pinched during cage installation.

Note

Horizontal actuator only: Follow the note in step 2 above to ensure the gaskets are in the proper location during valve assembly.

6. Lubricate the inside of the cage as completely as possible. Insert the lubricated cage (key 21) into the valve body. Ensure the lower cage diameter slides over the outside diameter of the seat ring. If there is any question regarding the proper seating of the cage inside the valve body, the following measurements can be taken for confirmation. Measure the thickness of the cage flange at its largest diameter. Measure the depth of the mating counterbore where the cage flange engages into the valve body. When assembled with a new cage gasket, the resulting depth from the top of the valve body to the top of the cage flange should be the difference in these two measured values, minus an additional 0.045 inches to allow for the uncompressed gasket.
7. **Flow Up Construction only:** If applicable, install the magnetite catcher (key 79) by threading into the bore of the plug (key 22). Apply four tackwelds equally spaced along the circumference of the plug to prevent rotation during service.

If the TBX-P is an ANSI/FCI 70-2 Class V construction, proceed with steps 8 through 15; otherwise proceed directly to step 16 for Class IV constructions.

8. The plug assembly includes a plug (key 22), stem (key 23), stem pin (key 53), retainer (key 25), piston ring (key 45) and Bore Seal ring (key 46). Lubricate the plug assembly at all raised outside diameter surfaces and lubricate the piston ring(s) and Bore Seal ring.
9. Orient the Bore Seal for correct sealing action based on the process fluid flow direction through the valve, refer to figure 3 to complete this step.

Figure 3. Fisher Bore Seal Construction

10. Place the Bore Seal plug seal over the top of the valve plug. The retainer will help guide the Bore Seal down onto the plug. Do not force the Bore Seal over the plug (figure 4).

11. For the Flow-up design, the Bore Seal installation tool (figure 8) must be inserted into the Bore Seal prior to using the retainer to guide it down the plug.
12. Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the Bore Seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
13. If applicable, remove the retainer and then the installation tool. Place the Bore Seal retainer back onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
14. Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place to secure the Bore Seal retainer.

Figure 4. Retainer Guiding Fisher Bore Seal Onto the Plug

15. Install the lubricated plug assembly into the cage. The piston ring(s) should require some radial compression to collapse into the cage diameter. Do not use a metallic tool to create this piston ring compression as this could damage the outer sealing diameter of the ring. The plug(s) should slide into the cage(s) smoothly with little effort until the Bore Seal ring reaches its mating cage diameter. The extra load required to seat the Bore Seal trim seal will be applied during actuator set up.
16. ANSI/FCI 70-2 Class IV constructions only: The plug assembly includes a plug (key 22), stem (key 23), stem pin (key 53), and two piston rings (key 45). Lubricate the plug assembly at all raised outside diameter surfaces and lubricate the piston rings. Install the lubricated plug assembly into the cage. The piston rings should require some radial compression to collapse into the cage diameter(s). Do not use a metallic tool to create this piston ring compression, as this could damage the outer sealing diameter of the ring. The plug(s) should slide into the cage(s) smoothly with little effort. Refer to figures 5 and 7.
17. Install the second cage gasket (key 43) over the cage boss where it will be self-centering for the mating bonnet groove.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

18. Apply appropriate high-temperature anti-seize lubricant to the bonnet studs (key 54) and screw them into the valve body. Back the studs out 1/2 to 1 turns after bottoming the stud in the valve body.
19. Lubricate the bonnet locating surfaces and carefully install the bonnet (key 6). Use care to avoid bending the stem.
20. Install bonnet stud washers (key 52) and nuts (key 55) and hand tighten.
21. Tighten the bonnet nuts (key 55) in a uniform, multistage cross pattern. Monitor the distance between the bonnet and body and keep it even to ensure that the bonnet is being torqued evenly. It is recommended that torquing be performed in a minimum of four torque levels until the final torque level is achieved. You may need to torque multiple times at each torque level to ensure that the bonnet is torqued evenly. Required torque can be found in table 4. After final torquing, ensure there is an even gap and that the metal-to-metal contact between the valve body and bonnet is achieved around the entire circumference of the body-bonnet joint.

Table 4. Recommended Body/Bonnet Bolting Torque with Nickel Anti-Seize Lubricant⁽¹⁾

BOLT SIZE, Inch	THREADS PER INCH	LUBRICATION	RECOMMENDED BOLT TORQUE ⁽²⁾	
			N•m	Lbf•ft
1	8	Nickel Anti-Seize	522	385
1-1/8			712	525
1-1/4			942	695
1-3/8			1268	935
1-1/2			1654	1220
1-5/8			2129	1570
1-3/4			2671	1970
1-7/8			3308	2440
2			4027	2970
2-1/4			5776	4260

1. For other lubricants, contact your [Emerson sales office](#) for recommended bolt torque.
2. Torques for lubricated studs with heavy hex nuts.

22. After the body/bonnet studs have been torqued to the required level, check the plug movement to ensure that the plug still moves freely.
23. Recheck cleanliness of the packing box. Insert the packing box ring (key 63) over the stem and into the packing box. Measure the depth of the packing box before and after ring insertion to be certain that it has traveled to the bottom of the packing box. Insert packing rings (key 64), after lubricating with high temperature grease, into the packing box and staggering the gaps on adjacent rings. The packing follower (key 65) can be used to ensure that each packing ring is pushed down before installing the next packing ring.
24. After all packing rings are installed, thoroughly lubricate the studs (key 69) and insert the packing follower (key 65) and the packing flange (key 66). Tighten the hex nuts (key 68) tight enough to block leakage but not so tight that stem travel is hindered. Consult table 5, Recommended Packing Nut Torque for recommended torque levels. Evenly tighten the nuts to the maximum level, then loosen and retighten to the minimum torque level. After operating, further tightening may be required to prevent leakage.
25. Install the actuator on the valve in accordance with manufacturer's standard procedure. If this is an ANSI/FCI 70-2 Class V construction, the plug assembly will require an additional load and travel to seat the Bore Seal ring (refer to figures 6 and 7 for details). After calibration of the actuator, the valve should be ready to return to service.

Parts Ordering

Each TBX-P valve is assigned a serial number that can be found on the bonnet flange. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts, refer to the serial number and key numbers for each part required. The key numbers in the Parts List and the assembly drawing in figures 9, 10, and 11 can be used to help in part identification.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

X0162

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and operation information for the Fisher TBX-T desuperheater. Refer to separate instruction manuals for instructions covering the actuator and accessories.

Do not install, operate, or maintain a TBX-T desuperheater without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. **To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings.** If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

Water atomization and vaporization are key elements in any steam conditioning application. The TBX-T design incorporates a spraywater manifold of variable geometry AF nozzles that produce an optimized spray pattern over a wide operating range. These nozzles are strategically placed to achieve optimal mixing and quick vaporization at all flowing conditions. Years of research in spray atomization and vaporization were key to optimizing the water injection system. Extensive use of CFD analysis, in addition to field performance feedback, was used to validate spray system enhancements.

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the TBX-T desuperheater is installed where service conditions could exceed the limits of the pressure rating noted on the nameplate. To avoid such injury or damage, provide a relief valve for over pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

When ordered, the desuperheater configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and fluid conditions. Do not apply any other conditions to the desuperheater without first contacting your local [Emerson sales office](#).

1. Before installation, all piping upstream of the desuperheater must be blown clean so that no loose materials such as welding slag, dirt or other foreign matter, are left in the pipe. Use care to keep foreign matter out of the line openings while preparing the desuperheater installation.

⚠ WARNING

Do not lift the desuperheater by its cooler manifold piping. Personal injury or damage to equipment could occur if the desuperheater is improperly lifted into place.

All lifting and rigging must be completed in accordance with federal/national/provincial, state and local regulations and applicable lifting and rigging equipment standards. Only personnel trained in proper lifting and rigging practices shall perform desuperheater assembly lifting, rigging and installation. Because each lift will be unique, the method of lifting the desuperheater assembly, the correct location for attaching and lifting the desuperheater assembly, and what the desuperheater assembly will do when lifted shall be considered for each lift.

Lifting and rigging equipment used to lift, install or remove a desuperheater assembly or component must be properly selected and sized for the weight and configuration of the desuperheater assembly or component being lifted. The weight of the complete desuperheater assembly, including attached accessories, must be taken in consideration for this purpose. The lifting and rigging equipment must be properly maintained and inspected for damage before each use.

Lifting lugs or other lifting equipment attached to the desuperheater must never be used to lift or support the weight of attached piping.

If the TBX-T is equipped with butt weld ends, the desuperheater body must be supported using a lifting sling or other method that does not place a load or force onto the finished surface of the butt weld ends. The TBX-T does not have a stable resting condition. The desuperheater inlet and outlet must be fully supported until fully welded (butt weld end connections) or bolted (flanged end connections) into the piping.

2. Arrange lifting slings, or other lifting and rigging equipment appropriate for the desuperheater weight and configuration, around the main steam pipe to safely lift the TBX-T to the pipe opening.

⚠ WARNING

Do not expose the TBX-T to undue stresses by installing it in bent pipes or flanges. Personal injury and equipment damage could result from flange sealing failure due to improper installation.

3. Flanged Connections—Lubricate the flange connection bolts with a high temperature thread lubricant. Install flange gaskets and connection bolts per accepted practices and tighten securely.
4. Welded Connections—Welding procedures should be in accordance with the applicable codes and the base materials. For preheat, welding electrodes, and post weld heat treatment, refer to the applicable codes and practices applicable for the specific facility. Materials are specified on the customer specification sheet.

CAUTION

Depending on desuperheater body materials used, post weld heat treating may be required. If so, damage to internal parts is possible. In general, if post weld heat treating is to be performed, all nozzles should be removed. Contact your [Emerson sales office](#) for additional information.

5. Remove the spraywater control valve and flush the cooling water line until all debris is removed from the line prior to connecting it to the TBX-T desuperheater. Use only clean sources of cooling water to reduce the possibility of nozzle clogging. A strainer should be installed in the water line as close to the TBX-T desuperheater as possible. To determine appropriate mesh size, refer to desuperheater sizing and specification document, or contact your Emerson sales office. Review strainer manufacturer's pressure drop curves to determine appropriate strainer body size. You may need to use a strainer that is larger than the water line size.

⚠ WARNING

Failure to use a strainer could result in nozzle clogging and subsequent property damage or loss. Uncontrolled temperatures resulting from clogged nozzles may result in equipment or process temperature limits being exceeded. Exceeding system temperature limits could result in property damage or personal injury.

6. A length of straight pipe is required downstream of the TBX-T desuperheater to ensure complete vaporization of cooling water. An example of a typical installation appears in figure 2. Consult the TBX-T cooler sizing sheet for the required distance of straight pipe. This is unique for each application and is supplied by Emerson Automation Solutions.
7. Typically, a temperature sensor should be mounted a minimum distance of 9.1 m (30 feet) downstream of the TBX-T desuperheater. This distance will vary depending on a number of factors including steam velocity and percentage of spraywater. Consult the TBX-T cooler sizing sheet provided with the unit for this temperature sensor distance. The steam line should not have any branch lines dividing the steam flow between the TBX-T desuperheater and the temperature sensor. If you have any questions, contact your local [Emerson sales office](#).
8. A typical installation is illustrated in figure 2. A temperature sensor (TE) measures changes in temperature and a temperature transmitter (TT) transmits the signal to the temperature control device. The output signal from the controller is sent to the positioner on the cooling water (spraywater) control valve (SWCV). The positioner's output signal strokes the SWCV open, increasing water pressure on the nozzles. Increasing water pressure upstream of the nozzles increases water flow through the nozzles.

CAUTION

Pneumatic lines (where applicable) should be thoroughly blown clean with dry air before connection. Check to make sure wiring connections are made per the equipment manufacturer's instructions and in accordance with local, regional, and national codes.

Maintenance

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Use bypass valves or completely shut off the process to isolate the desuperheater from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the desuperheater.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Servicing

Table 2. Inspection Summary

Key	Part Description	Inspection Tips and Diagnostics	Repair	Replacement
1	Steam Pipe (not replacement part)	Inspect for erosion, thermal fatigue, and other damage.	Consult your local Emerson Service Center for a recommendation on necessary weld repair or replacement	
2	Nozzle Body (not replacement part)	Inspect for erosion, thermal fatigue, and other damage.	Consult your local Emerson Service Center for a recommendation on necessary weld repair or replacement	
3	Nozzle Sleeve	Inspect for particulate or magnetite buildup when spray nozzles are replaced.	Clean if necessary.	As needed
7	Nozzle Body Flange	Inspect gasket surfaces for damage that could indicate gasket leakage when spray nozzles are replaced.	Replacement Only	As needed
10	Spray Nozzle	Refer to Nozzle Maintenance Section.		Replacement every 24-36 months for optimal performance

Nozzle Maintenance and Replacement

When subjected to normal operating conditions, it is possible that wear, blockage, and/or weld fatigue will occur to the nozzle assembly. During regularly scheduled maintenance, visually inspect the nozzles for wear and blockage. Your local Emerson Service Center can help to determine the extent of weld fatigue and the correct course of action. Poor performing nozzles or nozzle failure is typically caused by wear, corrosion, erosion, and/or blockage. The following instruction will help to determine if any of these problems are present and provide a recommended course of action for each.

Note

For optimal performance, nozzles should be inspected every 18-24 months and replaced every 24-36 months.

1. **OPTIONAL:** Figure 3 shows the spray pattern that will need to be present during operation of the AF nozzles. Testing can be performed by attaching the existing or an alternate, similar pressure, water line to the spray water input connection. If this spray pattern is not present, replacement is recommended.

Figure 3. Fisher AF Nozzle Cross Section

A7191-2D

2. Loosen and remove the nozzle body flange stud nuts (key 6) and washers (key 4). Then, remove the nozzle body flange (key 7). Inspect the nozzle body flange gasket surfaces for damage. If damage is present replacement is necessary.
3. Remove the nozzle sleeve (key 3) with attached spray nozzle (key 10), nozzle sleeve gasket (key 9), and nozzle body flange gasket (key 8). Inspect the nozzle sleeve for particulate or magnetite buildup and clean if necessary.
4. Inspect the spray annulus surface, the area between the plug stem and spray head, for excessive wear, erosion/corrosion, or blockage due to particulate. Wear is defined as any nicks, cuts, or gouges on or immediately around the spray annulus. Erosion/corrosion is defined as any form of rust or erosion of the metal on the plug stem or spray head. Blockages are defined when small particulate becomes trapped between the plug stem and spray head or spring casing and spray head. Replacement of the nozzle is recommended if any of the preceding problems are present.
5. Grind off the tack welds holding the nozzle (key 10) in place. Apply a penetrant type thread lubricant and allow to soak prior to unscrewing the nozzle. Using the provided flats on the side of the spray head, unscrew the nozzle from the nozzle sleeve (key 3).
6. Grind excess tack weld material off both the nozzle (key 10) and nozzle sleeve (key 3).
7. In the absence of external forces, the nozzle must be fully closed. If the nozzle is not fully closed, it will need to be replaced.
8. Inspect the water injection holes for reduced or non-circular shape due to erosion. Every hole must be the same size and shape. If any are over-sized or non-circular in shape, the nozzle will need to be replaced.
9. Inspect the interior of the water injection holes for buildup of particulate or magnetite. Nozzle replacement will be needed if any buildup is present.

Note

Complete disassembly of the nozzle is strongly discouraged, due to individual spare parts not being available.

10. **OPTIONAL:** To further check the nozzle for buildup of particulate or magnetite, the nozzle can be disassembled. If disassembled, take great care not to damage the sharp edges of the spray annulus on the plug stem and the

sprayhead, as this will greatly affect the spray pattern. Do not compress a removed spring by hand or with a tool, as compression beyond its normal operating range will damage the spring.

To disassemble the nozzle, first remove the pin using a small drill bit as a punch, and unscrew the spring casing from the plug stem. The nozzle can be reassembled by following a reverse order of disassembly, taking care to line the hole in the plug stem up with the hole in the spring casing, then pressing the pin back into place through the two parts.

11. The internal spring may relax over time and not provide the tensile force required to shut off and control flow. If the nozzle spring is suspected of being too relaxed, then the nozzle should be replaced.
12. The travel can be determined by using a feeler gauge to measure the distance between the spray head near the water injection ports to the side of the spring casing, as outlined in figure 3. This measurement must match the factory set plug stem travel for the corresponding nozzle type as shown in table 3.

Table 3. AF Nozzle Specifications

NOZZLE TYPE	PLUG TRAVEL, INCHES
AF7	0.014
AF10	0.028
AF14	0.029
AF17	0.034
AF20	0.036
AF24	0.042
AF28	0.048
AF32	0.056
AF35	0.065
AF40	0.063
AF44	0.069

13. Inspect nozzle threads for damage and clean if needed. If damage is present, nozzle replacement will be necessary.
14. Rinse both the nozzle (key 10) and nozzle sleeve (key 3) to remove particulate.
15. Screw nozzle into the nozzle sleeve (key 3) and tighten just until the spray head is flat and tight against the nozzle sleeve.
16. Tack-weld a small piece of welding wire onto the nozzle sleeve (key 3) next to either of the spray head flats to prevent rotation during service; refer to figure 4. Maintain low heat to prevent distortion of the nozzle.

Figure 4. Spray Nozzle Tack Weld Location

17. Reassemble in the following order: nozzle sleeve gasket (key 9), nozzle body flange gasket (key 8), spray nozzle/sleeve assembly, nozzle body flange (key 7), washers (key 4), and stud nuts (key 6). It is recommended that the nozzle sleeve gasket and nozzle body flange gasket be replaced with new ones.

Parts Ordering

Each TBX-T desuperheater is assigned a serial number. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts, refer to the serial number and key numbers for each part required. The key numbers in the Parts List and the assembly drawing in figure 5 can be used to help in part identification.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher desuperheater, because they may void your warranty, might adversely affect the performance of the desuperheater, and could cause personal injury and property damage.

W9915

Introduction

Scope of Manual

This instruction manual provides installation, operation, maintenance, and parts information for the Fisher Vee-Ball V150E rotary control valve (see figure 1).

For information on ENVIRO-SEAL™ packing, see the ENVIRO-SEAL Packing System for Rotary Valves instruction manual, [D101643X012](#). Refer to separate manuals for information concerning the actuator, positioner and accessories.

Do not install, operate, or maintain a V150E valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

V150E Vee-Ball valves (figure 1) with a V-notch ball are used in throttling service. The V150E valve is a raised-face flanged construction. The splined valve shaft connects to a variety of Fisher rotary-shaft actuators.

Table 1. Specifications

Valve Sizes and End Connection Styles DN ■ 80x100, ■ 100x150, ■ 150x200, ■ 200x250, ■ 250x300 and NPS ■ 3x4, ■ 4x6, ■ 6x8, ■ 8x10, ■ 10x12 flanged valves that mate with ■ PN 10/16, ■ JIS 10K, or ■ CL150 raised-face flanges (see table 2)	Actuator Mounting Standard valve construction is for right-hand mounting, as viewed from upstream end of valve with the shaft horizontal. Actuator can be mounted in any of four quadrants. Left-hand actuator mounting is available upon request
Dimensions See table 6 for dimensions	Valve/Actuator Action With compact 2052 spring and diaphragm or Fisher 1061 piston rotary actuator, the valve is field-reversible between PDTc or PDTO: push-down-to-close (extending actuator rod closes valve) and push-down-to-open (extending actuator rod opens valve)
Standard Flow Direction Forward (into the convex face of the V-notch ball)	Approximate Weight See table 6
Maximum Ball Rotation 90 degrees	
Orientation Valve shaft must be horizontal when installed in a horizontal or vertical pipeline	

1. The pressure/temperature limits in this manual and any applicable standard or code limitation for valve should not be exceeded.

Table 2. Valve Body Material, End Connections, and Ratings

VALVE DESIGN	VALVE BODY MATERIAL	VALVE SIZE	FLANGE END CONNECTIONS
V150E	CG8M	DN 80x100, 100x150, 150x200, 200x250, 250x300	Compatible with PN 10/16 or JIS 10K raised-face flanges
		NPS 3x4, 4x6, 6x8, 8x10, 10x12	Compatible with CL150 raised-face flanges

Specifications

Specifications for these valves are shown in table 1 and in bulletin 51.3:V150E, V150E Expanded Outlet Vee-Ball Control Valve ([D103429X012](#)).

Installation

Installation steps are provided in this section for V150E valves. Key numbers in installation procedures are shown in figure 10 unless otherwise indicated.

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed either the valve body rating or the mating pipe flange joint rating. To avoid such injury or damage, provide a relief valve for overpressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. To avoid possible personal injury and because some valve/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#) or Local Business Partner.

⚠ WARNING

The valve drive shaft is not necessarily grounded to the pipeline when installed. Personal injury or property damage could result from an explosion caused by a discharge of static electricity from valve components if the process fluid or the atmosphere around the valve is flammable. If the atmosphere around the valve or the process fluid is flammable, electrically bond the drive shaft to the valve.

Note

Standard PTFE packing is composed of a partially conductive carbon-filled PTFE female adaptor with PTFE V-ring packing. Standard graphite packing is composed of all conductive graphite ribbon packing. Alternate shaft-to-valve body bonding is available for hazardous service areas where the standard packing is not sufficient to bond the shaft to the valve (see the following step).

Attach the optional bonding strap assembly (key 131, figure 2) to the valve drive shaft (key 6) with the clamp (key 130, figure 2) and connect the other end of the bonding strap assembly to the valve body with the cap screw (key 23).

1. If the valve is to be stored before installation, protect the flange mating surfaces and keep the valve body cavity dry and free of foreign material.
2. Install a three-valve bypass around the control valve assembly if continuous operation will be necessary during inspection and maintenance of the valve.
3. The valve is normally shipped as part of a control valve assembly, with an actuator mounted on the valve. If the valve and actuator have been purchased separately or if the actuator has been removed, mount the actuator according to the Actuator Mounting section and the appropriate actuator instruction manual.
4. Standard flow direction is with the smaller diameter flange end facing upstream.
5. Install the valve in a horizontal or vertical pipeline with the drive shaft in a horizontal position.

CAUTION

Do not allow the valve to be installed in the pipeline with the drive shaft in the vertical position because of excessive wear to valve component parts.

6. The actuator can be right- or left-hand mounted with the shaft in a horizontal orientation as shown in figure 1. If necessary, refer to the appropriate actuator instruction manual for actuator installation and adjustment procedures.

CAUTION

Ensure the valve and adjacent pipelines are free of foreign material that could damage the valve seating surfaces.

7. Be certain the valve and adjacent pipelines are free of any foreign material that could damage the valve seating surfaces.
8. Be sure the pipeline flanges are in line with each other.

Figure 2. Optional Shaft-to-Body Bonding Strap Assembly

Installing V150E Valves

1. Install the V150E valve using standard length flange studs and nuts, appropriate for the inlet and outlet ends of the valve as dictated by the size and rating of the flange, to connect the valve flanges to the pipeline flanges.
2. Lubricate the studs with anti-seize lubricant.
3. Insert flat-sheet line flange gaskets (or spiral-wound gaskets with compression-controlling center rings) that are compatible with the flowing media.
4. Connect pressure lines to the actuator as indicated in the actuator instruction manual. When an auxiliary manual actuator is used with a power actuator, install a bypass valve on the power actuator (if one is not supplied) for use during manual operation.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If the valve has ENVIRO-SEAL live-loaded packing installed, this initial re-adjustment will probably not be required. See ENVIRO-SEAL Packing System for Rotary Valves instruction manual, [D101643X012](#), for packing instructions.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

Key numbers in this procedure are shown in figure 10, unless otherwise noted.

⚠ WARNING

The Vee-ball closes with a shearing, cutting motion, which could result in personal injury. To avoid injury, keep hands, tools, and other objects away from the Vee-ball while stroking the valve.

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations.
- The valve packing area may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Packing Maintenance

Key numbers in this procedure are shown in figure 10, unless otherwise noted. A detailed view of the packing is also shown in figure 3.

If the valve is equipped with the ENVIRO-SEAL Packing System, refer to:

- the separate ENVIRO-SEAL Packing System for Rotary Valves instruction manual, [D101643X012](#), for maintenance instructions, and
- the Parts List section of this manual for retrofit kits, parts kits, and individual parts.

If the packing is relatively new and tight on the drive shaft (key 6), and if tightening the packing follower nuts does not stop leakage, it is possible that the drive shaft is worn or nicked so that a seal cannot be made. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches on the packing box wall. Inspect the drive shaft and packing box wall for nicks or scratches while performing the following procedure.

Replacing Packing

When using this procedure, it is recommended that the actuator **not** be removed from the valve while the valve is still in the pipeline or between flanges. Valve/actuator adjustments must be made with the valve out of the pipeline. Refer to the Determining Closed Position portion of the Actuator Mounting section.

Disassembly

⚠ WARNING

Observe the steps in the **WARNING** at the beginning of the Maintenance section.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, shut off all pressure lines to the power actuator, release pressure from the actuator, and disconnect the pressure lines from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you are working on the equipment.
2. Remove line bolting, remove the control valve from the pipeline, and place the valve/actuator assembly on a flat surface with the inlet facing up.
3. Remove the actuator cover. Take note of the orientation of the actuator with respect to the valve body and the lever orientation with respect to the valve drive shaft (see figure 9).

⚠ WARNING

When the actuator is removed from the valve, the ball/shaft assembly may suddenly rotate, with a shearing, cutting motion, which could result in personal injury. To avoid injury, carefully rotate the ball to a stable position after the actuator is removed.

CAUTION

When removing the actuator from the valve, do not use a hammer or similar tool to drive the lever or actuator off the valve shaft. Driving the lever or actuator off the valve shaft could damage the ball, seal, and valve.

If necessary, use a puller to remove the lever or actuator from the valve shaft. It is okay to tap the puller screw lightly to loosen lever or actuator, but hitting the screw with excessive force could damage the ball, seal, and valve.

4. Loosen the clamped lever, remove the actuator mounting screws and nuts (keys 23 and 24), and remove the actuator. (If necessary, refer to the actuator instruction manual for assistance.)
5. If applicable, remove the bonding strap assembly before attempting to remove the packing (see figure 2).
6. Remove the packing follower nuts and packing follower (keys 17 and 20). For alloy packing constructions, the packing follower (key 17) and a separate packing flange (key 40) must be removed if present.

If the valve is equipped with the ENVIRO-SEAL packing system, refer to the ENVIRO-SEAL Packing System for Rotary Valves instruction manual, [D101643X012](#), for disassembly.

⚠ WARNING

Personal injury could result from packing leakage. Do not scratch the drive shaft or packing box wall while removing packing parts in the following procedure.

7. Remove the packing parts (see figure 3, keys 16, 17, 35, and 39 depending on construction) using a formed wire hook with a sharp end. Pierce the rings with the sharp end of the hook in order to remove them. Do not scratch the

drive shaft or packing box wall; scratching these surfaces could cause leakage. Clean all accessible metal parts and surfaces to remove particles that would prevent the packing from sealing.

Assembly

If the valve is equipped with the ENVIRO-SEAL packing system, refer to the ENVIRO-SEAL Packing System for Rotary Valves instruction manual, [D101643X012](#), for assembly.

1. To help ensure correct centering of the Vee-ball (key 2) on the seal (key 11), make sure the ball is closed while you install or tighten new packing. Insert a screwdriver, pry bar, or similar tool between the lower ear of the ball and the valve body. Use the pry to move the ball tightly against the bearing on the actuator side of the valve (see figure 4). Keep the ball in that position until you have completed packing installation and adjustment.
2. Install the new packing parts using the parts sequence shown in figure 3. Install the packing follower (key 17).
3. Secure the packing follower with the packing follower nuts (key 20). Tighten the nuts far enough to stop leakage under operating conditions.

Note

If the valve is equipped with a bonding strap assembly (figure 2), re-install the assembly.

4. Reconnect the actuator and lever in accordance with the orientations that were noted in step 3 of the disassembly procedures. If necessary, use figure 9 to identify the correct index marks.
5. Refer to the appropriate actuator instruction manual to complete actuator assembly and adjustment.
6. When the control valve is in operation, check the packing follower for leakage and retighten the packing follower nuts (key 20) as necessary.

Replacing the HD Ball Seal

Perform this procedure if the control valve is not shutting off properly or if seal inspection or replacement is necessary.

The valve / actuator assembly must be removed from the pipeline and the actuator must be removed from the valve to replace the ball seal. Key numbers are shown in figure 13 unless otherwise indicated. Ball Seal assembly details (with key numbers) are also shown in figure 5.

WARNING

Perform the steps in the **WARNING** at the beginning of the Maintenance section of this manual.

Removing the HD seal

1. Remove line bolting, remove the control valve from the pipeline, remove the actuator (as discussed in the packing section), and place the valve body on a flat work surface.
 - a. For NPS 3x4 and 4x6 valves, the ball must be removed to access the seal. See the Bearing and Ball Maintenance Disassembly section on page 12 in this manual. Then return to this procedure and continue with the next steps.

Figure 3. Packing Arrangements

Figure 4. Typical Fisher V150E Valve Showing Pry Bar

- b. For NPS 6x8 and larger valves, the HD seal can be removed through the outlet end of the valve with the ball installed. Carefully rotate the ball past the 90 degree open position until it is no longer in contact with the HD seal.

CAUTION

Due to the ball shape, take care when you rotate either the front skirted edge or the circular back edge of the ball out of the HD seal, as the seal could be damaged.

2. With the inlet side of the valve facing up, push the HD metal seal (key 11) into the valve body (key 1).

CAUTION

Exercise care to avoid damaging components in the following procedure.

- It might be necessary to remove the HD metal seal by carefully tapping it with a soft punch and hammer. Take care not to damage the valve body.

- If the seal is difficult to push out, it is recommended that a seal removal plate be used to press the HD metal seal out of the valve body. Refer to figure 6 for dimensions of the seal removal plate.

Figure 5. Ball Seal Assembly

3. The seal can be removed through the outlet end of the valve. In NPS 6x8 and larger valves there is room to manipulate the seal around the ball and remove it from the outlet end. Remove the wave spring (key 13), and the radial seal (key 37).
4. If replacement of the ball, shafts (keys 6 or 9), or bearings (key 10) is needed, proceed to the Bearing and Ball Maintenance procedure. If only the seal is to be replaced, proceed to the Installing HD Metal Seals section.

⚠ WARNING

The Vee-Ball closes with a shearing, cutting motion, which could result in personal injury. To avoid injury or property damage, keep hands, tools, and other objects away from the Vee-Ball while stroking the valve.

Figure 6. HD Seal Removal Plate Dimensions

VALVE SIZE, NPS	DIMENSION A	
	Minimum-Maximum, mm	Minimum-Maximum, Inches
3x4	75.9-76.2	2.990-3.000
4x6	95.0-95.3	3.740-3.750
6x8	126.7-127.0	4.990-5.000
8x10	158.5-158.8	6.240-6.250
10x12	212.5-212.7	8.365-8.375

Installing HD metal seals

Refer to figures 6, and 13 for key number locations during seal installation.

Thoroughly clean all parts that are to be reused and obtain replacement parts. Be sure that all sealing surfaces are in good condition without scratches or wear. Place the valve body on a flat surface with the inlet side of the valve facing up.

1. Lubricate the radial seal (key 37) and install into the appropriate groove in the valve body, making sure the open side of the radial seal faces away from the ball.
2. Install the wave spring (key 13) into the appropriate groove in the valve body.
3. **HD Metal Seal Lubrication** will assist with break-in of the HD metal seals and with assembly. It is required that both the ball surface and seal be lubricated with dry film lubricant or equivalent moly disulfide.
4. Position the valve body on a flat surface with the outlet side of the valve facing up.
 - a. On all sizes without the ball installed, the HD seal can be installed by pushing the HD seal past the wave spring and radial seal, making sure the HD metal seal remains level. Following this, install the remaining trim components as explained under the Bearing and Ball Maintenance section and specifically the Assembly heading on page 13.
 - b. On NPS 6x8 and larger valves, if the ball is still installed, rotate the ball past the 90 degree open position and hold it there while you install the HD metal seal (key 11) into the valve body. Push the HD seal past the wave spring and radial seal, making sure the HD metal seal remains level.
5. Use the pry to move the ball tightly against the bearing on the actuator side of the valve to help ensure correct side-to-side centering of the ball (key 2) on the seal (key 11). See figure 4.
6. Be sure that the HD seal is fully installed in the valve. Carefully rotate the ball to engage the HD seal while applying force across the middle of the seal to compress the wave spring until the ball is fully engaged. Be cautious during this process, knowing that excessive force may damage the ball. Keep the ball in the engaged position going forward.
7. Continue to check the ball's position and re-center if necessary during actuator mounting and packing adjustments.

Bearing and Ball Maintenance

⚠ WARNING

Before performing the steps in this section, observe the **WARNING** at the beginning of the Maintenance section on page 5.

Procedures for disassembly and assembly of the bearings and ball cannot be accomplished until the shaft and valve packing are removed from the valve. Refer to the Replacing Packing procedures to remove the actuator, and to remove the packing flange and packing follower from the valve. When the packing disassembly steps are complete, return to this section.

Disassembly

⚠ WARNING

When the actuator is removed from the valve, the ball/shaft assembly may suddenly rotate, with a shearing, cutting motion, which could result in personal injury. To avoid injury, carefully rotate the ball to a stable position at the bottom of the valve body cavity. Make sure the ball will not rotate.

Key numbers in this procedure are shown in figures 5 and 10, unless otherwise indicated.

1. A taper key (key 4) is used to connect the ball and drive shaft.
2. Carefully rotate the ball to the open position after the actuator is disconnected. Make sure the ball will not rotate (see warning above). Provide support for the ball during the following disassembly.
3. Working from the small end of the groove pin (key 7), use a pin punch to drive the groove pin out of the ball ear and follower shaft.

For tack welded taper keys, driving the taper key out of the ball ear will shear the tack welding.

4. Locate the small end of the taper key (key 4). Using a pin punch on the smaller end of the taper key, drive it out of the ball (key 2) and drive shaft (key 6). Note: driving the taper key in the wrong direction will tighten it.
5. Pull the drive shaft (key 6) out of the actuator side of the valve body.

CAUTION

Exercise care to avoid damaging components in the following procedure.

6. The ball will be free to move when both shafts are removed. Make sure the sealing surface of the ball is not damaged while removing the follower shaft.
7. Use a piece of continuous threaded rod as a removal rod when moving the follower shaft (key 9) into the center of the ball. Refer to table 3 for a description of the size threaded rod needed. The length of the rod should allow easy working room from the valve body.

Table 3. Continuous Threaded Rod

Valve Size, NPS	Threaded Rod Thread Size	Thread Depth in Follower Shaft, Inches
3x4	1/4-20	0.5
4x6	1/4-20	0.5
6x8	1/4-20	0.5
8x10	5/16-18	0.62
10x12	5/16-18	0.62

8. Carefully remove the follower shaft and ball (key 2) from the outlet end of the valve body.
9. The bearings are not pressed in, so they can be removed with minimal force. Be careful not to damage the machined surfaces of the bearing bore if prying is required.
10. For HD seal removal, follow the steps outlined under Removing HD Seal on page 7.

Assembly

1. Inspect all sealing surfaces to ensure they are in good condition and without scratches or wear.
2. Install the HD ball seal. See Installing the HD Seal on page 12, and follow steps 1 – 4. Then return to this procedure and continue with the next steps.
3. Install the replacement bearings (key 10) by hand. The bearing flanged end should touch the valve body.
4. **Installing the Vee-Ball:**

Lubrication will assist with break-in of the HD metal seals and with assembly. It is required that both the ball surface and seal be lubricated with dry film lubricant or equivalent moly disulfide.

⚠ WARNING

The ball might be damaged if it is allowed to fall into the valve body. To avoid personal injury or damage to the sealing surfaces, support the ball to prevent it from falling into or out of the valve body cavity.

Place the valve body on a table or bench with the inlet side down and carefully install the ball into the valve body cavity from the outlet end.

When installing the ball (key 2) into the valve body assembly, firmly support the ball while installing the shafts in the following steps.

5. **Installing the follower shaft (key 9):**
 - **For NPS 3x4 valves:** The follower shaft (key 9) should already have been inserted into the ball ear before the ball was put into the valve body. With the ball rotated open and not in contact with the HD seal, insert the follower shaft (key 9) into the valve body bearing (key 10).
 - **For NPS 4x6 and larger valves:** With the ball rotated open and not in contact with the HD seal, insert the follower shaft (key 9) through the ball, and into the valve body bearing (key 10).
6. Align the hole in the follower shaft with the holes in the ball. Insert the small end of the groove pin (key 7) into the hole in the ball and into the follower shaft. The pin will hold the parts in place while the drive shaft (key 6) is being installed.
7. **Installing the Drive Shaft:**

CAUTION

The drive shaft must be used with the correct Vee-Ball. Refer to the tag (see figure 7) attached to the Vee-Ball and to the drive shaft.

Failure to use the correct Vee-Ball/ shaft combination may result in the ball not being in the position indicated by the slash mark on the end of the shaft. If the ball is not properly aligned with the slash mark, the valve will not function correctly and seal damage may result.

Figure 7. Informational Tag

Installing the Taper Key

Current standard construction materials for all valves require the taper key (key 4, figure 9) to be tack welded in place after properly seating, using the following procedure. Use standard welding preparations when preparing parts for reassembly.

CAUTION

Make sure the drive shaft is free of oil or grease, otherwise the taper pin or taper key will not seat properly. Failure to properly set the taper pin or taper key could result in it coming loose while in service. Loosening of the taper key in service could result in improper valve function and equipment damage.

- Install the drive shaft (key 6) into the valve body through the ball and into the ball.
- Insert the taper key (key 4) into ball and drive shaft (keys 2 and 6) as shown in figure 8. The taper key inserts with the flat side of the key facing the drive shaft (key 6).
- Using a flat end punch, drive the groove pin (key 7) into the ball ear and follower shaft until it is flat with the ball ear surface. Stake both ends of the pin hole with a center punch to ensure the groove pin does not come out.
- Using a flat end punch, drive the taper key (key 4) into the ball ear and drive shaft (key 6) until solid, heavy contact is obtained between the key and shaft.
- Measure the position of the taper key head.
- Drive the taper key in further using the minimum distance shown in table 4.
- Inspect the ball/shaft taper key connection to verify that the taper key spans the entire shaft flat width. If not, the taper key must be driven in further until this condition is satisfied. However, do not exceed the maximum depths shown in table 5.

Note

All valve taper keys are tack welded, except titanium.

15. When the above conditions are met, tack weld the taper key (key 4) to the ball ear on the head end of the key (see figures 8 and 10). Use a:
 - 1/8 inch diameter weld on NPS 3x4, 4x6, 6x8 valves,
 - 3/16 inch diameter weld on NPS 8x10 and 10x12 valves
16. Use the pry to move the ball tightly against the bearing on the actuator side of the valve to help ensure correct side-to-side centering of the ball (key 2) on the seal (key 11). See figure 4.
17. Be sure that the HD seal is fully installed in the valve. Carefully rotate the ball to engage the HD seal while applying force across the middle of the seal to compress the wave spring until the ball is fully engaged. Be cautious during this process, knowing that excessive force may damage the ball. Keep the ball in the engaged position going forward.
18. Continue to check the ball's position and re-center if necessary during actuator mounting and packing adjustments.

For all constructions: Refer to Packing Maintenance, and other procedures as necessary to complete the assembly of the valve.

Actuator Mounting

Use the appropriate actuator instruction manual, this section of this manual, and figure 9 of this manual when mounting the actuator or changing actuator styles and positions.

1. To help ensure correct centering of the Vee-Ball (key 2) on the seal (key 11), be sure the ball is closed when mounting the actuator (for applications other than Spring Return Fail-Open).
2. Clean the valve shaft and actuator lever splines to be sure the actuator lever will slide on easily. Only drive the lever in if absolutely necessary.
3. Carefully wedge the ball solidly against the actuator-side bearing, using a screwdriver or similar tool inserted between the lower ear of the ball and the valve body. This will center the ball. See figure 4.

Figure 8. Taper Key Installation

3180727-E
A6035-1

Table 4. Taper Key Minimum Depth

Valve Size, NPS	Minimum Depth To Drive Taper Key After Initial Solid Contact, mm (Inches)
3x4, 4x6, 6x8	4.8 (0.188)
8x10, 10x12	5.6 (0.219)

Table 5. Taper Key Maximum Depth

Valve Size, NPS	Maximum Depth To Drive Taper Key After Initial Solid Contact, mm (Inches)
3x4, 4x6	7.1 (0.281)
6x8	7.9 (0.312)
8x10, 10x12	9.5 (0.375)

4. Keep the wedge in place while installing the lever, if necessary. Remove the wedge after you have clamped the actuator lever on the valve shaft and have connected the lever to the actuator piston rod or diaphragm rod.

Determining Mounting Position

The actuator can be either right or left-hand mounted, with the actuator on the right or left side when viewed from upstream (see figure 9).

The Series B Vee-Ball has one V-notch. For **right-hand mounting (standard)**, the ball will be in the top of the valve body when the valve is open and the shaft is horizontal. In this position the ball rotates CCW to Close. For **left-hand mounting (standard)**, the ball will be in the bottom of the valve body when the valve is open and the shaft is horizontal. In this position the ball rotates CCW to Close. An optional ball for **left-hand mounting**, which rotates into the top of the valve body when the shaft is horizontal, is also available. In this position the ball rotates CW to Close.

Determining Closed Position

1. The valve must be removed from the line to check the position of the ball.

⚠ WARNING

The Vee-Ball closes with a shearing, cutting motion. To avoid personal injury, keep hands, tools, and other objects away from the ball while stroking the valve.

2. Rotate the ball to the closed position.
3. Position the ball in the proper location
 - When viewed from the valve body inlet, the ball is in the proper position when the flat spot on the top of the ball is exactly in the center of the seal package.

Make a copy of the centering template in figure 13 out of a suitable stiff material. Place the centering template in the opening at the seal (See figure 12). Find the center of the template and make sure the spot on the ball is centered directly below it.

4. Adjust the actuator as described in the appropriate actuator instruction manual until the ball is centered in the closed position. A line is stamped on the actuator end of the drive shaft (see figure 9) to indicate the ball position.

Use the appropriate actuator instruction manual and figure 9 of this manual when mounting the actuator or changing actuator styles and positions.

Parts Ordering

A serial number is assigned to each valve and stamped on the nameplate. Always refer to the valve serial number when corresponding with your [Emerson sales office](#) or Local Business Partner regarding spare parts or technical information. When ordering replacement parts, also specify the complete 11-character part number from the parts kits or parts list information.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Introduction

Scope of Manual

This instruction manual provides installation, operation, maintenance, and parts information for Fisher Slurry Vee-Ball V150S and V300S rotary control valves, NPS 3 through 12 (see figure 1).

Refer to separate manuals for information concerning the actuator, positioner and accessories.

Do not install, operate, or maintain V150S or V300S valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Table 1. Specifications

Valve Sizes NPS ■ 3, ■ 4, ■ 6, ■ 8, ■ 10, and ■ 12 End Connection V150S: CL150 Raised-face flange V300S: CL300 Raised-face flange Shutoff Classification Construction does not provide tight shutoff. Nominal gap between ball and flow ring seat is 0.035 inch for high chrome iron construction and 0.015 inch for ceramic insert construction. Construction Materials Standard Construction: See table 2 Flow Direction Reverse flow recommended (into concave face of ball, out through the flow ring)	Valve Installation Shaft axis shall be horizontal Actuator Mounting Right-hand or left-hand, as viewed from upstream end of valve Maximum Ball Rotation 90 degrees Valve/Actuator Action Standard ball rotation is clockwise (CW) to close with right hand mount actuator. Left hand mount actuator with counterclockwise (CCW) to close ball action is optional. For horizontal pipe run and horizontal shaft orientation, it is recommended the ball rotate to the top of valve body upon opening. With diaphragm or piston rotary actuator and splined shaft, the valve is field-reversible between push-down-to-close or push-down-to-open: ■ PDTC (extending actuator rod closes valve) and ■ PDTO (extending actuator rod opens valve)

Description

The Slurry Vee-Ball valve shown in figure 1 mates with CL150 or CL300 raised face flanges. Rugged construction, highly wear-resistant trim materials, and an unrestricted straight through flow path make the design ideal for controlling the most abrasive of slurries.

A shaft with a choice of drive connections will allow a variety of power operated actuators and valve positioners or controllers to be used.

The design is particularly effective in minimizing erosive damage to the adjoining pipework, thereby providing greater operational safety and service life when compared with other valve types.

Specifications

Specifications for these valves are shown in table 1 and in Fisher Bulletin 51.3:V150S Slurry Vee-Ball V150S and V300S Rotary Control Valves ([D103154X012](#)).

Installation

WARNING

Safe work practices should be followed when handling the valve and actuator.

Some types of ceramic trim, including PSZ, can create a spark under certain conditions when an edge of one ceramic part is struck against a second ceramic part with enough force. Do not use ceramic trim where the process fluid has volatile or combustible properties.

The valve drive shaft is not necessarily grounded to the pipeline when installed. Personal injury or property damage could result from an explosion caused by a discharge of static electricity from valve components if the process fluid or the atmosphere around the valve is flammable. If the valve is installed in a hazardous area, electrically bond the drive shaft to the valve.

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed either the valve body rating or the mating pipe flange joint rating. To avoid such injury or damage, provide a relief valve for overpressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Because some valve/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

Figure 3. Optional Shaft-to-Body Bonding Strap Assembly

1. Install the valve in the direction of the flow arrow fitted to the valve body.
2. Install the valve with the shaft axis in the horizontal position.
3. If required, fit a bonding strap assembly (key 131) to the drive shaft (key 8) with the clamp, (key 130, figure 3) and connect the other end of the bonding strap assembly to the valve body with actuator mounting cap screw.
4. If the valve and actuator have been purchased separately or if the actuator has been removed, mount the actuator according to the Actuator Mounting section and the appropriate actuator instruction manual.
5. The actuator can be right- or left-hand mounted with the shaft in a horizontal orientation as shown in figure 1. If necessary, refer to the appropriate actuator instruction manual for actuator installation and adjustment procedures.

Table 4. Fisher V150S Dimensions

12	3.5	1-1/2	1.5	5.25	1.5	5/8-11

1. This nominal valve shaft diameter is the shaft diameter through the packing box. Use this diameter when selecting Fisher actuators.

Figure 5. Fisher Slurry Vee-Ball Dimensions for Double D Shaft Drive (see table 6)

Maintenance

⚠ WARNING

The V-notch ball closes with a shearing, cutting motion, which could result in personal injury. To avoid injury, keep hands, tools, and other objects away from the V-notch ball while stroking the valve.

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- The valve packing area may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Packing Maintenance

1. It is recommended that the valve be removed from the line when replacing packing to allow correct set up of the actuator after actuator removal.
2. Remove the packing follower nuts and packing follower (keys 18 and 16).
3. Remove the packing parts (see figure 4 and keys 15 and 14) using a purposed designed packing extraction tool to avoid damaging the packing box bore and shaft surfaces.

4. Install the new packing parts using the sequence shown in figure 4. Fit the packing follower (key 16). Fit nuts (key 18).
5. Tighten the packing nuts to compress the packing to seal for operating conditions. At the same time push the ball and shroud on the drive end against the valve body inside location face to center the ball. This can be done by using a lever (wood) against the inside ball lug face and the valve body liner inlet.

Disassembly

⚠ WARNING

Observe the steps in the WARNING at the beginning of the Maintenance section.

Reference figures 9 and 10.

Figure 6. Packing Arrangements

NOTE:

1 Includes zinc washers for graphite ribbon packing only.

2885170

STANDARD PACKING

CAUTION

Trim parts are made from brittle material, handle with care to avoid chipping or breakage.

1. Remove the actuator cover (where applicable). Take note of the orientation of the actuator with respect to the valve body and the lever orientation with respect to the valve drive shaft.
2. Remove the actuator.
3. Remove the flow ring retainer screws, clips and flow ring retainer (keys 22, 23, and 5).
4. Knock or press out the flow ring (key 4).

5. Position the ball to allow access to the shaft pins. Use a modified parallel pin punch (figure 7) to to knock out the shaft pins, (key 10) through the shaft and ball lugs.

Note

The punch dimensions should be as per table 7 to avoid damaging the ball and shaft. The hole diameter in the ball is larger than the hole in the shaft and the punch needs to be centrally located with the pin.

6. Remove packing follower (key 16). Remove plug (key 20) and spring (key 19).
7. Knock or press each shaft (key 9) out through the ball and the bearings (key 7).
8. Remove ball (key 3) and shrouds (key 6).
9. Knock, press, or pull out bearings (key 7).
10. Knock or press out body liner (key 2).
11. Remove packing (key 15).

For service applications involving scale formation that sets up and “freezes” mating parts, supplementary recommendations for disassembly can be provided by your [Emerson sales office](#).

Assembly

WARNING

Observe the steps in the WARNING at the beginning of the Maintenance section.

Reference figures 9 and 10.

CAUTION

Trim parts are made from brittle material, handle with care to avoid chipping or breakage.

1. Clean all surfaces of the parts to be used. Ensure all mating surfaces are in good condition and free from scratches and dents. Replace worn parts. Fit new gaskets (key 13 and 21) and packing (key 15).
2. Position the valve body with flow arrow uppermost.
3. Fit the valve body liner (key 2) into the valve body, aligning cross-holes with shaft bore axis.
4. Fit the bearings (key 7) through the valve body liner into the valve body.
5. Place bearing shrouds (key 6) over the bearings and through the valve body liner to contact faces in the valve body bore.
6. Orientate the ball (key 3) so that the lug with the location slot will be on the non-drive side of the valve body, that is opposite from the actuator. Place the ball on a wad of rag to rest in the bottom of the valve body with the lugs uppermost. Fit the drive shaft (key 8) through the bearing on the drive side and into the hexagon hole of the ball, aligning the holes for the shaft pins. With a splined shaft, the indicator line on the splined shaft end should be on the ball side to indicate the ball “seat location.” Fit the follower shaft (key 9).
7. Fit the shaft pins (key 10) through the ball and into the shaft using a pin punch (figure 7). Position the pins approximately centrally about the shaft axis.

8. Next install the packing. Fit the studs (key 17), packing box ring (key 14), packing set (key 15), packing follower (key 16), and nuts (key 18). Adjust the packing tightness for use.
9. Before fitting the flow ring, tap the end of the bearing on the drive end to ensure that the ball/shroud assembly is hard against the valve body inner recess location on the drive end.
10. Next fit the flow ring.
 - a. For one piece High Chrome Iron flow ring (key 4), fit into the valve body and valve body liner. Fit the gasket, (key 13) and flow ring retainer (key 5). Secure with retainer screws (key 22) and clips (key 23). Check that the ball rotates freely.
 - b. For flow ring with ceramic insert, position the valve body on the valve body liner flange face with the ball secured and facing upwards. Make sure the flow ring insert type (key 28) and flow ring insert (key 29) are clean and free of grease and oil. Apply a bead of Loctite™ 620 around the smaller outside diameter of the ceramic insert and push the insert into the flow ring. Place shims on the upper ball face (recommended thickness 0.015 inch) and lower the flow ring assembly into place. Secure with retainer, screws and clips. Push the insert down onto the shims and allow the adhesive to set.
11. Coat thread of non-drive end body plug with Loctite 567 and fit gasket (key 21), spring (key 19), and plug (key 20) to body. Tighten plug by hand until gasket contact is achieved. Continue to tighten body plug an additional 1/4-turn from gasket contact.

For service applications involving scale formation that sets up and “freezes” mating parts, supplementary recommendations for assembly can be provided by your [Emerson sales office](#).

Actuator Mounting

Use the appropriate actuator instruction manual, this section of this manual, and figure 8 of this manual when mounting the actuator or changing actuator styles and positions.

1. To help ensure correct centering of the V-notch ball (key 3) on the flow ring (key 4 or 28/29), be sure the ball is closed when mounting the actuator (for applications other than Spring Return Fail-Open).

Figure 7. Pin Punch

Table 7. Pin Punch Dimensions

Valve Size, NPS	Ball Pin Hole Ø	Shaft Pin Hole Ø	A Min	B Max	C Max	D Min
3 and 4	0.19	0.16	0.25	0.15	0.085	1.45
6	0.22	0.19	0.25	0.18	0.105	1.85
8 and 10	0.28	0.25	0.38	0.24	0.135	2.2
12	0.28	0.25	0.38	0.24	0.135	2.6

2. Clean the valve shaft and actuator lever splines to be sure the actuator lever will slide on easily. Only drive the lever in if absolutely necessary.
3. Carefully wedge the ball solidly against the actuator-side bearing to center the ball.
4. Keep the wedge in place while installing the lever, if necessary. Remove the wedge after you have clamped the actuator lever on the valve shaft and have connected the lever to the actuator piston rod or diaphragm rod.

Determining Mounting Position for Spline Shaft/Lever Type

The actuator can be either right or left-hand mounted, with the actuator on the right or left side when viewed from upstream (see figure 8).

For **right-hand mounting (standard)**, the ball will be in the top of the valve body when the valve is open and the shaft is horizontal. In this position the ball rotates CW to Close.

For **left-hand mounting**, the ball will be in the top of the valve body when the valve is open and the shaft is horizontal. In this position the ball rotates CCW to Close.

Figure 8. Index Marks for Actuator Lever Orientation for NPS 3 through 12 Valves

ACTUATOR		VALVE OPEN	ACTUATOR POSITION			
MOUNTING	STYLE		1	2	3	4
(OPTIONAL) LEFT-HAND	STYLE D PUSH DOWN TO CLOSE					
	STYLE C PUSH DOWN TO OPEN					
(STANDARD) RIGHT-HAND	STYLE B PUSH DOWN TO CLOSE					
	STYLE A PUSH DOWN TO OPEN					
NOTE: 1. Arrow on lever indicates direction of actuator thrust to close valve.						

Determining Closed Position

1. The valve must be removed from the line to check the position of the ball.

⚠ WARNING

The V-notch ball closes with a shearing, cutting motion. To avoid personal injury, keep hands, tools, and other objects away from the ball while stroking the valve.

2. Rotate the ball to the closed position.
3. Position the ball in the proper location.
4. The ball is in its closed position when the Vee plane of the ball, (opposite the convex side) is parallel to the liner end flange face of the valve body. Measure to check. Adjust the actuator linkage or travel stops to position.

CAUTION

To extend operating life of the V-notch ball, always ensure the V-notch ball rotates into the top of the valve body to open.

Parts Ordering

A serial number is assigned to each valve and stamped on the nameplate. Always refer to the valve serial number when corresponding with your [Emerson sales office](#) regarding spare parts or technical information. When ordering replacement parts, also specify the complete 11-character part number from the parts kits.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts List

Note

Contact your Emerson sales office for Part Ordering information.

Common Parts (figures 9 and 10)

Key Description

- 1 If you need a valve body as a replacement part, order by valve size, serial number, and desired valve body material.
- 2* Valve Body Liner
- 3* V-notch Ball
- 4* Flow Ring
- 5 Flow Ring Retainer
- 6* Bearing Shroud (2 req'd)
- 7* Bearing (2 req'd)
- 8 Drive Shaft Spline
- 8 Drive Shaft
- 9 Follower Shaft
- 10* Shaft Pin (2 req'd)

Key Description

- 13* Gasket
- 14* Packing Box Ring
- 15* Packing Set
- 16 Packing Follower
- 17 Stud (2 req'd)
- 18 Nut (2 req'd)
- 19 Spring
- 20 Plug
- 21* Gasket
- 22 Retainer Screw (2 req'd)
- 23 Retainer Clip (2 req'd)
- 24 Actuator Mounting Screw (4 req'd)
- 25 Nameplate
- 26 Drive Screw (4 req'd)
- 27 Flow Arrow
- 28 Flow Ring Insert
- 29 Flow Ring Insert
- 130 Clamp
- 131 Bearing Clamp Assembly

W3698-1

Introduction

Scope of Manual

This instruction manual provides installation, maintenance, and parts ordering information for NPS 4 through 24 Fisher V250 valves (figure 1) that mate with ASME flanges. Other instruction manuals provide information covering the actuator and accessories.

Do not install, operate, or maintain a V250 valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The V250 valve is a flangeless rotary control valve used for high pressure, throttling or on-off control of liquid or gas applications (see figure 1). These valves operate on a rotary motion input through a splined valve-shaft/actuator-shaft connection for use with power or manual handwheel actuators. The single seal, dual seal, and flow ring constructions are covered in this instruction manual.

Instruction Manual

D100422X012

Table 1. Specifications

Valve Sizes and End Connection Styles NPS 4 through 24 flangeless valves retained by line flange bolts and designed to fit between ASME raised-face or ring-type joint flanges. See table 2 for valves that install between ASME flanges Maximum Inlet Pressure⁽¹⁾ Consistent with applicable pressure-temperature ratings listed in table 2 Maximum Allowable Shutoff Pressure Drop^(1,2,3) Single-Seal and Dual-Seal Construction: 155 bar (2250 psi) at 38°C (100°F) and 103 bar (1500 psi) at 82°C (180°F) except where further limited by the pressure-temperature rating of the valve body Flow Ring Construction: Limited by the pressure-temperature rating of the valve body Seal Material Temperature Capability⁽¹⁾ Single-Seal and Dual-Seal Construction: -46 to 82°C (-50 to 180°F) with LCC or stainless steel valve bodies Flow Ring Construction with Nitrile O-Rings: -46 to 93°C (-50 to 200°F) with LCC steel and stainless steel valve bodies Flow Ring Construction with Fluorocarbon O-Rings: -46 to 204°C (-50 to 400°F) with LCC steel and stainless steel valve bodies	Flow Characteristic Modified equal percentage Flow Direction Forward Flow: Single seal construction is standard for forward flow (see figure 4) Bidirectional Flow: Flow ring construction can be used for either forward or reverse flow (see figure 5) Bidirectional Shutoff: Dual seal construction is required to provide shutoff for bidirectional flow (see figure 12) Shutoff Classification Single Seal and Dual Seal Constructions: 0.0001% of maximum valve capacity (less than 1% of Class IV, ANSI/FCI 70-2) Flow Ring Construction: 1% of maximum valve capacity Maximum Ball Rotation 90 degrees Actuator Mounting Right-hand or left-hand mounted as viewed from the valve body inlet for forward flow Approximate Weights See table 3
--	---

1. The pressure/temperature limits in this manual and any applicable standard or code limitation for valve should not be exceeded.

2. Maximum allowable shutoff pressure drops are further limited for the following constructions. The NPS 12 with S20910 drive shaft is limited to 128 bar (1862 psi) from -46 to 59°C (-50 to 139°F) and to 103 bar (1490 psi) at 93°C (200°F). The NPS 16 with 17-4PH steel, with 2-1/2 inch splined drive shaft is limited to 69 bar (1000 psi), and with the S20910, 2-1/2 inch splined drive shaft is limited to 55 bar (795 psi) at all service temperatures. The NPS 24 with S20910 drive shaft is limited to 92 bar (1336 psi) at all service temperatures.

3. NPS 20 CL900 and NPS 24 CL900 flow ring is limited to 1500 psi.

Table 2. Pressure Rating and Flange Compatibility

Valve Size, NPS	Inlet Pressure Capability	ASME Flange Compatibility

20 (CL900)	2045	4500
24	2404	5300

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage resulting from the sudden release of pressure, do not install the valve assembly where service conditions could exceed the limits given on the valve and actuator nameplates. Use pressure-relieving devices as required by accepted industry, local, state, or federal codes, and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

Avoid personal injury or property damage caused by uncontrolled movement or dropping of the valve assembly.

Hoist rings are sized to lift only the valve and actuator. Do not use hoist rings to lift the valve if piping or other structures are added.

Rig the lift to use two hoist rings and take appropriate precautions to avoid unbalanced loading which may result in sudden swinging or movement of the assembled unit, including additional lifting and/or support methods when necessary.

Failure to utilize safe lifting practices may result in equipment damage and/or personal injury.

1. If the valve will be placed in storage prior to installation, protect the flanges and keep the inside of the valve dry and clear of foreign material.
2. Install a three-valve bypass around the control valve assembly if continuous operation will be necessary during inspection and maintenance of the valve.
3. Inspect the valve body for damage and be certain that the valve body cavity is free of foreign material.
4. Be certain that adjacent pipelines are free of any foreign material, such as pipe scale or welding slag, that could damage the valve body seating surfaces.
5. A V250 valve is normally shipped as part of a control valve assembly, with a power or manual handwheel actuator mounted on the valve. If the valve and actuator have been purchased separately or if the actuator has been

removed for maintenance, mount the actuator according to the actuator mounting procedure and adjust actuator travel before inserting the valve into the pipeline. This allows necessary measurements to be made during the actuator adjustment process.

The actuator can be either right-or left-hand mounted, as viewed from the valve body inlet, in any of the positions shown in figure 10. Refer to the Actuator Mounting procedure in this manual and to the actuator instruction manual for mounting and adjusting instructions before proceeding.

6. Before installing the valve, make sure the flow through the valve matches the flow direction arrow on the valve. Failure to do so can damage the seal in a valve with a single seal construction.

For bidirectional flow, install the valve so the highest pressure flow matches the flow direction arrow on the valve. Install the V250 valve in any position, but the recommended orientation is in a horizontal pipeline with the shaft positioned horizontally and the ball closing in the downward direction.

CAUTION

To avoid damage to the ball sealing surface, rotate the ball to the fully open position before installing the valve between the pipeline flanges.

7. With the ball in the fully open position, install line flange gaskets and insert the valve between the pipeline flanges. Use standard composition gaskets, or other flat sheet gaskets compatible with the flow media, between the valve and the pipeline flanges. Spiral wound gaskets without compression controlling centering rings are not recommended.

CAUTION

Uneven tightening of line bolts may cause uneven wear of the ball surface, leakage downstream or to atmosphere, or uneven flange gasket alignment. Tighten line bolts evenly when installing the valve.

8. Center the valve in the line by making sure the mating flanges are aligned. Secure the valve in the line with the cap screws (keys 33 and 34, figures 11 and 12), line bolts (key 35, not shown), and hex nuts (key 44, not shown). Required clearances for installation of the long line bolt studs and the required engagement length for the cap screws are shown in figure 2. When tightening the cap screws and line bolts, use accepted bolting procedures. Lubricate the studs or bolts and tighten the nuts in a crisscross sequence to ensure proper alignment of the valve with the flanges.
9. For hazardous atmosphere or oxygen service valves, read the following WARNING, and perform the instruction provided in the WARNING and provide the bonding strap assembly mentioned in step 10 below if the valve is used in a hazardous application.

⚠ WARNING

The V250 is not necessarily grounded to the pipeline when installed. If the process fluid or the atmosphere around the valve is flammable, personal injury or property damage could result from an explosion caused by a discharge of static electricity from the valve components. If the valve is installed in a hazardous area, electrically bond the drive shaft to the valve.

Note

The packing is composed of all conductive packing rings (graphite ribbon packing) to electrically bond the shaft to the valve for hazardous area service or non-conductive PTFE packing rings. For oxygen service applications, perform the following step.

Figure 2. Flange Bolt Lengths

20 ⁽²⁾	---	---	16.5	---	---	16.5

1. These bolts may be installed from either end of the valve.

2. For NPS 20 size, only studs and nuts are used. See the M dimension.

39A1060-A
A3140-1

- Attach the bonding strap assembly (key 41, figure 3) to the shaft with the clamp (key 40, figure 3), and connect the other end of the bonding strap assembly to the valve with the machine screw (key 43, figure 3).
- Connect pressure lines to the actuator as indicated in the actuator instruction manual. When a manual actuator is used with a power actuator, install a bypass valve on the power actuator (if not already supplied) for use during manual operation.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions. Instructions are presented in this section for replacing the shaft seals, the ball seal or flow ring, the drive and follower shafts, the ball and bushing, and the valve outlet gasket.

Key number locations are shown in figure 11 for single seal and flow ring constructions, and in figure 12 for dual seal constructions.

⚠ WARNING

Personal injury or property damage can result due to a sudden release of pressure or process fluid if the pipe plug (key 42, figure 12) is removed while the valve is pressurized. To avoid such injury or damage, remove the pipe plug only when the control valve is isolated from the pressure system, or provide a hand valve to control relief of internal valve pressure to avoid personal injury or property damage.

A V250 valve with a dual seal construction contains a pipe plug port (key 42, figure 12) on the underside of the valve. This port can be used to relieve internal valve pressure for testing seal integrity when in the pipeline.

If the pipe plug port is to be used for testing seal integrity when the valve is in the pipeline, the plug should be replaced with a hand valve to allow controlled relief of valve pressure during seal leak rate testing.

⚠ WARNING

Avoid personal injury or damage to property from sudden release of pressure or uncontrolled process fluid. Before starting disassembly:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from either side of the valve.
- For dual seal valve constructions, remove pressure and drain the valve interior by removing the pipe plug (key 42).
- Vent the power actuator loading pressure.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Replacing the Follower Shaft Seal

Both the follower and drive shaft seals should be replaced at the same time. Key number locations are shown in figure 11 or 12.

Note

The valve shaft's sealing surfaces are critical in obtaining a good seal. If the valve shafts are scratched, nicked or worn, replace or repair the valve shaft before installing new shaft seals.

Both seal rings, drive end and follower end, should be replaced at the same time.

1. Isolate the control valve from the line pressure, release pressure from both sides of valve, and drain the process media from both sides of the valve. For dual seal valve constructions, remove pressure and drain the valve interior cavity. Shut off and disconnect all lines from the power actuator.

⚠ WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

CAUTION

When removing the actuator in the following step, use a wheel puller to separate the actuator parts from the valve shaft. Failure to do this could cause damage to the actuator parts and the drive shaft.

2. Remove the cap screws (key 29) from the actuator mounting yoke and, while referring to the actuator instruction manual for assistance, remove the actuator. For oxygen service and hazardous area applications, remove the clamp and bonding strap assembly (keys 40 and 41, figure 3).
3. Install the new backup ring and shaft seal in the seal carrier. Be sure to install the backup ring on the correct side (see figure 4).
4. Replace the seal carrier and secure it with the hex nuts (key 8). Be careful not to damage the shaft seal or O-ring during replacement of the seal carrier.
5. Mount the actuator to the valve while referring to the Actuator Mounting section of this instruction manual and to the appropriate actuator instruction manual. If appropriate, install or replace the bonding strap assembly and the clamp (key 41 and 40, figure 3).

Replacing Ball Seal or Flow Ring

Perform this procedure if the control valve is not shutting off properly (that is, leaking downstream). This procedure does not require removing the actuator from the valve. In addition to being shown in figures 11 and 12, key numbers are shown in figure 5 for the ball seal constructions and in figure 6 for the flow ring construction.

Removal

1. Isolate the control valve from the line pressure, release pressure from both sides of valve, and drain the process media from both sides of the valve. For dual seal valve constructions, remove pressure and drain the valve interior cavity. Shut off and disconnect all lines from the power actuator.

⚠ WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

The ball (key 2) closes with a shearing motion. To avoid personal injury, keep hands, tools, and other objects away from the ball while stroking the valve.

CAUTION

Damage to the ball (key 2) may occur if the ball is not in the fully open position while the valve is being removed from the pipeline. If necessary, pressure the actuator temporarily to retain the ball in the open position while removing the valve from the pipeline.

2. With the ball in the fully open position, unscrew the line bolts and remove the valve from the pipeline.
3. Unscrew the cap screws (key 15, figures 11 and 12 only) and remove the seal protector ring (key 14) or the flow ring (key 14) from the inlet end of the valve. Then remove the O-ring (key 13), the ball seal (key 11), and the shim seals (key 10). The flow ring construction will have no ball seal. For a dual seal construction, repeat this procedure on the other end of the valve.
4. Thoroughly clean all metal surfaces. Check all parts for damage, and replace damaged parts with new parts if necessary.

Figure 4. Ball Seal Detail

Figure 5. Flow Ring Detail

Figure 6. Seal & Backup Ring Assembly

5. Proceed to the appropriate Installation procedure to install the removed parts.

Installation of Single or Dual Ball Seal

1. Check the seal surface of the valve (key 1) for scratches that may prevent the shim seals (key 10) from sealing off internal valve pressures.
2. Rotate the ball (key 2) to the closed position as indicated by the travel indicator scale (key 37, figures 10 and 11 only).
3. Place the appropriate number of shim seals into the valve:
 - For NPS 4 through 10 valves, insert up to 6 shim seals into the valve.
 - For NPS 12 through 24 valves, insert up to 7 shim seals into the valve.
4. Inspect the sealing surface of the ball seal (key 11) for possible damage. Then place the ball seal on top of the shim seals with any nicks or scratches facing away from the ball.
5. Add or remove the 0.25 mm (0.010 inch) thick shim seals to the valve until the ball seal firmly contacts the ball sealing surface (i.e., without rocking) when pressed tightly against the shim seal assembly.
6. Temporarily remove the ball seal, and remove 3 shim seals.
7. Replace the ball seal, and then place the O-ring (key 13) into the valve.
8. With the ball seal centered on the ball, install the seal protector ring (key 14) and secure it to the valve with the cap screws (key 15).
9. For dual seal constructions, repeat this procedure on the other end of the valve.

Installation of Flow Ring

1. Check the seal surface of the valve (key 1) for scratches that may prevent the shim seals (key 10) from sealing off internal valve pressures.
2. Rotate the ball (key 2) to the closed position as indicated by the indicator scale (key 37, figure 11 only).
3. Place the appropriate number of shim seals into the valve:
 - For NPS 4 through 10 valves, insert 6 shim seals into the valve.
 - For NPS 12 through 24 valves, insert 7 shim seals into the valve.
4. Making certain the flow ring (key 14) is centered and does not contact the ball, secure the flow ring to the valve with the cap screws (key 15).

5. Measure the clearance between the flow ring and the ball with a wire gauge. Add or subtract shim seals until the minimum clearance is 0.38 mm (0.015 inches) for valves used for forward flow and 0.76 mm (0.030 inches) for reverse flow.
6. Once minimum clearance is obtained, temporarily remove the flow ring.
7. Insert the O-ring (key 13) into the valve, and secure the flow ring to the valve with the cap screws (key 15).

Installing Live-Loaded PTFE Packing

These steps refer only to the Live Loaded PTFE Packing. Key number locations are shown in figures 11, 12, and 13.

Note

The valve shaft's packing surfaces are critical in obtaining a good seal. If the valve shafts are scratched, nicked or worn, replace or repair the valve shaft before installing the Live Loaded PTFE Packing parts. Both seal rings, drive end and follower end, should be replaced at the same time.

1. Remove the hex nuts (key 8) from the seal carrier (key 17 on the drive shaft end and key 3 on the follower shaft end). Remove the spacer (key 22). On NPS 4, 12, and 24 valves, the stud bolt (key 4) will need to be removed. The drive pin (key 28) needs to be removed from the outboard end of the valve body.
2. Replace the seal carrier and spacer with the new packing box (key 17 or 3). To keep the ball properly centered inside the valve body, the bushing spacer shims may need to be added or removed (see the Replacing Drive Shaft, Follower Shaft, Ball, Bushings, and Valve Outlet Gasket -- Assembly section).
3. Secure the packing box with hex nuts (key 8), for NPS 6, 8, 10, 16, or 20 valves, or socket head cap screw (key 4), for NPS 4, 12, or 24 valves. Lubricate the hex nuts or cap screws and tighten them. Be careful not to damage the O-ring during installation of the packing box.
4. Install the packing box studs (key 100).

Note

The Belleville springs must be stacked properly and packing box parts must be assembled in the correct order, if the packing parts are to function properly.

5. Install the packing ring, female and male adaptors, anti-extrusion rings, and packing box rings (keys 105, 106, and 107). Be sure to install the packing rings in the order and quantity shown in figure 13.
6. Install the spring pack assembly (key 103 or 104), which includes the Belleville springs, packing follower, and O-ring. The O-ring is a non-functional part used to retain the packing springs during assembly.
7. Install the packing flange (key 102) on the shaft. Then lubricate and install the packing nuts (key 101), hand tightening them. Apply lubricant to the stud threads, internal nut threads and contacting face of the nut. Packing flanges with flats on the sides may need to be oriented with the mounting bracket so the flange will fit between the legs of the bracket.
8. To obtain optimum maximum benefit from the packing system, tighten the packing flange nuts and compress the Belleville springs to their Target Load. The Belleville springs are designed to provide optimum performance at their Target Load, 85% of their maximum deflection/compression.

To obtain the Target Load compression, tighten the packing flange nuts alternately and evenly, keeping the packing flange parallel with the valve flange, until the Belleville springs are compressed 100%. Then loosen each packing flange nut one half turn (180° of rotation).

Replacing Drive Shaft, Follower Shaft, Ball, Bushings, and Valve Outlet Gasket

This procedure is to be performed to replace the valve ball, the drive shaft, and the follower shaft, if the ball does not rotate in response to rotation of the actuator end of the drive shaft, or if there is leakage around the outlet gasket.

Disassembly

CAUTION

When removing the actuator from the valve, do not use a hammer or similar tool to drive the lever off the valve shaft. Driving the actuator lever off the valve shaft could move the ball (key 2) from the centered position, causing damage to the ball, the ball seal (key 11), and the valve (key 1).

Use care when removing the actuator lever and, if necessary, use a wheel puller to remove the lever or actuator from the valve shaft. It is okay to tap the wheel puller screw lightly to loosen the lever or actuator, but hitting the screw with excessive force could also damage the valve.

1. Remove the cap screws (key 29) from the actuator mounting yoke and, while referring to the actuator instruction manual for assistance, remove the actuator. If appropriate, remove the clamp and bonding strap assembly (key 40 and 41, figure 3).
2. Remove either the seal protector ring (key 14) or the flow ring (key 14) from the inlet end of the valve assembly by following steps 1, 2, and 3 of the Replacing Ball Seal or Flow Ring section. For dual seal constructions, note that this procedure should be repeated on the outlet end of the valve.
3. Proceed as appropriate: For single seal constructions and flow ring constructions (figure 11 only), remove the cap screws (key 15). Then, remove the valve outlet (key 5) and gasket (key 12).

Note

Perform the following step with the inlet end of the valve assembly facing upward and with the ball (key 2) in the fully open position.

4. Remove the hex nuts (key 8) from the follower shaft (key 7) side of the valve. Then remove the seal carrier (key 3). Inspect and replace the seal (key 16) and O-ring (key 23) if necessary.

Note

During the following step, it may be necessary to apply heat to the retainer screw (key 32) to disengage the thread locking adhesive (high strength) (key 30) that holds the retainer screw in place.

5. Remove the retainer screw (key 32).
6. Using a soft-faced hammer to prevent damaging the end of the follower shaft (key 7), drive the follower shaft into the flow bore of the ball just enough so that the split ring (key 31) can be removed. Then remove the split ring.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D100422X012

V250 Valve

November 2020

Table 4. Shaft Retainer and Retainer Screw Torques

VALVE SIZE, NPS	N•m		Lbf•Ft	
	Shaft Retainer (Key 25)	Retainer Screw (Key 32)	Shaft Retainer (Key 25)	Retainer Screw (Key 32)
4	136	27	100	20
6	759	27	560	20
8	1390	41	1025	30
10	1760	41	1295	30
12	2390	68	1760	50
16	3830	68	2825	50
20	6660	68	4910	50
24	12300	68	9075	50

7. Remove the follower shaft (key 7), the spacer (key 22), the bushing spacer shims (key 18), the bushing (key 20), the thrust washer (key 19), and the thrust spacer (key 21) from the valve.
8. Insert a ball support post (see figure 7) into the follower shaft (key 7) bore of the valve. Use of the ball support post will ensure that the ball sealing surfaces will not get damaged as the shaft retainer (key 25) is being removed. Position the ball support post so that the ball will be supported firmly inside the valve body cavity during the performance of the next three steps.

Note

During the following step, it may be necessary to apply heat to the shaft retainer (key 25) to disengage the thread locking adhesive (high strength) (key 30) that holds the shaft retainer in place.

9. Remove the shaft retainer (key 25) and the washer (key 24).
10. Remove the hex nuts (key 8) from the drive shaft (key 6) side of the valve. Then remove the seal carrier (key 17). Inspect and replace the seal (key 16) and O-Ring (key 23) if necessary.
11. With the ball firmly supported, remove the drive shaft (key 6) and attached parts out of the valve. Attached parts will include the spacer (key 22), the bushing spacer shims (key 18), the bushing (key 20), the thrust washer (key 19), and the thrust spacer (key 21).
12. While maintaining firm support of the ball (key 2), proceed as follows:
 - a. First, remove the ball support post through the follower shaft bore of the valve.
 - b. Then, while being careful not to damage the sealing surfaces of the ball, remove the ball through the outlet end of the valve.
13. Inspect and, if necessary, replace all parts. Then, proceed to the assembly procedure below.

A3141-1

Figure 8. Index Marks on Drive Shaft and Ball

79BA08073-A
B1793

Assembly

1. Position the ball (key 2) so that it is firmly supported inside the valve (key 1). Insert a ball support post (see figure 7) into the follower shaft (key 7) bore of the valve. Position the ball support post so that the ball will be supported firmly inside the valve body cavity while performing steps 2 through 5.

CAUTION

Damage to the valve assembly and downstream equipment could occur if the shaft retainer (key 25) should become disengaged from the drive shaft (key 6) during operation of a V250 control valve assembly. To prevent such damage, make sure that the internal threads in the Polygon coupling end of the drive shaft and the external threads of the shaft retainer are cleaned thoroughly before applying thread locking adhesive (high strength) (key 30) as described in step 5 of this assembly procedure.

2. Insert the drive shaft (key 6) into the drive shaft side of the valve and ball assembly. When inserting the drive shaft, make sure that the index mark on the Polygon coupling end of the drive shaft is aligned with the index mark on the hub of the ball. Refer to figure 8 for the location of these index marks.
3. Install the thrust spacer (key 21) into the drive shaft side of the valve and position it so that it is in contact with the ball hub. Then, install the thrust washer (key 19) and the bushing (key 20).
4. Insert the washer (key 24) into the ball. Lubricate the exposed surface of the washer with a good quality grease or lubricant.

CAUTION

Improper tightening of the shaft retainer (key 25) could allow the shaft retainer to become disengaged from the drive shaft (key 6) during operation of a V250 control valve assembly. This could cause damage to the valve assembly and downstream

equipment. To prevent such damage, make sure that the shaft retainer is tightened to the appropriate torque value listed in table 4.

5. Apply thread locking adhesive (high strength) (key 30) to the threads of the shaft retainer (key 25). Then, install the shaft retainer into the inside end of the drive shaft. Tighten the shaft retainer to the torque value listed in table 4.

CAUTION

Damage to the valve assembly and downstream equipment could occur if the retainer screw (key 32) should become disengaged from the follower shaft (key 7) during operation of a V250 control valve assembly. To prevent such damage, make sure that the internal threads in the inside end of the follower shaft and the external threads of the retainer screw are cleaned thoroughly before applying thread locking adhesive (high strength) (key 30) as described in step 8 of this assembly procedure.

6. While maintaining firm support of the ball (key 2), remove the ball support post through the follower shaft bore of the valve. Then install the follower shaft into the valve. When installing the follower shaft, make sure that the drilled hole containing the two pins (key 9) is aligned with the two notches machined on the inside surface of the ball hub.
7. Temporarily position the follower shaft so that it protrudes slightly into the flow bore of the ball. Place the split ring (key 31) on the end of the follower shaft. Then, return the follower shaft to its original position.

CAUTION

Improper tightening of the retainer screw (key 32) could allow the retainer screw to become disengaged from the follower shaft (key 7) during operation of a V250 control valve assembly. This could cause damage to the valve assembly and downstream equipment. To prevent such damage, make sure that the retainer screw is tightened to the appropriate torque value listed in table 4.

8. Apply thread locking adhesive (high strength) (key 30) to the threads of the retainer screw. Then, install the retainer screw into the inside end of the follower shaft until it is at least flush with the end surface of the follower shaft. Make sure that the drilled hole containing the two pins (key 9) is still aligned with the two notches machined on the inside surface of the ball hub. Tighten the retainer screw to the torque value listed in table 4.
9. Install the thrust spacer (key 21) into the follower shaft side of the valve and position it so that it is in contact with the ball hub. Then, install the thrust washer (key 19) and the bushing (key 20).
10. Center the ball inside the valve along the axis of both the drive shaft and the follower shaft. The maximum deviation in measurement between the valve and ball from one side to the other should be no more than 0.005 inches (0.127 mm) as shown in figure 9.
11. In order to maintain proper centering of the ball inside the valve, the bushing spacer shims (key 18) must be installed in the following manner:
 - a. For the **drive shaft** side of the valve, install several bushing spacer shims around the drive shaft and into the valve.
 - b. Then, temporarily install the spacer (key 22) and the seal carrier (key 17).
 - c. Repeat this process, but add only one more bushing spacer shim into the valve each time, until contact between the seal carrier and the valve is broken.
 - d. Then, remove one bushing spacer shim and secure the spacer and seal carrier to the valve with the hex nuts (key 8). Be careful not to damage the seal (key 16) or O-ring (key 23) during replacement of the seal carrier.

Figure 9. Proper Alignment for Centering the Ball

- a. For the follower shaft side of the valve, install several bushing spacer shims around the follower shaft and into the valve.
 - b. Then, temporarily install the spacer (key 22) and the seal carrier (key 3).
 - c. Repeat this process, but add only one more bushing spacer shim into the valve each time, until contact between the seal carrier and the valve is broken.
 - d. Then, remove one bushing spacer shim and secure the spacer and seal carrier to the valve with the hex nuts (key 8). Be careful not to damage the seal (key 16) or O-ring (key 23) during replacement of the seal carrier.
12. Install the seal protector ring (key 14, figure 5) or the flow ring (key 14, figure 6) and all remaining parts by following the appropriate procedures presented in the Ball Seal and Flow Ring Maintenance section.
 13. For NPS 20 CL900 and NPS 24 CL900 valves, lifting hoist rings are provided. If the safety hoist rings were removed, replace them and torque them to 312 N•m (230 lbf•ft).
 14. Mount the actuator to the valve while referring to the actuator mounting section of this instruction manual and to the appropriate actuator instruction manual. If appropriate, replace the bonding strap assembly and the clamp (key 41 and 40, figure 4).
 15. Install the valve into the pipeline by referring to the Installation section of this instruction manual.

48A8905-B
48A8827-A

Actuator Mounting

Use the appropriate actuator instruction manual and figure 10 of this instruction manual when changing actuator styles and positions. The actuator may be either right- or left-hand mounted. Figure 10 shows the correct lever/shaft orientation for both left-hand mounting and right-hand mounting configurations.

Travel Adjustment

Actuator travel adjustment can be performed with the valve either in or out of the pipeline. Key numbers referenced in the following procedures are shown in figure 11 for single seal and flow ring constructions and in figure 12 for dual seal constructions.

For valve assemblies in the pipeline:

1. Rotate the ball (key 2) to either the open or closed position as indicated by the travel indicator scale (key 37) on the outboard end of the valve.
2. Adjust the actuator as described in the appropriate actuator instruction manual until the arrow stamped on the end of the follower shaft (key 7) is fully aligned with the open or closed position on the travel indicator scale.

For valve assemblies out of the pipeline, proceed as follows:

1. Rotate the ball to the fully open position. The fully open position is achieved when the inside surface of the ball bore (key 2) is completely square with the line flange gasket surface of the seal protector ring (key 14) or flow ring (key 14).
2. Adjust the actuator as described in the appropriate actuator instruction manual until the inside surface of the ball bore is at right angles to the line flange gasket surface of the seal protector ring or flow ring.
3. Adjust the travel indicator scale (key 37) until the arrow stamped on the end of the follower shaft (key 7) is fully aligned with the open position.

Parts Ordering

When corresponding with your [Emerson sales office](#) about this equipment, always mention the valve serial number.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Figure 1. Fisher Buried Service with V260 Valve

X2061

Introduction

Scope of Manual

This instruction manual provides installation, operation, maintenance, and parts information for the Fisher V260 and V270 Buried Service (see figure 1). Refer to separate manuals for information concerning the valve, actuator, positioner, and accessories.

Do not install, operate, or maintain a V260 or V270 valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The Fisher V260 and V270 Buried Service construction incorporates a shaft extension from the actuator to valve designed only to transfer the torque required to operate the valve. When installed the Buried Service construction can provide up to a -25 dBA noise reduction with no impact on flow.

Installation

WARNING

- To avoid personal injury, always wear protective gloves, clothing, and eyewear when performing any installation operations.
- To avoid personal injury or property damage resulting from the bursting of pressure retaining parts, be certain the service conditions do not exceed the limits given in this manual.
- To avoid personal injury or property damage that can result from the sudden release of process pressure if valve or mating pipe flange pressure ratings are exceeded, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
- If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.
- To avoid personal injury or property damage caused by tipping of the valve, do not transport, store, or maintain the valve and extension assembly in the vertical orientation.

WARNING

- Failure to utilize safe lifting and rigging practices could result in property damage and personal injury or death.
- All lifting and rigging must be completed in accordance with federal/national/provincial, state and local regulations and applicable lifting and rigging equipment standards. Only personnel trained in proper lifting and rigging practices shall perform valve/actuator assembly lifting, rigging and installation. Because each lift will be unique, the method of lifting the valve assembly, the correct location for attaching and lifting the valve assembly, and what the valve assembly will do when lifted shall be considered for each lift.
- Lifting and rigging equipment used to lift, install or remove a valve assembly or component must be properly selected and sized for the weight and configuration of the valve assembly or component being lifted. The weight of the complete valve assembly, including attached accessories, must be taken in consideration for this purpose. The lifting and rigging equipment must be properly maintained and inspected for damage before each use.
- If the valve is supplied with an actuator or handwheel, do not use the actuator or handwheel to lift the complete valve assembly. Lifting lugs attached to the actuator must not be used to lift the complete valve assembly unless clearly marked as being rated to support the complete valve assembly weight.
- Hoist rings or other lifting equipment attached to the valve or actuator must never be used to lift or support the weight of attached piping.

NOTICE

Care must be taken when lifting the valve/actuator assembly to ensure all accessories and tubing are not damaged in the process. Accessories and tubing may need to be removed prior to lifting to prevent damage and properly reinstalled before use. Protect valve flange faces and other connection surfaces from damage during lifting.

Key number locations are shown in figures 5 and 6, unless otherwise noted. Throughout this manual, the component key number will be identified for clarity.

1. For the valve assembly, please reference Instruction Manual for V260 ([D102178X012](#)) or V270 ([D104297X012](#)). After valve assembly, orient the valve body with the shaft horizontal and key positioned toward the top of the shaft. Secure the body for further assembly. Lubricate and install the O-ring (key 63) on packing box housing. Take care to ensure it will not get pinched when assembled. Install the shaft key onto the valve shaft.
2. Attach the stem extension housing assembly (key 60) to mounting pad on the packing box housing of the valve assembly. Apply lubricant and install thrust bearing (key 65) into position. Fasten stem extension housing to packing box housing cap screws with washers (key 61 and 62) according to the torque values as shown in table 4 and 5.

Note

Standard Fisher live-loaded PTFE packing is composed of partially conductive packing rings (carbon-filled PTFE male and female adaptors) to electrically bond the drive shaft to the valve body. For hazardous area service, an alternate shaft-to-body bonding strap is also available by using the following step (see figure 2).

3. For hazardous area applications where redundant shaft-to-body grounding is preferred, before installing the stem extension housing assembly, attach the optional bonding strap assembly to the valve drive shaft with the clamp and connect the other end of the bonding strap assembly to the packing studs to connect with valve body as shown in figure 2.
4. Lubricate and install O-ring (key 68) into the O-ring groove on actuator adaptor end of stem extension assembly (key 64). Continue to install the stem extension assembly until it is seated against the thrust bearing. Apply lubricant to the thrust bearing (key 65) surface and insert the stem extension assembly into stem extension housing assembly (key 60). Slide the shaft into the shaft adapter on the end of stem extension assembly (key 64), take care to maintain the keyway alignment and to not damage the thrust bearing.
5. Rotate the stem extension assembly (key 64) watching the ball to ensure the keyway was aligned and seated properly.

NOTICE

Be certain the valve and adjacent pipelines are free of any foreign material that could damage the valve sealing surfaces.

6. Provide appropriate flange gaskets, and place the valve in the pipeline. Tighten flange bolting in a star pattern to ensure the flange gaskets are compressed evenly.
7. Attach actuator as described in Actuator Mounting section and applicable actuator instruction manual.

Figure 2. Optional Shaft-to-Body Bonding Strap Assembly

A3143-2

Actuator Mounting

After the stem extension assembly (key 64) is installed, insert actuator key (key 69) into key slot into the actuator end of stem extension assembly. Connect with Bettis actuator, fasten cap screws and washers (key 66 and 67) according to the torque values listed in table 4 and 5.

Some designs require adaptor plates to match different Bettis actuators. When adaptor plates are required, attach the adaptor plate to the actuator first, and then fasten adaptor plate/actuator assembly onto the extension housing assembly (key 60).

Two different venting plugs need to be installed after above steps completed. Apply pipe thread sealant to the threads of the Y602-12 vent assembly (key 70) and to the lower pipe plugs (key 71). Pay attention to install the Y602-12 vent assembly (key 70) on the actuator side and oriented to make the opening face downward, and vent plug (key 71) on valve body side. The Y602-12 vent assembly need be above the ground after extension assembly/valve assembly buried.

Determining Closed Position

1. To confirm proper actuator adjustment visually check the position of the ball.
2. Adjust the actuator linkage or travel stops as described in the actuator instruction manual so that at the end of stroke, the valve ball bore diameter in the full open (100%) position is in alignment and centered within the upstream and downstream valve seal inside diameters. The actuator linkage or travel stops should be adjusted so that the full closed (0%) valve position is precisely 90 degrees from the visually verified 100% open position. (See figure 3.)

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

⚠ WARNING

Avoid personal injury or equipment damage from sudden release of process pressure or uncontrolled movement of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Do not loosen any pressure retaining bolting while the valve is still pressurized. For V270, this includes the body to tailpiece nuts (key 21), packing box housing screws (key 10), packing nuts (key 36) or pipe plugs (keys 23 and 28). For V260, this includes the body hex nut (key 19), packing box housing nut (key 23), packing nuts (key 101) and pipe plug (key 25).
- Avoid injury by keeping hands, tools, and other objects away from the ball while stroking the valve.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Check the actuator cannot suddenly open or close the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- A tip over hazard exists for the valve/actuator assembly. Ensure the valve/actuator assembly is properly secured and always supported to prevent falling or rolling which may cause injury or property damage.
- Use lock-out/tag-out best practices and procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box housing may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Packing Maintenance

Refer to figure 4 for details of the enhanced ENVIRO-SEAL PTFE packing. All maintenance operations in this section may be performed on an unpressurized valve that is still installed inline and before extension assembly installed.

Note

For additional information on the live-loaded packing system refer to the enhanced ENVIRO-SEAL Packing System Instruction Manual ([D101643X012](#)).

Stopping Leakage

Optimum performance of the enhanced ENVIRO-SEAL PTFE packing system is obtained when the Belleville springs are compressed to the required “target load.” The target load is the point where the springs are compressed to 85% of their maximum deflection.

Under normal conditions, the packing nuts should not require re-tightening. However, when servicing, if the springs do not remain at the target load of 85% compression, retighten the packing box nuts per the following:

1. Tighten the packing flange nuts alternately and evenly, keeping the packing flange parallel with the valve flange (see figure 4) until the Belleville springs are compressed 100% (or completely flat).

- a. For PTFE packing, loosen each packing flange nut one half turn (180° of rotation).
2. The target load of 85% compression has now been reached. If leakage continues, replace the packing components and inspect the packing box housing bore and valve drive shaft for damage as described in the following procedures.

Replacing Packing

Replacing the packing requires bleeding off the system and removing the actuator and stem extension assembly and housing from the valve. It is not necessary to remove the valve from the pipeline to adjust or replace packing, but for buried service, the stem extension assembly and housing must also be removed.

Refer to figure 4 which identifies the V270 packing components by key number.

Figure 4. Packing Arrangement Details

Packing Disassembly

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, shut off all pressure lines (or other power source) to the power actuator, release pressure from the actuator, and disconnect the pressure lines from the actuator. Use lockout/tagout procedures to be sure that the above measures stay in effect while disassembling the equipment.

⚠ WARNING

- See the **WARNING** at the beginning of the Maintenance section for more information before removing the valve from the pipeline.
- Use proper lifting and rigging practices while moving the valve or valve/actuator assembly.

2. Remove line bolting, remove the control valve from the pipeline, and place the actuator/extension assembly/valve assembly on a flat surface. Position and secure the valve assembly with the shaft in the horizontal orientation.
3. To assist with future reassembly, note and mark the orientation of the actuator with respect to the extension assembly and the coupler orientation with respect to the stem extension assembly (key 64).
4. Refer to the appropriate actuator instruction manual for info on removal.
5. Remove the actuator mounting screws while properly supporting the actuator then separate the actuator from the stem extension assembly. For Fail-Open actuators, the actuator will need to be pressurized to move the valve ball to the closed position until the actuator is completely removed from the extension assembly.
6. Refer to figure 3, make the orientation line vertical to make the key position upward. Remove the extension assembly from the valve packing box housing.
7. If necessary, remove the bonding strap assembly, shown in figure 2 from the valve before removing the packing parts.
8. Remove the packing follower nuts, packing flange, and spring pack and packing follower.
9. Remove the packing parts:
 - a. If the packing box housing is mounted on the valve: Remove the packing rings from the packing box housing with an appropriate tool. Do not scratch the drive shaft or packing gland bore. Scratching these surfaces could cause leakage. Clean, inspect, and obtain replacement parts as necessary for reassembly. Examine the drive shaft and packing gland bore for any signs of damage that may prevent proper sealing.
 - b. If the packing box housing is separated from the valve (refer to V270 Instruction Manual ([D104297X012](#)) for disassembly instructions): Remove the drive shaft from the packing box housing. With the drive shaft removed, remove all internal packing parts. Clean, inspect, and obtain replacement parts as necessary for reassembly. Examine the drive shaft and packing gland bore for any signs of damage that may prevent proper sealing.

Packing Assembly

For additional information on the live-loaded packing system refer to the enhanced ENVIRO-SEAL Packing System Instruction Manual ([D101643X012](#)).

1. If the packing housing box is removed from the valve, Refer to the appropriate valve instruction manual to reinstall the drive shaft and packing box housing assembly on the valve.
2. Place the new packing components over the drive shaft and slide each into the packing box housing until properly seated at the bottom of the packing gland. Use the parts sequence shown in figure 4 and verify the Belleville springs are in the correct configuration.
3. Secure the spring pack and packing follower assembly and packing flange with the packing nuts.
4. Tighten the packing flange nuts alternately and evenly, keeping the packing flange parallel with the valve flange, until the Belleville springs are compressed 100% (or completely flat).
 - a. For PTFE packing, loosen each packing flange nut one half turn (180° of rotation).
5. If necessary, install the bonding strap assembly shown in figure 2.
6. Use the steps provided in the Installation section to install the extension assembly, and use the steps provided in the Actuator Mounting section to install the actuator. For actuator travel adjustments, refer to the appropriate actuator instruction manual.
7. When the control valve is in operation, the vent assembly (key 70) can be checked for any signs of packing leakage.

Parts Ordering

A serial number is assigned to each valve and stamped on the nameplate. Always refer to the valve serial number when corresponding with your [Emerson sales office](#) regarding spare parts or technical information. When ordering replacement parts, also specify the part name and desired material.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts List

Note

Contact your [Emerson sales office](#) for Part Ordering information.

Introduction

Scope of Manual

This instruction manual provides installation, operation, maintenance, and parts information for the Fisher V260 control valve. Refer to separate manuals for information concerning the actuator, positioner, and accessories (see figure 1).

Do not install, operate, or maintain a V260 valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

V260 throttling ball valves are available in single-seal, double block-and-bleed, dual-seal, and bidirectional flow constructions with or without attenuators. Valves with dome-style attenuators combine the efficiency of a rotary valve with the noise reducing capability of a special trim (figure 4). Valves without attenuators present little or no restriction to flow at full travel.

Table 1. Specifications

Valve Body Size and End Connection Styles⁽¹⁾ NPS 6, 8, 10, 12, 16, 20, and 24 flanged valves with CL150, CL300, and CL600 raised-face or ring-type joint flanges compatible with ASME B16.5. See table 2 for face-to-face dimensions. Consult factory for other pressure ratings. Maximum Inlet Pressures and Temperatures⁽¹⁾ Consistent with CL150, CL300, and CL600 pressure-temperature ratings per ASME B16.34 Maximum Allowable Shutoff Pressure Drop⁽¹⁾ For Single-Seal and Dual-Seal Construction: (Except where further limited by the pressure-temperature rating of valve body material) For LF2 valve body material: CL150: 19.6 bar (285 psi) at 38°C (100°F) CL300: 51 bar (740 psi) at 38°C (100°F) CL600: 103 bar (1480 psi) at 38°C (100°F) Seal Material and Temperature Capability⁽¹⁾ ■ POM⁽²⁾ (Standard) -29 to 82°C (-20 to 180°F) ■ PTFE/PEEK⁽²⁾⁽³⁾ (Optional) -29 to 93°C (-20 to 200°F) Flow Characteristic Modified equal percentage	Flow and Shutoff Direction Unidirectional flow for Fisher V260 is forward flow. Seal is upstream. ■ Single Seal Constructions: Should be used for unidirectional flow and unidirectional shutoff only. ■ Dual Seal Constructions: V260A and V260C may be used for unidirectional or bidirectional flow. V260B should be used for unidirectional flow only for most effective anti-cavitation protection. Bidirectional shutoff requires the dual seal construction. Shutoff Classification (per ANSI/FCI 70-2 and IEC 60534-4) Single-Seal Composition Constructions: Class IV, optional Class VI Dual-Seal Composition Constructions: Class IV, optional Class VI Maximum Ball Rotation 90 degrees Actuator Mounting Right-hand or left-hand mounted as viewed from the valve inlet for forward flow Approximate Weight See table 2
---	--

1. The pressure-temperature limits in this instruction manual and any applicable standard or code limitation for valve should not be exceeded.

2. POM stands for polyoxymethylene, PTFE stands for polytetrafluorethylene, and PEEK stands for poly-ether-ether-ketone.

3. Temperature limits of PTFE/PEEK is limited due to standard nitrile O-ring. Contact your [Emerson sales office](#) for higher temperature options, up to 232°C (450°F).

Educational Services

Installation

⚠ WARNING

- To avoid personal injury, always wear protective gloves, clothing, and eyewear when performing any installation operations.
- To avoid personal injury or property damage resulting from the bursting of pressure retaining parts, be certain the service conditions do not exceed the limits given in this manual.
- To avoid personal injury or property damage that can result from the sudden release of process pressure if valve or mating pipe flange pressure ratings are exceeded, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.
- Service conditions are limited for valve and trim material combinations. Do not apply any other service condition to the valve without first contacting your [Emerson sales office](#).
- Personal injury could result from packing leakage. The valve packing was tightened before shipment however, the packing might require some readjustment to meet specific service conditions.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
- If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.
- To avoid personal injury or property damage, a minimum of two swivel hoists must be used when lifting NPS 24 CL600 assemblies.

Table 2. Face-to-Face Dimensions and Approximate Weights

VALVE SIZE, NPS (CL600 ⁽¹⁾)	FACE-TO-FACE DIMENSIONS	APPROXIMATE WEIGHT
	mm	kg
6	559	311
8	661	424
10	788	653
12	840	882
16	990.6	2472
20	1144	4313
24	1397	7257
	Inches	lbs
6	22	686
8	26.04	975
10	31.04	1550
12	33.07	2025
16	39	5450
20	47	9500
24	55	16000

1. For CL150 and CL300 valves, face-to-face dimensions are the same as CL600 valves.

Key number locations are shown in figure 6, unless otherwise noted.

1. Install a three-valve bypass around the control valve assembly if continuous operation will be necessary during inspection and maintenance of the valve.
2. The valve is normally shipped as part of a control valve assembly, with an actuator mounted on the valve. The valve/actuator assembly is adjusted at the factory before the unit is shipped.

If the valve or actuator has been purchased separately or if the actuator has been removed, mount the actuator according to the Actuator Mounting section and the appropriate actuator instruction manual. Make any necessary

adjustments on the bench before installing the valve in the pipeline. With the valve in the pipeline, you cannot see the exact position of the ball to determine the fully open or closed positions.

3. Standard flow direction is shown in figure 6. If possible, install the valve in a horizontal pipeline with the drive shaft horizontal. The actuator can be right- or left-hand mounted in any of the positions shown in the actuator instruction manual. If necessary, refer to the appropriate actuator instruction manual for installation and adjustment procedures.
4. Be certain the valve and adjacent pipelines are free of any foreign material that could damage the valve sealing surfaces. Impurities or entrained solids in the process fluid could plug the passages in the trim. If the process fluid is not clean, install a filter upstream to keep the pipeline free of impurities or entrained solids.
5. Provide appropriate flange gaskets, and place the valve in the pipeline. Tighten flange bolting in a criss-cross sequence to ensure the flange gaskets are loaded evenly.

Note

Standard Fisher V260 valve packings (key 105) are composed of:

- Conductive packing ring (graphite ribbon packing), or
- Partially conductive packing rings (For example: a carbon-filled PTFE female adaptor with PTFE V-ring packing or a graphite-composition packing ring with PTFE/composition packing ring)

In order to electrically bond the drive shaft to the valve body for hazardous area service, an alternate shaft-to-body bonding strap can be provided by using the following step.

Figure 2. Optional Shaft-to-Body Bonding Strap Assembly

37A6528-A
A3143-2

6. For hazardous applications, attach the optional bonding strap assembly (key 131) to the valve drive shaft (key 6) with the clamp (key 130) and connect the other end of the bonding strap assembly to the valve body with the mounting cap screw as shown in figure 2.
7. Connect pressure lines to the actuator as indicated in the actuator instruction manual. When an auxiliary manual actuator is used with a power actuator, install a bypass valve on the power actuator (if one is not supplied) for use during manual operation.
8. If the valve has ENVIRO-SEAL™ live-loaded packing installed, an initial re-adjustment may not be required, depending on your application. See the Fisher instruction manual titled ENVIRO-SEAL Packing System for Rotary Valves ([D101643X012](#)) for packing instructions and adjustments (see figure 3).

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

Key numbers are shown in figure 6, unless otherwise noted.

⚠ WARNING

Avoid personal injury or equipment damage from sudden release of process pressure or uncontrolled movement of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Dual-seal valve constructions can retain pressure and process fluid even after process pressure has been removed from both sides of the valve. Relieve this pressure before disassembling or removing the valve from the line. Take additional care if the process fluid is hot, flammable, caustic, or hazardous.
- Carefully secure the valve in an upright position. The roundness of the flanges and valve body allow it to easily roll from side-to-side. The combined weight of the valve/actuator assembly could cause injury or property damage when falling to the side.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Avoid injury by keeping hands, tools, and other objects away from the ball while stroking the valve.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
- To avoid personal injury or property damage, a minimum of two swivel hoists must be used when lifting NPS 24 CL600 assemblies.

Packing Maintenance

Note

For the ENVIRO-SEAL Packing System, refer to the separate ENVIRO-SEAL Packing System for Rotary Valves instruction manual ([D101643X012](#)), for maintenance instructions.

Stopping Leakage

For standard PTFE V-ring packing, leakage around the packing follower may be stopped by tightening the packing follower nuts.

If the packing is relatively new and tight on the drive shaft, and if tightening the packing follower nuts does not stop the leakage, the drive shaft may be worn or nicked so that a seal cannot be made. If the leakage comes from the outside diameter of the packing, the leakage may be caused by nicks or scratches on the packing box wall. Inspect the drive shaft and packing box wall for nicks or scratches while performing the following procedure.

Replacing Packing

Replacing the packing requires bleeding off the system and removing the actuator from the valve. Valve/actuator adjustments cannot be made correctly without observing the fully open or closed position of the ball (key 11). It is not

necessary to remove the valve from the pipeline, if care is taken to note the position and alignment of the lever and shaft and to not disturb the turnbuckle position.

Figure 3. Packing Arrangement Details

Disassembly

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, shut off all pressure lines (or other power source) to the power actuator, release pressure from the actuator, and disconnect the pressure lines from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

⚠ WARNING

See the **WARNING** at the beginning of the Maintenance section for more information before removing the valve from the pipeline.

2. Remove line bolting, remove the control valve from the pipeline, and place the actuator/valve assembly on a flat surface.
3. Remove the actuator cover. Note and mark the orientation of the actuator with respect to the valve body and the lever orientation with respect to the valve drive shaft, to assist with reassembly.
4. Loosen the lever locking device cap screw. Loosening the lever turnbuckle adjustment is not necessary during disassembly. When remounting the actuator, the turnbuckle will be used for actuator adjustments.
5. Removing the actuator from the valve:
 - a. Remove the actuator mounting screws, bolts, or nuts.

CAUTION

When removing the actuator from the valve, do not use a hammer or similar tool to drive the lever or actuator off the valve shaft. Driving the lever or actuator off the valve shaft could damage the ball, seal(s), and valve.

If necessary, use a wheel puller to remove the lever or actuator from the valve shaft. Tap the wheel puller screw lightly to loosen the lever or actuator. Do not hit the screw with excessive force. Using excessive force could damage the ball, seal(s), and valve.

- b. Slide the lever along the valve shaft while removing the actuator from the valve.
6. If necessary, remove the bonding strap assembly, shown in figure 2, from the valve before attempting to remove the packing box parts.
7. Remove the packing follower nuts, packing flange, and packing follower (keys 101, 102, and 114, figure 3).
8. Remove the packing parts:
 - a. If the packing housing (key 16) is mounted on the valve: Use a formed wire hook with a sharp end to pierce the packing rings, and pull the rings out of the packing box. Do not scratch the drive shaft or packing box wall. Scratching these surfaces could cause leakage. Clean, inspect, and obtain replacement parts as necessary for reassembly.
 - b. If the packing housing is removed from the valve: Remove the drive shaft (key 20) from the packing housing. With the drive shaft removed, remove all internal parts. Clean, inspect, and obtain replacement parts as necessary for reassembly.

The packing sets (key 105) listed in the parts list do not include any metal parts. Either clean and reuse metal packing parts or obtain replacements by ordering them individually.

Assembly

If the valve is equipped with the ENVIRO-SEAL packing system, refer to the ENVIRO-SEAL Packing System Rotary Valves instruction manual ([D101643X012](#)) for assembly.

1. If the packing housing assembly (key 16) is removed from the valve, use the valve assembly steps to reinstall the drive shaft (key 20) and packing housing assembly on the valve.
2. For standard packing arrangements, install the new packing parts using the parts sequence shown in figure 3.
3. Secure the packing follower and packing flange with the packing nuts (keys 114, 102, and 101). Tighten the nuts far enough to stop leakage during operating conditions.
4. If necessary, install the bonding strap assembly shown in figure 2.
5. Use the steps provided in the Actuator Mounting section to install the actuator on the valve. For actuator travel adjustments, refer to the appropriate actuator instruction manual.
6. When the control valve is installed in the pipeline and in operation, check around the packing follower for leakage and retighten the packing nuts as necessary.

Seal Ring Maintenance

Disassembly

⚠ WARNING

For valves with dual-seals, fluid and/or a hazardous material may be trapped under pressure in the valve body cavity. To avoid personal injury, relieve the pressure, and drain any remaining fluid or hazardous material from the valve body cavity. If necessary, disassemble the valve in a safe area for cleaning.

See the WARNING at the beginning of the Maintenance section for more information before removing the valve from the pipeline.

Disassemble the valve only to the extent necessary to accomplish the needed inspection and repairs. For some repairs (for example, the trim parts only) complete disassembly of the valve is not necessary. Follow the disassembly procedures to the point necessary to accomplish the repair, then skip to the appropriate assembly steps to complete the reassembly of the valve. Always clean and protect sealing surfaces from damage.

Mark parts as necessary to allow them to be returned to the same position as removed. For example: Be sure to return the tailpiece to the same end of the valve from which it was removed. Also, the seal assembly within the tailpiece should be returned to the same tailpiece from which it was removed. The bearing plates should be marked and reinstalled on the ball in the same position as they were, when removed.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, shut off all pressure lines to the power actuator, release pressure from the actuator, and disconnect the pressure lines from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Remove line bolting, remove the control valve from the pipeline, and clean all valve surfaces. Place the actuator/valve assembly on a flat working surface.
3. Mark parts as necessary to allow them to be returned to the same position during re-assembly.
4. Perform the procedure in the Packing Maintenance section to remove the actuator from the valve. When valve maintenance is complete, refer to the Mounting Actuator procedure at the end of the Maintenance section to re-install the actuator on the valve.
5. Provide a clean soft working surface to protect the tailpiece-flange sealing surface.
 - a. If the valve does not have an attenuator dome, lift the valve and place it on its side with either tailpiece flange resting on the flat surface. Be sure the valve is in a stable, upright position before releasing the hoist connection.
 - b. If the valve has a single attenuator dome, it is best to position the valve body so the tailpiece with the dome is in the down position. Be sure the valve is stable, in an upward position before releasing the hoist connection.

Note

If the packing is in good condition, it is possible to remove and replace the seal assembly, or dome assembly without removing the packing box assembly. However, the packing assembly must be removed to remove the ball (key 11) from the valve body.

6. Remove the packing housing nuts (key 23). Remove the packing housing assembly from the valve. The assembly includes all the packing box parts, drive shaft, O-ring seals, bearing, and other parts.
7. Remove the nuts from the studs (keys 19 and 3) to remove the tailpiece/valve connection. (Refer to figure 6).

Note

While lifting the tailpiece (key 2 or 6) from the valve body, check to see if the seal assembly is lifting with the tailpiece. (Note: Some valve constructions do not have a seal assembly installed in the tailpiece.) If it is, slide something between the ball and tailpiece to protect the ball in case the seal assembly falls out of the tailpiece.

8. If the valve has dual attenuator domes, tap the dome to loosen it from the top tailpiece before the top tailpiece is lifted from the valve body.
9. Turn the tailpiece over so the seal assembly is facing up, and place it on a clean soft surface with the flange face down.
10. For NPS 6, from the tailpiece assembly or from the valve, remove the seal assembly (key 9), wave spring (key 8), retaining ring (key 41), and o-ring seal (key 7). Clean and protect all sealing surfaces.

For NPS 8 through 24, from the tailpiece assembly or from the valve, remove the seal assembly, wave spring, and O-ring seal (keys 8 and 7). Clean and protect all sealing surfaces.

⚠ WARNING

In the next step, be sure to secure the bearing plates on the ball to prevent them from falling. When lifting the ball, the bearing plates may slide-off the ball trunnions which may cause personal injury or property damage.

11. Turn the ball (key 11) to the closed position. Use a nylon sling through the ball bore to lift the ball out of the valve body. Lift the ball and set it on a clean soft surface.
12. Remove the two bearing plates and thrust washers (key 4 and 30) from the ball (key 11). Inspect the bearing in the bearing plates and thrust washers (keys 29 and 30). If necessary, remove and replace the bearings (key 29).
13. Evenly loosen the hex nuts from the studs on the lower tailpiece (key 2 or 6). Remove the valve body from the tailpiece.
14. Remove from the tailpiece assembly, the dome assembly and/or the seal assembly, wave spring, and O-ring seal. Clean and protect all sealing surfaces.

Assembly

Be sure to replace valve parts in the same position that they were removed. Use the following suggested sequence to reassemble the valve.

Note

Clean and protect all sealing surfaces from damage while installing parts. Lubricate parts when necessary as an aid for installing parts, and to help protect sealing surfaces.

Key number locations are shown in figure 6.

1. Place the tailpiece (key 2 or 6), pipe flange end down on a clean soft surface with the seal assembly or attenuator dome cavity facing up.
2. Lubricate (key 42) and install the O-rings (key 12) on both tailpieces.

For characterized domes, install the grooved end of the dome groove pin (key 33) into the tailpiece, as far as it will go. Use only a light tapping force, taking care not to bend the pin. This groove pin will prevent the attenuator dome from rotating with respect to the tailpiece.

3. Install the inlet end attenuator dome (key 28 or 10) into the tailpiece (key 6). Use the lifting lugs in the two threaded holes for ease of handling.

For characterized attenuators, align the pin hole in the dome with the groove pin (key 33) placed in the tailpiece in step 3. High Density attenuators don't require this orientation.

4. For NPS 6 dual seal V260A or V260B constructions, install the the retaining ring (key 41) into the tailpiece (key 6). Take care not to damage the sealing surface of the tailpiece.

For NPS 8 through 24 dual seal V260A or V260B constructions, lubricate (key 42) and install the O-ring (key 15) on the dome spacer (key 13). If a dual dome is being assembled, install the dome spacer into the tailpiece, using the two threaded holes as lifting lugs.

5. Apply thread locking adhesive (key 45) to and install the two cap screws (key 36) that hold the washers (key 37) which help retain the dome or dome spacer (if applicable) in the tailpiece.

For constructions with dual dome and/or dual seals, lubricate (key 42) and install the O-ring (key 7) in the groove on the inlet seal (key 9). Install the wave spring (key 8) over the end of the seal. Install the seal assembly O-ring (key 7) between the dome spacer and the dome (key 10).

Note

Verify that the ball opens into the dome windows last. (See figure 5)

If not, remove the dome and tailpiece and turn it 180 degrees to allow the windows to open last.

6. Install the grooved end of the groove pins (key 5) into the bearing plates (key 4) as far as they will go. Use only a light tapping force, taking care not to bend the pins.
7. Apply dry film lubrication (key 43) between the trunnion surfaces on the ball and the trunnion bearings.
8. Install new bearings (key 29) in the bearing plates (key 4).

WARNING

In the next step, be sure to secure the bearing plates on the ball to prevent them from falling. When lifting the ball, the bearing plates may slide off the ball trunnions which may cause personal injury or property damage.

9. Lift the ball with a nylon sling through the bore and turn the ball until the port and trunnions are horizontal.
10. Slide one ball thrust washer (key 30) onto each side of the ball trunnions, and install a bearing plate (key 4) on each side of the ball trunnions.
11. Carefully lower the ball and bearing plates onto the lower (inlet) tailpiece taking care not to damage the ball surface.
While lowering the ball, guide the groove pins in the bearing plates into their proper location in the tailpiece. To determine the proper location for Right Hand Mounting, turn the splined trunnion so that it is on your right hand side when the attenuator dome is in front of you and the bottom of the valve is nearest you.
12. Install the grooved end of the groove pin (key 18) into the valve body, as far as it will go. Use only a light tapping force, taking care not to bend the pin. Apply lubricant (key 44) and install the body studs (key 3) in the valve body and install two swivel hoists for lifting the valve body.
13. Lift the valve body, using the swivel hoists, so it is centered over the ball and bearing plates. Be sure the shaft hole is aligned with the splined trunnion on the ball. When lowering the valve body, take care not to damage the ball. Guide the groove pins in the valve body into their proper location in the tailpiece.
14. Install the hex nuts (key 19) on the studs (key 3) and hand-tighten them.
15. Lubricate (key 42) and install the O-ring (key 14) on the packing housing (key 16). Install the shaft bearing (key 32) in the packing box housing.
16. Install the packing housing studs (key 22) in the valve body.
17. Apply anti-seize lubricant (key 44) to the large spline on the shaft. Line-up the missing spline tooth with the appropriate space in the ball, and install the drive shaft (key 20) into the ball.
18. Install the shaft thrust washer (key 24) onto the shaft.

Instruction Manual

D102178X012

V260 Valve

December 2018

19. Install the packing housing (key 16) and nuts (key 23), and tighten them evenly. Orient the length of the packing box housing perpendicular to the bore of the valve body.

⚠ WARNING

Refer to table 3 for bolt torque requirements. Exceeding any torque requirements could damage the valve and impair safe operation.

Table 3. Torque Values

VALVE SIZE, NPS	PRESSURE RATING	VALVE BODY HEX NUT (KEY 19)		MOUNTING FLANGE HEX NUT (KEY 23)	
		N•m	lbf-ft	N•m	lbf-ft

	CL300	3470	2560	990	730
	CL600	6088	4490	1749	1290

20. Assemble the seal and install the second tailpiece using the following steps.

For dual seal and dual dome constructions, it is easier to lay the valve assembly on its side while installing the second tailpiece.

21. For NPS 6 install the dome, retaining ring, and alignment groove pin in the tailpiece.

For NPS 8 through 24 install the dome, dome spacer, and alignment groove pins (if a characterized attenuator is used) in the tailpiece.

22. Lubricate (key 42) and install the seal assembly O-ring (key 7) in the groove of the seal as shown in figure 6.

23. Install the wave spring (key 8) over the end of the seal (key 17 or 9). Note that the spring is not required with the attenuator dome (key 28, figure 6).

24. For single seal constructions, place the seal ring assembly into the tailpiece, taking care not to damage the O-ring (key 7) while sliding it into the tailpiece. Also, be careful to protect all sealing surfaces.

For dual seal constructions, place the seal assembly (key 17) into the dome, dome spacer and tailpiece.

25. Lift the second tailpiece assembly and align it with the valve body studs and pins. Slide the tailpiece onto the studs and bearing plate pins. The groove pins in the valve body should be guided into the pin holes in the tailpiece. Pull it up tightly, taking care not to damage the tailpiece O-ring as it is pulled into the valve body.

26. Install the hex nuts (key 19) on the studs (key 3) and hand-tighten them. Torque all the hex nuts evenly.

⚠ WARNING

Refer to table 3 for bolt torque requirements. Exceeding any torque requirements could damage the valve and impair safe operation.

27. Refer to the Packing Maintenance section to install the packing parts.

Actuator Mounting

Use the appropriate actuator instruction manual when mounting the actuator or changing actuator styles and positions.

Determining Mounting Position

The actuator can be either right- or left-hand mounted.

Note

Right-hand mounting means that the actuator is mounted on the right side of the valve when viewed from the valve inlet.

Left-hand mounting means that the actuator is mounted on the left side of the valve when viewed from the valve inlet.

Right- or left-hand mounting can change the actuator action from push-down-to-close to push-down-to-open, or vice-versa.

Determining Closed Position

1. You must remove the valve from the pipeline to check the position of the ball.
2. Adjust the actuator linkage or travel stops as described in the actuator instruction manual. Adjust the actuator so that the valve ball will be fully open or closed when the actuator is at the end of its stroke, depending on the actuator action selected.

Parts Ordering

A serial number is assigned to each valve and stamped on the nameplate. Always refer to the valve serial number when corresponding with your [Emerson sales office](#) regarding spare parts or technical information. When ordering replacement parts, also specify the part name and desired material.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Introduction

Scope of Manual

This instruction manual provides installation, operation, maintenance, and parts information for the Fisher V280 Full-Bore Ball control valve (see figure 1). Refer to separate manuals for information concerning the actuator, positioner, and accessories.

Do not install, operate, or maintain a V280 valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The Fisher V280 is a three-piece, trunnion mounted, full-bore control valve designed with features for optimized pressure, flow, and process control. The V280 comes standard as a single-seal construction with optional dual-seal construction allowing for bidirectional flow and double block-and-bleed operation, with or without attenuation. Valve constructions with attenuators combine the efficiency of a rotary valve with the noise reducing capability of a special trim. Valve constructions without attenuators present little or no restriction to flow at full travel. The V280 construction meets ANSI/NACE MR0175/ISO 15156 as standard.

Specifications

Valve Sizes and End Connection Styles

NPS ■ 6, ■ 8, ■ 10, ■ 12, and ■ 16 flanged valve size with CL900 raised-face flanges compatible with ASME B16.5. Consult your [Emerson sales office](#) for other end connection styles

Maximum Inlet Pressure and Temperatures⁽¹⁾

Consistent with CL900 pressure-temperature ratings per ASME B16.34

Maximum Allowable Shutoff Pressure Drop⁽¹⁾

For Single-Seal and Dual-Seal Construction (except where further limited by pressure-temperature rating of the valve body):

CL900: 153.2 bar (2220 psig) at 38°C (100°F)

Shutoff Classifications

Single or Dual-Seal Construction

Class IV standard: ANSI/FCI 70-2 and IEC 65034-4

Class VI optional: ANSI/FCI 70-2 and IEC 65034-4

Flow Characteristic

- Modified linear with single high-density attenuator
- Modified equal percentage with single characterized attenuator
- Modified equal percentage without attenuator

Flow and Shutoff Direction

Unidirectional flow is forward flow. Seal is upstream

Single Seal Construction: Should be used for unidirectional flow and unidirectional shutoff only

Dual Seal Construction: V280 with Aerodome and unattenuated V280 may be used for unidirectional and bidirectional flow

V280 with Hydrodome should be used for unidirectional flow only for effective anti-cavitation protection. Bidirectional shutoff requires dual seal construction

Flow Coefficients

See Fisher [Catalog 12](#)

Seal Material and Temperature Capabilities⁽¹⁾

Standard: POM (polyoxymethylene) -29 to 82°C (-20 to 180°F)

Optional: POM (polyoxymethylene) with Nitrile MoS₂ Impregnated O-rings -46 to 82°C (-50 to 180°F) or PTFE/PEEK⁽²⁾ with fluorocarbon O-rings -23 to 204°C (-10 to 400°F)

Maximum Ball Rotation

90°

Actuator Mounting

Right-hand or left-hand mounted as viewed from the valve inlet from forward flow

Packing Arrangements

PTFE Packing: Standard construction

ENVIRO-SEAL™ Packing: This optional packing system provides improved sealing, guiding, and transmission of loading force to control liquid and gas emissions

Approximate Weights

See table 2

Options

- Double block-and-bleed applications (Dual seal construction is required)
- Two or three-stage Aerodome attenuator, two-stage or three-stage Hydrodome attenuator
- Ring type joint flanges
- Inconel drive shaft
- Keyed shaft
- Nitrile MoS₂ Impregnated O-rings
- S31600 SST ENC ball
- PTFE/PEEK seal insert
- Contact your Emerson sales office for other options

1. The pressure or temperature limits in this bulletin and any applicable standard or code limitation for this valve should not be exceeded.

2. PTFE stands for Polytetrafluoroethylene and PEEK stands for PolyEtherEtherKetone.

Installation

⚠ WARNING

- To avoid personal injury, always wear protective gloves, clothing, and eyewear when performing any installation operations.
- To avoid personal injury or property damage resulting from the bursting of pressure retaining parts, be certain the service conditions do not exceed the limits given in this manual.
- To avoid personal injury or property damage that can result from the sudden release of process pressure if valve or mating pipe flange pressure ratings are exceeded, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.
- Service conditions are limited for valve and trim material combinations. Do not apply any other service conditions to the valve without first contacting your [Emerson sales office](#).
- Personal injury could result from packing leakage. See the Packing Maintenance section for adjustment information.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
- If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.
- Use proper lifting and rigging practices while moving the valve or valve/actuator assembly.

Key number locations are shown in figure 4 unless otherwise noted. Throughout this manual, the component key number will be identified for clarity.

1. Install a three-valve bypass around the control valve assembly if continuous operation will be necessary during inspection and maintenance of the valve.
2. The valve is normally shipped as part of a control valve assembly, with a factory adjusted actuator mounted on the valve. If the valve or actuator has been purchased separately, or if the actuator has been removed, refer to the Actuator Mounting section and the appropriate actuator instruction manual for installation and adjustment procedures.
3. The standard valve construction allows uni-directional flow. If possible, install the valve in a horizontal pipeline with the drive shaft (key 20) horizontal. The actuator can be right- or left-hand mounted in any of the positions shown in the actuator instruction manual.

CAUTION

Be certain the valve and adjacent pipelines are free of any foreign material that could damage the valve sealing surfaces.

Impurities or entrained solids in the process fluid could plug the passages in the trim. If the process fluid is not clean, install a filter upstream to keep the pipeline free of impurities or entrained solids.

4. Provide appropriate flange gaskets, and place the valve in the pipeline. Tighten flange bolting in a star pattern to ensure the flange gaskets are compressed evenly.

Note

Standard Fisher V280 valve packings (key 105) are composed of:

- Conductive packing ring (graphite ribbon packing), or

- Partially conductive packing rings (for example: a carbon-filled PTFE female adaptor with PTFE V-ring packing or a graphite-composition packing ring with a PTFE/composition packing ring).

To electrically bond the drive shaft to the valve body for hazardous area service, an alternate shaft-to-body bonding strap can be provided by using the follow step (see figure 2).

- For hazardous area applications where redundant shaft-to-body grounding is preferred, attach the optional bonding strap assembly (key 117) to the valve drive shaft (key 20) with the clamp (key 116) and connect the other end of the bonding strap assembly to the valve body with the mounting cap screw (key 25) as shown in figure 2.

Figure 2. Optional Shaft-to-Body Bonding Strap Assembly

GH02761

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

⚠ WARNING

Avoid personal injury or equipment damage from sudden release of process pressure or uncontrolled movement of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Do not loosen any pressure retaining bolting while the valve is still pressurized. This includes the body-to-tailpiece nuts (key 18), packing box housing nuts (key 21), packing nuts (key 101) or pipe plug (keys 26).
- Avoid injury by keeping hands, tools, and other objects away from the ball while stroking the valve.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Check that the actuator cannot suddenly open or close the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure, relieve any process pressure from both sides of the valve body, and drain the process media from both sides of the valve.

- **Dual-seal constructions can retain pressure and process fluid even after process pressure has been removed from both sides of the valve. The ball should be partially opened to relieve this pressure before disassembling or removing the valve from the line. Take additional care if the process fluid is hot, flammable, caustic, or hazardous.**
 - **A tip over hazard exists for the valve/actuator assembly. Ensure the valve/actuator assembly is properly secured and always supported to prevent falling or rolling which may cause injury or property damage.**
 - **Use lock-out/tag-out best practices and procedures to be sure that the above measures stay in effect while you work on the equipment.**
 - **The valve packing box housing may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings.**
 - **Check with your process or safety engineer for any additional measures that must be taken to protect against process media.**
-

Packing Maintenance

Refer to figure 3 for details of the standard PTFE V-ring packing (left) and the ENVIRO-SEAL packing system (right). All maintenance operations in this section may be performed on an unpressurized valve that is still installed inline.

Note

For additional information on the ENVIRO-SEAL packing system refer to the ENVIRO-SEAL Packing System Instruction Manual ([D101643X012](#)).

Stopping Leakage

For standard PTFE V-ring packing, leakage around the packing follower may be stopped by tightening the packing follower nuts. If the packing is relatively new and tight on the drive shaft, and if tightening the packing follower nuts does not stop the leakage, the drive shaft may be worn or nicked so that a seal cannot be made. If the leakage comes from the outside diameter of the packing, the leakage may be caused by nicks or scratches on the packing box housing packing gland bore.

For ENVIRO-SEAL packing, optimal performance is obtained when the Belleville springs are compressed to the required target load. The target load is the point where the springs are compressed to 85% of their maximum deflection.

Under normal conditions, the packing nuts should not require re-tightening. However, when servicing, if the springs do not remain at the target load of 85% compression, retighten the packing nuts (key 101) per the following:

1. Tighten the packing flange nuts (key 101) alternately and evenly, keeping the packing flange parallel with the valve flange (see figure 3), until the Belleville springs are compressed 100% (or completely flat).
 - a. For PTFE packing, loosen each packing flange nut one half turn (180° of rotation).
2. The target load of 85% compression has now been reached. If leakage continues, replace the packing components and inspect the packing box housing, packing gland bore, and valve drive shaft for damage as described in the following procedures.

Replacing Packing

Replacing the packing requires bleeding off the system and removing the actuator from the valve. Valve/actuator adjustments cannot be made correctly without observing the fully open or closed position of the valve ball (key 3). It is not necessary to remove the valve from the pipeline to make adjustments if care is taken to note the position and alignment of the actuator lever and valve shaft and to not disturb the actuator turnbuckle position.

Refer to figure 3 which identifies the V280 packing components by key number (also see the Parts List section of this manual).

Figure 3. Packing Arrangement Details

Packing Disassembly

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, shut off all pressure lines (or other power source) to the power actuator, release pressure from the actuator, and disconnect the pressure lines from the actuator. Use lockout/tagout procedures to be sure that the above measures stay in effect while disassembling the equipment.

⚠ WARNING

- See the **WARNING** at the beginning of the Maintenance section for more information before removing the valve from the pipeline.
- Use proper lifting and rigging practices while moving the valve or valve/actuator assembly.

2. Remove line bolting, remove the control valve from the pipeline, and place the actuator/valve assembly on a flat surface.
3. To assist with future reassembly, note and mark the orientation of the actuator with respect to the valve body and the actuator lever orientation with respect to the valve drive shaft.
4. Refer to the appropriate actuator instruction manual for information on removal.

CAUTION

When removing the actuator from the valve, do not use a hammer or similar tool to drive the lever or actuator off the valve drive shaft (key 20). Driving the lever or actuator off the valve drive shaft could damage the ball, seals, and valve.

If necessary, use a wheel puller to remove the lever or actuator from the valve drive shaft. Tap the wheel puller screw lightly to loosen the lever or actuator. Do not hit the screw with excessive force. Using excessive force could damage the ball, seal, and valve.

5. Loosen the actuator lever locking device cap screw. Loosening the lever turnbuckle adjustment is not necessary during disassembly. When remounting the actuator, the turnbuckle will be used for actuator adjustments.
6. Remove the actuator mounting screws, bolts, or nuts while properly supporting the actuator and separate the actuator and mounting bracket from the valve.
7. Slide the lever along the valve drive shaft (key 20) while removing the actuator from the valve.
8. If necessary, remove the bonding strap assembly, shown in figure 2 from the valve before removing the packing parts.
9. Remove the packing follower nuts, packing flange, spring pack (only applicable to ENVIRO-SEAL), and packing follower (keys 101, 102, and 114).
10. Remove the packing parts:
 - a. If the packing box housing (key 6) is mounted on the valve: Use a formed wire hook with a sharp end to pierce the packing rings, and pull the rings out of the packing box housing. Do not scratch the drive shaft or packing gland bore. Scratching these surfaces could cause leakage. Clean, inspect, and obtain replacement parts as necessary for reassembly. Examine the drive shaft and packing gland bore for any signs of damage that may prevent proper sealing.
 - b. If the packing box housing is separated from the valve (refer to Seal Ring Maintenance section of this manual for disassembly instructions): Remove the drive shaft (key 20) from the packing box housing. With the drive shaft removed, remove all internal packing parts. Clean, inspect, and obtain replacement parts as necessary for reassembly. Examine the drive shaft and packing gland bore for any signs of damage that may prevent proper sealing.

Note

Verify that the grounding ball is installed in the drive shaft-to-ball tang interface to guarantee electrical continuity between ball trim and valve drive shaft.

The packing sets (key 105) listed in the parts list do not include any metal parts. Either clean and reuse metal packing parts or obtain replacements by ordering them individually.

Packing Assembly

For additional information on the ENVIRO-SEAL packing system refer to the ENVIRO-SEAL Packing System Instruction Manual ([D101643X012](#)).

If the packing housing box (key 6) is removed from the valve, use the valve assembly steps to reinstall the drive shaft (key 4) and packing box housing assembly on the valve. (Refer to Seal Ring Maintenance section of this manual for additional assembly instructions).

1. Place the new packing components over the valve drive shaft (key 20) and slide each into the packing box housing until properly seated at the bottom of the packing gland bore. Use the parts sequence shown in figure 3 and verify the correct configuration.
2. For standard packing arrangements, secure the packing follower and packing flange with packing nuts (keys 114, 102, and 101). Tighten the packing flange nuts alternately and evenly until leakage has stopped during operating

conditions (only applicable to standard packing), keeping the packing flange parallel with the valve flange (see figure 3).

3. If necessary, install the bonding strap assembly (keys 116 and 117) shown in figure 2.
4. Use the steps provided in the Actuator Mounting section to install the actuator on the valve. For actuator travel adjustments, refer to the appropriate actuator instruction manual.
5. When the control valve is in operation, carefully examine the packing follower region for any signs of leakage.

Seal Ring Maintenance

⚠ WARNING

- See the **WARNING** at the beginning of the Maintenance section for more information before removing the valve from the pipeline.
- Use proper lifting and rigging practices while moving the valve or valve/actuator assembly.

Valve Disassembly

Refer to figure 4 to identify the V280 valve components by key number.

Disassemble the valve only to the extent necessary to accomplish the needed inspection and repairs. For some repairs complete disassembly of the valve is not necessary. Follow the disassembly procedures to the point necessary to accomplish the repair, then skip to the appropriate assembly steps to complete the reassembly of the valve. Always clean and protect sealing surfaces from damage.

Note

It is not necessary to remove the base bracket for maintenance.

Mark parts as necessary to allow them to be returned to the same position and orientation as removed. The tailpiece, for instance, shall be returned to the same end of the valve from which it was removed. The seal assembly shall also be returned to the same tailpiece and in the same orientation from which it was removed.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, shut off all pressure lines to the power actuator, release pressure from the actuator, and disconnect the pressure lines from the actuator. Use lockout/tagout procedures to be sure that the above measures stay in effect while working on the equipment.
2. Remove line bolting, remove the control valve from the pipeline, and clean all valve surfaces. Place the actuator/valve assembly on a flat working surface.
3. Mark parts as necessary to allow them to be returned to the same position during reassembly.
4. Refer to the appropriate actuator instruction manual for information on removal. Loosen the actuator mounting screws, bolts, or nuts while properly supporting the actuator then separate the actuator and mounting bracket from the valve. When valve maintenance is complete, refer to the Mounting Actuator procedure in this manual to reinstall the actuator on the valve.

5. Provide a clean soft working surface to protect the tailpiece-flange serrated surface. Lift the valve and place it on either tailpiece flange face. Be sure the valve is in a stable, upright position before releasing the hoist connection.

Note

If the packing (key 105) is in good condition, it is possible to remove and replace the seal assembly (key 5) without removing the packing box housing assembly. However, the packing box housing assembly must be removed to remove the ball (key 3) from the valve body.

6. Remove the packing box housing nuts (key 21).
7. Remove the packing box housing assembly from the valve. The assembly includes the drive shaft (key 20), O-ring and back-up ring (keys 13 and 16), shaft bearing (key 7), shaft thrust washer (key 11), and all packing parts.

Note

Verify that the grounding ball is installed in the drive shaft-to-ball tang interface to guarantee electrical continuity between ball (key 3) and valve drive shaft (key 20).

8. If it is desired to separate the packing box assembly parts, loosen or remove the packing components and slide the shaft down and out the valve side of the packing box housing. Inspect the drive shaft bushing (key 7) and the thrust washer (key 11). If necessary, replace worn components.
9. Remove the valve body nuts (key 18) from the studs (key 4) on the upper tailpiece and remove the tailpiece (key 2) from the valve body (key 1).

CAUTION

While lifting the tailpiece (key 2) with seal (key 5) from the valve body (key 1), check to see if the seal (key 5) is lifting with the tailpiece. If so, use caution in case the seal falls out and protect the ball and the body sealing surfaces. An additional strap can be employed to ensure the seal is captured in the event it disengages from the tailpiece.

If the valve assembly is resting on the base bracket during disassembly, secure the valve when removing the tailpieces from the body to prevent tipping.

10. Turn the tailpiece assembly over so the seal is facing up and place it on a clean soft surface to protect the flange serrated surface.
11. Remove the seal (key 5) from the tailpiece by using the 1/4-20 UNC jack bolt tappings on the seal flange. This will aid with disengaging the O-ring from the tailpiece seal gland. Be sure to not use any tools that could cause damage to the sealing surface. Note the configuration of the seal O-ring (key 14) and back-up ring (key 15) and the wave spring (key 17). Ensure the bearing plate (key 8) dowel pins (key 23) are accounted for.
12. If the tailpiece has an attenuator dome (key 24), place a flat head screw driver in the removal notch on the retaining ring (key 28) and pry the retaining ring out of the groove. Once the removal notch end of the retaining ring is out of the groove, pull up on the removal notch end to unseat the retaining ring from the groove. Be sure not to scratch the O-ring sealing surface while performing this operation. Clean and protect all sealing surfaces.

⚠ WARNING

When lifting the ball, ensure the bearing plates (key 8) are secure on the ball trunnions to prevent parts from falling which may cause personal injury or property damage.

13. Turn the ball (key 3) to the closed position. Use an approved lifting sling through the ball bore to lift the ball out of the valve body. Lift the ball and set it on a clean soft surface.
14. Remove the two bearing plates (key 8) and thrust washers (key 10) from the ball. Inspect the lined bushing (key 9) in each bearing plate and the thrust washers. If necessary, replace worn components.
15. Evenly loosen the nuts (key 18) from the studs (key 4) on the lower tailpiece and lift the body (key 1) from the tailpiece (key 2).
16. For dual seal constructions, repeat step 11.
17. For dual dome attenuator constructions, repeat step 12.

Valve Assembly

Be sure to replace valve parts in the same position and orientation from which they were removed. Use the following steps to reassemble the valve.

Note

Clean and protect all sealing surfaces from damage while installing parts. Lubricate components when necessary as an aid for installation, and to help protect sealing surfaces.

Refer to figure 4 that identifies the V280 valve components by key number.

During assembly, visually inspect component surfaces that interface with an O-ring or seal for any damage or foreign material that may prevent proper sealing.

1. Place both tailpieces (key 2), flange end down on a clean soft surface with the seal assembly cavity facing up. Use caution to protect the flange end serrated surfaces.
2. For all attenuator dome constructions, lubricate the tailpiece retaining ring groove, attenuator dome counterbore surface, and the surface where the attenuator dome will rest against the tailpiece with an anti-seize lubricant (key 45). This will aid in the disassembly process.
3. For all attenuator dome constructions, install the grooved end of the groove pin (key 27) into the tailpiece as far as it will go. Take care not to bend the pin. This groove pin will prevent the attenuator dome from rotating within the tailpiece.
4. Install the attenuator dome by aligning the pin hole in the attenuator dome with the groove pin (key 27) installed in the bottom of the tailpiece.
5. Install the retaining ring (key 28) into the tailpiece by expanding the coils of the retaining ring and installing one end into the groove. Hold the one end installed into the groove and press down around the perimeter of the retaining ring in a winding fashion until the ring is fully seated into the groove. There should be audible indication of the ring once it has fully seated in the groove. Take care to not damage the sealing surface of the tailpiece.
6. Lubricate (key 33) the tailpiece counterbore above the retaining ring groove where the seal will sit in the tailpiece.
7. On the seal (key 5), install the O-ring (key 14) and back-up ring (key 15) with the back-up ring towards the valve body (see figure 4).
8. Install the wave spring (key 17) into the tailpiece.
9. Lubricate (key 33) the installed O-ring and back-up ring on the seal and insert the seal assembly into the tailpiece counterbore. Maintain axial alignment of the two components as the seal assembly is drawn down into place.

Note

For single or dual characterized attenuator dome constructions, verify that the ball opens into the attenuator dome window(s) last. If not, remove the attenuator dome and tailpiece and rotate 180° to allow the window(s) to open last.

10. Lubricate (key 33) the half-dovetail groove on the tailpiece (key 2) and install the O-rings (key 12) in both tailpieces.
11. If necessary, install the grooved end of the groove pins (key 23) into the bearing plate (key 8) as far as they will go.
12. Install new bushings (key 9) in the bearing plates (key 8) by aligning the split in the bushing towards the longer side of the bearing plate (see figure 4).

⚠ WARNING

When lifting the ball, ensure the bearing plates (key 8) are secure on the ball trunnions to prevent parts from falling which may cause personal injury or property damage.

13. Use an approved lifting sling through the ball bore to lift the ball (key 3). Orient the ball so the port and trunnions are parallel with the ground.
14. Lubricate and install the thrust washers (key 10) and bearing plates on both ball trunnions.
15. Install the ball and bearing plates assembly onto the lower tailpiece. While lowering the ball, guide the groove pins in the bearing plates into their proper location in the tailpiece pin holes.
16. Place the body (key 1) on an appropriate work surface.
17. Install the grooved end of the groove pins (key 22) into the body. Take care to not bend the pins during assembly.
18. If studs (keys 4) were removed from valve body during disassembly, apply anti-seize lubricant (key 45) to the threads of the studs and holes and install in both sides of the body with the material identifier facing outward.
19. Lubricate (key 33) the tailpiece O-ring sealing surface of the body and lower the body over the ball and onto the tailpiece, guiding the body over the ball and aligning the pin holes on the tailpiece with the groove pins (key 22) installed in the body. Make sure that the body shaft bore is aligned to the same side as the tang slot on the ball.
20. Apply anti-seize lubricant (key 45) to the face and threads of the nuts (key 18). Install the nuts on the studs by hand with the material identifier facing outward. Use an appropriate torque device to apply the final torque specification (see table 3).
21. Repeat step 19 before installing the upper tailpiece.
22. Install the upper tailpiece from steps 1 through 10 over the studs (key 4) and pins (key 22) installed in the body.
23. Repeat step 20 once the upper tailpiece has been installed on the body.
24. Insert the drive shaft (key 20) through the body shaft bore to engage the shaft tang with the ball tang slot. Install the shaft thrust washer (key 11) onto the shaft.
25. Install the drive shaft bushing (key 7) in the packing box housing from the end that engages the body.
26. Lubricate (key 33) and install the O-ring (key 13) and back-up ring (key 16) on the packing box housing.
27. Lubricate the packing box housing studs (key 19) with an anti-seize lubricant (key 45) and install in the valve body.
28. After lubricating (key 33) the body shaft bore, position the packing box housing assembly over the drive shaft and slide into place ensuring the O-ring (key 7) properly engages the body shaft bore. Make sure to orient the length of the packing box housing perpendicular to the bore of the valve body (see figure 4).
29. Install the packing components as detailed in the Packing Maintenance section of this manual.
30. Apply anti-seize lubricant to the packing box housing nuts (key 21) and torque to the required specifications (see table 3).
31. For keyed shafts, install the valve shaft key (key 38), flat washer (key 39) and hex head bolt (key 40). The purpose of the washer and hex bolt is to prevent the key from migrating axially out of the keyway in-service.
32. If the base bracket was removed from the body during disassembly, place it on the body flats that correspond with the desired shaft orientation (horizontal or vertical). Lubricate the two socket head cap screws with an anti-seize lubricant (key 45), place a washer (key 41) over each screw, and install into the body. Torque to the required specifications (see table 4).

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

V280 Valve

August 2019

33. If the swivel hoist rings (key 35) were removed during disassembly, reinstall the two swivel hoist rings into the body flats that correspond with the desired shaft orientation (horizontal or vertical). Do not lubricate the threads. Torque to the required specifications (see table 4).

Table 3. Bolt Torque Specifications

VALVE SIZE, NPS	CLASS	FASTENER SIZE	VALVE BODY HEAVY HEX NUT TORQUE ⁽¹⁾		FASTENER SIZE	PACKING BOX HOUSING HEAVY HEX NUT TORQUE ⁽¹⁾

1. Base bracket fasteners must be lubricated to achieve proper preload.

2. Do not lubricate swivel hoist ring fasteners. If lubricated, consult your [Emerson sales office](#) for additional torque specifications.

Actuator Mounting

Use the appropriate actuator instruction manual for mounting the actuator or changing the actuator position. Attach the actuator mounting bracket to the valve packing box and tighten the mounting bracket fasteners as detailed in table 5.

Table 5. Required Actuator Mounting Bracket-to-Valve Bolt Torque Specifications

VALVE SIZE, NPS	FASTENER SIZE, INCH	SAE J429 GRADE 5/NCF3 ⁽¹⁾

10			
12	1-1/4-8	1490	1100
16			

1. Fasteners must be lubricated to achieve proper preload.

Determining Closed Position

1. To confirm proper actuator adjustment visually check the position of the ball.
2. Adjust the actuator linkage or travel stops as described in the actuator instruction manual so that at the end of stroke, the valve ball bore diameter in the full open (100%) position is in alignment and centered within the upstream and downstream valve seal inside diameters. The actuator linkage or travel stops should be adjusted so that the full closed (0%) valve position is precisely 90 degrees from the visually verified 100% open position. The valve has a given dead band where the seal is in full contact with the ball, so if the valve position is not precisely 90 degrees from the visually verified 100% open position, leakage past the seal could occur.
3. For reference, two parallel lines are machined on the actuator mounting end of the valve drive shaft (key 20). The lines represent the orientation of the valve ball bore. The ball is in the closed position when the two lines are perpendicular to the pipeline bore.

Parts Ordering

A serial number is assigned to each valve and stamped on the nameplate. Always refer to the valve serial number when corresponding with your [Emerson sales office](#) regarding spare parts or technical information. When ordering replacement parts, also specify the part name and desired material.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual provides installation, operation, maintenance and parts ordering information for NPS 1 through 12 Fisher V500 eccentric plug rotary control valves. Refer to separate manuals for information concerning the actuator and accessories.

WARNING

 Do not install, operate or maintain a V500 valve without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

1.2 Description

The V500 rotary control valve is a flanged (Figure 1) valve with a self-centering seat, eccentrically rotating plug and splined valve shaft. Suitable for forward or reverse flow use, this valve mates with a variety of actuators to provide throttling or on-off service. Valves mate with CL150, 300 or 600 raised face pipeline flanges.

Figure 1. Fisher V500 Flanged Rotary Control Valve with 1061 Actuator and FIELDVUE™ DVC6200 Digital Valve Controller

W8380-1

Table 1. Specifications

Valve Sizes ⁽¹⁾	Flow Direction
NPS ■ 1, ■ 1-1/2, ■ 2, ■ 3, ■ 4, ■ 6, ■ 8, ■ 10 and ■ 12	■ Reverse Flow (Standard Direction): Past valve plug and through seat ring tends to close the valve, recommended for erosive and general service ■ Forward Flow: Through seat ring and past valve plug; tends to open the valve, recommended for high pressure drop and high cycle service
End Connection Style	Actuator Mounting
■ Raised-face flanges, ■ ring-type joint flanges (ASME B16.5) ■ CL150, ■ CL300 or ■ CL600 Valve bodies with EN flanges also available; consult your Emerson sales office.	■ Left-hand or ■ right-hand as viewed from the upstream side of the valve. See Figure 2.
Maximum Inlet Pressure ⁽²⁾	Valve Plug Rotation
Consistent with applicable ASME B16.34 or EN 12516-1 ratings	Counterclockwise to close (when viewed from actuator side of valve) through 90° of valve plug rotation
Shutoff Classification	Valve/Actuator Action
Class IV per ANSI/FCI 70-2 and IEC 60534-4 (0.01% of valve capacity at full travel), for either flow direction. Leak rates for full and restricted port valves are based on full port capacities. Reduced port valves seat at the full port diameter.	With diaphragm or piston rotary actuator, field-reversible between ■ push-down-to-close (extending actuator rod closes the valve) and ■ push-down-to-open (extending actuator rod opens the valve)
Flow Characteristic	Shaft Diameters ⁽³⁾ and Approximate Weights
Modified linear	See Table 2
1. The valve size shown in this manual refers to Nominal Pipe Size (NPS). 2. The pressure or temperature limits in this manual and any applicable standard limitations should not be exceeded. 3. Shaft diameter and spline end must match available shaft diameter of actuator.	

Section 2: Installation

WARNING

Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.

To avoid personal injury or property damage resulting from the sudden release of pressure, do not install the valve assembly where service conditions could exceed the limits given on the appropriate nameplates or the mating pipe flange rating. Use pressure-relieving devices as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any other hazards that may be present from exposure to process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some valve body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

Table 2. Shaft Diameter and Approximate Weights

VALVE SIZE, NPS	SHAFT DIAMETER		APPROXIMATE WEIGHT		
			Flanged		
	Through Valve	At Spline End	CL150	CL300	CL600
	mm		kg		
1	12.7	12.7	5.4	5.9	5.9
1-1/2	15.9	15.9	8.6	9.5	10
2	15.9	15.9	9.5	11	13
3	25.4	25.4	19	24	26
	25.4	19.1			
4	31.8	31.8	36	42	50

	38.1	31.8			
8	38.1	38.1	79	98	135
10	44.5	44.5	186	213	317
12	53.8	53.8	218	256	370
	53.8	50.8			
	in.		lbs		
1	1/2	1/2	12	13	13
1-1/2	5/8	5/8	19	21	23
2	5/8	5/8	21	25	28
3	1	1	42	52	57
	1	3/4			
4	1-1/4	1-1/4	79	93	111
6	1-1/2	1-1/2	120	152	204
	1-1/2	1-1/4			
8	1-1/2	1-1/2	75	217	298
10	1-3/4	1-3/4	408	468	697
12	2-1/8	2-1/8	478	563	815
	2-1/8	2			

Key numbers in this procedure are shown in Figure 11 (NPS 1 and 1-1/2 valves), Figure 14 (NPS 2 through 8 valves) and Figure 15 (NPS 10 and 12) unless otherwise indicated.

NOTICE

To prevent product damage during storage, keep the valve body cavity dry and clear of foreign material.

1. If the valve is to be stored before installation, protect the flange mating surfaces and keep the valve body cavity dry and clear of foreign material.
2. Install a three-valve bypass around the control valve assembly if continuous operation will be necessary during inspection and maintenance of the valve.
3. A V500 valve is normally shipped as part of a control valve assembly, with a power or manual actuator mounted on the valve. If the valve and actuator have been purchased separately or if the actuator has been removed from the valve, mount the actuator according to the Actuator Mounting procedure. Also, adjust the actuator travel using the Adjusting Actuator Travel procedure before installing the valve. The necessary measurements cannot be made with the valve installed.
4. Before starting the actual installation of the valve, determine the proper installation orientation of the valve plug (key 2) and actuator. Determine the flow direction of the process fluid through the valve. See Figure 2.

NOTICE

Ensure the valve and adjacent pipelines are free of foreign material that could damage the valve seating surfaces.

5. Before installing the valve, make sure the flow direction arrow (key 32) on the valve matches the actual process fluid flow direction through the valve for the application where the valve will be installed.
6. Install the flange gaskets and insert the valve between the mating pipeline flanges. Use flat sheet gaskets compatible with the process media or spiral wound gaskets with compression-controlling center rings.

			8	8	6.75	III

Figure 4. Optional Shaft-to-Body Bonding Strap Assembly**NOTE**

For best shutoff performance and to reduce bearing wear, it is recommended that you install the valve shaft in a horizontal direction. See Figure 1.

2.1 Ceramic Trim

Some types of ceramic trim, including the VTC (very tough ceramic) variety, can create a spark under certain circumstances. When the edge of a ceramic part is struck against a second ceramic part with enough force, a spark can be created.

⚠ WARNING

Avoid personal injury and property damage from ignition of process fluid caused by sparks from ceramic trim. Do not use ceramic trim where the process fluid is unstable or if it is an explosive mixture (such as air and ether).

⚠ WARNING

The valve drive shaft is not necessarily grounded to the pipeline when installed. Personal injury or property damage could result if the process fluid or the atmosphere around the valve is flammable, from an explosion caused by a discharge of static electricity from the valve components. If the valve is installed in a hazardous area, electrically bond the drive shaft to the valve.

1. Prepare to install the line bolts and nuts. Consult Figures 3, 4 and 5 before installing the line bolts and nuts.

NOTE

Standard PTFE packing is composed of a partially conductive carbon-filled PTFE female adaptor with PTFE V-ring packing. Standard graphite packing is composed of all conductive graphite ribbon packing rings. Alternate shaft-to-valve body bonding is available for hazardous service areas where the standard packing is not sufficient to bond the shaft to the valve (see the following step).

2. For hazardous applications, attach the bonding strap assembly (key 131) to the shaft with the clamp (key 130) and connect the other end of bonding strap assembly to the valve body with the cap screw (key 25). See Figure 4.

For all valve bodies, install the line bolts and nuts; then, tighten them using accepted bolting procedures. These procedures include, but are not limited to, lubricating the line bolts and hex nuts and tightening the nuts in a crisscross sequence to ensure proper gasket load.

3. If a purge is desired for the purged bearing construction, remove the pipe plugs (keys 29 and 24) and install the purge lines. Purge pressure should be greater than the pressure within the valve and the purge fluid should be as clean as possible.
4. Connect pressure lines to the actuator as indicated in the actuator instruction manual. When a manual actuator is used with a power actuator, install a bypass valve on the power actuator (if not already supplied) for use during manual operation.

WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any other hazards that may be present from exposure to process media.

If the valve has enhanced ENVIRO-SEAL™ live-loaded packing installed readjustment will probably not be required. See the Emerson Automation Solutions instruction manual entitled ENVIRO-SEAL Packing System for Rotary Valves ([D101643X012](#)) for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the Parts Kit section later in this manual.

Section 3: Maintenance

WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- **Do not remove the actuator from the valve while the valve is still pressurized.**
- **Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.**
- **Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.**
- **Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.**
- **Vent the power actuator loading pressure and relieve any actuator spring precompression.**
- **Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.**
- **The valve packing area may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings.**
- **Check with your process or safety engineer for any other hazards that may be present from exposure to process media.**

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

As used in these instructions, the term “actuator” refers to power actuators (such as pneumatic diaphragm or piston actuators) or manual actuators (such as handwheel or handlever actuators).

3.1 Packing Maintenance

Key numbers are referenced in Figures 11, 13 and 14 unless otherwise indicated.

NOTE

For the ENVIRO-SEAL packing system, refer to the Parts Ordering section for retrofit kits and parts kits (see Figure 15). Refer to the separate ENVIRO-SEAL instruction manual for maintenance instructions.

Standard ENVIRO-SEAL packing systems can be used in vacuum service with packing rings in the standard orientation. It is not necessary to reverse the ENVIRO-SEAL PTFE packing rings.

Stopping Leakage

All maintenance procedures in this section may be performed with the valve body (key 1) in the line.

For packing other than spring-loaded packings, leakage around the packing follower (key 14) can be stopped by tightening the packing flange nuts (key 16). If leakage cannot be stopped in this manner, replace the packing according to the Replacing Packing procedure.

If the packing is relatively new and tight on the valve shaft (key 3) and if tightening the packing nuts does not stop leakage, it is possible that the valve shaft is worn or nicked so that a seal cannot be made. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches on the packing box wall. Inspect the shaft and packing box wall for nicks or scratches when performing the following procedures.

Replacing Packing

NOTE

If the valve has enhanced ENVIRO-SEAL live-loaded packing installed, see the separate ENVIRO-SEAL instruction manual.

This procedure may be performed without removing the actuator from the valve body if adding PTFE/composition packing rings as a temporary measure. However, the actuator must be removed if replacing any other kind of packing or if the metal packing parts (keys 14, 17 and, if used, 18) need to be replaced.

Removing the Packing

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve and drain the process media from both sides of the valve. If using a power actuator, also shut off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

NOTICE

When the actuator is removed from the valve, do not use a hammer or similar tool to drive the lever or actuator off the valve shaft. Driving the lever or actuator off the valve shaft could damage the valve plug, seal and valve.

If necessary, use a wheel puller to remove the lever or actuator from the valve shaft. It is okay to tap the wheel puller screw lightly to loosen the lever or actuator, but hitting the screw with excessive force could damage the valve plug, seal and valve.

2. If necessary, remove the cap screws (key 25) and hex nuts (key 26). Then remove the actuator while referring to the actuator manual for assistance.
3. Remove the packing nuts (key 16). For NPS 1 through 8 remove the packing follower (key 14). For NPS 10 and 12, remove the packing flange (key 45) and then remove the packing follower (key 14).
4. Remove the old packing rings (key 13), packing box ring (key 17) and, if used, the lantern ring (key 18).

⚠ WARNING

Do not scratch the valve shaft or packing box wall. Scratching these surfaces could cause leakage.

5. Clean all accessible metal parts and surfaces to remove particles that would prevent the packing from sealing.
6. If necessary, complete the steps in the Replacing the Valve Plug, Shaft and Bearings section and return to the Installing Packing steps below.

Installing Packing

1. Install the new packing rings and packing box ring by stacking the parts as shown in Figure 5. Make sure split rings are arranged so that the splits do not line up to form a leak path. Then slide the stack into the packing box as far as will go while being careful to avoid trapping air among the rings.
2. Install the studs (key 15) and packing follower (key 4) and for NPS 10 and 12, also install the packing flange (key 45). Install the nuts (key 16).

⚠ WARNING

To prevent possible product damage or leakage, make sure the valve plug remains in the closed position when installing new packing parts.

3. Make sure the valve plug is in the closed position when installing new packing parts.
4. Insert a screw driver, pry bar or similar tool between the lower ear of the plug and the valve body (see Figure 6). Use the pry to move the plug tightly against the thrust washer and bearing on the actuator side of the valve. Keep the valve plug in that position until you have completed the packing installation.
5. Tighten packing flange nuts enough to stop leakage under normal conditions.
6. Mount the actuator while referring to the actuator mounting procedures of the actuator instruction manual. You must complete the Adjusting Actuator Travel procedure in this manual before installing the valve in the pipeline, due to the measurements that must be made during the actuator adjustment process.
7. When the control valve is being put back into operation, check the packing follower for leakage and retighten the packing nuts as necessary.

3.2 Replacing Retainer, Seat Ring, Face Seals and Insert

This procedure is to be performed if the control valve is not shutting off properly, if the port diameter is to be changed by installing a different seat ring or if seat ring inspection is necessary. The actuator and valve (key 1) must be removed from the pipeline; however, the actuator may remain mounted during this procedure. The insert is an optional part for most constructions, but is required on the NPS 2, 3 and 4 Globe Face-to-Face design.

A retainer tool is required to remove the retainer (key 5), seat ring (key 4), face seals (key 8) and insert (key 135). If specifically ordered, a tool is supplied with the valve; a tool can also be ordered individually. If desired, a tool can be machined using the dimensions shown in Figure 7.

During assembly, handle the retainer, seat ring, face seals and insert carefully. Critical areas that must be protected are the threads and inner surface of the retainer (key 5), the sealing surfaces of the face seals (key 8), the face seal grooves in the seat ring (key 4), the shutoff surface of the seat ring and the face seal surface in the valve body (key 1) or in the insert.

A new retainer gasket (key 11) and insert gasket (key 134) are required whenever the retainer (key 5) is removed. Other parts in good condition can be reused.

Disassembly of Retainer, Seat Ring, Face Seals and Insert

The insert is an optional part for most constructions, but is required on the NPS 2, 3, and 4 Globe Face-to-Face design. Key numbers are shown in Figures 11, 13 and 14 unless otherwise noted.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body and drain the process media from both sides of the valve. If using a power actuator, also shut off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Remove line bolting. Then, remove the control valve from the pipeline and place the valve on a flat surface with the retainer (key 5) facing up.
3. Rotate the valve shaft (key 3) to move the valve plug (key 2) into the open position.

NOTE

The retainer (key 5) was installed at the factory using the torque listed in Table 6.

4. Remove the retainer by engaging the retainer tool, attaching an impact wrench or other suitable tool and unscrewing the retainer. Inspect the retainer.

NOTICE

Place the retainer on a protected, flat surface where the threads and inner surface will not be contaminated or damaged.

5. Remove the retainer gasket (key 11). Inspect the gasket surfaces on the valve body (key 1).
6. Lift out the seat ring (key 4), both face seals (key 8), insert (key 135), and insert gasket (key 134). Inspect the parts and place them on a flat, protected surface.
7. Inspect the shutoff surface of the valve plug. If it is worn, nicked or scratched, proceed to the Replacing Valve Plug, Shaft and Bearings procedure. If the parts are in good shape and do not require maintenance, continue to the Assembly procedure.

Figure 5. Packing Arrangements

NOTES:

1. INCLUDES ZINC WASHERS (KEY 28) FOR GRAPHITE RIBBON PACKING ONLY.
2. INCLUDED IN PTFE V-RING PACKING SET (KEY 13).
3. FOR ONLY PTFE/BOUND-COMPOSITION PACKING, TOP RING IS CONDUCTIVE GRAPHITE FILAMENT RING.

Figure 7. Data for Making and Using Retainer Tool (Key 33) (Also See Tables 5 and 6)

B1899-2

Assembly of Retainer, Seat Ring, Face Seals and Insert

WARNING

Seat ring installation requires that the valve plug (key 2) remain in the open position. To avoid personal injury or damage to tools, valve parts or other items resulting from plug closing, prevent plug travel by using travel stops, manual actuators, constant supply pressure to a pneumatic actuator or other steps as appropriate. When installing the seat ring, keep hands, tools and other objects out of the valve.

1. Apply enough supply pressure to the actuator to open the valve plug or take other steps to hold the valve plug open.
2. Clean the valve body, the retainer threads, the retainer gasket surface and the seat ring sealing surface.
3. Using either face seals (key 8) in good condition or new face seals, place one seal in the seat ring cavity.

Table 7. Assembly Clearance

VALVE SIZE	SEAT RING AND RETAINER CLEARANCE			
	mm		in.	
NPS	Min.	Max.	Min.	Max.
2	0.05	0.17	0.002	0.007
3 to 12	0.08	0.30	0.003	0.012

NOTE

The seat ring (key 4) may have one or two shutoff surfaces. The shutoff surfaces are the narrow, rounded edges of the seat ring bore. Inspect the seat ring and locate the shutoff surfaces before proceeding. Insert the gasket (key 134) and body insert (key 135) into valve body prior to face seal installation.

4. Insert the seat ring into the seat ring cavity with the correct shutoff surface facing the valve plug and shaft. The seat ring will cover the face seal installed in step 3.
5. Place the second face seal on the seat ring.
6. Apply anti-seize lubricant to the gasket surface in the valve body. Install the gasket (key 11), while making certain that for NPS 2 through 12 sizes the concave surface of the gasket is up (hump surface of gasket down).
7. Apply anti-seize lubricant to the threads and bottom of the retainer (key 5). Thread the retainer into the valve body.
8. Refer to Figure 7. With the appropriate torque indicating tool, tighten the retainer to the torque listed in Table 6.
9. A gap between the seat ring (key 4) and retainer (key 5) allows the seat ring to self-center. Applying the proper amount of torque during installation should position the retainer and seat ring properly. However, for NPS 2 through 12 valves, use a feeler gauge to measure between the parts as shown in Figure 14, making certain the necessary clearance exists.

Compare the measured gap to the clearance in Table 7 and proceed as follows:

- If the measured clearance is within table values, proceed to the next step.
- If the measured gap is larger than the maximum, tighten the retainer—apply more torque than that listed in Table 6, if necessary—until the clearance is within maximum and minimum values.
- If the measured clearance is smaller than the minimum, remove the retainer, seat ring and face seals, clean the parts and reassemble so as to obtain the necessary clearance.

10. Perform the Adjusting Actuator Travel procedure and then install the control valve in the pipeline.

3.3 Replacing Valve Plug, Shaft and Bearings

Perform this procedure to replace the valve plug (key 2), expansion pin assembly (keys 9 and 10), shaft (key 3) or bearings (keys 6 and 42). For NPS 12, follower shaft (key 3) and groove pins (key 39) are also the parts need to be replaced. These parts are independently replaceable; for example, installing a new valve plug does not require replacing a reusable valve shaft or expansion pin assembly. Key numbers refer to Figures 11, 13 and 14 unless otherwise indicated.

Disassembly of Valve Plug, Shaft and Bearings

WARNING

To avoid personal injury resulting from contact with edges of the valve plug (key 2) and seat ring (key 4) during plug rotation, stay clear of the plug edges when rotating the plug. To avoid damage to tools, valve parts or other items resulting from valve plug rotation, keep tools and other property away from the edges of the plug.

NOTICE

To avoid increased leakage, increased valve component wear or possible damage to the valve body (key 1), plug (key 2), shafts (keys 3 and 38) and bearings (keys 6 and 42) resulting from a sharp blow to the actuator body or valve parts, use a wheel puller to separate the actuator parts from the valve shaft.

Do not drive the actuator parts off the valve shaft since this could move the valve bearings, shaft and plug away from proper alignment, causing improper seating of the plug. Such misalignment may result in damage to valve components if the valve is returned to service without disassembly and inspection of the valve plug alignment.

NOTE

Following removal of the valve from the pipeline and partial disassembly, the valve shaft may be used to remove bearings in accordance with the procedure described in step 8.

NOTE

For globe face-to-face NPS 2, 3 and 4, disassembly of retainer, seat ring and insert prior to plug, shaft and bearings disassembly, to make sure plug and bearings can be placed out from retainer side of valve body.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body and drain the process media from both sides of the valve. If using a power actuator, also shut off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Remove the actuator cover. Note the actuator orientation with respect to the valve body and the lever orientation with respect to the valve drive shaft (see Figure 2). Remove the lever but do not loosen the actuator turnbuckle adjustment. Remove the actuator mounting screws and nuts and remove the actuator. If necessary, refer to the actuator instruction manual for assistance.
3. With the valve body (key 1) out of the pipeline, loosen the packing nuts (key 16). If the packing is to be reused, do not remove it. However, Emerson recommends that the packing be replaced whenever the drive shaft is removed.
4. Rotate the plug (key 2) to the fully open position.

Figure 8. Detail of Valve Plug for Pin Removal

A3307-1

Table 8. Data for Tapped Hole in Valve Shaft

VALVE SIZE, NPS	SHAFT DIAMETERS				THREAD SIZE, UNC
	Through Valve Body	At Spline End	Through Valve Body	At Spline End	
	mm	mm	in.		
1	12.7	12.7	0.50	0.50	10-24
1-1/2	15.9	15.9	0.62	0.62	1/4-20
2	15.9	12.7	0.62	0.62	10-24
3	25.4	15.9	1.00	1.00	3/8-16
	25.4	25.4	1.00	0.75	5/16-18
4	31.8	19.1	1.25	1.25	3/8-16
6	38.1	38.1	1.50	1.50	1/2-13
	38.1	31.8	1.50	1.25	3/8-16
8	38.1	38.1	1.50	1.50	1/2-13
10	44.5	44.5	1.75	1.75	1/2-13
12	53.8	53.8	2.12	2.12	3/4-10
	53.8	50.8	3.12	2	

5. For NPS 1 through 10, refer to Figure 8. Find the expansion pin (key 9) and the taper pin (key 10) inside of it. These parts are holding the valve plug in position on the shaft. Find the larger hole in the valve plug hub where these pins enter the hub. On the opposite side of the plug hub is a smaller hole where the chamfered end of the expansion pin rests on the inner lip of the hole. Using a pin punch and hammer, strike the chamfered end of the expansion pin through the smaller hole. Remove both pins from the valve plug hub in the direction shown in Figure 8.

Driving the pins in the other direction will tighten the pins.

For NPS 12, drive out two groove pins (key 39) that secure the plug (key 2) to the drive shaft (key 3) and follower shaft (key 38). Remove both pins from the valve plug hub in the direction shown in Figure 8. Driving the pins in the other direction will tighten the pins. Remove the hex nuts (key 44) and then remove the bottom flange (key 40). Thread a bolt into the end of the follower shaft and pull the follower shaft out of the valve. Refer to Table 9 for thread sizes. The bearing (key 6) may come out with the follower shaft.

WARNING

To avoid personal injury or damage to tools, valve parts or other items and plug damage resulting from the valve plug falling from the valve body, support the plug to prevent it from falling as the shaft (key 3) is being removed.

6. Pull the drive shaft (key 3) from the valve body. If the shaft cannot be removed by hand, attach a slide hammer or similar tool to the spline end of the valve shaft. If the shaft has a tapped hole at the spline end of the shaft; refer to Table 8 for thread sizes.
7. Remove the plug and thrust washer (key 12) from the valve body.

NOTE

For NPS 1 through 8, two shaft bearings (key 6) are located inside the valve body on either side of the valve plug. Only one of these two bearings is identified by key 6. The other bearing is located along the valve shaft on the other side of the valve plug. For NPS 10 and 12, there are two shaft bearings. One is identified as key 6 and the other is identified as key 42.

8. If the shaft bearings are to be replaced, remove the packing (key 13).
9. If the bearing closest to the packing (key 6 on NPS 1 through 8 and key 42 on NPS 10 and 12) requires replacement and cannot be removed by hand, press it out using a ram with dimensions given in Figure 9 and Table 9.

NOTICE

Ensure the bearing stop is not moved when pressing out the bearing. Movement may cause the new bearing and valve plug to not be centered with the seal, causing possible leakage or damage of the seal/plug.

Insert the ram through the packing box and press the bearing into the valve body cavity. The bearing stop (key 7) does not need to be removed; take care not to move the bearing stop when pressing out the bearing.

10. For NPS 1 through 8, if the second bearing (key 6) requires replacement and cannot be removed by hand, use one of the following methods:
 - Knock or pry the bearing out or
 - Use the valve shaft as a piston to drive the bearing from the valve body. To accomplish this, first, fill the bearing bore with a heavy grease and then insert the end of the shaft back through the valve body and into the grease-filled bearing. Protect the splined end of the shaft with, for example, a block of wood; then strike the protected end. When the shaft is struck, it will act as a piston, pushing the grease into the bearing bore. The grease will then force the bearing out of the bore and farther along the shaft. Soon, the bearing will be positioned for easy removal.

For NPS 10 and 12, if the bearing (key 6) on the follower shaft requires replacement and cannot be removed by hand, press it out using a ram with dimensions as given in Figure 9 and Table 9. Press the bearing into the valve body cavity.

11. If used, remove the O-rings (keys 19 and 20) from the bearings. Also, for NPS 1 through 8, remove the pipe plug (key 29).

Table 9. Ram Dimensions

VALVE SIZE, NPS	A MAXIMUM MINIMUM		L	
	mm	in.	mm	in.
1	15.1 14.7	.594 .578	114	4.50
1-1/2	18.3 17.9	.719 .703	114	4.50
2	18.3 17.9	.719 .703	127	5.00

8	42.1 41.7	1.656 1.641	229	9.00
10	48.4 48.0	1.905 1.890	229	9.00
12	57.8 57.4	2.275 2.260	260	10.25

Figure 9. Ram Dimension for Bearing Removal (Also See Table 9)

A3308

Assembly of Valve Plug, Shaft and Bearings

NOTE

Before starting to assemble the valve components, place the valve body (key 1) on a flat surface with the retainer (key 5) facing down as shown in Figure 10. This orientation of the valve body allows easier installation of the valve plug.

For globe face-to-face NPS 2, 3 and 4, assembly of plug, shaft and bearings, prior to retainer, seat ring and insert assembly to make sure plug and bearings can be placed into valve body from retainer side of body.

1. Thoroughly clean the parts before assembly.
2. If O-rings (keys 19 and 20) are used, apply a small amount of lubricant to the O-rings so the bearings will easily slide into the valve body. Insert the smaller O-ring (key 20) inside the bearing and the larger O-ring (key 19) around the outside of the bearing.

NOTICE

To avoid damage to O-rings resulting from contact with sharp edges within the bearing holes, use appropriate care when installing the O-rings.

3. Slide the bearings (key 6) and O-rings (keys 19 and 20), if used, into the valve body as shown in Figures 11, 13 and 14.

NOTE

Place the valve body on a flat surface with the retainer (key 5) facing down so that you can look into the valve body cavity. This orientation makes installing the valve plug easier. The retainer should be facing up for globe face-to-face NPS 2, 3 and 4.

4. Inspect the valve shaft (key 3). Insert the shaft end with the pin hole into the packing box and through the bearings that was previously installed in the packing box in step 3. Stop before the shaft enters the main valve body cavity. Support the end of the shaft that extends out from the valve body.
5. Determine the correct orientation of the valve plug (key 2) required by the specific installation orientation of the valve and the flow direction of the process fluid. See Figure 2.
6. For NPS 1 through 10, inspect the valve plug. Note the location of the larger hole on the valve plug hub. Place the valve plug in the valve body cavity.

For NPS 12, place the plug in the valve body cavity. Slide the follower shaft, splined end first, through the bearing (key 6) that was previously installed in step 3 and into the hub of the plug. Align the groove pin hole in the follower shaft with the hole on the plug hub.

7. For NPS 1 through 10, position the valve plug so the larger hole is facing up, away from the seat ring and retainer (near from the seat ring and retainer for globe face-to-face NPS 2, 3 and 4). The valve plug must also be oriented so the seating surface of the plug is correctly positioned for the specific application as shown by the illustrations in Figure 2.

For NPS 12, determine the correct orientation of the plug (key 2) required by the specific installation orientation of the valve and the flow direction of the process fluid. See Figure 2. The groove pin holes in both the drive shaft (key 3) and the hub of valve plug are offset from center. Make certain the holes will align.

Figure 10. Detail of Valve Plug for Pin Insertion

NOTE

Before proceeding, inspect the valve plug position once again to ensure the correct orientation as described in step 6. If the valve plug is not properly installed, it will not rotate properly and will not shutoff in service.

8. Hold the thrust washer(s) (key 12) between the valve plug (key 2) and the bearing installed next to the packing as shown in Figures 11, 13 and 14.
For NPS 1 through 10, slide the valve shaft (key 3) from the packing box into the valve body through the thrust washer(s) and plug. If the shaft material is S17400, use two 0.7938 mm / 1/32 in. 17-7 PH thrust washers. If the shaft material is S20910, use one 1.587 mm / 1/16 in. alloy 6 thrust washer.

For NPS 12, align the zero mark located on the end of the drive shaft with the zero mark located on the plug hub. Slide the valve drive shaft (key 3) from the packing box housing into the valve body through the thrust washer and into the hub of the plug.
9. Secure the valve plug in the correct open position. Inspect the splined end of the valve shaft and locate the slash mark on the splined end. Rotate the valve shaft until the slash mark is vertical and facing out from the center of the shaft in the same direction as the valve plug seating surface. See Figure 10.

NOTE

When the valve shaft is correctly positioned, the slash mark on the splined end will be parallel with the plug shutoff surface. See Figure 10. If the plug is not properly aligned with the slash mark, the valve will not function correctly.

10. Secure the plug to the shaft (key 3) as follows:

For NPS 1 through 10:

- a. Look into the valve body and find the larger pin hole on one side of the valve plug hub. Find the smaller hole on the opposite side of the hub. These holes should line up with the hole through the shaft (key 3). For NPS 10, refer to Figure 10 for the pins insertion orientation.

NOTE

If the holes in the valve plug hub do not line up with the hole in the shaft, check the slash mark on the splined end of the shaft. Make sure the shaft and plug are properly oriented.

NOTICE

For NPS 1 through 2, use only N10276 expansion and taper pins (keys 9 and 10) with VTC (ceramic) valve plug. With any other pin material, there is danger of the pins expanding and cracking the plug as temperature rises. For that reason, the NPS 1 through 2 VTC valve plugs are sold only as a set that includes N10276 pins. Use only the pins that are furnished with the set.

Components of the VTC valve plug assembly for the NPS 3 through 8 cannot be repaired in the field.

- b. Place the chamfered end of the expansion pin (key 9) into the larger hole in the plug hub (see Figure 11).

NOTICE

To avoid damage to the expansion pin, valve plug or shaft resulting from the application of excessive force on the expansion pin, use appropriate care when driving the expansion pin through the plug hub and shaft. Use the right tool. Do not use excessive force.

- c. For NPS 1 through 8, drive the expansion pin into the larger hole until the chamfered end of the pin reaches the inner lip of the smaller hole on the opposite side of the plug. Closely observe the progress of the pin to avoid striking it after it has reached the lip of the smaller hole. For NPS 10, drive the expansion pin into the pin hole until the expansion pin flange touch the plug hub.
- d. Place the taper pin (key 10) into the open end of the expansion pin. Drive the taper pin into the expansion pin until the pins, plug and shaft are snug. Do not attempt to drive either pin flush with the hub.

For NPS 12, to secure the plug to the follower shaft, align the groove pin hole in the plug hub and the hole on the opposite side of the plug with the groove pin hole through the follower shaft (key 38). Use pin punches to drive in the groove pin until it is flush with the surface of plug hub. Stake both ends of the pin hole in the plug hub to retain the pin during this step. Then to secure the plug to the drive shaft, it should be noticed that the groove pin holes in both the drive shaft (key 3) and the hub of the plug are offset from center and have spline ridges. Make certain in the holes in the plug hub will align with the hole in the drive shaft. Secure the plug to the drive shaft by using pin punches and driving in the groove pin until it is flush with the surface of the plug hub. Make certain that the groove pin goes completely through the drive shaft and into the opposite side of the plug hub.

11. Rotate the plug by hand to check that it rotates properly. If rotation interferes with the valve body, drive out the pins (keys 9 and 10) for NPS 1 through 10 and the groove pin (key 39) for NPS 12. Remove the valve shaft (keys 3 and 38) and repeat this procedure starting with step 4.
12. For NPS 1 through 8, if used, install the pipe plug (key 29). For NPS 10 and 12, install the gasket (key 41), bottom flange (key 40) and then install and tighten the hex nuts (key 44) (reference table below). Make sure the pipe plug (key 29) is installed in the bottom flange. For NPS 10 and 12, lubricate the bottom flange studs (key 43) and hex nuts (key 43) with appropriate anti-seize lubricant. Install the bottom flange studs (key 43), gasket (key 41), bottom flange (key 40) and then install and tighten the hex nuts (key 44) using accepted bolting procedures. See Table 10 for torque values. Make sure the pipe plug (key 29) is installed in the bottom flange if applicable.

Table 10. Bottom Flange Bolting Torque

VALVE SIZE, NPS	TORQUE	
	N-m	Lbf-ft
10	141	104
12	176	130

13. If the seat ring (key 4), face seals (key 8) and retainer (key 5) need to be installed, complete the assembly instructions in the procedure for Replacing Retainer, Seat Ring and Face Seals. If the seat ring has previously been installed, proceed to Adjusting Actuator Travel.

3.4 Adjusting Actuator Travel

Perform this procedure whenever the actuator is removed or disconnected from the valve and whenever the seat ring and retainer (keys 4 and 5) are removed. Actuator travel that is too short will increase shutoff leakage; too much travel will cause excessive plug and seat ring torque.

Any of the Fisher pneumatic (spring-and- diaphragm, piston or spring-return piston), electric, electrohydraulic or manual actuators—or any other operator—must be adjusted for use with a V500 valve so that the valve plug is rotated to the fully closed position. The fully closed position is obtained when a gap of 0.001 in. exists between the seat ring (key 5) and retainer (key 4).

Note that this gap is also measured when assembling the seat ring, retainer and face seals to ensure correct assembly. Measure the gap according to this procedure to ensure proper actuator adjustment. Merely completing the assembly measurement is not sufficient.

Travel for different actuators is adjusted differently (some use turnbuckle assemblies; some use externally adjusted travel stops; others use internal limit switches). Refer to the actuator instruction manual for adjustment instructions.

1. Mount the actuator following the instructions in the actuator instruction manual. Refer to Figure 3 to select actuator mounting style and position and to orient the actuator lever with the valve shaft (key 3).
2. For actuators with clamped levers,

NOTICE

When installing the actuator onto the valve, do not use a hammer or similar tool to drive the lever or actuator onto the valve shaft. Driving the lever or actuator onto the valve shaft could damage the valve plug, seal ring and other valve components.

- Clean the valve shaft splines and actuator lever splines to be sure the actuator lever will slide on easily.
 - Pull the valve shaft (key 3), by hand, toward the packing (key 13). Or,
 - If the lever does not slide easily on the valve shaft, carefully wedge the valve plug solidly against the actuator-side thrust washer using a screwdriver or similar tool in the same direction as the pry bar shown in Figure 6.
3. Clamp the lever to the valve shaft.

NOTICE

Do not apply full actuator signal (pressure or power) to the actuator in the next step. Full signal may wedge the valve plug into the seat ring. Use a regulated signal source and gradually increase the signal to slowly stroke the actuator.

4. Adjust actuator travel and stroke the actuator so that the plug is close to but not contacting the seat ring at full actuator travel. If available on electric actuators, use a manual handwheel to position the plug.
5. Adjust travel, using full actuator signal, until the valve plug contacts the seat ring around its full circumference. This contact self-centers the seat ring on the valve plug.
6. Continue to adjust travel until a gap of 0.001 in. exists between the seat ring and retainer, as shown in Figure 14, at full actuator travel.
7. Refer to the actuator instruction manual to lock the actuator travel adjustment.

3.5 Changing Valve Flow Direction

The V500 valve may be installed in either forward or reverse flow service. Forward flow enters the seat ring first, then flows past the valve plug. If changing flow direction is necessary, release all pressure from the valve and actuator. Remove the control valve assembly from the pipeline and rotate the assembly about the valve shaft to put the retainer end of the valve where the other end was. Refer to the procedure for Changing Actuator Mounting Style if the actuator must be repositioned and refer to the Installation section to install the control valve assembly. Be sure to reposition the flow direction arrow on the valve body.

3.6 Changing Actuator Mounting Style

Refer to Figure 3 of this manual and the actuator instruction manual when changing mounting styles or positions. Right-hand mounting places the actuator on the right side of the valve as viewed from the upstream side of the valve; left-hand mounting places the actuator on the left side of the valve. Remember that the upstream side of the valve inlet is the retainer end of the valve body for forward flow and the other end of the valve body is the upstream side for reverse flow.

Complete the Adjusting Actuator Travel procedure whenever the actuator is removed.

Section 4: Parts

4.1 Parts Ordering

A serial number is assigned to each valve and stamped on the nameplate. Always refer to the valve serial number when corresponding with your [Emerson sales office](#). When ordering replacement parts, also specify the part name and desired material.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

4.2 Parts Kits

Repair Kits

Repair kits include recommended spares for standard and sealed bearing constructions.

Table 11. Repair Kits

PARTS INCLUDED IN KITS		QUANTITY IN KIT
Key Number	Description	
9	Expansion pin	1
10	Taper pin	1
11	Retainer gasket	1
19	O-ring (sealed bearing only)	2
20	O-ring (sealed bearing only)	2

Valve Size, NPS	Kit Parts Number
1	RV500X00012
1-1/2	RV500X00022
2	RV500X00032
3	RV500X00042
4	RV500X00052
6	RV500X00062
8	RV500X00072

Repair Kits for ENVIRO-SEAL Packing

Packing boxes in these valves may be deep-drilled. If the valve being repaired has a deep packing box, additional parts are required. Refer to the Packing Maintenance section in this manual.

Table 12. Repair Kits for ENVIRO-SEAL Packing

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual provides installation, operation, maintenance and parts ordering information for NPS 14, 16, 20, 24x20 and 24 V150 and NPS 14, 16, 20 and 24 V300 rotary control valves. For smaller valves (NPS 1 through 12), refer to the Vee-Ball V150, V200 and V300 Rotary Control Valves NPS 1 through 12 instruction manual (D101554X012). For information on ENVIRO-SEAL™ packing, see the ENVIRO-SEAL Packing System for Rotary Valves instruction manual (D101643X012). Refer to separate manuals concerning the actuator, positioner and mounted accessories.

WARNING

Do not install, operate or maintain V150 and V300 valves without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

1. NPS 24x20 available only for V150, not for V300 valves. 2. Flangeless NPS 24.							

Table 3. Valve Sizes, End Connection Styles and Ratings⁽¹⁾⁽²⁾

VALVE BODY MATERIAL	FLANGE COMPATIBILITY	RATING	FACE-TO-FACE DIMENSION, mm / in.
WCC or CG8M	CL150 (V150) raised-face	ASME B16.34 CL150	NPS 14 and 16 Valves: ASME B16.10 Short NPS 20 Valves: 508 / 20 NPS 24 and 24x20 Valves: 610 / 24 NPS 24 Flangeless Valves: 508 / 20 NPS 24 Valves: 610 / 24
	CL300 (V300) raised-face	ASME B16.34 CL300	NPS 14 Valves: 38 / 15 NPS 16 Valves: 406 / 16 NPS 20 Valves: 508 / 20 NPS 24 Flangeless Valves: 508 / 20 NPS 24 Valves: 610 / 24
1. Do not exceed the material temperature capabilities or the pressure drop limitations shown in bulletin 51.3: Vee-Ball (D101363X012). 2. The pressure/temperature limits in this manual and any application code limitations, should not be exceeded.			

1.2 Description

The V150 or V300 Vee-Ball valve with a V-notch ball is used in throttling or on-off service. The V150 valve (Figure 1) is a raised-face flanged construction available in CL150. The V300 valve is a raised-face flanged construction available in CL300. The splined valve shaft connects to a variety of rotary actuators.

1.3 Specifications

Specifications for these valves are shown in Table 1 and bulletin 51.3: Vee-Ball Fisher Vee-Ball V150, V200 and V300 Rotary Control Valves ([D101363X012](#)).

Emerson Education Services
Phone: 800-338-8158
Email: education@emerson.com
emerson.com/mytraining

Section 2: Installation

Key numbers are shown in Figure 10, unless otherwise indicated.

WARNING

- Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.
- Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed either the valve body rating or the mating pipe flange joint rating. To avoid such injury or damage, provide a relief valve for overpressure protection as required by government or accepted industry codes and good engineering practices.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Because some valve body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

Install the valve with the drive shaft in the horizontal position as shown in Figure 1.

NOTICE

To maximize seal life, the valve should be installed so the drive shaft will be in the horizontal orientation while in service. Please contact your Emerson sales office for evaluating vertical drive shaft installations.

1. If the valve is to be stored before installation, protect the flange mating surfaces and keep the valve cavity dry and free of foreign material.
2. Install a three-valve bypass around the control valve assembly if continuous operation will be necessary during inspection and maintenance of the valve.
3. Mounting the Actuator:
 - a. The valve is normally shipped as part of a control valve assembly, with the actuator mounted on the valve. The factory makes actuator/valve adjustments before the valve is shipped.
 - b. If the valve and actuator have been purchased separately or if the actuator has been removed, mount the actuator according to the Actuator Mounting section of this manual.
4. Be certain the valve and adjacent pipelines are free of any foreign material that could damage the valve seating surfaces.
5. Be sure the mating line flanges are aligned. Provide standard flat sheet flange gaskets (or spiral wound gaskets with compression-controlling centering rings) that are compatible with the process fluid.

Refer to Figure 2 for required clearance for valve installation and stud length. Lubricate the studs with anti-seize lubricant.

6. Install the valve using studs and nuts to connect the valve flanges to the pipeline flanges. The seal protector ring (key 3) end of the valve requires longer line flange studs than standard (see Figure 2).

Table 4. Required Clearances for Installation of Fisher V150 and V300 Valves

VALVE SIZE, NPS	DIMENSION						
	A ⁽⁵⁾		B ⁽⁵⁾	M ⁽²⁾ (Min.)		N ⁽⁶⁾

24 ⁽⁷⁾	20.00	20.00	12.75	27.00	29.25	---	---

1. ASME B16.10 (Short) applies to NPS 14 and 16 valves only.

2. Inlet flange stud bolt length is longer than the standard length as specified in ASME B16.5.

3. NPS 20, CL150 valves do not comply with ASME B16.10 (Short).

4. Valve body mates with NPS 24 ASME CL150 flanges. Internal based on NPS 20 valve design.

5. If the Cavitrol Hex anti-cavitation trim is installed, the A and B dimension will be 12.7 mm / 1/2-in. longer than the dimension specified.

6. For V150 and V300 valve assemblies with the Cavitrol Hex anti-cavitation trim installed, dimension M bolt length is required for both the inlet and outlet flange ends.

7. For NPS 24 V150 and V300 flangeless option only.

Figure 2. Required Clearances for Installation of Fisher V150 and V300 Valves

13B6967-B
A6064-1

Do not attempt to use standard-length line flange studs for the seal protector end of the valve. Refer to Figure 2 for length of flange studs required.

Install all remaining studs. Tighten the nuts in a criss-cross sequence to ensure the flange gaskets are properly loaded.

⚠ WARNING

The valve drive shaft is not necessarily grounded to the pipeline when installed. Personal injury or property damage could result if the process fluid or the atmosphere around the valve is flammable, from an explosion caused by a discharge of static electricity from the valve components. If the valve is installed in a hazardous area, electrically bond the drive shaft to the valve.

Standard PTFE packing is composed of a partially conductive carbon-filled PTFE female adaptor with PTFE V-ring packing. Standard graphite packing is composed of all conductive graphite ribbon packing rings. Alternate shaft-to-valve body bonding is available for hazardous service areas where the standard packing is not sufficient to bond the shaft to the valve (see the following step and Figure 4).

7. For hazardous applications, attach the optional bonding strap assembly (key 131, Figure 4) to the valve drive shaft (key 6) with the clamp (key 130, Figure 4) and connect the other end of the bonding strap assembly to the valve body with the cap screw (key 23).
8. Connect pressure lines to the actuator as indicated in the actuator instruction manual. When an auxiliary manual actuator is used with a power actuator, install a bypass valve on the power actuator (if one is not supplied) for use during manual operation.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might need some re-adjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If the valve has ENVIRO-SEAL live-loaded packing installed, this initial re-adjustment will probably not be required. Refer to the ENVIRO-SEAL Packing System for Rotary Valves instruction manual (D101643X012) for packing instructions.

Section 3: Maintenance

Valve parts are subject to normal wear and must be inspected and/or replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

⚠ WARNING

The Vee-ball closes with a cutting motion. To avoid personal injury, keep hands, tools and other objects away from the ball while stroking the valve.

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Make sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.
- The valve packing area may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

3.1 Packing Maintenance

Key numbers are shown in Figure 10, unless otherwise indicated. A detailed view of the packing is also shown in Figure 3.

If the valve is equipped with the ENVIRO-SEAL Packing System, refer to the ENVIRO-SEAL Packing System for Rotary Valves instruction manual ([D101643X012](#)).

NOTE

For the ENVIRO-SEAL Packing System, refer to the Parts List section for individual parts (see Figure 3). Refer to the ENVIRO-SEAL Packing System for Rotary Valves instruction manual ([D101643X012](#)) for maintenance instructions.

Stopping Leakage

For PTFE V-ring packing, leakage around the packing follower and packing flange (keys 17 and 40) can be stopped by tightening the packing follower nuts (key 20).

If the packing is relatively new and tight on the drive shaft (key 6) and if tightening the packing follower nuts does not stop leakage, it is possible that the drive shaft is worn or nicked so that a seal cannot be made. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks, scratches or corrosion on the packing box wall.

If the leakage cannot be stopped by the above steps, the packing must be removed and replaced. Inspect the drive shaft and packing box before installing new packing parts.

Packing Replacement

When replacing the packing, the actuator should not be removed from the valve while the valve is still in the pipeline or between flanges. Valve/actuator adjustments must be made with the valve out of the pipeline.

Disassembly

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve and drain the process media from both sides of the valve. If using a power actuator, shut off all pressure lines to the power actuator, release pressure from the actuator and disconnect the pressure lines from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Remove line bolting, remove the control valve from the pipeline and place the actuator/valve assembly on a protected flat surface with the seal protector ring facing up.
3. Remove the actuator cover. Note the orientation of the actuator with respect to the valve body and the lever orientation with respect to the valve drive shaft (see Figure 8).

WARNING

When the actuator is removed from the valve, the ball/shaft assembly may suddenly rotate, resulting in personal injury. To avoid injury, carefully rotate the ball to the stable position after the actuator is removed.

Figure 3. Packing Arrangements

A6063

STANDARD PACKING ASSEMBLY

NOTE:

1. INCLUDES ZINC WASHERS (KEY 36) FOR GRAPHITE RIBBON PACKING ONLY.

ENVIRO-SEAL PTFE PACKING SYSTEM

42B8445-B
B2412

ENVIRO-SEAL GRAPHITE PACKING SYSTEM

NOTICE

When removing the actuator from the valve, do not use a hammer or similar tool to drive the lever or actuator off the valve shaft. Driving the lever or actuator off the valve shaft could damage the ball, seal and valve.

If necessary, use a wheel puller to remove the lever or actuator from the valve shaft. It is okay to tap the wheel puller screw lightly to loosen the lever or actuator, but hitting the screw with excessive force could damage the ball, seal and valve.

NOTE

Some actuator designs have a bolt inserted in the lever to spread the clamp on the valve spline shaft. Tightening the bolt expands the splined lever connection allowing the valve shaft to be removed.

4. When removing the lever (do not loosen the actuator turnbuckle adjustment), remove the actuator mounting screws and nuts (keys 23 and 24) and remove the actuator. (If necessary, refer to the actuator instruction manual for assistance.)
5. If necessary, remove the bonding strap assembly before attempting to remove the packing (see Figure 4).
6. Remove the packing flange and nuts and packing follower (keys 20, 40 and 17).
If the valve is equipped with the ENVIRO-SEAL packing system, refer to the ENVIRO-SEAL Packing System for Rotary Valves instruction manual (D101643X012) for disassembly.
7. Remove the packing parts (key 16 packing set includes additional key numbers) by making a formed wire hook with a sharp end. Pierce the rings with the sharp end of the hook in order to remove them. Do not scratch the drive shaft or packing box wall; scratching these surfaces could cause leakage. Clean all accessible metal parts and surfaces to remove particles that would prevent the packing from sealing. (Note: Metal packing parts are not provided in the packing set).

Assembly

If the valve is equipped with the ENVIRO-SEAL packing system, refer to the ENVIRO-SEAL Packing System Rotary Valves instruction manual (D101643X012) for assembly.

1. Install the new packing parts using the parts sequence shown in Figure 3.
2. Insert the packing follower and packing flange (keys 17 and 40) and secure them with the packing follower nuts (key 20). Tighten the nuts far enough to stop leakage during operating conditions.

NOTE

If the valve is equipped with a bonding strap assembly (Figure 4), re-install the assembly.

3. Reconnect the actuator and lever in accordance with the orientations that were noted in step 3 of the disassembly procedures. If necessary, use Figure 8 to identify the correct index marks.
4. If necessary, refer to the appropriate actuator instruction manual to complete actuator assembly and adjustment.
5. When the control valve is in operation, check the packing follower for leakage and retighten the packing follower nuts (key 20) as necessary.

3.2 Ball Seal Replacement

Perform this procedure if the control valve is not shutting off properly or if seal inspection is necessary. Remove the actuator/valve assembly from the pipeline.

The actuator may remain mounted on the valve during the ball seal inspection and replacement procedures. Ball seal assembly details (with key numbers) are also shown in Figure 5. Upon inspection, if it is found that the ball, drive shaft or bearings need to be replaced, use this procedure to remove the ball seal. Then, proceed to the Bearing and Ball Maintenance procedures to replace the ball, bearings or shafts. Then return to this procedure and begin with the assembly steps in the Ball Seal Replacement section.

During disassembly and re-assembly procedures, handle the seal protector ring, seal and other parts (keys 3, 11, 13 and 37) carefully to prevent damage. A new gasket (key 15) is required whenever the seal protector ring (key 3) is removed.

NOTICE

Due to the Vee-ball shape, take care to never rotate either the front skirted edge of the ball or the circular back edge of the ball through the ball seal at any time. The seal could be damaged.

The flow ring construction does not use a seal (key 11), radial seal (key 37) or wave spring (key 13). Use this procedure to remove the seal protector ring for flow ring constructions, but disregard any instructions calling for the seal and other seal parts.

Disassembly

WARNING

If the actuator is removed from the valve, the ball/shaft assembly may suddenly rotate, resulting in personal injury. To avoid injury, carefully rotate the ball to the stable position after the actuator is removed. If necessary, lock the ball in a specific position when directed by the following steps.

Key numbers are shown in Figure 10, unless otherwise indicated.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve and drain the process media from both sides of the valve. If using a power actuator, also shut off all pressure lines to the power actuator and release all pressure from the actuator.
2. Remove line bolting, remove the control valve/actuator assembly from the pipeline and place the valve on a protected flat surface with the seal protector ring facing up. Carefully rotate the ball to the open position.

NOTE

Lifting bolt holes are provided in the seal retainer or flow ring to assist in its removal from the valve body.

3. Remove the retainer screws (key 21). Carefully remove the seal protector ring and gasket (keys 3 and 15). (For flow ring constructions, go to step 4.)
 - a. For valves with composition seal, remove the seal (key 11) from the valve body (key 1).
 - b. For valves with HD metal seal, once the protector ring has been removed from the valve, push the metal seal (key 11) out of the seal protector ring (key 3). Remove the radial seal (key 37). Inspect, clean or obtain replacement parts as necessary.

It might be necessary to remove the HD metal seal by carefully tapping it with a soft punch and hammer. Take care not to damage the seal protector ring surfaces.
4. Inspect, clean or obtain replacement parts as necessary. Inspect the gasket and sealing surfaces on the valve body (key 1), ball (key 2), ball seal (key 11) and seal protector ring (key 3) for damage.
5. If a replacement ball, drive and follower shafts or bearings (keys 2, 6, 9 and 10) are needed, proceed to the Bearing and Ball Maintenance procedure for disassembly and assembly procedures. If only the seal is to be replaced, proceed to the assembly procedure below.

Assembly

Refer to Figure 5 for part and key number locations during seal installation.

1. Thoroughly clean all parts that are to be re-used or obtain replacement parts. Be sure that all sealing surfaces are in good condition without scratches or wear. If the valve has been installed between line flanges and the flange studs and nuts have been tightened, always replace the gasket (key 15).

If you have not already done so, lift the valve and place it with the outlet flange face flat on the protected working surface. Use the lever from the actuator or provide some other safe method to rotate the ball into the closed position. The inlet flange face should be up and the ball approximately centered within the opening.
2. Make sure the ball cannot rotate during seal assembly procedures (read the Warning on page 11).
3. For valves with composition ball seals:
 - Install the composition seal (key 11) into the valve body.
 - Install the gasket (key 15) on the valve body.
 - Install the seal protector ring (key 3) into the valve body. (Go to step 6 below.)
4. For valves with HD metal seals:
 - Lubricate with Mag Lub or an equivalent lubricant and install the radial seal (key 37) into the appropriate groove in the seal protector ring making sure the open side of the radial seal faces away from the ball.
 - Install the wave spring (key 13) on the seal protector ring (key 3).
 - Install the HD metal seal (key 11) into the seal protector ring (key 3), past the radial seal. While pushing it past the radial seal, make sure the HD metal seal is level.
 - To assist with break-in of the HD metal seals, it is recommended that the ball and seal be lubricated. Apply dry film lubricant to the seat of the HD metal seal (key 11) and to the face of the ball.

NOTE

During break-in, if the Vee-Ball rotation is not smooth, it may be necessary to tighten the packing slightly to dampen any tendency for stick-slip motion of the ball and seal assembly.

5. Install the HD metal ball seal/seal protector ring assembly into the valve body (key 1). Go to step 6 below.
6. Install the retaining screws (key 21) that secure the seal protector ring (key 3) to the valve body (key 1). Tighten the screws (key 21).
7. If necessary, refer to the Packing Maintenance procedures to install the packing. Install the actuator using the Actuator Mounting procedures or to the appropriate actuator instruction manual.

3.3 Bearing and Ball Maintenance

Procedures for disassembly and assembly of the bearings and ball cannot be accomplished until the ball seal and valve packing are loosened.

- Refer to the Packing Maintenance procedures to remove the actuator.
- Refer to the Ball Seal Replacement procedures to remove the seal from the valve.
- Install an “eye” bolt into the threaded hole within the ball cavity (see Figure 10).
(Note: The eye bolt provides a method for lifting and controlling the rotation of the ball during the following procedures. (Read the following Warning.)
- When ball seal disassembly steps are complete, return to this section.

If you have not already done so, place the valve on a flat protected working surface with the seal side down, prior to removing and installing the ball and bearings. Key numbers in this procedure are shown in Figure 10, unless otherwise indicated.

Figure 4. Optional Shaft-to-Body Bonding Strap Assembly

A3143-2/IL

Figure 5. Ball Seal Assembly Detail**Figure 6. Flow Ring Construction**

E0849

Disassembly

WARNING

When the actuator is removed from the valve, the ball may suddenly rotate, resulting in personal injury. To avoid injury, carefully rotate the ball to a stable position.

Once the drive and follower shafts have been removed from the valve body, the ball may fall out of or into the valve body. To avoid personal injury or damage to the sealing surfaces of the ball, provide a hoist to support the ball to prevent it from falling as the shafts are being removed.

1. Carefully lift the valve and set it on the edge of the flanges so the ball is in the open position and in the down position. (Note: The weight of the ball should turn it into the open position.) Block the drive end of the valve body to hold the shaft in a horizontal position.
2. Drive the pins (key 7) out of the drive shaft and out of the follower shaft (keys 6 and 9).
Both pins are tack welded to the ball ears. To remove a pin, insert a pin punch into the open hole, opposite the tack welded side and break the tack weld while driving the pin out.
3. Carefully lift the valve and place the valve on the working surface with the seal side down (read the Warning on page 14).
Because of the weight of the ball, it should rotate so the contoured sealing surface of the ball is resting on the surface.
4. Remove the flange nuts (key 47), the bottom flange (key 44) and gasket (key 45) from the valve. Use a hoist to lift valve body slightly.
Make sure the sealing surface of the ball is not damaged while removing the follower shaft (key 9).
5. Push the follower shaft (key 9) into the center of the ball. For valves with metal bearings, remove the thrust washer (key 38).
6. Pull the drive shaft (key 6) out of the actuator side of the valve body. For valves with metal bearings, remove the thrust washer (key 38).
7. Removing the bearings (key 10):
 - a. For PEEK bearings, remove the bearings by hand. If the bearings are tight in the valve body, pull or drive them out with a slight pressure.
 - b. For metal bearings, use a press and ram to remove the drive shaft bearings out of the valve body. Refer to Figure 7 for ram dimensions.
 - To remove the follower shaft bearing from the bottom flange (key 44), use a blind-hole bearing puller similar to CG2545AB, which is made by Snap-on Tools. If you do not have such a tool, you can machine the bearing out of the bottom flange.

NOTE

For proper shutoff performance, the ball and seal require the bearing (key 10) to be positioned correctly. If you removed the bearings (key 10), be sure to locate the new bearings as shown in Figure 7.

8. Thoroughly clean all surfaces of parts that are to be re-used or obtain replacement parts. Upon reassembly, the pins needs to be tack welded to the ball ears. Remove excess weld material, if the parts are to be used during re-assembly.

Assembly

1. Inspect all sealing surfaces to ensure they are in good condition and without scratches or wear. Thoroughly clean all parts and make sure they are free of oil or grease.
2. Installing bearings (key 10):
 - a. For PEEK bearings, install the drop-in bearings by hand. The bearing flanged end should touch the drive shaft bearing support surface (see Figure 10). Also, install the bearing (key 10) into the bottom flange (key 44). The bearing flange should touch the surface of the bottom flange.

For NPS 24 V150 and V300 valve constructions, the PEEK bearings are flangeless and can be dropped in by hand.

- b. For metal bearings (key 10):
 - For the valve body, use a press and ram to install the bearings. Refer to Figure 7 for dimensions and tolerances of the ram and bearings.
 - Press the bearing in until it is flush with the valve body (key 1).

The acceptable tolerance for bearing location is: flush with the valve body to 1.5 mm / 0.06 in. inside the bearing bore. That is, the bearings should not protrude into the flow cavity of the valve.

- Press the bearing into the bottom flange, using the same tolerances shown for bearing installation into the valve body.

WARNING

The ball might be damaged if it is allowed to fall into the valve body. To avoid personal injury or damage to the sealing surfaces, support the ball to prevent it from falling into the valve body cavity.

3. Installing the ball, drive and follower shafts (keys 2, 6 and 9):
 - If you have not already done so, place the valve body (key 1) on a flat protected working surface with the seal side flat on the working surface.
 - In the the next step, make sure the splined ear of the ball is aligned with the packing box side of the valve body.

NOTICE

The ball might be damaged if it is allowed to hit the flange edge or interior of the valve cavity while it is being lowered into the valve body.

- Using the "eye" bolt in the center of the ball cavity, lift the ball above the valve. Carefully, start lowering the ball, splined ear first, down into the valve body through the outlet flange. When the ball ear enters the valve body, it needs to be misaligned with the drive shaft bearing support.

As the ball clears the outlet opening, turn and rotate the ball as necessary to align the splined ball ear with the drive shaft bearing support (see Figure 10).

Allow the ball to come to rest on the contoured sealing surface of the ball on the protected surface.

4. Carefully lift the valve body until the drive shaft (key 6) can be inserted through valve shaft bore and bearing (key 10) and into the drive shaft/splined ear of the the ball.

NOTE

1. See note 1, Figure 10.
 2. For valves with metal bearings and the NPS 24 flangeless PEEK bearings, hold the thrust washer (key 38, Figure 10) in place before inserting the drive shaft.
-

Make sure that the "O" mark on the shaft aligns with the "O" mark on the ball ear, within the ball cavity. Insert the drive shaft (key 6) into the ball. If the "O" marks are aligned correctly, the drive shaft pin (key 7) should slide through the ball ear and drive shaft.

- With the valve body still lifted, align the ball follower shaft bore with the opening in the valve body for the lower flange (key 44). [Note: For valves with metal bearings and the NPS 24 flangeless PEEK bearings, hold the thrust washer (key 38, Figure 10) in place before inserting the follower shaft.] While aligning the pin holes, insert the follower shaft into the ball.
- Place the gasket (key 45) in position on the bottom flange (key 44). Insert the bottom flange into the valve body, onto the follower shaft and thread the bottom flange nuts (key 47) onto the studs (key 46). Hand tighten the nuts.

5. Installing the pins (key 7):

NOTICE

The ball might be damaged if it is allowed to hit the flange edge or interior of the valve cavity while it is being lowered into the valve body.

- Lift the valve and place it on the edge of both flanges. Make sure the ball is in its open position and in the lower half of the valve cavity. Block the packing box side of the valve so the drive shaft is horizontal.

Figure 7. Ram Construction and Bearing Installation

43B7128-A
A6062-1

Table 5. Bearing Ram Dimensions

VALVE SIZE, NPS	RAM LENGTH		RAM DIAMETER			
	L		D		d	
	mm	in.	mm	in.	mm	in.
14	172	6.75	51.30	2.02	44.45	1.75
			51.05	2.01	44.20	1.74
16	178	7.00	60.96	2.40	53.91	2.125
			60.71	2.39	53.72	2.115
20 and 24x20	216	8.50	70.35	2.77	63.50	2.50
			70.10	2.76	63.25	2.49
24	254	10	85.34	3.36	76.20	3.00
			85.09	3.35	75.95	2.99

- Insert the pin (key 7) into the ball ear and follower shaft until it is flat with the ball ear surface. (Note: the pin does not extend the full width of the ball ear.
- Refer to the Packing Replacement procedures and install the packing parts as described in that section. Slightly tighten the packing nuts (key 20).

- Using a pry bar, insert the bar between the ball ear and the follower shaft side of the valve body. Move the ball tightly towards the packing box side of the valve body and against the bearing flange or thrust washer. The ball should be centered within the seal cavity.
- Again, insert the bar between the ball ear and the follower shaft side of the valve body. While holding the ball in place, tighten the packing box nuts (key 20).

If the ball is not held in place while tightening the packing box nuts, the ball will move to an off-center position.

6. Welding the pins (key 7):

NOTE

When welding the pins to the ball ears, use a compatible filler rod material. For CG8M (317 stainless steel) balls use 317L (most preferred), 316L or 309L (least preferred) filler rod.

Tack weld both pins (key 7) to the ball ears with a 10 mm / 3/8-in. diameter weld.
(Note: Good weld penetration is required on both the pin and ball ear.)

7. Tighten the bottom flange nuts using the following torque values:

Table 6. Torque Nut Values

VALVE SIZE, NPS	VALVE	STUD SIZE	QUANTITY	TORQUE	
				N•m	ft•lbs
14	V150	1/2-13	6	102	75
	V300	5/8-11		176	130
16	V150	9/16-12		141	104
	V300	5/8-11		176	130
20	V150	5/8-11		176	130
	V300	3/4-10		258	190
24	V150	7/8-9		373	275
	V300	7/8-9		373	275

8. Lift the valve and place it with the outlet flange face flat on the protected working surface. Use the lever from the actuator or provide some other safe method to rotate the ball into the closed position. The inlet flange face should be up to allow the installation of the ball seal. The ball should be centered within the valve opening.
9. Refer to the Ball Seal Replacement procedures to install the ball seal and seal protector ring.

3.4 Cavitrol Hex Replacement

Disassembly

WARNING

Observe the steps in the WARNING at the beginning of the Maintenance section.

1. Isolate the control valve from line pressure, drain the process media from both sides of the valve and remove the control valve/actuator assembly from the pipeline as described in the Ball Seal Replacement section.
2. Place the valve on a protected flat surface with the body outlet flange facing up.
3. Remove the four fasteners (key 67) securing the Cavitrol Hex trim to the valve body.

WARNING

To avoid personal injury or property damage, do not use the four threaded lifting holes provided in the Cavitrol Hex trim to lift the complete valve assembly. The four threaded holes are sized for lifting only the Cavitrol Hex trim.

All lifting and rigging must be completed in accordance with federal/national/provincial, state and local regulations and applicable lifting and rigging equipment standards. Lifting and rigging equipment used to lift, install or remove the Cavitrol Hex trim must be properly selected and sized for the weight of the component. The weights of the Cavitrol Hex trim are provided in Table 7.

4. Install hoist rings or other appropriate lifting equipment into the four 3/8 in.-16 threaded holes provided in the Cavitrol Hex trim flange.
5. Remove the Cavitrol Hex trim and place on a protected flat surface.
6. Remove gasket (key 65) from the valve body outlet flange.

Assembly

The Cavitrol Hex anti-cavitation trim (key 64) is available for the NPS 14, 16 and 20, V150 and V300 flanged, raised-face, body constructions. To retrofit the Cavitrol Hex to an existing valve assembly, special body machining is required. Four threaded holes must be added to the valve body outlet flange. Contact your [Emerson sales office](#) for retrofit information.

NOTE

The Cavitrol Hex anti-cavitation trim will add 12.7 mm / 1/2-in. to the face to face dimension of the valve. Refer to Table 4 of this manual for information on required flange stud length.

1. The Cavitrol Hex anti-cavitation trim (key 64) is to be installed last, after the Vee-Ball valve body assembly is complete. The recommended valve orientation for assembly is with the body outlet flange facing up.
2. Ensure the ball is in the open position.
3. Place the gasket (key 65) over the body outlet flange serrated surface as illustrated in Figure 11.
4. Install hoist rings or other appropriate lifting equipment into the four 3/8 in.-16 threaded holes in the Cavitrol Hex flange.

Table 7. Fisher Cavitrol Hex Dimensions and Weight

VALVE SIZE	FLANGE THICKNESS C (ADD TO OVERALL FACE-TO-FACE DIMENSION)		WEIGHT	
NPS	mm	in.	kg	lbs
14	12.7	0.5	44.1	97.3
16	12.7	0.5	63.5	139.9
20	12.7	0.5	111.2	245.1

5. Insert the Cavitrol Hex anti-cavitation trim into the valve, ensuring the holes in the body outlet flange align with the holes in the trim flange. Remove lifting equipment used to install Cavitrol Hex trim.
6. Install four fasteners (key 67) and adequately tighten to secure the trim to the valve assembly.

3.5 Whisper NXV Trim Installation

To install the Whisper NXV or retrofit into an existing valve, special welding is required. Please contact your [Emerson sales office](#) for service information.

3.6 Whisper NXV Trim Maintenance

For NPS 14 and 16 valves with Whisper NXV Trim, the Whisper Trim Attenuator requires special removal processes to be separated from the ball. Contact your [Emerson sales office](#) for more information.

NOTICE

The Whisper NXV Trim attenuator is only compatible with CG8M, CF3M or CF8M ball materials. Use of non-compatible ball materials with the S31603 (316L) Whisper NXV Trim may result in insufficient weld strength leading to damage to the valve seal, attenuator and other valve components and interfere with proper valve operation.

Figure 8. Index Mark for Actuator Lever Orientation

ACTUATOR		VALVE OPEN	ACTUATOR POSITION			
MOUNTING	STYLE		1	2	3	4
(STANDARD) RIGHT-HAND	STYLE A PUSH DOWN TO CLOSE					
	STYLE B PUSH DOWN TO OPEN					
(STANDARD) LEFT-HAND	STYLE C PUSH DOWN TO OPEN					
	STYLE D PUSH DOWN TO CLOSE					
(OPTIONAL) LEFT-HAND	STYLE C PUSH DOWN TO CLOSE					
	STYLE D PUSH DOWN TO OPEN					
NOTE: 1. ARROW ON LEVER INDICATES DIRECTION OF ACTUATOR THRUST TO CLOSE VALVE.						

3.7 Actuator Mounting

Standard flow direction is with the seal protector ring (key 3) facing upstream. Install the valve with the drive shaft horizontal and the ball closing in the downward direction (see Figure 8).

⚠ WARNING

The Vee-ball (key 2, Figure 10) closes with a cutting motion. To avoid personal injury, keep hands, tools and other objects away from the ball while stroking the valve.

Actuator travel must be adjusted before installing the valve in the pipeline because it is not possible to accurately determine the closed position once the valve is in the line.

The actuator can be right or left-hand mounted in any of four positions as shown in Figure 8.

NOTE

Right-hand mounting—Actuator is on the right side of the valve when viewed from the valve inlet.

Left-hand mounting—Actuator is on the left side of the valve when viewed from the valve inlet.

However, when changing the valve from right to left-hand mounting or vice versa, a different valve drive shaft and ball are required. If a new shaft and ball are required, refer to the Bearing and Ball Maintenance section and the Parts List in this manual.

NOTE

If necessary, it is possible to mount the valve in the left-hand position with the ball rotating to the top of the valve. This will require a non-standard ball. The ball rotates clockwise to close. Refer to Figure 8 or contact your [Emerson sales office](#) for assistance.

Determining Open Position

The valve must be removed from the pipeline to check the position of the ball.

1. Rotate the ball to the open position. The open position of the ball is shown in Figure 9.
2. Adjust the actuator linkage until the open position is obtained using the appropriate actuator instruction manual procedures.
3. Stroke the valve to the closed position.

Make sure the actuator does not stroke the ball more than 90 degrees when rotating to the closed position (see Figure 9).

Figure 9. Determining the Ball Position

A6065

Figure 10. Fisher V150 and V300 Valve Assembly

NOTES:

1. THE V-NOTCH BALL EXTENDS TO THIS POINT WHEN ROTATED 180 DEGREES AWAY FROM THE CLOSED POSITION.
SEE BEARING AND V-NOTCH BALL ASSEMBLY PROCEDURES.
2. KEYS 24, 30, 31, 35 AND 36 ARE NOT SHOWN.

Section 4: Parts

4.1 Parts Kits

Cavitrol Hex Retrofit Kit

Kit includes the Cavitrol Hex (key 64), gasket (key 65) and fasteners (key 67). Kits are available for the NPS 14, 16 and 20 V150 and V300 flanged, raised-face body constructions. To retrofit the Cavitrol Hex anti-cavitation trim to an existing valve assembly, special body machining is required. Contact your [Emerson sales office](#) for retrofit information.

Valve Size, NPS	Material	Kit Part Number
14	S31603	RCAVHEX0102
16		RCAVHEX0122
20		RCAVHEX0142
14	R31233	RCAVHEX0112
16		RCAVHEX0132
20		RCAVHEX0152

4.2 Parts Ordering

A serial number is assigned to each valve and stamped on the nameplate. Always refer to the valve serial number when corresponding with your [Emerson sales office](#) regarding spare parts or technical information.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

4.3 Parts List

Key	Description	Key	Description
1	Valve body assembly If a part number is required, contact your Emerson sales office .	25	Pipe plug
2*	Ball	26	Identification nameplate
3	Seal protector ring	27	Drive screw
6*	Drive shaft	28	Flow arrow (2 req'd)
7*	Pin (2 req'd)	30	Body size/serial number nameplate
9*	Follower shaft	31	Nameplate wire (not shown)
10*	Bearing (2 req'd)	35*	Packing ring (4 req'd)
11*	Ball seal	36*	Packing washer (Use with Graphite ribbon packing, 3 req'd)
13*	Wave spring Use with HD metal seal	37*	Radial seal Use with HD metal ball seal
15*	Gasket	38	Thrust washer (4 req'd)
16*	Packing set, set includes PTFE V-ring packing with one Carbon-filled conductive ring, male adapter and female adapter	39*	Packing box ring
17	Packing follower	40	Packing flange
19	Packing follower stud (2 req'd)	44	Bottom flange
20	Packing follower nut (2 req'd)	45*	Gasket
21	Retainer screw (used with B8M)	46	Bottom flange stud (6 req'd)
23	Actuator mounting screw (4 req'd)	47	Hex nut (6 req'd)
24	Actuator mounting nut (4 req'd)	64	Cavitrol hex

Introduction

Scope of Manual

This instruction manual provides installation, operation, maintenance, and parts information for the Fisher Vee-Ball V150 (NPS 1 through 12), V200 (NPS 1 through 10), and V300 (NPS 1 through 12) rotary control valves (see figure 1). NPS 3 through 12 valves without an Rotary Attenuator currently in production are referred to as Series B (for more information on this distinction see Appendix A).

For larger valves (NPS 14, 16, and 20), refer to a separate instruction manual. For information on ENVIRO-SEAL™ packing, see the ENVIRO-SEAL Packing System for Rotary Valves instruction manual ([D101643X012](#)). Refer to separate manuals for information concerning the actuator, positioner and accessories.

Do not install, operate, or maintain Vee-Ball valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Valve End Connection Styles V150: Flanged valves that mate with CL150 raised-face flanges and EN 1092-1 Type B raised-face and Type F Recess V200: Flangeless (all sizes) and flanged valves that mate with CL600 raised-face flanges (NPS 2-8) V300: Flanged valves that mate with CL300 raised-face flanges and EN 1092-1 Type B raised-face and Type F Recess	Maximum Ball Rotation Standard: Ball rotates counterclockwise to close when viewed from actuator side of valve Optional: Ball rotates clockwise to close Ball rotation is 90 degrees
Maximum Inlet Pressure⁽¹⁾ Consistent with applicable ASME B16.34 or EN 12516-1 ratings	Valve/Actuator Action With diaphragm or piston rotary actuator, field-reversible between: ■ push-down-to-close (extending actuator rod closes valve) and ■ push-down-to-open (extending actuator rod opens valve.) See actuator manual for details
Standard Flow Direction Forward (into the convex face of the Vee-ball)	

1. The pressure/temperature limits in this manual, and any applicable code or standard limitation, should not be exceeded.

Description

The V150, V200, and V300 Vee-Ball valves (figure 1) with a V-notch ball are used in throttling or on-off service. The V200 is a flangeless construction. The V150 and V300 valves are raised-face flanged constructions. The splined valve shaft of all these valves connect to a variety of rotary-shaft actuators.

Specifications

Specifications for these valves are shown in table 1 and in the Fisher Vee-Ball V150, V200, and V300 Rotary Control Valves Bulletin 51.3:Vee-Ball ([D101363X012](#)).

	CK3MCuN	NPS 1, 1-1/2, 2, 3, 4, 6, 8, 10, 12	

1. WCC and EN Std 1.0619 are dual certified. CF3M and EN SST 1.4409 are dual certified.
 2. CF3M is a standard offering in Europe and Asia Pacific.
 3. NORSOK compliant materials available upon request.
 4. Flangeless V200 assemblies mate with raised-face flanges.
 5. Valve body mates with NPS 24 ASME CL150 flanges. Internal based on NPS 20 valve design.

Installation

Separate installation steps are provided in this section for V150 and V300 flanged valves, V200 flangeless valves. Key numbers in installation procedures are shown in figures 24, 25, and 26 unless otherwise indicated.

Some types of ceramic trim, including VTC, can create a spark under certain conditions. If an edge of a ceramic part is struck against a second ceramic part with enough force, it can produce a spark.

⚠ WARNING

Avoid personal injury and property damage from ignition of process fluid caused by sparks from ceramic trim. Do not use ceramic trim where the process fluid is unstable or if it is an explosive mixture (such as ether and air).

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed either the valve body rating or the mating pipe flange joint rating. To avoid such injury or damage, provide a relief valve for overpressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

Figure 2. Flange Stud Length for Seal Protector End

1A4520

Table 3. Flange Stud Lengths Required for Seal Protector Ring End of Fisher V150, V200, and V300 Valves

VALVE SIZE		V150 ⁽²⁾				V200 ⁽¹⁾		V300 ⁽²⁾	
		ANSI/ISA 575.08.02 Face-to-Face		ASME B16.10 Short Face-to-Face		ANSI/ISA 575.08.02 Face-to-Face		ANSI/ISA 575.08.02 Face-to-Face	
DN	NPS	mm	Inches	mm	Inches	mm	Inches	mm	Inches
25	1	70	2.75	95	3.75	---	---	89	3.50
40	1-1/2	83	3.25	127	5.00	---	---	102	4.00
50	2	95	3.75	146	5.75	121	4.75	95	3.75
80	3	95	3.75	133	5.25	140	5.50	121	4.75
100	4	108	4.25	146	5.75	165	6.50	127	5.00
150	6	114	4.50	152	6.00	197	7.75	140	5.50
200	8	121	4.75	171	6.75	216	8.50	152	6.00
250	10	133	5.25	165	6.50	---	---	171	6.75
300	12	140	5.50	159	6.25	---	---	184	7.25

1. For the flanged V200, the same bolt lengths are used for both the inlet and outlet flange ends because the studs for threaded flange holes are double nutted. If the Cavitrol Hex anti-cavitation trim is installed, the required outlet flange bolt length will be 1/2" longer than the Dimension specified in the table above. See Vee-Ball bulletin ([D101363X012](#)).

2. For V150 and V300 valve assemblies with the Cavitrol Hex anti-cavitation trim installed, the same bolt lengths are used for both the inlet and outlet flange ends.

⚠ WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. To avoid possible personal injury and because some valve/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

⚠ WARNING

The valve drive shaft is not necessarily grounded to the pipeline when installed. Personal injury or property damage could result from an explosion caused by a discharge of static electricity from valve components if the process fluid or the atmosphere around the valve is flammable. If the atmosphere around the valve or the process fluid is flammable, electrically bond the drive shaft to the valve.

Note

Standard PTFE packing is composed of a partially conductive carbon-filled PTFE female adaptor with PTFE V-ring packing. Standard graphite packing is composed of all conductive graphite ribbon packing. Alternate shaft-to-valve body bonding is available for hazardous service areas where the standard packing is not sufficient to bond the shaft to the valve (see the following step).

Attach the optional bonding strap assembly (key 131, figure 3) to the valve drive shaft (key 6) with the clamp (key 130, figure 3) and connect the other end of the bonding strap assembly to the valve body with the cap screw (key 23).

1. If the valve is to be stored before installation, protect the flange mating surfaces and keep the valve body cavity dry and free of foreign material.
2. Install a three-valve bypass around the control valve assembly if continuous operation will be necessary during inspection and maintenance of the valve.
3. The valve is normally shipped as part of a control valve assembly, with an actuator mounted on the valve. If the valve and actuator have been purchased separately or if the actuator has been removed, mount the actuator according to the Actuator Mounting section and the appropriate actuator instruction manual.
4. Standard flow direction is with the seal protector ring (key 3) facing upstream.
5. Install the valve in a horizontal or vertical pipeline with the drive shaft in a horizontal position.

NOTICE

To maximize seal life, the valve should be installed so the drive shaft will be in the horizontal orientation while in service. Please contact your Emerson sales office for evaluating vertical drive shaft installations.

6. The actuator can be right- or left-hand mounted with the shaft in a horizontal orientation as shown in figure 1. If necessary, refer to the appropriate actuator instruction manual for actuator installation and adjustment procedures.

NOTICE

Ensure the valve and adjacent pipelines are free of foreign material that could damage the valve seating surfaces.

7. Be certain the valve and adjacent pipelines are free of any foreign material that could damage the valve sealing surfaces.
8. Be sure the pipeline flanges are in line with each other.

Installing V150, V300, and Flanged V200 Valves

1. Install the V150 and V300 valve using studs (keys 32 and 33, not shown) and nuts to connect the valve flanges to the pipeline flanges. The seal protector ring (key 3) end of the valve requires longer line flange studs (key 32) than standard. Do not use standard-length line flange studs for the seal protector ring end of the valve. The seal protector ring end of the valve for the DN25/NPS 1 constructions will have threaded flange holes due to insufficient nut clearance.

Figure 3. Optional Shaft-to-Body Bonding Strap Assembly

2. See table 3 and figure 2 for length of studs for the seal protector ring end of V150 and V300 valves. Lubricate the studs with anti-seize lubricant.
3. Insert flat-sheet line flange gaskets (or spiral-wound gaskets with compression-controlling center rings) that are compatible with the flowing media.
4. Connect pressure lines to the actuator as indicated in the actuator instruction manual. When an auxiliary manual actuator is used with a power actuator, install a bypass valve on the power actuator (if one is not supplied) for use during manual operation.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If the valve has ENVIRO-SEAL live-loaded packing installed, this initial re-adjustment will probably not be required. See ENVIRO-SEAL Packing System for Rotary Valves Instruction Manual ([D101643X012](#)) for packing instructions.

Installing V200 Valves

Stud length dimensions are shown in figure 4 for the seal protector ring end of the valve. For V200, CL600, the dimension from the center line of the valve bore to the mounting flange face is larger than a CL150 or 300 valve.

1. Install the V200 valve using long studs (key 32, figure 4) to connect the two pipeline flanges. Refer to figure 4 for the size of studs required. Lubricate the studs with anti-seize lubricant.
2. Install two studs in the flanges before you place the valve in the line. Place the two studs so they will contact the line-centering notches at the bottom of the valve body.
3. Insert flat-sheet line flange gaskets (or spiral-wound gaskets with compression-controlling center rings) that are compatible with the process fluid.
4. Place the valve on the two studs. Install all remaining studs. Measure carefully to be sure the valve is centered on the pipeline flanges and tighten the flange stud nuts. Tighten the nuts in a criss-cross sequence to be sure the flange gaskets are properly torqued.
5. Connect pressure lines to the actuator as indicated in the actuator instruction manual. When an auxiliary manual actuator is used with a power actuator, install a bypass valve on the power actuator (if one is not supplied) for use during manual operation.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

10	11.69	13.00	5.94	16.50	17.75	---	---

1. IEC 534-3-2 face-to-face dimensions are equivalent to ANSI/ISA S75.08.02 face-to-face dimensions.

2. 150 pound class only.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

Key numbers in this procedure are shown in figures 24, 25, and 26, unless otherwise noted.

⚠ WARNING

The Vee-ball closes with a shearing, cutting motion, which could result in personal injury. To avoid injury, keep hands, tools, and other objects away from the Vee-ball while stroking the valve.

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations.
- The valve packing area may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Packing Maintenance

Key numbers in this procedure are shown in figures 24, 25, and 26, unless otherwise noted. A detailed view of the packing is also shown in figure 5.

If the valve is equipped with the ENVIRO-SEAL Packing System, refer to:

- the separate ENVIRO-SEAL Packing System for Rotary Valves instruction manual ([D101643X012](#)) for maintenance instructions, and
- the Parts List section of this manual for retrofit kits, parts kits, and individual parts.

If the packing is relatively new and tight on the drive shaft (key 6), and if tightening the packing follower nuts does not stop leakage, it is possible that the drive shaft is worn or nicked so that a seal cannot be made. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches on the packing box wall. Inspect the drive shaft and packing box wall for nicks or scratches while performing the following procedure.

Replacing Packing

When using this procedure, it is recommended that the actuator **not** be removed from the valve while the valve is still in the pipeline or between flanges. Valve/actuator adjustments must be made with the valve out of the pipeline. Refer to the Determining Closed Position portion of the Actuator Mounting section.

Disassembly

WARNING

Observe the steps in the **WARNING** at the beginning of the Maintenance section.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, shut off all pressure lines to the power actuator, release pressure from the actuator, and disconnect the pressure lines from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you are working on the equipment.
2. Remove line bolting, remove the control valve from the pipeline, and place the valve/actuator assembly on a flat surface with the seal protector ring facing up.
3. Remove the actuator cover. Take note of the orientation of the actuator with respect to the valve body and the lever orientation with respect to the valve drive shaft (see figure 6).

WARNING

When the actuator is removed from the valve, the ball/shaft assembly may suddenly rotate, with a shearing, cutting motion, which could result in personal injury. To avoid injury, carefully rotate the ball to a stable position after the actuator is removed.

NOTICE

When removing the actuator from the valve, do not use a hammer or similar tool to drive the lever or actuator off the valve shaft. Driving the lever or actuator off the valve shaft could damage the ball, seal, and valve. If necessary, use a puller to remove the lever or actuator from the valve shaft. It is okay to tap the puller screw lightly to loosen lever or actuator, but hitting the screw with excessive force could damage the ball, seal, and valve.

4. Remove the clamped lever (do not loosen the actuator turnbuckle adjustment), remove the actuator mounting screws and nuts (keys 23 and 24), and remove the actuator. (If necessary, refer to the actuator instruction manual for assistance.)

5. If applicable, remove the bonding strap assembly before attempting to remove the packing (see figure 3).
6. Remove the packing follower nuts and packing follower (keys 17 and 20). For alloy packing constructions, the packing follower (key 17) and a separate packing flange (key 40) must be removed if present.

If the valve is equipped with the ENVIRO-SEAL packing system, refer to the ENVIRO-SEAL Packing System for Rotary Valves instruction manual ([D101643X012](#)) for disassembly.

WARNING

Personal injury could result from packing leakage. Do not scratch the drive shaft or packing box wall while removing packing parts in the following procedure.

7. Remove the packing parts (see figure 5, keys 16, 17, 35, and 39 depending on construction) using a formed wire hook with a sharp end. Pierce the rings with the sharp end of the hook in order to remove them. Do not scratch the drive shaft or packing box wall; scratching these surfaces could cause leakage. Clean all accessible metal parts and surfaces to remove particles that would prevent the packing from sealing.

Assembly

If the valve is equipped with the ENVIRO-SEAL packing system, refer to the ENVIRO-SEAL Packing System for Rotary Valves instruction manual ([D101643X012](#)) for assembly.

Series B only

1. For NPS 8, 10, and 12 valves, install the packing spacer (key 34) if it has been removed.
2. To help ensure correct centering of the Vee-ball (key 2) on the seal (key 11), make sure the ball is closed while you install or tighten new packing. Insert a screwdriver, pry bar, or similar tool between the lower ear of the ball and the valve body. Use the pry to move the ball tightly against the bearing on the actuator side of the valve (see figure 6). Keep the ball in that position until you have completed packing installation and adjustment.
3. Install the new packing parts using the parts sequence shown in figure 5. Install the packing follower (key 17). Alloy constructions have a packing follower (key 17) and a separate packing flange (key 40) that must be replaced.
4. Secure the packing follower with the packing follower nuts (key 20). Tighten the nuts far enough to stop leakage under operating conditions.

Handle the seal protector ring, seal, and other parts carefully to prevent damage. A new gasket (key 15) is required whenever the seal protector ring (key 3) (figure 11) is removed.

Flow ring construction does not use a seal, shims, or spring seal. Use this procedure to remove the seal protector ring from flow ring constructions, but disregard any instructions calling for the seal, shims, or spring seal.

Note

If the valve is equipped with a bonding strap assembly (figure 3), re-install the assembly.

5. Reconnect the actuator and lever in accordance with the orientations that were noted in step 3 of the disassembly procedures. If necessary, use figure 23 to identify the correct index marks.
6. Refer to the appropriate actuator instruction manual to complete actuator assembly and adjustment.
7. When the control valve is in operation, check the packing follower for leakage and retighten the packing follower nuts (key 20) as necessary.

Replacing the Ball Seal

Disassembly

Perform this procedure if the control valve is not shutting off properly or if seal inspection is necessary. If you find upon inspection that the ball, shaft, or bearings need to be replaced, use this procedure to remove the ball seal. Then, proceed to the Bearing and Ball Maintenance procedures. Then, return to this procedure and begin with the assembly of the ball seal steps.

While the actuator/valve assembly must be removed from the pipeline, the actuator may remain mounted on the valve as you replace the ball seal.

Key numbers are shown in figures 24, 25, and 26, unless otherwise indicated. Ball Seal assembly details (with key numbers) are also shown in figures 8, 9, and 10.

STANDARD PACKING

ENVIRO-SEAL PTFE PACKING SYSTEM

ENVIRO-SEAL GRAPHITE PACKING SYSTEM

B2412-1

Figure 6. Typical Vee-Ball Valve Showing Pry Bar

⚠ WARNING

Perform the steps in the **WARNING** at the beginning of the Maintenance section of this manual.

1. Remove line bolting, remove the control valve from the pipeline, and place the valve on a flat surface with the seal protector ring facing up. Carefully rotate the ball to the open position.
2. Remove protector ring screws and washers (keys 21 and 22). Carefully remove the seal protector ring and gasket (keys 3 and 15). (For flow ring constructions, go to step 4.)
 - a. For a Fisher TCM seal, remove the seal (key 11) from the valve body. For NPS 1, 1-1/2, and 2 valves, also remove the backup ring (key 14, figure 8) from the valve body.
 - b. For a flat metal seal, remove the spring seal, seal, and shims (keys 13, 11, and 12). (Note: It may be necessary to re-use some of the original shims when reassembling the flat metal seal.)
 - c. For an HD ball seal or a high temperature HD ball seal, once the protector ring has been removed from the valve, push the metal seal (key 11) out of the seal protector ring (key 3). Remove the wave spring (key 13), and on the HD metal seal, the radial seal (key 37).

Note

The high temperature HD ball seal also has a piston ring (key 133) that will need to be removed. It will be in two pieces for the NPS 1, 1-1/2 and 2 valves, and one piece with a break in it for the NPS 3 through 12 valves.

NOTICE

Exercise care to avoid damaging components in the following procedure.

- It might be necessary to remove the HD seal by carefully tapping it with a soft punch and hammer. Take care not to damage the seal protector ring.
 - NPS 3 through 12 valves, if the seal is difficult to push out, it is recommended that a seal removal plate be used to press the HD seal out of the seal protector ring. Refer to figure 12 for dimensions of the seal removal plate.
 - NPS 10 and 12 valves with a Rotary Attenuator only: Remove the retaining ring (key 41) in the seal protector ring. This retaining ring is an octagonal-shaped support wire. To remove the retaining ring, find one of the free ends of the ring. Use a screwdriver or similar tool to pry inward and upward until the ring is removed.
3. Inspect the gasket and sealing surfaces on the valve body (key 1 or 1A), the seal protector ring (key 3), Vee-Ball (key 2), and the retaining ring (key 41 for NPS 10 and 12 valves with a Rotary Attenuator only). Be sure the sealing surfaces are not damaged.
 4. If replacement of the ball, shafts (keys 6 or 9), or bearings (key 10) is needed, proceed to the Bearing and Ball Maintenance procedure. If only the seal is to be replaced, proceed to the Assembly steps below.

Assembly

Refer to figures 8, 9, and 10 for key number locations during seal installation. Valve key number locations are shown in figures 24, 25, and 26.

1. Thoroughly clean all parts that are to be re-used and obtain replacement parts. Be sure that all sealing surfaces are in good condition without scratches or wear. If the valve has been installed between line flanges and the flange studs and nuts have been tightened, always replace the gasket (key 15) with a new gasket.
2. To help ensure correct side-to-side centering of the ball (key 2) on the seal (key 11), make sure the ball is closed while you install the seal or flow ring and seal protector ring. Insert a screwdriver, pry bar, or similar tool between the lower ear of the ball and the valve body (see figure 6).
3. Use the pry to move the ball tightly against the bearing on the actuator side of the valve. Be careful, excessive force may damage the ball. Keep the ball in that position until you have completed seal or flow ring installation. Check the ball's position periodically, and re-center if necessary, during lever assembly and packing adjustments.

⚠ WARNING

The Vee-Ball closes with a shearing, cutting motion, which could result in personal injury. To avoid injury or property damage, keep hands, tools, and other objects away from the Vee-Ball while stroking the valve.

4. Install the seal.

NOTICE

Due to the Vee-ball shape, take care to never completely rotate either the front skirted edge or the circular back edge of the ball out of the ball seal as the seal could be damaged.

300	12	263.3-263.5	10.365-10.375

Installing Fisher TCM Plus or Extra ball seals:

- a. NPS 1, 1-1/2, and 2 valves: Install the backup ring (key 14). Install the Fisher TCM seal (key 11) into the valve body. Refer to figure 7.
 - Install the gasket (key 15) on the valve body.
 - Install the seal protector ring (key 3) into the valve body. Now go to step 5 in this procedure.
- b. NPS 3 through 12 valves: Install the Fisher TCM seal (key 11) into the valve body.
 - Install the gasket (key 15) on the valve body.
 - Install the seal protector ring (key 3) into the valve body. Now go to step 5 in this procedure.

Installing flat metal seals:

- a. Install 12 shims in the valve and install the flat metal seal on top of the shims.
- b. Install the spring seal (key 13) on the flat metal seal (key 11) with the convex side of the spring seal facing the ball.
- c. Install the seal protector ring, and install the protector ring screws and washers (keys 21 and 22). Tighten the screws.
- d. Add or remove shims under the ball seal as necessary to obtain zero ball seal deflection as accurately as possible.

Note

Zero ball seal deflection for a flat metal seal is the point at which the addition of one 0.13 mm (0.005 inch) thick shim causes contact between the ball and ball seal to be broken. Hold the parts tightly together when determining zero deflection, or improper zero deflection might result.

- e. After zero deflection is reached, remove the seal protector ring, spring seal, seal and 4 shims. Final assembly of the control valve should not exceed a maximum of 9 shims for zero deflection. If more than 9 shims are required, contact your [Emerson sales office](#).
- f. Install the gasket (key 15) on the valve body.
- g. Install the seal protector ring (key 3) into the valve body. Now go to step 5 in this procedure.

Installing HD ball seals:

Note

The older and newer designs of the NPS 1 and 1-1/2 seal protector ring are functionally the same, but are different lengths and not interchangeable. All NPS 1 and 1-1/2 sizes of V150 and V300 valves are the newer design. The change in seal protector ring length occurred in the 1992/1993 timeframe and affects NPS 1 and 1-1/2 V200 valves only. To determine whether you have the older or newer design, measure the length of the seal protector ring (key 3, figure 26) from its pipeline flange mating surface to its opposite end. Compare your measurement to those listed in figure 7.

- a. **For NPS 1 and 1-1/2 valves:** The older and newer designs of the NPS 1 and 1-1/2 seal protector rings are functionally the same, but are different lengths and not interchangeable. Refer to figure 7 for protector ring dimensions.
 - Install the wave spring (key 13) onto the ball seal.
 - Lubricate and install the radial seal (key 37) onto the ball seal (key 11). Make sure the open side of the radial seal faces away from the ball.
 - Push the ball seal assembly into the seal protector ring (key 3).
 - Go to step 5 in this procedure.

b. For all NPS 3 through 8 valves and NPS 10 and 12 valves without Rotary Attenuator:

- Lubricate and install the radial seal (key 37) into the appropriate groove in the seal protector ring making sure the open side of the radial seal faces away from the ball.
- Install the wave spring (key 13) into the seal protector ring (key 3).
- Install the HD seal (key 11) into the seal protector ring (key 3), past the radial seal. While pushing it past the radial seal, make sure the HD seal is level. Go to step 5 in this procedure.

c. For NPS 10 and 12 valves with Rotary Attenuator:

- Lubricate the radial seal with lithium grease and install the radial seal (key 37) into the appropriate groove in the seal protector ring making sure the open side of the radial seal faces away from the ball.
- Install the wave spring (key 13) into the seal protector ring (key 3).
- To install the retaining ring (key 41), find one of the free ends of the ring. Insert the free end into the groove in the seal protector ring. Work around the ring, pressing it into the groove until the ring is completely in its groove.
- Install the HD seal (key 11) into the seal protector ring (key 3), past the radial seal. While pushing it past the radial seal, make sure the HD seal is level.
- The HD seal uses a retaining ring (key 41) for NPS 10 and 12 valves only. This retaining ring is an octagonal-shaped support wire. Go to step 5 in this procedure.

Installing high temperature HD ball seals:

a. For NPS 1, 1-1/2 and 2 valves: The older and newer designs of the NPS 1 and 1-1/2 seal protector rings are functionally the same, but are different lengths and not interchangeable. All part numbers in this manual are for the newer design. Refer to figure 7 for ring dimensions.

- Place the wave spring (key 13) on top of the HD seal (key 11).
- Break the piston ring (key 133) into two approximately equal pieces either by placing the ring over a pencil or similar object and applying pressure down-wards on the ring until the ring snaps. Be sure to match the broken ends together as you install it on the HD seal (key 11).
- Lay the HD seal (key 11) down on a flat surface and push the seal protector ring (key 3) into place. Make sure the seal is level. Go to step 5 in this procedure.

b. For NPS 3 through 8 valves:

- Place the piston ring (key 133) and retaining ring (key 132) into the appropriate groove in the seal protector ring (key 3). The piston ring has one break in it; do **not** break it further.
- Install the wave spring (key 13) into the seal protector ring (key 3).
- Lay the HD seal (key 11) down on a flat surface and push the seal protector ring (key 3) past the piston ring (key 133) and into place. Make sure the seal is level. Go to step 5 in this procedure.

c. For NPS 10 and 12 valves:

- Place the piston ring (key 133) and retaining ring (key 132) into the appropriate groove in the seal protector ring (key 3). The piston ring has one break in it; do not break it further.
 - Install the wave spring (key 13) into the seal protector ring (key 3).
 - If the valve has a Rotary Attenuator, install the retaining ring (key 41). The octagonal shaped support wire ring has two free ends. Place one of the free ends into the groove in the seal protector ring. Then starting at the inserted end, press the rest of the ring into the groove completely.
 - Lay the HD seal (key 11) down on a flat surface and push the seal protector ring (key 3) past the piston ring (key 133) and into place. Make sure the seal is level. Go to step 5 in this procedure.
5. Install a replacement gasket (key 15) on the valve body (key 1 or 1A). Install the HD ball seal/seal protector ring assembly into the valve body (key 1 or 1A).
 6. Install washers (or clips), and screws that clamp the seal protector ring to the valve body [keys 3, 21, and 22; the V200 valve uses clips (key 22) in place of washers].
 7. If necessary, refer to the Packing Maintenance procedures to install the packing. Install the actuator using the Actuator Mounting procedures or to the appropriate actuator instruction manual.

HD Ball Seal Lubrication

To assist with break-in of the HD seals, it is recommended that the ball and seal be lubricated with dry film lubricant or equivalent moly disulfide.

Bearing and Ball Maintenance

⚠ WARNING

Before performing the steps in this section, observe the WARNING at the beginning of the Maintenance section on page 8.

DN 80 - 300 (NPS 3 through 12) Valves

Procedures for disassembly and assembly of the bearings and ball cannot be accomplished until the ball seal and valve packing are removed from the valve.

Refer to the Replacing Packing procedures to remove the actuator, and to remove the packing flange and packing follower from the valve. When the packing disassembly steps are complete, return to this section.

Refer to the Replacing the Ball Seal procedures to remove the ball seal from the valve.

Table 4. Continuous Threaded Rod

Valve Size, DN	Valve Size, NPS	Threaded Rod Thread Size	Thread Depth in Follower Shaft
80	3	0.25-20	0.5
100	4	0.25-20	0.5
150	6	0.25-20	0.5
200	8	0.3125-18	0.62
250	10	0.3125-18	0.62
300	12	0.3125-18	0.94

Disassembly

⚠ WARNING

When the actuator is removed from the valve, the ball/shaft assembly may suddenly rotate, with a shearing, cutting motion, which could result in personal injury. To avoid injury, carefully rotate the ball to a stable position at the bottom of the valve body cavity. Make sure the ball will not rotate.

Key numbers in this procedure are shown in figures 24, 25, and 26, unless otherwise indicated.

1. A taper key (key 4, figures 14, 24, 25 and 32) is used to connect the ball and drive shaft in NPS 3 through 12 valves.
2. Carefully rotate the ball to the open position after the actuator is disconnected. Make sure the ball will not rotate (see warning above). Provide support for the ball during the following disassembly.
3. Working from the small end of the groove pin (key 7), use a pin punch to drive the groove pin out of the ball ear and follower shaft.

Welded Taper Key Replacement

For tack welded taper keys, driving the taper key out of the ball ear will shear the tack welding.

4. Locate the small end of the taper key (key 4, see figures 14, 24, 25 and 32). Using a pin punch on the smaller end of the taper key, drive it out of the ball (key 2) and drive shaft (key 6). Note: driving the taper key in the wrong direction will tighten it.
5. Pull the drive shaft (key 6) out of the actuator side of the valve body.

NOTICE

Exercise care to avoid damaging components in the following procedure.

6. The ball will be free to move when both shafts are removed. Make sure the sealing surface of the ball is not damaged while removing the follower shaft.
 - a. Unscrew the pipe plug (key 25) if one is installed. Use a punch to drive the follower shaft (key 9) into the center of the ball.
 - b. If a pipe plug is not installed, use a piece of continuous threaded rod as a removal rod when moving the follower shaft (key 9) into the center of the ball. Refer to the table 4 for a description of the size threaded rod needed. The length of the rod should allow easy working room from the valve body.
7. Carefully remove the follower shaft and ball (key 2) from the valve body.

Rotary Attenuator Maintenance

For NPS 4 valves with attenuator, remove the ball/attenuator through the inlet of the valve. Taking hold of the follower shaft ear on the ball/attenuator, you must position the scalloped edge of the attenuator against the valve bore opening and then pivot, or roll, the ball/attenuator out of the valve body (see figure 18).

For NPS 6, 8, 10, and 12 valves with attenuator, remove the ball/attenuator through the outlet of the valve by carefully turning and manipulating the ball. The NPS 6, 8, 10, or 12 ball/attenuator will not come straight out of the valve body.

Whisper NXV Trim Maintenance

For NPS 4, 6, 8, 10, and 12 valves with Whisper NXV Trim, the Whisper Trim Attenuator requires special removal processes to be separated from the ball. Contact your [Emerson sales office](#) for more information.

8. Remove the bearings (key 10) by hand. If the bearings are tight in the valve body, then pull or drive them out with a slight pressure.
 - To remove the follower shaft bearings, use a blind-hole bearing puller. If you do not have such a tool, you can machine the bearing out.
9. Thoroughly clean surfaces of all parts that are to be re-used or obtain replacement parts.

Assembly

1. Inspect all sealing surfaces to ensure they are in good condition and without scratches or wear.
2. Install the replacement bearings (key 10) by hand. The bearing flanged end should touch the valve body.
3. **Installing the Vee-Ball:** Ensure the ball part number matches up with the appropriate seal type as shown in the key 2 ball table in the parts list section of this instruction manual.

⚠ WARNING

The ball might be damaged if it is allowed to fall into the valve body. To avoid personal injury or damage to the sealing surfaces, support the ball to prevent it from falling into or out of the valve body cavity.

Note

For ease of assembly, the follower shaft (key 9) should be inserted into the ball before installing the ball in the following applications:

- NPS 3 valve without ball/Rotary Attenuator
- NPS 4 through 12 valves with ball/Rotary Attenuator.

Carefully install the ball into the valve body cavity.

- **For Vee-Ball with Rotary Attenuator (NPS 4 through 12 valves),** carefully install the ball into the valve body cavity. For NPS 4 valves, install the ball/attenuator through the inlet of the valve. For NPS 6, 8, 10, and 12 valves, install the ball/attenuator through the outlet of the valve. Taking hold of the follower shaft ear on the ball/attenuator, you must position the scalloped edge of the attenuator against the valve bore opening and then carefully pivot, or roll, the ball/attenuator into the valve body (see figure 18).
- **For Vee-Ball with Whisper NXV Trim (NPS 4 through 12 valves),** installation of new Whisper NXV trim and reinstallation of previously removed trim requires special welding processes. Contact your [Emerson sales office](#) for more information.

NOTICE

The Whisper NXV Trim array is only compatible with CG8M, CF3M, or CF8M ball materials.

Use of non-compatible ball materials with the S31603 (316L) Whisper NXV Trim may result in insufficient weld strength leading to damage to the valve seal, array and other valve components and interfere with proper valve operation.

After you have installed the ball (key 2) into the valve body assembly, firmly support the ball while installing the shafts.

4. Installing the follower shaft (key 9):

- **For NPS 3 valves:** The follower shaft (key 9) should already have been inserted into the ball before the ball was put into the valve body. Insert the follower shaft (key 9) into the valve body bearing (key 10).

- For NPS 4 and larger valves: Insert the follower shaft (key 9) through the ball, and into the valve body bearing (key 10).
- For NPS 4 through 12 valves with ball/Rotary Attenuator: The follower shaft (key 9) should already have been inserted into the ball/attenuator before the ball was put into the valve body. Insert the follower shaft (key 9) into the valve body bearing (key 10).

Then for all sizes, align the hole in the follower shaft with the holes in the ball. Insert the small end of the groove pin (key 7) into the hole in the ball and into the follower shaft. The pin will hold the parts in place while the drive shaft (key 6) is being installed.

Table 5. Taper Key Minimum Depth

Valve Size, DN	Valve Size, NPS	Minimum Depth To Drive Taper Key After Initial Solid Contact, mm (Inches)
80, 100, 150	3, 4, 6	4.8 (0.188)
200, 250, 300	8, 10, 12	5.6 (0.219)

Table 6. Taper Key Maximum Depth

Valve Size, DN	Valve Size, NPS	Maximum Depth To Drive Taper Key After Initial Solid Contact, mm (Inches)
80, 100	3, 4	7.1 (0.281)
150	6	7.9 (0.312)
200, 250	8, 10	9.5 (0.375)
300	12	10.3 (0.406)

5. Installing the Drive Shaft:

NOTICE

The drive shaft must be used with the correct Vee-Ball. Refer to the tag (see figure 13) attached to the Vee-Ball and to the drive shaft.

Failure to use the correct Vee-Ball/shaft combination may result in the ball not being in the position indicated by the slash mark on the end of the shaft. If the ball is not properly aligned with the slash mark, the valve will not function correctly and seal damage may result.

Figure 13. Informational Tag

NOTICE

Make sure the drive shaft is free of oil or grease, otherwise the taper pin or taper key will not seat properly. Failure to properly set the taper pin or taper key could result in it coming loose while in service. Loosening of the taper key in service could result in improper valve function and equipment damage.

- a. Insert the drive shaft into the valve body bearing (key 10), and into the ball ear. Align the hole in the drive shaft with the holes in the ball.
- b. Insert the taper key into the ball and drive shaft as shown in figure 14.
 - Installing the Taper Key

Current standard construction materials for all NPS 3 through 12 valves require the taper key (key 4, figure 14) to be tack welded in place **after** properly seating, using the following procedure. Use standard welding preparations when preparing parts for reassembly.

NOTICE

Make sure the drive shaft (key 6) is free of oil or grease, otherwise the taper key will not seat properly. Failure to properly set the taper pin or taper key could result in it coming loose while in service. Loosening of the taper key in service could result in improper valve function and equipment damage.

Figure 14. Taper Key Installation

6. Install the drive shaft (key 6) into the valve body through the ball and into the lower bearing.
7. Insert the taper key (key 4) into ball and drive shaft (keys 2 and 6) as shown in figure 14. The taper key inserts, with the flat side of the key, facing the drive shaft (key 6).

8. Using a flat end punch, drive the groove pin (key 7) into the ball ear and follower shaft until it is flat with the ball ear surface. Stake both ends of the pin hole with a center punch to ensure the groove pin does not come out.
9. Using a flat end punch, drive the taper key (key 4) into the ball ear and drive shaft (key 6) until solid, heavy contact is obtained between the key and shaft.
10. Measure the position of the taper key head.
11. Drive the taper key in further using the minimum distance shown in table 5.
12. Inspect the ball/shaft taper key connection to verify that the taper key spans the entire shaft flat width. If not, the taper key must be driven in further until this condition is satisfied. However, do not exceed the maximum depths shown in table 6.

Note

All valve taper keys are tack welded, except titanium.

13. When the above conditions are met, tack weld the taper key (key 4) to the ball ear on the head end of the key (see figures 24 and 25).

Use a:

- 1/8 inch diameter weld on NPS 3 through 6 valves,
- 3/16 inch diameter weld on NPS 8 through 10 valves, and
- 1/4 inch diameter weld on NPS 12 valves.

Figure 15. Typical Metal Micro-Notch Ball and Drive Shaft

For all constructions: Refer to Replacing the Ball Seal, Packing Maintenance, and other procedures as necessary to complete the assembly of the valve.

DN 25 through 50 (NPS 1 through 2) Valves

Procedures for disassembly and assembly of the bearings and ball cannot be accomplished until the ball seal and valve packing are removed from the valve.

Refer to the Replacing Packing procedures to remove the actuator, and to remove the packing flange and packing follower from the valve. When the packing disassembly steps are complete, return to this section.

Refer to the Replacing the Ball Seal procedures to remove the ball seal from the valve.

Disassembly

⚠ WARNING

When the actuator is removed from the valve, the ball/shaft assembly may suddenly rotate, with a shearing, cutting motion, which could result in personal injury. To avoid injury, carefully rotate the ball to a stable position at the bottom of the valve body cavity. Make sure the ball will not rotate.

Key numbers in this procedure are shown in figures 24, 25, and 26, unless otherwise indicated.

1. A taper pin (key 4, figure 20) is used in the NPS 1, 1-1/2, and 2 valves, and in the NPS 1 Metal Micro-Notch valve (figure 21).
2. Ceramic Micro Notch ball constructions: A screw (key 4, figure 22) is used to attach the ball to the drive shaft.

NOTICE

Exercise care to avoid damaging components in the following procedure.

- a. The parts are held together with a screw and an adhesive. Remove the screw (key 4) and separate the drive shaft from the ball. In some cases, a small amount of heat can be applied to help loosen the adhesive. However, excessive heat may damage other valve component parts.
- b. Once the shafts have been removed from the valve body, the ball may fall. To avoid personal injury or damage to the sealing surfaces, provide support for the ball to prevent it from falling as the shaft(s) are being removed.

Table 7. Continuous Threaded Rod

Valve Size, DN	Valve Size, NPS	Threaded Rod Thread Size	Thread Depth in Follower Shaft
25	1	1/4-20	0.5
40	1.5	1/4-20	0.5
50	2	1/4-20	0.5

Figure 16. Dimensions of Ball in Ball / Shaft Assembly

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D101554X012

Vee-Ball Valves

April 2024

VALVE SIZE		A			
		NEW - WITHOUT THRUST WASHER		OLD - WITH THRUST WASHER	
DN	NPS	mm	Inches	mm	Inches
25	1	32.9	1.29	31.8	1.25
40	1.5	48.6	1.91	47.7	1.88
50	2	64.5	2.54	63.4	2.50

3. Carefully rotate the ball to the open position after the actuator is disconnected. Make sure the ball will not rotate (see warning above). Provide support for the ball during the following disassembly.
4. Unscrew the pipe plug (key 25). (The pipe plug is optional and may not be available.)
5. Working from the small end of the groove pin (key 7), use a pin punch to drive the groove pin out of the ball ear and follower shaft.

Note

All NPS 1 Micro-Notch constructions use a one piece shaft. They do not have a follower shaft.

6. Locate the small end of the taper key (key 4, figure 14). Using a pin punch on the smaller end of the taper key, drive it out of the ball (key 2) and drive shaft (key 6). Note: driving the taper key in the wrong direction will tighten it.
7. Pull the drive shaft (key 6) out of the actuator side of the valve body.

Note

The new ball/shaft assembly (key 48) does not require a thrust washer (key 38) in valves ordered after November 01, 2001.

Discard the thrust washer in valves ordered prior to this date when new ball/shaft assemblies are used as spare parts.

Figure 17 shows the informational tag that is attached with the new ball/shaft assembly when shipped as a spare part. Refer to figure 16 for dimensions of the ball in the ball/shaft assembly.

Figure 17. Informational Tag

NOTICE

Exercise care to avoid damaging components in the following procedure.

8. Make sure the sealing surface of the ball is not damaged while removing the follower shaft.
 - a. If a pipe plug (key 25) is installed, use a punch to drive the follower shaft (key 9) into the center of the ball.
 - b. If a pipe plug is not installed, use a piece of continuous threaded rod as a removal rod when moving the follower shaft (key 9) into the center of the ball. Refer to the table 7 shown below for a description of the size threaded rod needed. The length of the rod should allow easy working room from the valve body.
9. Remove the ball (key 2) by carefully removing the follower shaft and ball from the valve body.
10. Remove the bearings (key 10) by hand. If the bearings are tight in the valve body, then pull or drive them out with a slight pressure.
11. Thoroughly clean surfaces of all parts that are to be re-used or obtain replacement parts.

Assembly

1. Inspect all sealing surfaces to ensure they are in good condition and without scratches or wear.
2. Install bearings (key 10) by hand. The bearing flanged end should touch the body.
3. Installing the ball (key 2):

⚠ WARNING

The Vee-Ball might be damaged if it is allowed to fall into the valve body. To avoid personal injury or damage to the sealing surfaces, support the ball to prevent it from falling into or out of the valve body cavity.

Figure 18. Ball/Rotary Attenuator Installation and Removal Method

Note

For ease of assembly, the follower shaft (key 9) should be inserted into the ball before installing the ball in an NPS 3 valve without ball/Rotary Attenuator

Carefully install the ball into the valve body cavity.

After you have installed the ball (key 2) into the valve body assembly, firmly support the ball while installing the shafts.

4. Installing the follower shaft (key 9):

- For NPS 1 through 2 valves: The follower shaft (key 9) should already have been inserted into the ball before the ball was put into the valve body. Insert the follower shaft (key 9) into the valve body bearing (key 10).

Note

All NPS 1 Micro-Notch constructions use a one piece shaft. They do not have a follower shaft.

5. Installing the Drive Shaft for Valves with Taper Pins

NOTICE

The drive shaft must be used with the correct Vee-Ball. Refer to the tag (see figure 13) attached to the Vee-Ball and to the drive shaft.

Failure to use the correct Vee-Ball/ shaft combination may result in the ball not being in the position indicated by the slash mark on the end of the shaft. If the ball is not properly aligned with the slash mark, the valve will not function correctly and seal damage may result.

Figure 19. Location of Indicator Hole in Micro-Notch Vee-Balls

NOTICE

Make sure the drive shaft is free of oil or grease, otherwise the taper pin will not seat properly. Failure to properly set the taper pin or taper key could result in it coming loose while in service. Loosening of the taper key in service could result in improper valve function and equipment damage.

6. Insert the drive shaft into the valve body bearing (key 10), and into the ball ear (or ball, for Micro-Notch constructions). Align the hole in the drive shaft with the holes in the ball.

Note

There is an indicator hole drilled in all Micro-Notch balls. This indicator hole must be oriented closest to the follower end of the ball/shaft assembly. See figure 19.

7. Insert the taper pin into the ball and drive shaft as shown in figures 20 and 21. The small end of the taper pin must be inserted into the larger hole side of the ball ear (or ball, for Micro-Notch constructions), and into the large hole side of the drive shaft.

Note

The taper pin will not fit correctly if inserted in the wrong direction through the ball ear (or ball, for Micro-Notch constructions) or through the drive shaft. Make sure the drive shaft and ball ear (or ball, for Micro-Notch constructions) are in the correct orientation for installing the pin.

- Installing Taper Pins in NPS 1, 1-1/2, and 2 Valves

Note

For NPS 1, 1-1/2, and 2 valves, the taper pins (figure 20) do not require welding.

Using a flat-end punch, drive the taper pin into the ball ear (or ball, for Micro-Notch constructions) and drive shaft until solid heavy contact is felt. Make sure the taper pin spans the width of the ball.

Using a flat end punch, drive the groove pin (key 7) into the ball and follower shaft until it is flat with the ball surface.

Installing the Drive Shaft in VTC Ceramic Vee-Ball Valves

NOTICE

The drive shaft must be used with the correct Vee-Ball. Refer to the tag (see figure 13) attached to the Vee-Ball and to the drive shaft.

Failure to use the correct Vee-Ball/ shaft combination may result in the ball not being in the position indicated by the slash mark on the end of the shaft. If the ball is not properly aligned with the slash mark, the valve will not function correctly and seal damage may result.

Figure 20. Taper Pin Installation for Fisher V150, V200, and V300 NPS 1, 1-1/2, and 2 Valves

Figure 21. Taper Pin Installation for Fisher V150, V200, and V300 NPS 1 Valves with Micro-Notch Ball Construction

Valves with NPS 1 ceramic micro-notch balls use a screw with a threaded valve shaft to connect the ball to the shaft. An adhesive is used to lock the screw in the valve shaft (keys 4 and 6, figure 22).

Figure 22. Screw Installation for Fisher V150, V200, and V300 NPS 1 Valves with VTC Ceramic Micro-Notch Ball Construction

Note

There is an indicator hole drilled in all Micro-Notch balls. The orientation of this hole in the ceramic Vee-Ball is to the right of the screw in the ball, and must be located closest to the follower end of the ball/shaft assembly. See figures 19 and 22.

⚠ WARNING

Avoid personal injury and property damage from ignition of process fluid caused by sparks from ceramic trim.

Do not use ceramic trim where the process fluid is unstable or if it is an explosive mixture (such as ether and air).

Within the valve body:

8. The threaded hole in the shaft, the screw and screw clearance hole in the ball must be free of oil and grease before applying an activator.
9. Apply Loctite® Depend® Activator 7387 to threaded hole, screw and ball clearance hole. Assemble the ball onto the shaft while aligning threaded shaft hole within the ball clearance hole.
10. The flat on the shaft must be oriented so that the head of the cap screw seats on the flat.
11. Apply 5 drops of Loctite Depend 330 into the hole in the ball.
12. Thread the screw into the shaft tightening it to 9.2 N•m (81 in•lbs) torque. Remove excess adhesive, Allow four hours to cure fully before continuing with assembly.

For all constructions: Refer to Replacing the Ball Seal, Packing Maintenance, and other procedures as necessary to complete the assembly of the valve.

Cavitrol Hex Installation

The Cavitrol Hex anti-cavitation trim (key 64) is available for the NPS 4 through 12, V150, V300, and V200 flanged, raised-face body constructions. To retrofit the Cavitrol Hex to an existing valve assembly, special body machining is required. Two threaded holes must be added to the valve body outlet flange. Contact your [Emerson sales office](#) for retrofit information.

Note

The Cavitrol Hex anti-cavitation trim will add 0.5 inch to the face to face dimension of the valve. Refer to table 3 of this manual for information on required flange stud length.

Assembly

1. The Cavitrol Hex anti-cavitation trim (key 64) is to be installed last, after the Vee-Ball valve body assembly is complete. The recommended valve orientation for assembly is with the body outlet flange facing up.
2. Ensure the ball is in the open position.
3. Place the gasket (key 65) over the body outlet flange serrated surface as illustrated in figure 28.
4. Insert the Cavitrol Hex anti-cavitation trim into the valve, ensuring the holes in the body outlet flange align with the holes in the trim flange.
5. Install two fasteners (key 21) and adequately tighten to secure the trim to the valve assembly.

Actuator Mounting

Use the appropriate actuator instruction manual, this section of this manual, and figure 23 of this manual when mounting the actuator or changing actuator styles and positions.

1. To help ensure correct centering of the Vee-Ball (key 2) on the seal (key 11), be sure the ball is closed when mounting the actuator (for applications other than Spring Return Fail-Open).
2. Clean the valve shaft and actuator lever splines to be sure the actuator lever will slide on easily. Only drive the lever in if absolutely necessary.
3. Carefully wedge the ball solidly against the actuator-side bearing, using a screwdriver or similar tool inserted between the lower ear of the ball and the valve body. This will center the ball. See figure 6.
4. Keep the wedge in place while installing the lever, if necessary. Remove the wedge after you have clamped the actuator lever on the valve shaft and have connected the lever to the actuator piston rod or diaphragm rod.

Determining Mounting Position

The actuator can be either right or left-hand mounted, with the actuator on the right or left side when viewed from upstream (see figure 23).

The Series B Vee-Ball, NPS 4 through 12 with Rotary Attenuator, and the NPS 1 micro-notch Vee-Ball have one V-notch. For **right-hand mounting (standard)**, the ball will be in the top of the valve body when the valve is open and the shaft is horizontal. In this position the ball rotates CCW to Close. For **left-hand mounting (standard)**, the ball will be in the bottom of the valve body when the valve is open and the shaft is horizontal. In this position the ball rotates CCW to Close. An optional ball for **left-hand mounting**, which rotates into the top of the valve body when the shaft is horizontal, is also available. In this position the ball rotates CW to Close.

The NPS 1 through 2 has two notches, and can be rotated in either direction.

Determining Closed Position

1. The valve must be removed from the line to check the position of the ball.

⚠ WARNING

The Vee-Ball closes with a shearing, cutting motion. To avoid personal injury, keep hands, tools, and other objects away from the ball while stroking the valve.

2. Rotate the ball to the closed position.
3. Position the ball in the proper location

For Series B:

- When viewed from the valve body inlet, the ball is in the proper position when the flat spot on the top of the ball is exactly in the center of the seal package.

Make a copy of the centering template in figure 27 out of a suitable stiff material. Place the centering template in the opening at the seal (See figure 27). Find the center of the template and make sure the spot on the ball is centered directly below it.

For NPS 1, 1-1/2, and 2 valves: Follow one of the procedures below:

- When viewed from the valve body inlet, the ball is in the proper position when both V-notches of the ball are centered between the machined diameter of the ledge that supports the seal.
 - If the ball has a spot machined on the top, align that spot to the exact center of the seal cavity.
4. Adjust the actuator linkage as described in the appropriate actuator instruction manual until the ball is centered in the closed position. A line is stamped on the actuator end of the drive shaft (see figure 23) to indicate the ball position.

Use the appropriate actuator instruction manual and figure 23 of this manual when mounting the actuator or changing actuator styles and positions.

The Micro-Notch ball closed position is approximately 5 degrees closed from the first point of flow. This establishes the zero degree position for the ball.

1. These dimensions are the same for ASME and DIN valves. 2. Note that ASME B16.10 Short dimensions are actually longer than ANSI/ISA S75.08.02 dimensions.							

Parts Ordering

A serial number is assigned to each valve and stamped on the nameplate. Always refer to the valve serial number when corresponding with your [Emerson sales office](#) regarding spare parts or technical information. When ordering replacement parts, also specify the key number, part name, and desired material using the parts list.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they will void your warranty, might adversely affect the performance of the valve, and could give rise to personal injury and property damage.

Note

For the NPS 2 V150 valve, this manual covers valves with serial numbers 12551183 and higher. Always reference the serial number of your valve when corresponding with your Emerson sales office.

Parts Kits

Retrofit Kits for ENVIRO-SEAL Packing

Retrofit kits include parts to convert existing V150, V200 and V300 valves with shallow (single packing depth) packing box to the ENVIRO-SEAL packing box construction. Retrofit kits include single PTFE packing. See following table.

ENVIRO-SEAL Packing Retrofit Kits

Repair Kits for ENVIRO-SEAL Packing

Repair kits include valves parts for shallow (single packing depth) for ENVIRO-SEAL packing box construction. Repair kits include single PTFE or graphite packing. See following table.

ENVIRO-SEAL Packing Repair Kits

SHAFT DIAMETER ⁽¹⁾		PART NUMBER	
mm	Inches	PTFE	Graphite
12.7	1/2	RRTYX000012	13B8816X012
15.9	5/8	RRTYX000022	13B8816X032
19.1	3/4	RRTYX000032	13B8816X052
25.4	1	RRTYX000052	13B8816X092
31.8	1-1/4	RRTYX000062	13B8816X112
38.1	1-1/2	RRTYX000072	13B8816X142
Parts Included in Kit			
Key	Description	Quantity	
105	Packing set	1	1
106	Anti-extrusion washer	2	--- ⁽²⁾
1. Diameter through the packing box. 2. Included in key 105.			

Repair Kits for Ball Seals

Seal repair kits include recommended spare parts for Fisher TCM Plus, S31600 stainless steel, CF10SMnN, or CD7MCuN ball seal constructions. The following table indicates the repair kit part number and the quantity of parts included in the kit.

Fisher V150, V200, and V300 Repair Kits

VALVE SIZE		KIT PART NUMBER			
		Ball Seal Material			
DN	NPS	TCM Plus	---	Alloy 6	CD7MCuN (Alloy 255 Duplex SST)
25	1	RV150X00CA2	---	RV150XHDAA2	RV150XHDCA2
40	1-1/2	RV150X00CB2	---	RV150XHDA2	RV150XHDCB2
VALVE SIZE		Ball Seal Material			
DN	NPS	TCM Plus	S31600 (316 SST)	CF10SMnN	CD7MCuN (Alloy 255 Duplex SST)
50	2 ⁽¹⁾	RV150X00C12	RV150X00M12	RV150X0HD12	RV150XHDC12
50	2 ⁽²⁾	RV150X00C82	---	RV150X0HD82	RV150XHDC82
80	3	RV150X00C22	RV150X00M22	RV150X0HD22	RV150XHDC22
100	4	RV150X00C32	RV150X00M32	RV150X0HD32	RV150XHDC32
150	6	RV150X00C42	RV150X00M42	RV150X0HD42	RV150XHDC42
200	8	RV150X00C52	RV150X00M52	RV150X0HD52	RV150XHDC52
250	10	RV150X00C62	RV150X00M62	RV150X0HD62	RV150XHDC62
300	12	RV150X00C72	RV150X00M72	RV150X0HD72	RV150XHDC72
Parts Included in Kit		Quantity in Kit			
Key No.	Description				
11	Ball seal	1	1	1	1
12	Shim seal ⁽³⁾	---	4	---	---
13	Spring seal	---	1	---	---
13	Wave spring	---	---	1	1
15	Gasket	1	1	1	1
37	Radial seal	---	---	1	1
21	Retainer screw	2 or 4 ⁽⁴⁾	2 or 4 ⁽⁴⁾	2 or 4 ⁽⁴⁾	2 or 4 ⁽⁴⁾
22	Retainer washer	2 or 4 ⁽⁴⁾	2 or 4 ⁽⁴⁾	2 or 4 ⁽⁴⁾	2 or 4 ⁽⁴⁾
1. V150's only for serial numbers below 12551183. 2. V150's for serial numbers 12551183 and above. All V200's and V300's. 3. Fewer shim seals are furnished in the parts kits than are used in the original construction of the valve. Most original shim seals can be reused. 4. A quantity of 2 is supplied for NPS 2 through 8 valves, and a quantity of 4 is supplied for NPS 10 and 12 valves.					

Cavitrol Hex Retrofit Kit

Kit includes the Cavitrol Hex (key 64), gasket (key 65), and fasteners (key 21). Kits are available for the NPS 4 through 12 V150, V300, and V200 flanged, raised-face body constructions. To retrofit the Cavitrol Hex anti-cavitation trim to an existing valve assembly, special body machining is required. Two threaded holes must be added to the valve body outlet flange. Contact your [Emerson sales office](#) for retrofit information.

Fisher V150, V200⁽¹⁾, and V300 Cavitrol Hex Kits

VALVE SIZE, NPS	KIT PART NUMBER	
	Material	
	S31603 (316L)	R31233 (Ultimet)
4	RCAVHEX0002	RCAVHEX0012
6	RCAVHEX0022	RCAVHEX0032
8	RCAVHEX0042	RCAVHEX0052
10	RCAVHEX0062	RCAVHEX0072
12	RCAVHEX0082	RCAVHEX0092
1. V200 raised face flanged body.		

Parts List

Note

Contact your [Emerson sales office](#) for Part Ordering information.

Common Parts (figures 24, 25 & 26)

Key	Description
1	If you need a valve body as a replacement part, order by valve size, serial number, and desired valve body material. Contact your Emerson sales office for assistance.
2*	Ball
2*	Ball w/ Rotary Attenuator
3	Seal Protector Ring
4*	Taper Key
6*	Drive Shaft
6*	Drive Shaft w/ Rotary Attenuator
7*	Groove Pin
9*	Follower Shaft
9*	Follower Shaft w/ Rotary Attenuator
10*	Bearing (2 req'd)
11*	Ball Seal
12*	Shim Seal (12 req'd) Use w/flat metal seal only
13*	Spring Seal Use w/ flat metal seal only
13*	Wave Spring use w/ HD Metal Seal only
14	Backup Ring (Composition seal only)
15*	Gasket
16*	Packing Set
17	Packing Follower w/integral flange
17	Packing Follower w/o integral flange
19	Packing Follower Stud
20	Packing Follower Nut
21	Seal Protector Screw
22	Seal Protector Clip
23	Actuator Mounting Screw
24	Actuator Mounting Nut
25	Pipe Plug (Optional) (not shown)

Key	Description
26	Identification Nameplate
27	Drive Screw
28	Flow Arrow
30	Nameplate
31	Nameplate Wire (not shown)
32	Line Flange Stud
33	Line Flange Stud
34	Spacer
35*	Packing Ring (4 req'd)
36*	Packing Washer
37*	Radial Seal Use w/HD Metal Seal
39*	Packing Box Ring
40	Packing Flange
41	Retaining Ring
48*	Ball-Shaft Assembly
64	Cavitrol Hex
65	Gasket
130	Clamp
131	Bonding Strap Assembly

ENVIRO-SEAL Packing System (Parts in all Type Vee-Ball Valves) (figure 5)

Key	Description
100	Packing Flange Stud
101	Packing Flange Nut
102	Packing Flange
103	Spring Pack Assembly
105*	Packing Set
106*	Anti-Extrusion Ring (2 req'd)
107*	Packing Box Ring
108*	Packing Ring (2 req'd)
109*	Anti-Extrusion Ring (2 req'd)
110	Lantern Ring
111	Tag
112	Tie Cable
113	Lubricant, anti-seize (not furnished with packing system)

Appendix A Instructions for Non-Series B

The Series B changes affected only the NPS 3 through 12 valves without attenuators. To determine if a Vee-Ball valve is Series B, you will need to examine several of the internal parts. Compare the distinctive skirted V-notch outline of the forward side and the circular edge on the reverse side of the Series B design ball to the V-notch on both sides of the non-series B design ball. Then look for bushings. The lack of bushings indicates the valve body is Series B.

All Vee-Ball valves NPS 3 through 12 produced before the Series B design changes use the Specifications table, the Installation, Maintenance, Packing Maintenance, Replacing Packing, and Replacing the Ball Seal instructions found elsewhere in this manual. Bearing and Vee-Ball Maintenance and Actuator Mounting instructions for these valves may be found below.

Maintenance

WARNING

The Vee-ball closes with a shearing, cutting motion, which could result in personal injury. To avoid injury, keep hands, tools, and other objects away from the Vee-ball while stroking the valve.

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- The valve packing area may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Procedures for disassembly and assembly of the bearings and ball cannot be accomplished until the ball seal and valve packing are removed from the valve.

1. Refer to the Replacing Packing procedures to remove the actuator, and to remove the packing flange and packing follower from the valve. When the packing disassembly steps are complete, return to this section.
2. Refer to the Replacing the Ball Seal procedures to remove the ball seal from the valve.

Disassembly

WARNING

When the actuator is removed from the valve, the ball/shaft assembly may suddenly rotate, with a shearing, cutting motion, which could result in personal injury. To avoid injury, carefully rotate the ball to a stable position. Make sure the ball will not rotate.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Vee-Ball Valves

April 2024

Instruction Manual

D101554X012

Key numbers in this procedure are shown in figures 24, 26, and 32, unless otherwise indicated. A taper key (key 4, figure 14) is used in NPS 3 through 12 Non-Series B valves.

3. Carefully rotate the ball to the open position after the actuator is disconnected. Make sure the ball will not rotate (see warning above). Provide support for the ball during the following disassembly.
4. Unscrew the pipe plug (key 25). (With newer valve constructions, the pipe plug is optional and may not be available.)
5. Working from the small end of the groove pin (key 7), use a pin punch to drive the groove pin out of the ball ear and follower shaft.

For tack welded taper keys, driving the taper key out of the ball ear will shear the tack welding.

6. Locate the small end of the taper key (key 4, see figure 14). Using a pin punch on the smaller end of the taper key, drive it out of the ball (key 2) and drive shaft (key 6). Note: driving the taper key in the wrong direction will tighten it.
7. Pull the drive shaft (key 6) out of the actuator side of the valve body.
8. Make sure the sealing surface of the ball is not damaged while removing the follower shaft.
 - a. If a pipe plug (key 25) is installed, use a punch to drive the follower shaft (key 9) into the center of the ball.
 - b. If a pipe plug is not installed, use a piece of continuous threaded rod as a removal rod when moving the follower shaft (key 9) into the center of the V-notch ball. Refer to the table 8 for a description of the size threaded rod needed. The length of the rod should allow easy working room from the valve body.
9. Remove the ball (key 2) by carefully removing the follower shaft and ball from the valve body.
10. Remove the packing box spacer (key 34) for NPS 8, 10, and 12 valves.
11. Removing the bearings (key 10):
 - a. For **composition bearings**, remove the bearings by hand. If the bearings are tight in the valve body, then pull or drive them out with a slight pressure. Allow the bushings (key 5 or 8) to remain in the valve body.

Table 8. Continuous Threaded Rod

Valve Size, NPS	Threaded Rod Thread Size	Thread Depth in Follower Shaft
3	1/4-20	0.5
4	1/4-20	0.5
6	1/4-20	0.5
8	5/16-18	0.62
10	5/16-18	0.62
12	5/16-18	0.94

- b. For **metal bearings**, use a press and ram to remove the drive shaft bearings out of the valve body. Refer to figures 30 and 31 ram dimensions. The bushings (key 5 or 8) will normally remain in the valve body.

To remove the follower shaft bearings, use a blind-hole bearing puller. If you do not have such a tool, you can machine the bearing out.

Note

For proper shutoff performance, the ball and seal require the bearing (key 10) to be positioned correctly. If you removed the bearings (key 10), be sure to locate the new bearings as shown in figures 30 and 31.

12. Thoroughly clean surfaces of all parts that are to be re-used or obtain replacement parts.

Assembly

1. Inspect all sealing surfaces to ensure they are in good condition and without scratches or wear.
2. Installing bearings (key 10):
 - a. For composition bearings, install the bearings by hand. The bearing flanged end should touch the bushing (key 5 or 8).
 - b. For metal bearings:
 - Use a press and ram to install the bearings (key 10). Refer to figures 30 and 31.
 - Press the bearings in until each bearing is flush with the bushing (key 5 or 8). The acceptable tolerance for bearing location is: flush with the bushing to 1.52 mm (0.060 inches) inside the bushing. That is, the bearings should not protrude into the flow cavity of the valve, and they should not be more than 1.52 mm (0.060 inches) inside the bushing.
 - Take care not to change the position of the bushings (key 5 or 8) when pressing in new bearings (key 10), otherwise the ball will not center in the valve body and seal.
3. Installing the Vee-Ball (key 2):

WARNING

The Vee-Ball might be damaged if it is allowed to fall into the valve body. To avoid personal injury or damage to the sealing surfaces, support the ball to prevent it from falling into or out of the valve body cavity.

Note

For ease of assembly, the follower shaft (key 9) should be inserted into the ball before installing the ball in an NPS 3 valve without ball/Rotary Attenuator.

Carefully install the ball into the valve body cavity.

After you have installed the ball (key 2) into the valve body assembly, firmly support the ball while installing the shafts.

4. Installing the follower shaft (key 9):

- For NPS 3 valves: The follower shaft (key 9) should already have been inserted into the ball before the ball was put into the valve body. Insert the follower shaft (key 9) into the valve body bearing (key 10).
- For NPS 4 and larger valves without Rotary Attenuator: Insert the follower shaft (key 9) through the ball, and into the valve body bearing (key 10).

Then for all sizes, align the hole in the follower shaft with the holes in the ball. Insert the small end of the groove pin (key 7) into the hole in the ball and into the follower shaft. The pin will hold the parts in place while the drive shaft (key 6) is being installed.

5. Insert the drive shaft (key 6) into the valve body bearing (key 10), and into the ball ear. Align the hole in the drive shaft with the holes in the ball.

NOTICE

The drive shaft must be used with the correct Vee-Ball. Refer to the tag (see figure 13) attached to the Vee-Ball and to the drive shaft.

Failure to use the correct Vee-Ball/ shaft combination may result in the ball not being in the position indicated by the slash mark on the end of the shaft. If the ball is not properly aligned with the slash mark, the valve will not function correctly and seal damage may result.

6. Installing the Taper Key (key 4):

Current standard construction materials for all NPS 3 through 12 valves require the taper key (key 4, figure 14) to be tack welded in place using the following procedure. Use standard welding preparations when preparing parts for reassembly.

NOTICE

Make sure the drive shaft (key 6) is free of oil or grease, otherwise the taper key will not seat properly. Failure to properly set the taper pin or taper key could result in it coming loose while in service. Loosening of the taper key in service could result in improper valve function and equipment damage.

1. Install the drive shaft (key 6) into the valve body through the ball and into the lower bearing.
2. Insert the taper key (key 4) into ball and drive shaft (keys 2 and 6) as shown in figure 14. The taper key inserts, with the flat side of the key, facing the drive shaft (key 6).
3. Using a flat end punch, drive the groove pin (key 7) into the ball ear and follower shaft until it is flat with the ball ear surface.
4. Using a flat end punch, drive the taper key (key 4) into the ball ear and drive shaft (key 6) until solid, heavy contact is obtained between the key and shaft.
5. Measure the position of the taper key head.
6. Drive the taper key in further using the minimum distance shown in table 8.

Table 9. Taper Key Minimum Depth

VALVE SIZE, NPS	MINIMUM DEPTH TO DRIVE TAPER KEY AFTER INITIAL SOLID CONTACT, mm (INCHES)
3, 4, 6	4.8 (0.188)
8, 10, 12	5.6 (0.219)

Table 10. Taper Key Maximum Depth

VALVE SIZE, NPS	MAXIMUM DEPTH TO DRIVE TAPER KEY AFTER INITIAL SOLID CONTACT, mm (INCHES)
3, 4	7.1 (0.281)
6	7.9 (0.312)
8, 10	9.5 (0.375)
12	10.3 (0.406)

7. Inspect the ball/shaft taper key connection to verify that the taper key spans the entire shaft flat width. If not, the taper key must be driven in further until this condition is satisfied. However, do not exceed the maximum depths shown in table 9.

Note

When welding standard valves that have a CG8M (317 SST) or CF3M (316L SST) ball, use 309 or 309L filler rod material.

Alloy valve taper keys are normally not welded.

8. When the above conditions are met, tack weld the taper key (key 4) to the ball ear on the head end of the key (see figure 26). Use a:

- 1/8 inch diameter weld on NPS 3 through 6 valves,
- 3/16 inch diameter weld on NPS 8 through 10 valves, and
- 1/4 inch diameter weld on NPS 12 valves.

For all constructions: Refer to Replacing the Ball Seal, Packing Maintenance, and other procedures as necessary to complete the assembly of the valve.

Actuator Mounting

Use the appropriate actuator instruction manual and figure 23 of this manual when mounting the actuator or changing actuator styles and positions.

To help ensure correct centering of the ball (key 2) on the seal (key 11), be sure the ball is closed when mounting the actuator. Do not use a hammer or other tool to drive the actuator lever onto the valve shaft.

Clean the valve shaft and actuator lever splines to be sure the actuator lever will slide on easily. If the lever does not slide on easily, carefully wedge the ball solidly against the actuator-side bearing using a screwdriver or similar tool inserted between the lower ear of the ball and the valve body.

Keep the wedge in place while installing the lever, but again, do not drive on the lever. Remove the wedge after you have clamped the actuator lever on the valve shaft and connected the lever to the actuator piston rod or diaphragm rod.

Determining Mounting Position

The actuator can be either right or left-hand mounted.

Note

Right-hand mounting—Actuator is on the right side of the valve when viewed from valve inlet.

Left-hand mounting—Actuator is on the left side of the valve when viewed from valve inlet.

The preferred location of the ball is in the top of the valve body when the valve is open. To convert from right to left hand-mounting, turn the valve to position the actuator mounting pad on the left and rotate the ball to the top of the valve.

The number one V-notch controls flow on right-hand mounting. Turn the valve 180 degrees, and rotate the ball to the top of the valve to obtain left-hand mounting. The number two V-notch controls flow for this construction. See figure 33.

Determining Closed Position

1. The valve must be removed from the line to check the position of the ball.

WARNING

The ball closes with a shearing, cutting motion. To avoid personal injury, keep hands, tools, and other objects away from the ball while stroking the valve.

2. Rotate the ball to the closed position.
3. Follow one of the procedures below:
 - When viewed from the valve body inlet, the ball is in the proper position when both V-notches of the ball are centered between the machined diameter of the ledge that supports the seal.
 - If the ball has a spot machined on the top, align that spot to the exact center of the seal cavity.
4. Adjust the actuator linkage as described in the appropriate actuator instruction manual until the condition described in step 3 exists. A line is stamped on the actuator end of the drive shaft (see figure 23) to indicate the ball position.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they will void your warranty, might adversely affect the performance of the valve, and could give rise to personal injury and property damage.

Introduction

Scope of Manual

This instruction manual provides installation, operation, maintenance, and parts information for the Fisher Vee-Ball Flangeless V200U rotary control valve sizes DN 25 through DN 250 (NPS 1 through NPS 10) (see figure 1).

For information on ENVIRO-SEAL™ packing, see the ENVIRO-SEAL Packing System for Rotary Valves instruction manual ([D101643X012](#)). Refer to separate manuals for information concerning the actuator, positioner and accessories.

Do not install, operate, or maintain Vee-Ball valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Table 1. Specifications

Valve Sizes See table 2 Valve End Connection Styles Flangeless (all sizes) ■ mates EN1092-1 PN10-40 Type B raised-face flanges (see table 2) ■ mates with ASME B16.5 CL150/CL300 raised-face flanges (see table 2) Maximum Inlet Pressure⁽¹⁾ Consistent with applicable EN 12516-1 or ASME B16.34 ratings Standard Flow Direction Forward (into the convex face of the Vee-Ball) Dimensions See table 4 Actuator Mounting ■ Right-hand, standard or ■ left-hand, optional, as viewed from the valve inlet (see figure 10 and the Actuator Mounting section)	Standard: Ball rotates counterclockwise to close when viewed from actuator side of valve Optional: Ball rotates clockwise to close Ball rotation is 90 degrees Valve/Actuator Action For right-hand mount actuator, the standard ball design and actuator action is counter-clockwise to close (CCW). The ball will rotate to the top of the valve body when open for a horizontal pipe run with the valve shaft positioned horizontal. ■ Left-hand actuator mounting with CCW action is an option. Left-hand actuator mounting with a special clockwise to close (CW) ball design and actuator action is also available to allow the ball to rotate to the top of the valve body for a horizontal pipe run with the valve shaft positioned horizontal. With diaphragm or piston rotary actuator, field-reversible between: ■ push-down-to-close (PDTC) (extending actuator rod closes valve) and ■ push-down-to-open (PDTO) (extending actuator rod opens valve.) Approximate Weight See table 3
--	--

1. The pressure/temperature limits in this manual, and any applicable code or standard limitation, should not be exceeded.

Description

The V200U Vee-Ball valves (figure 1) with a V-notch ball are used in throttling or on-off service. The V200U is a flangeless construction capable of interfacing with EN 1092-1 Type B or ASME B16.5 raised face flanges. The splined or square drive shaft connects to a variety of rotary-shaft actuator options.

Specifications

Specifications for these valves are shown in table 1 and in the Fisher V200U Vee-Ball Rotary Control Valves Bulletin 51.3:V200U (D104550X012).

Installation

Installation steps are provided in this section for V200U valves. Key numbers in installation procedures are shown in figure 16, 17, and 18 unless otherwise indicated.

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed either the valve body rating or the mating pipe flange joint rating. To avoid such injury or damage, provide a relief valve for overpressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. To avoid possible personal injury and because some valve/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

⚠ WARNING

The valve drive shaft is not necessarily grounded to the pipeline when installed. Personal injury or property damage could result from an explosion caused by a discharge of static electricity from valve components if the process fluid or the atmosphere around the valve is flammable. If the atmosphere around the valve or the process fluid is flammable, electrically bond the drive shaft to the valve.

Note

Standard PTFE packing is composed of a partially conductive carbon-filled PTFE female adaptor with PTFE V-ring packing. Standard graphite packing is composed of all conductive graphite ribbon packing. Alternate shaft-to-valve body bonding is available for hazardous service areas where the standard packing is not sufficient to bond the shaft to the valve (see the following step).

Attach the optional bonding strap assembly (key 131, figure 2) to the valve drive shaft (key 6) with the clamp (key 130, figure 2) and connect the other end of the bonding strap assembly to the valve body with the cap screw (key 23).

1. If the valve is to be stored before installation, protect the flange mating surfaces and keep the valve body cavity dry and free of foreign material.
2. Install a three-valve bypass around the control valve assembly if continuous operation will be necessary during inspection and maintenance of the valve.
3. The valve is normally shipped as part of a control valve assembly, with an actuator mounted on the valve. If the valve and actuator have been purchased separately or if the actuator has been removed, mount the actuator according to the Actuator Mounting section and the appropriate actuator instruction manual.

4. Standard flow direction is forward (fluid flows into the convex face of the V-notch ball).
5. Install the valve in a horizontal or vertical pipeline with the drive shaft in a horizontal position.

CAUTION

Do not allow the valve to be installed in the pipeline with the drive shaft in the vertical position because of excessive wear to valve component parts.

6. The actuator can be right- or left-hand mounted with the shaft in a horizontal orientation as shown in figure 1. If necessary, refer to the appropriate actuator instruction manual for actuator installation and adjustment procedures.

CAUTION

Ensure the valve and adjacent pipelines are free of foreign material that could damage the valve seating surfaces.

7. Be certain the valve and adjacent pipelines are free of any foreign material that could damage the valve sealing surfaces.
8. Be sure the pipeline flanges are in line with each other.

Figure 2. Optional Shaft-to-Body Bonding Strap Assembly

Installing V200U Valves

1. To avoid potential interference with the valve outlet end pipe flange, the V200U ball should be in the closed position prior to installation. Install the V200U valve using long studs to connect the two pipeline flanges. Refer to figure 3 for the length of studs required based on the mating pipeline flange pressure class. Lubricate the studs with anti-seize lubricant.

CAUTION

For DN 100, 200, and 250 (NPS 4, 8, and 10), damage to the ball (key 2) could occur if the downstream piping interferes with the ball rotation. Prior to installing the valve body between adjacent flanges, reference dimension P in table 4 and measure carefully to ensure the ball will rotate without interference.

2. Install two studs in the flanges before you place the valve in the line. Place the two studs so they will contact the line-centering features at the bottom of the valve body.
3. Insert appropriate flange gaskets that are compatible with the process fluid.
4. Place the valve on the two studs. Install all remaining studs. Measure carefully to be sure the valve is centered on the pipeline flanges, and tighten the flange stud nuts. Tighten the nuts in a criss-cross sequence to be sure the flange gaskets are properly torqued.
5. Connect pressure lines to the actuator as indicated in the actuator instruction manual. When an auxiliary manual actuator is used with a power actuator, install a bypass valve on the power actuator (if one is not supplied) for use during manual operation.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If the valve has ENVIRO-SEAL live-loaded packing installed, this initial re-adjustment will probably not be required. See ENVIRO-SEAL Packing System for Rotary Valves instruction manual ([D101643X012](#)) for packing instructions.

1. Clearance necessary to remove the bolt.
2. Minimum internal diameter of the mating pipe or flange required for Vee-Ball clearance.
3. The NPS 10 CL300 construction requires 4 bolts per side (8 total) to be installed in blind, tapped holes on the valve body. The M value for these 1 – 8 UNC fasteners is 140 mm (5.5 inch).

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

Key numbers in this procedure are shown in figures 16, 17, and 18 unless otherwise noted.

⚠ WARNING

The Vee-Ball closes with a shearing, cutting motion, which could result in personal injury. To avoid injury, keep hands, tools, and other objects away from the Vee-Ball while stroking the valve.

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations.
- The valve packing area may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Packing Maintenance

Key numbers in this procedure are shown in figures 16, 17, and 18 unless otherwise noted. A detailed view of the packing is also shown in figure 4.

If the valve is equipped with the ENVIRO-SEAL Packing System, refer to:

- The separate ENVIRO-SEAL Packing System for Rotary Valves Instruction Manual ([D101643X012](#)) for maintenance instructions, and
- The Parts List section of this manual for retrofit kits, parts kits, and individual parts.

If the packing is relatively new and tight on the drive shaft (key 6), and if tightening the packing follower nuts does not stop leakage, it is possible that the drive shaft is worn or nicked so that a seal cannot be made. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches on the packing box wall. Inspect the drive shaft and packing box wall for nicks or scratches while performing the following procedure.

Replacing Packing

When using this procedure, it is recommended that the actuator **not** be removed from the valve while the valve is still in the pipeline or between flanges. Valve/actuator adjustments must be made with the valve out of the pipeline. Refer to the Determining Closed Position portion of the Actuator Mounting section.

Disassembly

⚠ WARNING

Observe the steps in the WARNING at the beginning of the Maintenance section.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, shut off all pressure lines to the power actuator, release pressure from the actuator, and disconnect the pressure lines from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you are working on the equipment.
2. To avoid potential interference with the valve outlet end pipe flange, the V200U ball should be in the closed position prior to removal.
3. Remove line bolting, remove the control valve from the pipeline, and place the valve/actuator assembly on a flat surface with the seal protector ring facing up.
4. Remove the actuator cover. Take note of the orientation of the actuator with respect to the valve body and the lever orientation with respect to the valve drive shaft (see figure 14) for Fisher actuation.

⚠ WARNING

When the actuator is removed from the valve, the ball/shaft assembly may suddenly rotate, with a shearing, cutting motion, which could result in personal injury. To avoid injury, carefully rotate the ball to a stable position at the bottom of the valve body cavity. Make sure the ball will not rotate.

CAUTION

When removing the actuator from the valve, do not use a hammer or similar tool to drive the lever or actuator off the valve shaft. Driving the lever or actuator off the valve shaft could damage the ball, seal, and valve.

If necessary, use a puller to remove the lever or actuator from the valve shaft. It is okay to tap the puller screw lightly to loosen lever or actuator, but hitting the screw with excessive force could damage the ball, seal, and valve.

5. Remove the clamped lever (do not loosen the actuator turnbuckle adjustment), remove the actuator mounting screws and nuts (keys 23 and 24), and remove the actuator. (If necessary, refer to the actuator instruction manual for assistance.)
6. If applicable, remove the bonding strap assembly before attempting to remove the packing (see figure 2).
7. Remove the packing follower nuts and packing follower (keys 17 and 20). For alloy packing constructions, the packing follower (key 17) and a separate packing flange (key 40) must be removed if present.

If the valve is equipped with the ENVIRO-SEAL packing system, refer to the ENVIRO-SEAL Packing System for Rotary Valves Instruction Manual ([D101643X012](#)) for disassembly.

⚠ WARNING

Personal injury could result from packing leakage. Do not scratch the drive shaft or packing box wall while removing packing parts in the following procedure.

8. Remove the packing parts (see figure 4, keys 16, 17, 35, and 39 depending on construction) using a formed wire hook with a sharp end. Pierce the rings with the sharp end of the hook in order to remove them. Do not scratch the drive shaft or packing box wall; scratching these surfaces could cause leakage. Clean all accessible metal parts and surfaces to remove particles that would prevent the packing from sealing.

Assembly

If the valve is equipped with the ENVIRO-SEAL packing system, refer to the ENVIRO-SEAL Packing System for Rotary Valves Instruction Manual ([D101643X012](#)) for assembly.

1. To help ensure correct centering of the Vee-Ball (key 2) on the seal (key 11), make sure the ball is closed while you install or tighten new packing. Insert a screwdriver, pry bar, or similar tool between the lower ear of the ball and the valve body. Use the pry to move the ball tightly against the bearing on the actuator side of the valve (see figure 5). Keep the ball in that position until you have completed packing installation and adjustment.
2. Install the new packing parts using the parts sequence shown in figure 4. Install the packing follower (key 17).
3. Secure the packing follower with the packing follower nuts (key 20). Tighten the nuts far enough to stop leakage under operating conditions.

Note

If the valve is equipped with a bonding strap assembly (figure 2), re-install the assembly.

4. Reconnect the actuator and lever in accordance with the orientations that were noted in step 3 of the disassembly procedures. If necessary, use figure 10 to identify the correct index marks.
5. Refer to the appropriate actuator instruction manual to complete actuator assembly and adjustment.
6. When the control valve is in operation, check the packing follower for leakage and re-tighten the packing follower nuts (key 20) as necessary.

Figure 5. Typical Vee-Ball Valve Showing Pry Bar

Replacing the HD Ball Seal

Perform this procedure if the control valve is not shutting off properly or if seal inspection is necessary.

The valve / actuator assembly must be removed from the pipeline. To avoid potential interference with the valve outlet end pipe flange, the V200U ball should be in the closed position prior to removal. For DN 25 through 100 (NPS 1 through 4), the actuator may remain mounted on the valve for ball seal replacement. For DN 150 through 250 (NPS 6 through 10), the actuator must be removed from the valve to replace the ball seal. Key numbers are shown in figures 16, 17, and 18 unless otherwise indicated. Ball Seal assembly details (with key numbers) are also shown in figure 6.

Figure 6. Ball Seal Design

⚠ WARNING

Perform the steps in the **WARNING** at the beginning of the Maintenance section of this manual.

Removing the HD Seal

1. Remove line bolting, remove the control valve from the pipeline, remove the actuator (as discussed in the packing section), and place the valve body on a flat work surface.
 - a. For DN 25 through 100 (NPS 1 through 4), remove protector ring screws and washers (keys 21 and 22). Carefully remove the seal protector ring (keys 3) and gasket (keys 15).

- b. For DN 150, 200, and 250 (NPS 6, 8, and 10), the ball must be removed to access the seal. See the Bearing and Ball Maintenance Disassembly section of this manual. Then return to this procedure and continue with the next steps.
2. Remove HD seal from related component.
 - c. For DN 25 through 100 (NPS 1 through 4), once the protector ring (key 3) has been removed from the valve, push the metal seal (key 11) out of the seal protector ring (key 3). Remove the wave spring (key 13) and the radial seal (key 37).
 - d. For DN 150, 200, and 250 (NPS 6, 8, and 10), with the inlet side of the valve facing up, push the HD metal seal (key 11) into the valve body (key 1). Remove the wave spring (key 13) and the radial seal (key 37).

CAUTION

Exercise care to avoid damaging components in the following procedure.

- It might be necessary to remove the HD metal seal by carefully tapping it with a soft punch and hammer. Take care not to damage the seal protector ring and valve body.
- For DN 80 through 250 (NPS 3 through 10) valves, if the seal is difficult to push out, it is recommended that a seal removal plate be used to press the HD metal seal out of the valve body. Refer to figure 7 for dimensions of the seal removal plate.

Figure 7. HD Seal Removal Plate Dimensions

VALVE SIZE		DIMENSION A	
DN	NPS	Minimum-Maximum, mm	Minimum-Maximum, Inches
80	3	75.9-76.2	2.990-3.000
100	4	95.0-95.3	3.740-3.750
150	6	126.7-127.0	4.990-5.000
200	8	158.5-158.8	6.240-6.250
250	10	212.5-212.7	8.365-8.375

3. If replacement of the ball, shafts (keys 6 or 9), or bearings (key 10) is needed, proceed to the Bearing and Ball Maintenance procedure. If only the seal is to be replaced, proceed to the Installing HD Metal Seals section.

Installing HD Metal Seals

Refer to figures 6, 16, 17, and 18 for key number locations during seal installation.

Thoroughly clean all parts that are to be re-used and obtain replacement parts. Be sure that all sealing surfaces are in good condition without scratches or wear. If the valve has been installed between line flanges and the flange studs and nuts have been tightened, always replace the gasket (key 15) with a new gasket.

1. For DN 25 through 100 (NPS 1 through 4), before installing HD metal seals, ensure ball (key 2) is installed into valve body. Ball should be in closed position while you install the seal and seal protector ring. Insert a screwdriver, pry bar, or similar tool between the lower ear of the ball and the valve body (see figure 5).
2. Use the pry to move the ball tightly against the bearing on the actuator side of the valve. Be careful, excessive force may damage the ball. Keep the ball in that position until you have completed seal or flow ring installation. Check the ball's position periodically, and re-center if necessary, during lever assembly and packing adjustments. See figure 5.

⚠ WARNING

The Vee-Ball closes with a shearing, cutting motion, which could result in personal injury. To avoid injury or property damage, keep hands, tools, and other objects away from the Vee-Ball while stroking the valve.

3. Install the HD Seal.

a. For DN 25, 40 and 50 (NPS 1, 1-1/2, and 2):

- Install the wave spring (key 13) into the seal protector ring (key 3).
- Lubricate and install the radial seal (key 37) onto the ball seal (key 11). Make sure the open side of the radial seal faces away from the ball.
- Push the ball seal assembly into the seal protector ring (key 3).
- Install a replacement gasket (key 15) on the valve body (key 1). Install the HD ball seal/seal protector ring assembly into the valve body (key 1).
- Install clips and screws that clamp the seal protector ring to the valve body (keys 3, 21, and 22).
- If necessary, refer to the Packing Maintenance procedures to install the packing. Install the actuator using the Actuator Mounting procedures or to the appropriate actuator instruction manual.

b. For DN 80 and 100 (NPS 3 and 4):

- Install the wave spring (key 13) into the seal protector ring (key 3).
- Install the HD seal (key 11) into the seal protector ring (key 3), past the radial seal. While pushing it past the radial seal, make sure the HD seal is level.
- Install a replacement gasket (key 15) on the valve body (key 1). Install the HD ball seal/seal protector ring assembly into the valve body (key 1).
- Install clips and screws that clamp the seal protector ring to the valve body (keys 3, 21, and 22).
- If necessary, refer to the Packing Maintenance procedures to install the packing. Install the actuator using the Actuator Mounting procedures or to the appropriate actuator instruction manual.

- c. For DN 150, 200, and 250 (NPS 6, 8, and 10), position the valve body on a flat surface with the outlet side of the valve facing up.
- Lubricate the radial seal (key 37) and install into the appropriate groove in the valve body, making sure the open side of the radial seal faces away from the ball.
 - Install the wave spring (key 13) into the appropriate groove in the valve body.
 - The HD seal can be installed by pushing the HD seal past the wave spring and radial seal, making sure the HD metal seal remains level. Following this, install the remaining trim components as explained under the Bearing and Ball Maintenance Assembly section of this manual.
 - Use the pry bar or similar tool to move the ball tightly against the bearing on the actuator side of the valve to help ensure correct side-to-side centering of the ball (key 2) on the seal (key 11). See figure 5.
 - Be sure that the HD seal is fully installed in the valve. Carefully rotate the ball to engage the HD seal while applying force across the middle of the seal to compress the wave spring until the ball is fully engaged. Be cautious during this process, knowing that excessive force may damage the ball. Keep the ball in the engaged position going forward.
 - Continue to check the ball's position and re-center if necessary during actuator mounting and packing adjustments.

HD Ball Seal Lubrication

To assist with break-in of the HD seals, it is required that the ball and seal be lubricated with dry film lubricant or equivalent moly disulfide.

Bearing and Ball Maintenance

⚠ WARNING

Before performing the steps in this section, observe the **WARNING** at the beginning of the Maintenance section of this manual.

For DN 80 through 250 (NPS 3 through 10):

Procedures for disassembly and assembly of the bearings and ball cannot be accomplished until the shaft and valve packing are removed from the valve.

Refer to the Replacing Packing procedures to remove the actuator, and to remove the packing flange and packing follower from the valve. When the packing disassembly steps are complete, return to this section.

Disassembly

⚠ WARNING

When the actuator is removed from the valve, the ball/shaft assembly may suddenly rotate, with a shearing, cutting motion, which could result in personal injury. To avoid injury, carefully rotate the ball to a stable position at the bottom of the valve body cavity. Make sure the ball will not rotate.

Key numbers in this procedure are shown in figures 6, 17, and 18, unless otherwise indicated.

1. For DN 80 and 100 (NPS 3 and 4), seal protector ring (key 3) and HD seal (key 5) should be removed first, refers to procedure of Removing HD Seal on page 12. For DN 150, 200, and 250 (NPS 6, 8, and 10), HD seal will be removed after ball (key 2) is removed in this procedure.
2. A taper key (key 4) is used to connect the ball and drive shaft in DN 80 through 250 (NPS 3 through 10) valves.
3. Carefully rotate the ball to the open position after the actuator is disconnected. Make sure the ball will not rotate (see warning above). Provide support for the ball during the following disassembly.
4. Working from the small end of the groove pin (key 7), use a pin punch to drive the groove pin out of the ball ear and follower shaft.

For tack welded taper keys, driving the taper key out of the ball ear will shear the tack welding.

5. Locate the small end of the taper key (key 4). Using a pin punch on the smaller end of the taper key, drive it out of the ball (key 2) and drive shaft (key 6). Note: driving the taper key in the wrong direction will tighten it.
6. Pull the drive shaft (key 6) out of the actuator side of the valve body.

CAUTION

Exercise care to avoid damaging components in the following procedure.

7. The ball will be free to move when both shafts are removed. Make sure the sealing surface of the ball is not damaged while removing the follower shaft.
8. Use a piece of continuous threaded rod as a removal rod when moving the follower shaft (key 9) into the center of the ball. Refer to table 5 for a description of the size threaded rod needed. The length of the rod should allow easy working room from the valve body.

Table 5. Continuous Threaded Rod

Valve Size, DN	Valve Size, NPS	Threaded Rod Thread Size	Thread Depth in Follower Shaft, Inch
80	3	1/4-20	0.5
100	4	1/4-20	0.5
150	6	1/4-20	0.5
200	8	5/16-18	0.62
250	10	5/16-18	0.62

9. Carefully remove the follower shaft.
10. For DN 80 and 100 (NPS 3 and 4), the ball (key 2) should be removed from the inlet opening of the valve body. Lift the ball to clear the bearings (key 10). Engage the ball drive shaft side ear with the body as shown in figure 8 and carefully lift the ball by the follower side ear to remove.

For DN 150, 200, and 250 (NPS 6, 8, and 10), the ball (key 2) should be removed from the outlet opening of the valve body. Lift the ball to clear the bearings (key 10). Engage the ball drive shaft side ear with the body as shown in figure 9 and carefully lift the ball by the follower side ear to remove.

11. The bearings are not pressed in, so they can be removed with minimal force. Be careful not to damage the machined surfaces of the bearing bore if prying is required.

For HD seal removal, follow the steps outlined under Removing HD Seal of this manual.

Figure 8. DN 25 and 100 (NPS 1 through 4) Ball Removal

Figure 9. DN 150, 200, and 250 (NPS 6, 8, and 10) Ball Removal

Assembly

1. Inspect all sealing surfaces to ensure they are in good condition and without scratches or wear.

For DN 150, 200, and 250 (NPS 6, 8, and 10), install the HD ball seal. See Installing the HD Seal of this manual and follow steps 1 through 4. Then return to this procedure and continue with the next steps.

2. Install the replacement bearings (key 10) by hand. The bearing flanged end should touch the valve body.

3. **Installing the Vee-Ball:** Lubrication will assist with break-in of the HD metal seals and with assembly. It is required that both the ball surface and seal be lubricated with dry film lubricant or equivalent moly disulfide.

⚠ WARNING

The ball might be damaged if it is allowed to fall into the valve body. To avoid personal injury or damage to the sealing surfaces, support the ball to prevent it from falling into or out of the valve body cavity.

Place the valve body on a table or bench.

- For DN 80 and 100 (NPS 3 and 4), the ball (key 2) should be installed from the inlet opening of the valve body. The follower shaft (key 9) should be inserted into the ball before the ball is installed. Engage the ball drive shaft side ear with the body as shown in figure 8 then lower the follower side ball ear into the body and position the ball between the bearings.
 - For DN 150, 200, and 250 (NPS 6, 8, and 10), the ball (key 2) should be installed from the outlet opening of the valve body. Engage the ball drive shaft side ear with the body as shown in figure 9 then lower the follower side ball ear into the body and position the ball between the bearings.
4. **Installing the Follower Shaft (key 9):**
 - For DN 80 and 100 (NPS 3 and 4), the follower shaft (key 9) should already have been inserted into the ball before the ball was put into the valve body. Insert the follower shaft (key 9) into the valve body bearing (key 10).
 - For DN 150, 200, and 250 (NPS 6, 8, and 10), with the ball rotated open and not in contact with the HD seal, insert the follower shaft (key 9) through the ball, and into the valve body bearing (key 10).
 5. Align the hole in the follower shaft with the holes in the ball. Insert the small end of the groove pin (key 7) into the hole in the ball and into the follower shaft. The pin will hold the parts in place while the drive shaft (key 6) is being installed.
 6. **Installing the Drive Shaft (key 6):**

CAUTION

The drive shaft must be used with the correct Vee-Ball. Refer to the tag (see figure 10) attached to the Vee-Ball and to the drive shaft.

Failure to use the correct Vee-Ball/shaft combination may result in the ball not being in the position indicated by the slash mark on the end of the shaft. If the ball is not properly aligned with the slash mark, the valve will not function correctly and seal damage may result.

Make sure the drive shaft is free of oil or grease, otherwise the taper pin or taper key will not seat properly. Failure to properly set the taper pin or taper key could result in it coming loose while in service. Loosening of the taper key in service could result in improper valve function and equipment damage.

Figure 10. Informational Tag

7. Install the drive shaft (key 6) into the valve body through the valve body bearing and into the ball.
8. Insert the taper key (key 4) into ball and drive shaft (keys 2 and 6) as shown in figure 11. The taper key inserts with the flat side of the key facing the drive shaft (key 6).
9. Using a flat end punch, drive the groove pin (key 7) into the ball ear and follower shaft until it is flat with the ball ear surface. Stake both ends of the pin hole with a center punch to ensure the groove pin does not come out.
10. Using a flat end punch, drive the taper key (key 4) into the ball ear and drive shaft (key 6) until solid, heavy contact is obtained between the key and shaft.
11. Measure the position of the taper key head.
12. Drive the taper key in further using the minimum distance shown in table 6.
13. Inspect the ball/shaft taper key connection to verify that the taper key spans the entire shaft flat width. If not, the taper key must be driven in further until this condition is satisfied. However, do not exceed the maximum depths shown in table 7.

Note

All valve taper keys are tack welded, except titanium.

14. When the above conditions are met, tack weld the taper key (key 4) to the ball ear on the head end of the key (see figures 17 and 18). Use a:
 - 1/8-inch diameter weld on DN 80, 100, and 150 (NPS 3, 4, and 6) valves
 - 3/16-inch diameter weld on DN 200 and 250 (NPS 8 and 10) valves
15. Use the pry bar or similar tool to move the ball tightly against the bearing on the actuator side of the valve to help ensure correct side-to-side centering of the ball (key 2) on the seal (key 11). See figure 5.
16. Be sure that the HD seal is fully installed in the valve. Carefully rotate the ball to engage the HD seal while applying force across the middle of the seal to compress the wave spring until the ball is fully engaged. Be cautious during this process, knowing that excessive force may damage the ball. Keep the ball in the engaged position going forward.

17. Continue to check the ball's position and re-center if necessary during actuator mounting and packing adjustments.

For all constructions, refer to Packing Maintenance, and other procedures as necessary to complete the assembly of the valve.

Figure 11. Taper Key Installation

Table 6. Taper Key Minimum Depth

Valve Size, DN	Valve Size, NPS	Minimum Depth To Drive Taper Key After Initial Solid Contact, mm (Inches)
80, 100, 150	3, 4, 6	4.8 (0.188)
200, 250,	8, 10,	5.6 (0.219)

Table 7. Taper Key Maximum Depth

Valve Size, DN	Valve Size, NPS	Maximum Depth To Drive Taper Key After Initial Solid Contact, mm (Inches)
80, 100	3, 4	7.1 (0.281)
150	6	7.9 (0.312)
200, 250	8, 10	9.5 (0.375)

DN 25 through 50 (NPS 1 through 2) Valves

Procedures for disassembly and assembly of the bearings and ball cannot be accomplished until the ball seal and valve packing are removed from the valve.

Refer to the Replacing Packing procedures to remove the actuator, and to remove the packing flange and packing follower from the valve. When the packing disassembly steps are complete, return to this section.

Refer to the Replacing the Ball Seal procedures to remove the ball seal from the valve.

Disassembly

⚠ WARNING

When the actuator is removed from the valve, the ball/shaft assembly may suddenly rotate, with a shearing, cutting motion, which could result in personal injury. To avoid injury, carefully rotate the ball to a stable position at the bottom of the valve body cavity. Make sure the ball will not rotate.

Key numbers in this procedure are shown in figures 6 and 16 unless otherwise indicated.

1. A taper pin (key 4) is used in the DN 25, 40, and 50 (NPS 1, 1-1/2, and 2) valves.

CAUTION

Exercise care to avoid damaging components in the following procedure.

Table 8. Continuous Threaded Rod

Valve Size, DN	Valve Size, NPS	Threaded Rod Thread Size	Thread Depth in Follower Shaft
25	1	1/4-20	0.5
40	1.5	1/4-20	0.5
50	2	1/4-20	0.5

2. Carefully rotate the ball to the open position after the actuator is disconnected. Make sure the ball will not rotate (see warning above). Provide support for the ball during the following disassembly.
3. Working from the small end of the groove pin (key 7), use a pin punch to drive the groove pin out of the ball ear and follower shaft.
4. Locate the small end of the taper pin (key 4, figure 11). Using a pin punch on the smaller end of the taper pin, drive it out of the ball (key 2) and drive shaft (key 6). Note: driving the taper key in the wrong direction will tighten it.
5. Pull the drive shaft (key 6) out of the actuator side of the valve body.

Note

Figure 17 shows the informational tag that is attached with the new ball/shaft assembly when shipped as a spare part.

Figure 12. Informational Tag

CAUTION

Exercise care to avoid damaging components in the following procedure.

6. Make sure the sealing surface of the ball is not damaged while removing the follower shaft.
 - a. Use a piece of continuous threaded rod as a removal rod when moving the follower shaft (key 9) into the center of the ball. Refer to the table 8 for a description of the size threaded rod needed. The length of the rod should allow easy working room from the valve body.
7. Remove the ball (key 2) by carefully removing the follower shaft and ball from the valve body. See figures 8 and 9.
8. Remove the bearings (key 10) by hand. If the bearings are tight in the valve body, then pull or drive them out with a slight pressure.
9. Thoroughly clean surfaces of all parts that are to be re-used or obtain replacement parts.

Assembly

1. Inspect all sealing surfaces to ensure they are in good condition and without scratches or wear.
2. Install bearings (key 10) by hand. The bearing flanged end should touch the body.
3. Installing the ball (key 2):

⚠ WARNING

The Vee-Ball might be damaged if it is allowed to fall into the valve body. To avoid personal injury or damage to the sealing surfaces, support the ball to prevent it from falling into or out of the valve body cavity.

Carefully install the ball into the valve body cavity.

After you have installed the ball (key 2) into the valve body assembly, firmly support the ball while installing the shafts.

4. Installing the follower shaft (key 9):

- For DN 25 through 50 (NPS 1 through 2) valves: The follower shaft (key 9) should already have been inserted into the ball before the ball was put into the valve body. Insert the follower shaft (key 9) into the valve body bearing (key 10).

5. Installing the Drive Shaft for Valves with Taper Pins

CAUTION

Make sure the drive shaft is free of oil or grease, otherwise the taper pin will not seat properly. Failure to properly set the taper pin or taper key could result in it coming loose while in service. Loosening of the taper key in service could result in improper valve function and equipment damage.

6. Insert the drive shaft into the valve body bearing (key 10), and into the ball ear . Align the hole in the drive shaft with the holes in the ball.
7. Insert the taper pin into the ball and drive shaft as shown in figure 13. The small end of the taper pin must be inserted into the larger hole side of the ball ear, and into the large hole side of the drive shaft.

Note

The taper pin will not fit correctly if inserted in the wrong direction through the ball ear or through the drive shaft. Make sure the drive shaft and ball ear are in the correct orientation for installing the pin.

- Installing Taper Pins in DN 25, 40, and 50 (NPS 1, 1-1/2, and 2) Valves

Note

For DN 25, 40, and 50 (NPS 1, 1-1/2, and 2) valves, the taper pins (figure 13) do not require welding.

Using a flat-end punch, drive the taper pin into the ball ear and drive shaft until solid heavy contact is felt. Make sure the taper pin spans the width of the ball.

Using a flat end punch, drive the groove pin (key 7) into the ball and follower shaft until it is flat with the ball surface.

Figure 13. Taper Pin Installation

A6033-1

Actuator Mounting

Use the appropriate actuator instruction manual, this section of this manual, and figure 14 of this manual when mounting the actuator or changing actuator styles and positions.

1. To help ensure correct centering of the Vee-Ball (key 2) on the seal (key 11), be sure the ball is closed when mounting the actuator (for applications other than Spring Return Fail-Open).
2. Clean the valve shaft and actuator lever splines to be sure the actuator lever will slide on easily. Only drive the lever in if absolutely necessary.
3. Carefully wedge the ball solidly against the actuator-side bearing, using a pry bar or similar tool inserted between the lower ear of the ball and the valve body. This will center the ball. See figure 5.
4. Keep the wedge in place while installing the lever, if necessary. Remove the wedge after you have clamped the actuator lever on the valve shaft and have connected the lever to the actuator piston rod or diaphragm rod.

Determining Mounting Position

The actuator can be either right or left-hand mounted, with the actuator on the right or left side when viewed from upstream (see figure 14).

The Series B Vee-Ball has one V-notch. For **right-hand mounting (standard)**, the ball will be in the top of the valve body when the valve is open and the shaft is horizontal. In this position the ball rotates CCW to Close. For **left-hand mounting (standard)**, the ball will be in the bottom of the valve body when the valve is open and the shaft is horizontal. In this position the ball rotates CCW to Close. An optional ball for **left-hand mounting**, which rotates into the top of the valve body when the shaft is horizontal, is also available. In this position the ball rotates CW to Close.

(DN 25 and 50) NPS 1 through 2 has two notches and can be rotated in either direction.

Determining Closed Position

1. The valve must be removed from the line to check the position of the ball.

WARNING

The Vee-Ball closes with a shearing, cutting motion. To avoid personal injury, keep hands, tools, and other objects away from the ball while stroking the valve.

2. Rotate the ball to the closed position.
3. Position the ball in the proper location:

For Series B: When viewed from the valve body inlet, the ball is in the proper position when the flat spot on the top of the ball is exactly in the center of the seal package.

Make a copy of the centering template in figure 15 out of a suitable stiff material. Place the centering template in the opening at the seal (see figure 15). Find the center of the template and make sure the spot on the ball is centered directly below it.

For DN 25, 40, and 50 (NPS 1, 1-1/2, and 2) valves: Follow one of the following procedures:

- When viewed from the valve body inlet, the ball is in the proper position when both V notches of the ball are centered between the machined diameter of the ledge that supports the seal.
- If the ball has a spot machined on the top, align that spot to the exact center of the seal cavity.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D104548X012

V200U Valve

July 2021

- Adjust the actuator as described in the appropriate actuator instruction manual until the ball is centered in the closed position. A line is stamped on the actuator end of the drive shaft (see figure 14) to indicate the ball position.

Use the appropriate actuator instruction manual and figure 14 when mounting the actuator or changing actuator styles and positions.

Figure 14. V200U Index Marks for Actuator Lever Orientation

ACTUATOR		VALVE OPEN	ACTUATOR POSITION			
MOUNTING	STYLE		1	2	3	4
(STANDARD) RIGHT-HAND BALL ROTATES COUNTER-CLOCKWISE TO CLOSE	STYLE A PUSH DOWN TO CLOSE					
	STYLE B PUSH DOWN TO OPEN					
(STANDARD) LEFT-HAND BALL ROTATES COUNTER-CLOCKWISE TO CLOSE	STYLE C PUSH DOWN TO OPEN					
	STYLE D PUSH DOWN TO CLOSE					
(OPTIONAL) LEFT-HAND BALL ROTATES CLOCKWISE TO CLOSE	STYLE C (2) PUSH DOWN TO CLOSE					
	STYLE D PUSH DOWN TO OPEN					
NOTE: 1. ARROW ON LEVER INDICATES DIRECTION OF ACTUATOR THRUST TO CLOSE VALVE. 2. THE OPTIONAL LEFT-HAND ORIENTATION IS NOT AVAILABLE FOR MICRO-NOTCH VEE-BALLS.

Parts Ordering

A serial number is assigned to each valve and stamped on the nameplate. Always refer to the valve serial number when corresponding with your [Emerson sales office](#) regarding spare parts or technical information. When ordering replacement parts, also specify the key number, part name, and desired material using the parts list.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they will void your warranty, might adversely affect the performance of the valve, and could give rise to personal injury and property damage.

Retrofit Kits for ENVIRO-SEAL Packing

Retrofit kits include parts to convert existing V200U valves with shallow (single packing depth) packing box to the ENVIRO-SEAL packing box construction. Retrofit kits include single PTFE packing. See following table.

ENVIRO-SEAL Packing Retrofit Kits

SHAFT DIAMETER ⁽¹⁾		PART NUMBER	
mm	Inches	Single PTFE	Graphite
12.7	1/2	RRTYXRT0012	RRTYXRT0312
15.9	5/8	RRTYXRT0022	RRTYXRT0322
19.1	3/4	RRTYXRT0032	RRTYXRT0332
25.4	1	RRTYXRT0052	RRTYXRT0352

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and operation information for the Fisher Yarway AT-18/28, AT-38/48, and TempLow 4300 variable orifice desuperheaters. Refer to separate instruction manuals for information on the actuator and accessories.

Figure 1. Fisher Yarway Desuperheaters

Table 1. Specifications

Available Types Forged Design: Yarway AT-18/Yarway AT-28, Fabricated Design: Yarway AT-38/Yarway AT-48, Cast Design: Yarway TempLow 4300 series Common Characteristics: ■ Desuperheaters with ASME flange connections are designed according to ASME B16.34 – Valves Flanged, Threaded, and Welding End ■ Desuperheaters with EN flange connections are designed in accordance with EN12516 – Industrial Valves-Shell Design Strength Body Style and Flow Direction Angle Body and Flow Down Configurations⁽¹⁾ and Valve Size: See table 1 and figures 10, 11, and 12 End Connections Styles^(1,2) See table 1 Maximum Inlet Pressure and Temperature⁽¹⁾⁽²⁾ Consistent with ASME B16.34 and EN1092-1, unless limited by maximum pressure drop or material temperature capabilities Pressure Drop⁽¹⁾ Min pressure drop depends on nozzle selection (1 or 2 bar) 1 to 59 Bar: A to D_x nozzles in S41000 stainless steel 2 to 59 Bar: E to K nozzles in S41000 stainless steel 60 to 100 Bar: Alloy 6 material nozzle Pressure Drop Limitation: 100 Bar⁽³⁾	Shutoff Classifications per ANSI/FCI 70-2 and IEC 60534-4 Standard: Class V Flow Coefficients See Yarway AT-18/28, AT-38/48 and TempLow 4300 Insertion Style Desuperheater Bulletin (D104714X012) Packing Arrangements Single Graphite Nozzle Material Selection See Yarway AT-18/28, AT-38/48 and TempLow 4300 Insertion Style Desuperheater Bulletin (D104714X012) Material Temperature Capabilities⁽¹⁾ See table 2 Approximate Weight See table 3 Maximum Water Flow Capacity in Continuous Service Yarway AT-18 and AT-38: 25 m³/hr (110GPM) Yarway AT-28 and AT-48: 50 m³/hr (220GPM) Yarway TempLow 4300: 25 m³/hr (110GPM)
--	--

1. Do not exceed the pressure or temperature limits in the Yarway AT-18/28, AT-38/48 and TempLow 4300 Insertion Style Desuperheater Bulletin (D104714X012) nor any applicable code or standard limitations.

2. EN (or other valve body material) ratings and end connections can usually be supplied; consult your [Emerson sales office](#).

3. Consult your Emerson sales office for additional product options when maximum pressure drop exceeds 100 bar.

Do not install, operate, or maintain a Yarway AT-18/28, AT-38/48, and TempLow 4300 Desuperheater without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your Emerson sales office before proceeding.

Description

The Yarway AT-18/28 is a heavy duty A.T.-temp desuperheater with a forged body construction is specially designed for use on medium to high-pressure steam applications. The design is adaptable to various boiler codes and material specifications. The piston and stem are nitrided to give long life and galling resistance. Piston rings are specially hardened and subsequently nitrided and are provided with a special liquid tight slot. These rings offer running properties and enable controllable C_v (K_v) values as low as 0.005 C_v (0.0043 K_v).

The Yarway 38/48 is a standard duty A.T.-temp desuperheater is developed for use on low to medium pressure applications. The fabricated construction makes it easily adaptable to meet various boiler codes and material specifications. The unit can also be used as a liquid into gas injector for which high grade alloy such as stainless steel is often used. The vital trim components are similar to those used in Yarway AT-18/28 heavy duty A.T.-temp desuperheaters.

The Yarway TempLow 4300 desuperheater comes in standard constructions. The cast body mounts through a 3-inch flange in the steam line and is available in a wide variety of characteristics. Water pressure 3.5 to 100 bar (50 to 1450 psi) above steam pressure is employed to generate thin-film, conical sprays which are injected into the steam flow through a series of vortex spray nozzles. The fine spray evaporates rapidly in the steam, thereby minimizing the tendency for spray water to accumulate in the line.

Principle of Operation

Fisher Yarway AT-18/28, AT-38/48, and TempLow 4300 Desuperheaters can be used in many applications to efficiently reduce the temperature of superheated steam to the desired set point. These desuperheaters are of insertion style with angle body design and integrated spray water control. General applications are:

- Cooling of process steam or gas
- Boiler superheater attemperator
- Boiler reheater attemperator
- Auxiliary steam desuperheating (e.g. steam let down stations)

The Fisher Yarway AT-18/28, AT-38/48, and TempLow 4300 Desuperheaters regulate the amount of injection water by varying the number of open injection spray nozzles. This enables the water pressure at the nozzles to remain constant, independent of the number of injection nozzles in operation. This results in a near uniform spray over the entire operating range. Control of the nozzle opening is achieved by the positioning of a piston which is operated directly by an actuator mounted on the desuperheater. Because of this feature, a separate spraywater control valve is not required.

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the desuperheater is installed where service conditions could exceed the limits given in table 1 or on the nameplate. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

When ordered, the desuperheater configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and fluid conditions. Do not apply any other conditions to the desuperheater without first contacting your [Emerson sales office](#)

System Considerations

Note

The desuperheater water supply should be of good quality, clean and filtered – for example, boiler feed water – and should have a constant pressure as specified in the order documents. Each water supply line should be protected with its own individual strainer, Emerson recommends a strainer with a mesh size of approximately 100 mu (400 mu upon request) in the water supply line to protect the Desuperheater from clogging.

- Where there are positive shut-off components in the water supply, including electric actuators, then a safety relief valve of an approved type should be fitted.
- A straight run of pipe is required downstream of the desuperheater to ensure complete vaporization of the cooling water. Consult the desuperheater sizing sheet for installation recommendations, including the recommended straight pipe distance required.
- A temperature sensor should be mounted in accordance with the manufacturer's instructions. The recommended distance from the desuperheater to the temperature sensor changes with the velocity and percentage of spraywater required. Consult the desuperheater sizing sheet for installation recommendations, including the recommended distance required before the temperature sensor.
- Allow no branching out from the steam line, to divide or to add to the steam flow, between the temperature sensor and the desuperheater.

A typical control loop is illustrated in figure 2. A temperature sensor generates a signal (pneumatic or digital) through a transmitter. This signal is transmitted to the positioner on the desuperheater. The positioner output signal is piped to the actuator, which strokes the desuperheater governing the amount of spraywater flow.

Figure 2. Typical Control Loop with the Yarway Desuperheater

Preliminary Checks

1. Check that the information on the documentation, identification plate, and tag number complies with the order specification.
2. Check the desuperheater, actuator and accessories for any visible damage.
3. Remove the desuperheater carefully from its packaging, lifting by appropriately positioned straps around the body.

⚠ WARNING

To prevent personal injury and damage to equipment, do not use the water inlet connection, yoke, actuator or any of its accessories for lifting.

4. Leave the flange covers in place during transportation, until ready to install in the piping.

Mounting Considerations

⚠ WARNING

Personal injury could result from packing leakage. Packing was tightened prior to shipment. However, some readjustment will be required to meet specific service conditions.

- When installing the desuperheater, use gaskets and bolting material in accordance with the relevant piping code.
- Place the gasket onto the mounting flange and carefully insert the nozzle into the branch pipe.
- Ensure that the spray cylinder is pointed in the direction of the steam flow before tightening the mounting bolts. Reference figure 3 for water flange positions.

Figure 3. Yarway Desuperheater Water Flange Positions

Note

The desuperheater should be free of forces, moments, and torques.

- The desuperheater is provided with a lower body length, as specified in the general arrangement drawing and the mounting branch for the steam pipework must be manufactured to suit.
- The length of the T-dimension in figure 4, should be such that, the centerline of the spray cylinder is located on the centerline of the steam pipe (figure 6).
- The mounting branch should be NPS 3 (DN 80) or NPS 4 (DN 100) nominal bore, maximum pipe schedule 160 for clearance purposes (check the applicable power piping code).

Figure 4. Yarway Desuperheater T Dimension

Figure 5. Yarway Desuperheater Mounting Orientations

- The "vertical-up" position is preferred for the valve stem and actuator.
- Consult actuator documentation for assistance in actuator assembly.
- Installation may be in vertical or horizontal, but the direction of water injection should always be with the steam flow.
- The desuperheater may be mounted at 90° to the steam pipe, for all steam flow orientations, but avoid installation in the vertically downwards position, wherever possible.

Note

Horizontal oriented desuperheater must be installed with a support for weight compensation. Consideration must be given to supporting the actuator.

Maintenance

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the desuperheater.
- Use bypass valves or completely shut off the process to isolate the desuperheater from process pressure. Relieve process pressure from both sides of the desuperheater. Drain the process media from both sides of the desuperheater.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Nozzle Maintenance

Note

The spray cylinder is an assembly. Do not completely disassemble the individual nozzles.

Inspection Considerations

When subjected to normal operating conditions, thermal cycling does occur and temperature differentials at the desuperheater are usually the highest in the plant, it is possible that wear, blockage, and/or weld fatigue will occur to the desuperheater body or nozzle assembly.

- Wear is defined as any nicks, cuts, or gouges.
- Erosion/corrosion is defined as any form of rust or erosion of the metal on the nozzle.
- Blockages are defined as small particulate trapped within the nozzle.
- Weld fatigue is defined as appearance of cracks.

Spray cylinder (key 1), fastener ring (key 4), piston/stem assembly (key 3) and piston rings (key 2) are to be considered wear parts. During regularly scheduled maintenance (table 4), visually inspect the desuperheater welds for cracks and inspect nozzles for wear and blockage. Poor performing nozzles or nozzle failure is typically caused by wear, corrosion, erosion, and/or blockage. The following instructions will help to determine if any of these problems are present and provide a recommended course of action for each.

Table 4. Recommended Inspection and Replacement Schedule

Key	Part Name	Recommended Inspection	Recommended Replacement
1	Yarway Spray Cylinder	Inspect after first year of service and once every two years thereafter.	Once every 5 years of service
2	Piston Rings	N/A	Any time the unit is disassembled. Once every 5 years of service
3	Piston/Stem Assembly	N/A	Once every 5 years of service
4	Fastener Ring and Tack Welds	After first year of service	Once every 5 years of service
See Parts List	Packing Components	See Parts List	Any time the unit is disassembled

Inspection Procedure

⚠ WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

Disassembly Procedure

1. Disconnect all external connections. Consult actuator documentation for assistance in actuator removal.
2. Ensure that there is no residual pressure in either the steam or water lines.
3. Loosen steam flange and water flange bolting, but vent connections before complete removal.
4. The desuperheater may now be removed from the system.
5. Carefully lift the desuperheater using accepted lifting and rigging practices. Follow the lifting warning and instructions provided in the Preliminary Checks section. Ensure all accessories and all sealing surfaces are protected from damage during lifting.
6. Disassemble when in the horizontal position with the body extension section secured.

Disassembly Procedure

1. Mark the body extension (key 5) and the spray cylinder (key 1) with witness marks to ensure proper alignment at reassembly.
2. Grind off the nozzle tack welds. Make sure that the weld is removed sufficiently to allow rotation of the fastener ring (key 4) without damage.
3. Unscrew the fastener ring (key 4).
 - For AT-18/28 and AT-38/48 unscrew the fastener ring counter clockwise.
 - Threading on the body extension is right handed (key 5).
 - For TempLow 4300 unscrew fastener ring clockwise.
 - Threading on the body extension is left handed.

Note

If difficulties are encountered with the removal of the fastener ring (key 4), then the fastener ring may be removed by grinding through at two diametrically opposite points. Do not damage the body and spray cylinder threading.

Spray Cylinder Inspection

1. Inspect the condition of the cylinder internally.

- **Wear** is defined as any nicks, cuts, or gouges of the nozzle, especially in or around the orifice.
- **Erosion/corrosion** is defined as any form of rust or erosion of the metal on the nozzle.
- **Blockages** are defined as small particulate trapped within the nozzle orifice.

If any of the preceding problems are present, replacement of the spray cylinder is recommended. If not, proceed to step 2.

2. Scratches and blemishes may be removed by either polishing or honing. The cylinder bore should not exceed 32 mm (1.25 in) with a maximum eccentricity of 0.25 mm (0.009 in).
3. Debris can be removed from the nozzles by blowing through with compressed air.
4. Inspect the nozzle atomizer outlet holes. These should not show any undue elliptical wear, roughness or damage. If any are over-sized or non circular in shape, the nozzle will need to be replaced.
5. Carefully clean the cylinder threading. Where necessary, dressing with a small file.
6. Inspect seating surface. The seating surface should be clean and free from cuts, gouges or wire drawing. A proper seat shows a narrow concentric lapped seating band.
7. Clean the spray cylinder to remove scale. Thoroughly rinse.

Body Extension Inspection

1. Examine the threading on the body extension. Where necessary, dressing with a small file. If the threading is damaged, then weld repair may be possible. Contact your [Emerson sales office](#) for more information.

Piston and Stem Assembly Inspection

1. Remove the piston and stem (key 3). The piston and stem are always supplied as a complete assembly.
2. Inspect the piston for wear and tear.
3. Replace piston rings (key 2) any time that the unit is disassembled.

Note

Take care not to overstress the piston rings when fitting. The rings are marked 'top' and should always point in the direction of the packing box, for proper functioning.

4. Examine the condition of the stem. Where it runs in the packing box, remove any graphite with a fine grade emery cloth, polishing in the longitudinal direction.
5. The stem disc and seat may be lapped using a lapping compound to repair.

Packing Box Inspection

1. Remove all rings, lantern ring and packing material from the valve body.
2. Clean the packing box carefully, using a rotating wire brush and/or honing device.
3. Inspect the packing box and stem for straightness, wear, scratches, pitting and other abnormalities which would prevent establishment of a good seal around the packing.

4. If a spacer is supplied with this packing or if a spacer was removed from the packing box, make sure it is installed first. If one end of the spacer is chamfered, install chamfered end down so that it sits at bottom of packing box.

Note

Cleanliness of the packing area is vital for proper valve sealing. Do not use grease or lubricants in combination with graphite packing.

Reassembly

Reference installation content where needed in the subsequent sections of this Instruction Manual.

Packing Set Installation

Note

Packing (see Parts List) is supplied as a complete set and rings should be in same order as packaged in the set.

1. Install one ring at a time using a packing driver or gland bushing. Measure the depth of the packing box before and after ring insertion to be certain that it has traveled to the bottom of the packing box. Each ring must be seated individually with a packing driver. Pre-compression of each ring during installation is very important for the tightness of the seal.

NOTICE

Do not use screwdriver or other sharp object to install the packing. This could damage the packing and/or stem. If a packing driver is used, make sure that the diametrical clearances between the inner dimension (ID) of the driver and outer dimension (OD) of the stem and the OD of the driver and ID of the stuffing box do not exceed 0.5 mm (0.020 inch).

2. Stagger the joints (if present) on each successive ring 180° apart.
3. Check packing rings for proper fit. They should be push fit into packing box.

Note

Do not over compress the packing. The amount of compression should be only that which is required to the install the correct number of rings into the stuffing box. Compression of the packing in a partially filled packing box, to make room for the rest of the packing, can be accomplished using the gland bushing and taking up on the gland nuts.

4. After all packing rings are installed, thoroughly lubricate the studs and insert the packing follower and the packing flange (see Parts List).
5. Tighten the hex nuts to 45 N • m

Spray Cylinder Reassembly

1. Apply a thin coating of the lapping compound to the piston rings to prevent scoring. Position the slots in the piston rings (key 2), such that they are at 120° to each other.
2. Lapping spray cylinder (key 1) / seat surfaces (key 5) together. Use a fine grade polishing paste to lap the seating area of cylinder and body extension. The seal is metal to metal so a concentric seat area is vital.

Figure 6. Lapped Surfaces

3. Clean lapped surfaces before mounting.

Note

Always use a new fastener ring.

4. Mount fastener ring on the spray cylinder.
5. Mount fastener ring and spray cylinder on the body.
 - For AT-18/28 and AT-38/48 screw the fastener ring clockwise.
 - Threading on the body extension is right handed (key 5).
 - For TempLow 4300 screw the fastener ring counter-clockwise.
 - Threading on the body extension is left handed.

Note

For a two-column cylinder, the middle of two columns needs to be the centerline of spray cylinder when aligning with the water flange position, (figure 7). For a three-column cylinder, the middle column needs to be the centerline of spray cylinder when aligning with the water flange position.

Figure 7. Two-Column Spray Cylinder

Figure 8. Three-Column Spray Cylinder

6. Center spray cylinder. The gap at both side of fastener ring should be equal. 0.4 mm (1/64 inch) minimum, (figure 9).
7. Align spray cylinder with reference to water flange according to required position in general arrangement drawing, (figure 3 and 5).
8. Once positioned with reference to water flange, align the centerline of the spray cylinder.
9. Tighten fastener ring (key 4).
10. Tackweld between fastener ring and spray cylinder. Tackweld fastener ring and body to prevent unthreading. Place multiple welds around the unit (see figure 9).

Figure 9. Tackweld Details

GF14394

Troubleshooting

The following guide (table 2) is a basic first line troubleshooting guide. Contact your [Emerson sales office](#) for assistance if you are unable to resolve your field operation problem.

Table 2. Fisher Yarway AT-18/28, AT-38/48, and TempLow 4300 Desuperheater Troubleshooting

Problem	Reason	Possible Solution
Low temperature	Valve cycling, low system flow, valve throttling too close to seat	Reduce water pressure. Must be steam saturated pressure plus 50 psi
	Controller action reversed	Check system signal sense
	Water pressure too high	Reduce inlet water pressure
	Valve does not shut off	1. Check valve stroke 2. Check Instrument Signal (IS) shutoff point
	Valve seat leakage indicated	Secure system and evaluate seat leakage
High temperature, no control	Water pressure at valve inlet less than specified	1. Open water valve 2. Blow down strainer 3. Check supply pressure
	Air pressure to actuator/positioner	1. Air pressure too low. Adjust to 40-50 psi 2. Clean air set filter 3. Blow down air supply line 4. Check for moisture in instrument air
	Water pressure at valve as specified	1. Check valve stroke 2. Check water temperature 3. Check for valve plugging 4. Check water quality
Hunting or limit cycling	Temperature setpoint too close to saturation pressure temperature	1. Increase temperature (steam superheat) 2. Evaluate and readjust controller action
	Temperature controller tuning not correct	1. Positioner arm link bent, loose or binding
	Valve binding or friction	1. Check packing adjustment (some leakage expected) 2. Check packing gland/stem clearance 3. Use correct original type packing 4. Review positioner calibration 5. Check instrument air supply pressure

Parts Ordering

Each desuperheater is assigned a serial number that can be found on the desuperheater nameplate attached to the body or on a tag attached to the water pipe. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering a replacement parts, refer to the serial number and key number. The key numbers in figure 7, 8, and 9 can be used to help in part identification.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher Yarway desuperheater, because they may void your warranty, might adversely affect the performance of the desuperheater, and could cause personal injury and property damage.

X1962

Introduction

Scope of Manual

This instruction manual includes installation and operation information for the AT-25 Desuperheater.

Do not install, operate, or maintain a AT-25 Desuperheater without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The AT-25 Desuperheater offers efficient desuperheating in steam pipelines of NPS 16 and less. It is designed primarily for use in low-capacity superheated steam systems where the load is fairly constant. By utilizing a spray nozzle assembly that is removable from outside the desuperheater assembly, the AT-25 provides a venturi solution while maintaining a high level of serviceability.

Figure 2. Detail View of the Fisher Yarway AT-25 Desuperheater

Principle of Operation

Superheated steam flowing along the steam line enters the AT-25 Desuperheater throat, increasing its velocity, while reducing its pressure. This change from static to dynamic pressure is utilized to disintegrate the spraywater, injected from the spray nozzle within the venturi region. Directly after the throat area, the venturi profile is interrupted and the flow area drastically increased, resulting in intense turbulence and enhanced mixing of water and steam.

The outlet steam temperature is controlled by regulating the flow of cooling water by means of a conventional control valve. Spraywater flow is throttled as the control valve responds to the signal generated by the temperature control loop. The spraywater enters the desuperheater water connection and then continues into the spray nozzle. As the flow area is reduced, the spraywater accelerates through the injection point. The accelerated flow results in a fine spray for efficient and rapid evaporation.

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the AT-25 desuperheater is installed where service conditions could exceed the limits given in table 1 or on the nameplate. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

When ordered, the desuperheater configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and fluid conditions. Do not apply any other conditions to the desuperheater without first contacting your [Emerson sales office](#)

System Considerations

Note

The desuperheater water supply should be of good quality, clean and filtered – for example, boiler feed water – and should have a constant pressure as specified in the order documents. Each water supply line should be protected with its own individual strainer. For nozzle sizes N01 through N03, a mesh size of 40 is recommended. For nozzle sizes N04 and above, a mesh size of 20 is recommended.

- A straight run of pipe is required downstream of the desuperheater to ensure complete vaporization of the cooling water. Consult the desuperheater sizing sheet for installation recommendations, including the recommended straight pipe distance required.
- A temperature sensor should be mounted in accordance with the manufacturer's instructions. The recommended distance from the desuperheater to the temperature sensor changes with the velocity and percentage of spraywater required. Consult the desuperheater sizing sheet for installation recommendations, including the recommended distance required before the temperature sensor.
- Allow no branching out from the steam line, to divide or to add to the steam flow, between the temperature sensor and the desuperheater.

A typical control loop is illustrated in figure 3. A temperature sensor generates a signal (pneumatic or digital) through a transmitter. This signal is transmitted to the positioner on the spraywater control valve. The positioner output signal is piped to the actuator, which strokes the spraywater control valve governing the amount of spraywater flow.

Figure 3. Typical Control Loop with the AT-25 Desuperheater

Preliminary Checks

1. Check that the information on the documentation, identification plate, and tag number complies with the order specification.
2. Remove the AT-25 Desuperheater carefully from its packaging. Do not use the water inlet connection for lifting.
3. Before installation, check the AT-25 Desuperheater for any visible damage. Make sure that the protective covers are removed, and that butt weld ends and flange faces are clean and without blemish. Any damage to the unit should be reported immediately to your [Emerson sales office](#).

Mounting Considerations

- When installing the AT-25 Desuperheater, use gaskets and bolting material in accordance with the relevant piping code.
- To reduce the risk of spray nozzle clogging, it is recommended that the unit be installed with the water connection vertically upward.
- Buttweld AT-25 Desuperheaters should be welded inline using proper weld procedures.
- Post-weld heat treatment should be done with the pipeline filled with an inert gas (oxidation of the vena contracta area may lead to a significantly higher pressure drop over the AT-25 than calculated).
- Flush out the water line before connecting to the AT-25 Desuperheater mounting flange.
- For an installation example, see figure 3.

Note

The AT-25 Desuperheater should be free of forces, movements, and torques.

Maintenance

WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
 - Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
 - Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
 - Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
 - Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
-

Servicing

Although the AT-25 desuperheater is a simple design requiring very little maintenance, regular service intervals require removal of the spray nozzle assembly. It may also be necessary to service the unit in the event that the spray nozzle becomes clogged by debris. Prior to removal of the nozzle from the unit, ensure that the necessary gaskets and spare nozzles (if applicable) are available for rebuild if turnaround time for the repair is critical. Do not re-use the graphite gaskets. Review the drawing and specification sheet for clarification. If in doubt as to the construction, advise your [Emerson sales office](#) of the serial number and model number and ask for further clarification.

Service Item	Recommended Service Interval
Spray Nozzle Inspection	Every 18-24 months
Spray Nozzle Replacement	Every 24-36 months

Spray Nozzle Removal

1. Before removing the spray nozzle from the desuperheater, ensure that there is no residual pressure in either the steam or water lines.
2. Loosen the water flange bolts and disconnect the water supply line from the desuperheater water flange, taking care not to damage the water flange and nozzle mounting surfaces.
3. The spray nozzle may now be removed from the desuperheater.
4. Inspect the desuperheater sealing surfaces for damage. Repair if needed.

Note

If there is damage on the gasket surfaces that is too large for field repair, the unit may require replacement.

Spray Nozzle Inspection

1. Inspect the nozzle for excessive wear, erosion/corrosion, and/or blockage due to particulate.
 - Wear is defined as any nicks, cuts, or gouges of the nozzle, especially in or around the orifice.
 - Erosion/corrosion is defined as any form of rust or erosion of the metal on the nozzle.
 - Blockages are defined as small particulate trapped within the nozzle orifice.

If any of the preceding problems are present, replacement of the nozzle is recommended. If not, proceed to step 2.

2. Thoroughly flush the nozzle after inspection.

Spray Nozzle Installation

1. Verify that all flange and nozzle gasket mating surfaces are clean and free of damage.

Note

If there is damage on the gasket surfaces that is too large for field repair, the unit may require replacement.

2. Install a new gasket at the surface between the desuperheater water flange and the nozzle mating surface.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D104420X012

AT-25 VenTemp Desuperheater

July 2023

3. Insert the spray nozzle with the spray direction pointed in the downstream flow direction.
4. Install a new gasket at the surface between the nozzle mating surface and the water supply line flange.
5. Reconnect the water line flange connection. Use a high temperature nickel compound on the flange bolting.
6. After ensuring that the desuperheater is properly installed in the pipeline, the unit may be returned to service. The desuperheater should be monitored as the unit is brought online to ensure that there are no leaks in the connections.

Troubleshooting

The following guide (table 2) is a basic first line troubleshooting guide. Contact your [Emerson sales office](#) for assistance if you are unable to resolve your field operation problem.

Table 2. Fisher AT-25 VenTemp Desuperheater Troubleshooting

Problem	Possible Solution
Temperature setpoint is not reached	Check water source availability and pressure
	Check nozzle for plugging
	Make sure the set point is not below the saturation temperature
	Check to ensure full actuator stroke is reached
Temperature is below setpoint	Check temperature control loop – reset
	Check nozzle for fouling/poor spray pattern – clean/replace
	Check temperature sensor location – relocate per guidelines
	Tune control system parameters
Water in steam line	Temperature setpoint may be too close to saturation
	Check that steam traps are functioning properly
Water in steam line when steam line isolated	Review piping configuration for downstream tees and elbows
	Check for leakage of spraywater control valve

Parts Ordering

Each AT-25 desuperheater is assigned a serial number that can be found on the desuperheater body or on a tag attached to the water pipe. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering a replacement nozzle, refer to the serial number and key number. The key numbers in Figure 4 can be used to help in part identification.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts List

Note

Contact your Emerson sales office for Part Ordering information.

Key	Description
1*	Spray Direction Indicator
2*	Gasket
3	Water Flange
4*	Nozzle Pipe Assembly
5	Nameplate
6	Body
	If you need a valve body as a replacement part, order the valve size, Class and desired material. Contact your Emerson sales office.

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for NPS 1/2 through 8 YD and NPS 1/2 through 6 YS control valves. Refer to separate manuals for instructions covering the actuators and accessories.

Do not install, operate, or maintain YD or YS valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Table 1. Specifications

--	---

1. EN (or other) ratings and end connections can usually be supplied; consult your [Emerson sales office](#) or Local Business Partner.

2. The pressure or temperature limits in this manual, and any applicable standard limitations, should not be exceeded.

3. Certain bonnet bolting material selections may require a CL600 easy-e valve assembly to be derated. Contact your Emerson sales office or Local Business Partner.

Description

The YD and YS valves are three-way valves for throttling or on-off (flow switching) service with converging (flow mixing) or diverging (flow splitting) flow patterns. YS valves, when used in diverging service, are recommended for on-off applications only. These valves are generally shipped as part of a control valve assembly, having a diaphragm, piston, or manual actuator mounted on them. A typical construction is shown in figure 1.

Specifications

Specifications for the YD and YS valves are shown in table 1. Some specifications appear on the actuator nameplate if the valve is part of a complete control valve assembly.

Educational Services

emerson.com/fishervalvetraining

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure might result if the valve assembly is installed where service conditions could exceed the limits given in table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for overpressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#) or Local Business Partner.

Before installing the valve, inspect the valve and pipelines for any damage and any foreign material which may cause product damage.

1. Before installing the valve, inspect it for any shipping damage and for any foreign material in the valve body cavity.
2. Clean out all pipelines to remove pipe scale, chips, welding slag, and other foreign materials.
3. Use accepted piping and welding practices when installing the valve. For flanged valves, use suitable gaskets between the valve and the pipeline flanges.
4. Do not install the valve in a system where the working pressures exceed those specified in the ASME pressure/temperature ratings or those specified by Emerson Automation Solutions.
5. If continuous operation is required during maintenance and inspection, install a conventional three-valve bypass around the valve so that the valve can be isolated.
6. Orient the valve so that flow will be in the direction indicated by the flow arrows.

Note

The common port for the YD is the bottom port as shown on the flow direction plates (key 17) in figure 10. The common port for the YS is the left-hand port as shown on the flow direction plates in figure 9.

CAUTION

Depending on valve body materials used, post weld heat treating may be required. If so, damage to internal elastomeric and plastic parts, as well as internal metal parts is possible. Threaded connections may also loosen. In general, if post weld

heat treating is to be performed, all trim parts should be removed. Contact your [Emerson sales office](#) or Local Business Partner for additional information.

7. YD or YS control valves can be installed in any position, although the recommended position is with the actuator vertical above the valve. For NPS 4 and 6 YS valves, size 80 or larger actuators mounted between 45 degrees above and 45 degrees below horizontal should be supported. If forces other than normal gravitational forces are experienced, such as vibrational forces, smaller size actuators might also need to be supported when they are not in a vertical position. For further information, consult your Emerson sales office or Local Business Partner.

Table 2. Valve Body Sizes and End Connections

VALVES SIZE, NPS	CAST IRON VALVES	STEEL OR STAINLESS STEEL VALVES
1/2, 3/4	---	NPT screwed or socket weld
1	---	NPT screwed; CL150, 300, or 600 raised-face or ring-type joint flanged; butt welding; or socket weld
1-1/2, 2	NPT screwed; CL125 flat-face flanged; or CL250 raised-face flanged	NPT screwed; CL150, 300, or 600 raised-face or ring-type joint flanged; butt welding; or socket weld
2-1/2, 3, 4, 6	CL125 flat-face or CL250 raised-face flanged	CL150, 300, or 600 raised face or ring-type joint flanged; or butt welding
8	---	CL150, 300, or 600 raised face, ring-type joint, or butt welding

WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Valves with ENVIRO-SEAL live-loaded packing or HIGH-SEAL live-loaded packing will not require this initial re-adjustment. See the Fisher instruction manuals titled ENVIRO-SEAL Packing System for Sliding-Stem Valves or HIGH-SEAL Live-Loaded Packing System (as appropriate) for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the parts kit subsection near the end of this manual.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for trim maintenance, packing maintenance, and ENVIRO-SEAL bellows seal bonnet replacement. All maintenance operations may be performed with the valve in the line.

WARNING

Avoid personal injury or property damage from sudden release of process pressure or uncontrolled movement of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.

- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

CAUTION

Follow instructions carefully to avoid damaging the product surfaces, which could result in damage to the product.

Packing Lubrication

Figure 2. Lubricator and Lubricator/Isolating Valve (Optional)

Note

ENVIRO-SEAL and HIGH-SEAL packing do not require lubrication.

⚠ WARNING

To avoid personal injury or property damage resulting from fire or explosion, do not lubricate packing used in oxygen service or in processes with temperatures over 260°C (500°F).

If a lubricator or lubricator/isolating valve (figure 2) is provided for PTFE/composition or other packings that require lubrication, it will be installed in place of the pipe plug (key 14, figure 13). Use a good quality silicon-base lubricant. Do not lubricate packing used in oxygen service or in processes with temperatures over 260°C (500°F). To operate the lubricator, simply turn the cap screw clockwise to force the lubricant into the packing box. The lubricator/isolating valve operates the same way except open the isolating valve before turning the cap screw and then close the isolating valve after lubrication is completed.

Packing Maintenance

Note

For valves with ENVIRO-SEAL packing, see the Fisher instruction manual ENVIRO-SEAL Packing System for Sliding-Stem Valves for packing instructions.

For valves with HIGH-SEAL packing, see the Fisher instruction manual HIGH-SEAL Live-Loaded Packing System for packing instructions.

Packing Replacement

⚠ WARNING

Observe the warning at the start of the Maintenance section.

Table 3. Recommended Torque for Packing Flange Nuts

		CL600	35	310	53	466	17	149	25	223
31.8	1-1/4	CL300	36	318	54	477	17	152	26	228
		CL600	49	437	74	655	24	209	36	314

The following procedure covers PTFE V-ring packing. A similar procedure can be followed for PTFE/composition packing. However, because PTFE/composition packing comes in split rings, it is possible to replace the rings without removing the actuator from the valve.

Installation of graphite ribbon/filament packing requires special care to avoid trapping air between the rings. Start only one ring at a time without forcing the top of the packing ring below the bottom of the entrance chamfer of the packing box. Thus, when a ring is added, the stack should not be pushed into the cavity more than the thickness of the added ring.

The arrangement of packing box parts is shown in figures 3, 4, 5, 6, and 7. Key numbers used in the following steps are shown in figures 13 and 14.

1. Remove the actuator and bonnet according to steps 1 through 4 of the Disassembly procedure in the Maintenance section on page 7.
2. With the stem and valve plug assembly removed from the bonnet, remove the packing nuts (key 5), packing flange (key 3), wiper ring (key 12), and packing follower (key 13) from the bonnet. The old packing can then be pulled out with a packing hook (take care to avoid scratching the packing box wall) or pushed out using a rod inserted through the bottom of the bonnet.
3. Clean the packing box and all metal parts.
4. Complete maintenance necessary on other parts and install the bonnet on the valve as indicated in the Assembly section (starting on page 12).
5. Install the new packing and associated parts in the sequence shown in figures 3, 4, 5, 6, and 7. Be careful not to damage the packing during installation.
6. Replace the packing flange and packing flange nuts.

For **spring-loaded PTFE V-ring packing**, tighten the packing flange nuts until the shoulder on the packing follower contacts the bonnet.

For **graphite packing**, tighten the packing flange nuts to the maximum recommended torque shown in table 3. Then, loosen the packing flange nuts, and retighten them to the recommended minimum torque shown in table 3.

For **other packing types**, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in table 3. Then, tighten the remaining flange nut until the packing flange is level and at a 90-degree angle to the valve stem.

For **ENVIRO-SEAL or HIGH-SEAL live-loaded packing**, refer to the note at the beginning of the Packing Maintenance section.

7. Mount the actuator on the bonnet and make up the stem connection according to the procedure given in the appropriate actuator instruction manual.

Trim Maintenance

WARNING

Observe the warning at the start of the Maintenance section.

CAUTION

To avoid damaging parts, do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

Key numbers in the following procedures are shown in figure 10 for standard YD, in figure 11 for high-temperature YD, and in figure 9 for YS, except where indicated.

Disassembly

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve, and drain the process media from both sides of the valve. Remove actuator supply pressure, and use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

⚠ WARNING

See the **WARNING** at the beginning of the Maintenance section for more information.

2. Disconnect the actuator stem connector and remove the locknut (key 15, figure 13) that holds the actuator to the valve. (Valves with a 127 mm (5-inch) yoke boss use cap screws and nuts to secure the actuator on the valve). Then lift the actuator from the valve.

Figure 3. Fisher PTFE V-Ring Packing Arrangements

Figure 4. Detail of Fisher PTFE/Composition Packing Arrangements

TYPICAL (DOUBLE) ARRANGEMENTS

Figure 5. Fisher Graphite Ribbon/Filament Packing Arrangements

SINGLE PACKING ARRANGEMENT

DOUBLE PACKING ARRANGEMENT

A2438-2

- NOTE:
- 1 0.102 mm (0.004 INCH) THICK SACRIFICIAL ZINC WASHERS. USE ONLY ONE BELOW EACH GRAPHITE RIBBON RING.
- 2 HAS THE APPEARANCE OF A WOVEN OR BRAIDED RING.

Figure 6. PTFE Packing Arrangements for Use in Fisher ENVIRO-SEAL Bellows Seal Bonnets

3. Remove the nuts (key 16, figures 9 and 10) or cap screws from the bonnet flange.
4. Lift off the bonnet along with the valve plug and stem (keys 2 and 5, figures 9 and 10). Due to the design of the valve, several other trim parts will be drawn out with the valve plug. They are as follows:
 YD (Standard)--The upper cage (key 3A) and associated seals, gaskets, and shim (keys 9, 11, 19, 20A, 20B, and 22).
 YD (High Temperature)--The upper cage (key 3B) and associated gaskets and shim (keys 9, 11, and 22).
 YS--The upper seat (key 7), upper cage (key 3), and associated gaskets and shim (keys 9, 11, and 22).

CAUTION

The exposed portion of the cage provides a guiding surface that must not be damaged during disassembly or maintenance. Damage could affect valve performance. If the cage is stuck in the valve, use a rubber mallet to strike the exposed portion at several points around the circumference.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D100425X012

YD and YS Valves

July 2017

Figure 7. Double Graphite Ribbon/Filament Arrangements for Use in Fisher ENVIRO-SEAL Bellows Seal Bonnets

A5870

Take proper care not to damage any sealing or seating surfaces as nicks or scratches in these parts might cause leakage.

- Loosen the packing flange nuts (key 5, figures 13 and 14) and draw the valve plug and stem straight out the bottom of the bonnet. Lift all cage and seat parts off the valve plug and stem. If the stem for YD or YS requires replacing, drive the pin (key 6) out and unscrew the stem from the plug.

Table 4. Pin Drill Sizes

VALVE TYPE	VALVE STEM CONNECTION, mm (INCH)	DRILL SIZE, INCHES
YD & YS	9.5 (3/8)	3/32
	12.7 (1/2)	1/8
	19.1 (3/4)	3/16
	25.4 (1)	1/4

Table 5. Recommended Bolt Torques for B7 Body-to-Bonnet Bolting⁽¹⁾

VALVE SIZE, NPS	RECOMMENDED BOLT TORQUE, N•m (Lbf•ft)
1/2, 3/4	129 (95)
1, 1-1/2	129 (95)
2	96 (71)
2-1/2	96 (71)
3	169 (125)
4	271 (200)
6	549 (405)
8(2)	CL150/300: 373 (275) CL600: 522 (385)

1. For other materials, contact your [Emerson sales office](#) or Local Business Partner.
2. For NPS 8 YD valves, the bottom adaptor has shorter bolts than the bonnet, but the bolt torque is the same as the bonnet torque.

- To replace the adaptor (key 24, figure 15) on ENVIRO-SEAL bellows seal bonnets, place the plug stem assembly and valve plug in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out the pin (key 36, figure 15). Reverse the plug stem assembly in the soft-jaw chuck or vise. Grip the flat areas on the valve stem just below the threads for the actuator/stem connection. Unscrew the valve plug/adaptor assembly (key 24, figure 15) from the valve stem assembly (key 20, figure 15).

CAUTION

Never use an old stem with a new valve plug. The use of an old stem requires drilling a new pin hole through the stem (or adaptor, in case an ENVIRO-SEAL bellows seal bonnet is being used). This drilling weakens the stem or adaptor and may cause failure in service. However, a used valve plug may be reused with a new stem or adaptor.

7. The internal parts of the bonnet can now be disassembled, if necessary. For packing replacement, refer to the section entitled Packing Replacement on page 6.
8. *Standard YD Only*—It is recommended that the cage seal (key 19), seal ring (key 20A), and backup ring (key 20B) be replaced upon assembly. These can be removed by prying them out of the upper cage grooves with a screwdriver or a soft-tipped instrument. If a screwdriver is used, take care not to scratch the surfaces of the cage.
9. The remaining trim parts can now be lifted out of the valve. Under severe service conditions, some of these parts might have become stuck to the valve. In this case, it might be necessary to use a seat ring puller to remove these parts. Because there is a slight clearance around the outer circumference of the lower cage (key 4) and seat ring (key 8), it might be possible to remove these by tapping them loose, if interior room permits.

Assembly

YD (Standard)

1. Use new gaskets, seals, and shim (keys 9, 11, 14, 19, 20A, 20B, and 22) on assembly and wipe all sealing surfaces with a clean cloth.
2. For NPS 8 YD, install the bottom flange adaptor (key 24) and gasket (key 9).
3. Install the seat ring gasket (key 14) and place the seat ring (key 8) on top of the gasket.
4. Install the lower cage (key 4) into the valve, being certain that it fits down over the raised portion of the seat ring. The narrow portion of the cage windows should point downward.
5. Slip the O-ring cage seal (key 19) over the bottom of the upper cage (key 3A) and into the cage groove.

Figure 8. Typical Bolting Pattern

A0274-1

6. Press the backup ring (key 20B) and the seal ring (key 20A), respectively, into the inner groove of the upper cage. It might be necessary to bend one side of each of these in slightly to accomplish this. Take care not to distort the rings when doing this.
7. If a new stem (key 5) is to be used, screw the stem into the valve plug (key 2) until it wedges tight at the end of the valve stem thread.

CAUTION

Never use an old stem with a new valve plug. The use of an old stem requires drilling a new pin hole through the stem (or adaptor, in case an ENVIRO-SEAL bellows seal bonnet is being used). This drilling weakens the stem or adaptor and may cause failure in service. However, a used valve plug may be reused with a new stem or adaptor.

Locate the pilot hole in the valve plug and drill the hole through the plug and stem assembly (determine drill size from table 4). Drive in the pin to lock the assembly.

8. For ENVIRO-SEAL bellows seal bonnets, grip the flats of the stem extending out of the top of the bellows shroud with a soft-jaw chuck or other type of vise. Screw the valve plug/adaptor assembly onto the valve stem. Tighten as necessary to align the pin hole in the stem with one of the holes in the adaptor. Secure the adaptor to the stem with a new pin.

CAUTION

To prevent possible damage to the seal ring and cage seal, exercise care in the following procedure.

9. Place the upper cage (key 3A) over the plug assembly, being certain not to damage the seal ring, and lower this entire assembly into the valve. Due to the close fit between the valve body bore and the cage seal, it will be necessary to apply a steady force to the top of the cage for final positioning inside the valve body bore. Take care to ensure that the upper cage slips into the lower cage and the cage seal is not damaged.
10. Place the spiral wound gasket (key 11), shim (key 22), and bonnet gasket (key 9), respectively, over the upper cage.
11. Mount the bonnet onto the valve with the lubricator or pipe plug parallel with the pipeline.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson Automation Solutions representative immediately if a discrepancy between actual parts and approved parts is suspected.

12. Lubricate the valve stud bolts or cap screws (key 15) and install the nuts (key 16) on the bolts using accepted bolting practices. Tighten the nuts to the recommended bolt torques given in table 5. Follow a pattern similar to that shown in figure 8.

Note

It might be necessary to repeat the bolting pattern several times until the bonnet-to-body seal is made, because the tightening of one nut might loosen an adjacent nut. Repeat the pattern until none of the nuts will turn at the recommended torque.

13. Mount the actuator on the bonnet and make up the stem connection according to the procedure given in the appropriate actuator instruction manual.

YD (High Temperature)

1. Use new gaskets, seals, and shim (keys 9, 11, 13, 14, 19, 20, and 22) on assembly and wipe all sealing surfaces with a clean cloth.
2. For NPS 8 YD, install the bottom flange adaptor (key 24) and gasket (key 9).
3. Install the seat ring gasket (key 14) and place the seat ring (key 8) on top of the gasket followed by the spiral wound spring (key 13).
4. Install the lower cage (key 4) into the valve, being certain that it fits down over the raised portion of the seat ring. The narrow portion of the cage windows should point downward.
5. Place one of the retaining ring gaskets (key 19) into the valve.
6. If a new stem (key 5) is to be used, screw the stem into the valve plug (key 2) until it wedges tight at the end of the valve stem thread.

CAUTION

Never use an old stem with a new valve plug. The use of an old stem requires drilling a new pin hole through the stem (or adaptor, in case an ENVIRO-SEAL bellows seal bonnet is being used). This drilling weakens the stem or adaptor and may cause failure in service. However, a used valve plug may be reused with a new stem or adaptor.

Locate the pilot hole in the valve plug and drill the hole through the plug and stem assembly (determine drill size from table 4). Drive in the pin to lock the assembly.

7. For ENVIRO-SEAL bellows seal bonnets, grip the flats of the stem extending out of the top of the bellows shroud with a soft-jaw chuck or other type of vise. Screw the valve plug/adaptor assembly onto the valve stem. Tighten as necessary to align the pin hole in the stem with one of the holes in the adaptor. Secure the adaptor to the stem with a new pin.
8. Place the seal ring retainer (key 3C) into the valve and lower the valve plug assembly into the retainer orifice.
9. Carefully place the seal rings (key 20) over the valve plug, being certain that they rest against the retaining ring. Each of these has a cut through its cross section. These cuts should be oriented 180 degrees apart to ensure a proper seal.
10. Insert the other retaining ring gasket (key 19) on top of the retaining ring.
11. Lower the upper cage (key 3B) into the valve. When properly installed, the raised ring on the bottom of the cage should fit snugly into the groove formed by the seal rings and the retaining ring.
12. Place the spiral wound gasket (key 11), shim (key 22), and bonnet gasket (key 9), respectively, over the upper cage.

13. Mount the bonnet onto the valve with the lubricator or pipe plug parallel with the pipeline.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

14. Lubricate the valve stud bolts (key 15) and install the nuts (key 16) onto the bolts using good bolting practices. Tighten the nuts to the recommended bolt torques given in table 5. A pattern similar to that shown in figure 8 should be followed.

Note

It might be necessary to repeat the bolting pattern several times until the bonnet-to-body seal is made, because the tightening of one nut might loosen an adjacent nut. Repeat the pattern until none of the nuts will turn at the recommended torque.

15. Mount the actuator on the bonnet and make up the stem connection according to the procedure given in the appropriate actuator instruction manual.

YS

1. Use new gaskets and shim (keys 9, 11, 12, 13, 14 and 22) on assembly and wipe all sealing surfaces with a clean cloth.
2. Install the lower seat ring gasket (key 14) and place the lower seat ring (key 8) on top of the gasket followed by the spiral wound spring (key 13).
3. Install the lower cage (key 4) into the valve, being certain that it fits down over the raised portion of the seat ring. The narrow portion of the cage windows should point downward.
4. Place the upper seat ring gasket (key 12) into the valve.
5. If a new stem (key 5) is to be used, screw the stem into the valve plug (key 2) until it wedges tight at the end of the valve stem thread.

CAUTION

Never use an old stem with a new valve plug. The use of an old stem requires drilling a new pin hole through the stem (or adaptor, in case an ENVIRO-SEAL bellows seal bonnet is being used). This drilling weakens the stem or adaptor and may cause failure in service. However, a used valve plug may be reused with a new stem or adaptor.

Locate the pilot hole in the valve plug and drill the hole through the plug and stem assembly (determine drill size from table 4). Drive in the pin to lock the assembly.

6. For ENVIRO-SEAL bellows seal bonnets, grip the flats of the stem extending out of the top of the bellows shroud with a soft-jaw chuck or other type of vise. Screw the valve plug/adaptor assembly onto the valve stem. Tighten as necessary to align the pin hole in the stem with one of the holes in the adaptor. Secure the adaptor to the stem with a new pin.
7. Place the upper seat ring (key 7) and upper cage (key 3), respectively, over the plug and stem assembly, being certain not to scratch any sealing surfaces. Lower this entire assembly into the valve.
8. Place the spiral wound gasket (key 11), shim (key 22), and bonnet gasket (key 9), respectively, over the upper cage.
9. Mount the bonnet onto the valve with the lubricator or pipe plug parallel with the pipeline.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

10. Lubricate the valve stud bolts or cap screws (key 15) and install the nuts (key 16) onto the bolts using good bolting practices. Tighten the nuts to the recommended bolt torques given in table 5. A pattern similar to that shown in figure 8 should be followed.

Note

It might be necessary to repeat the bolting pattern several times until the bonnet-to-body seal is made, because the tightening of one nut might loosen an adjacent nut. Repeat the pattern until none of the nuts will turn at the recommended torque.

11. Mount the actuator onto the bonnet and make up the stem connection according to the procedure given in the appropriate actuator instruction manual.

ENVIRO-SEAL Bellows Seal Bonnet

Replacing a Plain or Extension Bonnet with an ENVIRO-SEAL Bellows Seal Bonnet (Stem/Bellows Assembly)

1. Remove the actuator and bonnet according to steps 1 through 4 of the Disassembly procedure in the Maintenance section on page 7.
2. With care, remove the valve plug and stem assembly from the valve. If necessary, also lift out the cage.

CAUTION

To prevent possible product damage, cover the opening in the valve in the following procedure to protect the sealing surfaces and to prevent foreign material from getting into the valve body cavity.

3. Remove and discard the existing bonnet gasket. Cover the valve body opening to protect sealing surfaces and to prevent foreign material from entering the valve body cavity.

Note

The ENVIRO-SEAL stem/bellows assembly for YD and YS valves is available only with a threaded and drilled plug/adaptor/stem connection. The existing valve plug can be reused with the new stem/bellows assembly or a new plug can be installed.

4. Inspect the existing valve plug. If the plug is in good condition, it can be reused with the new ENVIRO-SEAL stem/bellows assembly. To remove the existing valve plug from the stem, first, place the existing plug stem assembly and valve plug in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out or drill out the pin (key 8).
5. Reverse the plug stem assembly in the soft-jaw chuck or vise. Grip the valve stem in an appropriate place and unscrew the existing plug from the valve stem.

CAUTION

When installing a valve plug on the ENVIRO-SEAL stem/bellows assembly, the valve stem must not be rotated. Damage to the bellows may result.

Do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

Note

The ENVIRO-SEAL stem/bellows assembly has a one-piece stem.

6. To attach the valve plug to the stem of the new ENVIRO-SEAL stem/bellows assembly, first attach the plug to the adaptor (key 24). Locate the adaptor. Notice that a hole has not been drilled in the threads where the plug screws onto the adaptor. Secure the valve plug in a soft-jaw chuck or other type of vise. Do not grip the plug on any seating surface. Position the plug in the chuck or vise for easy threading of the adaptor. Thread the adaptor into the valve plug and tighten to the appropriate torque value.
7. Select the proper size of drill bit and drill through the adaptor using the hole in the valve plug as a guide. Remove any metal chips or burrs and drive in a new pin to lock the plug/adaptor assembly together.
8. Attach the plug/adaptor assembly to the ENVIRO-SEAL stem/bellows assembly by first securing the stem/bellows assembly in a soft-jaw chuck or other type of vise so that the jaws of the chuck or vise grip the flats of the stem extending out of the top of the bellows shroud. Screw the valve plug/adaptor assembly onto the valve stem. Tighten as necessary to align the pin hole in the stem with one of the holes in the adaptor. Secure the adaptor to the stem with a new pin.
9. Inspect the seat ring (key 9) and soft seat parts (keys 21, 22, and 23); replace, if necessary.
10. Place a new gasket (key 10) into the valve in place of the bonnet gasket. Install the new stem/bellows assembly with valve plug/adaptor by placing it into the valve on top of the new bellows gasket.

11. Place a new gasket (key 22) over the stem/bellows assembly. Place the new ENVIRO-SEAL bonnet over the stem/bellows assembly.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson representative immediately if a discrepancy between actual parts and approved parts is suspected.

12. Properly lubricate the bonnet stud bolts. Install and tighten the bonnet hex nuts to the proper torque.
13. Install new packing and the metal packing box parts according to the appropriate arrangement in figure 17 or 18.
14. Install the packing flange. Properly lubricate the packing flange stud bolts and the faces of the packing flange nuts.

For **graphite packing**, tighten the packing flange nuts to the maximum recommended torque shown in table 6. Then, loosen the packing flange nuts, and retighten them to the recommended minimum torque shown in table 6.

For **other packing types**, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in table 6. Then, tighten the remaining flange nut until the packing flange is level and at a 90-degree angle to the valve stem.

15. Install travel indicator parts and stem locknuts; mount the actuator onto the valve according to the procedure in the appropriate actuator instruction manual.

Replacement of an Installed ENVIRO-SEAL Bellows Seal Bonnet (Stem/Bellows Assembly)

1. Remove the actuator and bonnet according to steps 1 through 4 of the Disassembly procedure in the Maintenance section on page 7.

CAUTION

To prevent possible product damage, cover the opening in the valve in the following procedure to protect the sealing surfaces and to prevent foreign material from getting into the valve body cavity.

2. Carefully remove the ENVIRO-SEAL stem/bellows assembly. If necessary, also lift out the cage. Remove and discard the existing bonnet gasket and bellows gasket. Cover the valve body opening to protect sealing surfaces and to prevent foreign material from entering the valve body cavity.

CAUTION

The ENVIRO-SEAL stem/bellows assembly for YD and YS valves is available only with a threaded and drilled plug/adaptor/stem connection. The existing valve plug can be reused with the new stem/bellows assembly or a new plug

can be installed. If the existing valve plug is reused, and the adaptor is in good condition, it may also be reused. However, never reuse an old adaptor with a new valve plug. Using an old adaptor with a new valve plug requires drilling a new pin hole in the adaptor. This drilling weakens the adaptor and may cause failure in service. However, a used valve plug may be reused with a new adaptor.

3. Inspect the existing valve plug and adaptor. If they are in good condition, they can be reused with the new stem/bellows assembly and they do not need to be separated.

CAUTION

When removing/installing a valve plug on the ENVIRO-SEAL stem/bellows assembly, the valve stem must not be rotated. Damage to the bellows may result.

Do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

Note

The ENVIRO-SEAL stem/bellows assembly has a one-piece stem.

4. If the valve plug and adaptor are not in good condition and must be replaced, first remove the valve plug/adaptor assembly from the stem/bellows assembly; then remove the valve plug from the adaptor. First, place the stem/bellows assembly and valve plug in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out or drill out the pin (key 6, figure 9, 10, or 11. Drive out the pin (key 36, figure 15).

Table 6. Recommended Torque for Fisher ENVIRO-SEAL Bellows Seal Packing Flange Nuts

VALVE SIZE, NPS	VALVE STEM DIAMETER THROUGH PACKING	MINIMUM TORQUE		MAXIMUM TORQUE	
		N•m	Lbf•in	N•m	Lbf•in
1/2 - 2	1/2	3	24	5	48
3 - 4	1	7	60	10	84

5. Reverse the stem/bellows and plug/adaptor assembly in the soft-jaw chuck or vise. Grip the flat areas on the valve stem just below the threads for the actuator/stem connection. Unscrew the plug/adaptor assembly from the stem/bellows assembly. Unscrew the valve plug from the adaptor.
6. To attach either the existing valve plug or a new one to the stem of the new ENVIRO-SEAL stem/bellows assembly, first attach the plug to the adaptor (if the valve plug was removed from the adaptor) as follows:
 - Locate the adaptor. Notice that a hole has not been drilled in the threads where the plug screws onto the adaptor.
 - Secure the valve plug in a soft-jaw chuck or other type of vise. Do not grip the plug on any seating surface. Position the plug in the chuck or vise for easy threading of the adaptor.
 - Thread the adaptor into the valve plug and tighten to the appropriate torque value.
7. Complete the installation by following steps 7 through 9 and steps 12 through 15 of the ENVIRO-SEAL Bellows Seal Bonnet installation instructions given above.

Purging the ENVIRO-SEAL Bellows Seal Bonnet

The ENVIRO-SEAL bellows seal bonnet can be purged or leak tested. Refer to figure 15 for an illustration of an ENVIRO-SEAL bellows seal bonnet, and perform the following steps for purging or leak testing.

1. Remove the two diametrically opposed pipe plugs (key 16).
2. Connect a purging fluid to one of the pipe plug connections.
3. Install appropriate piping or tubing in the other pipe plug connection to pipe away the purging fluid or to make a connection to an analyzer for leak testing.

Parts Ordering

Each valve is assigned a serial number which can be found on the valve. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Always refer to the serial number when corresponding with your [Emerson sales office](#) or Local Business Partner about this equipment. When ordering replacement parts, also state the complete eleven-character part number for each part required from the following parts list.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts List

Note

Part numbers are shown for recommended spares only. For part numbers not shown, contact your [Emerson sales office](#) or Local Business Partner.

Note

Part numbers for most key numbers are listed in tables which follow.

YD and YS Valve

Key	Description	Part Number
1	If you need a valve body as a replacement part, order by valve size, serial number, and desired material	
17	Flow Direction Plate, SST	
18	Drive Screw, SST (4 req'd)	
21	Nameplate	
23	Wire	

Bonnet for YD and YS

1	Bonnet	
	If you need a bonnet as a replacement part, order by valve size and stem diameter, serial number, and desired material.	
14	Pipe Plug	
16	Pipe Plug (Used With Tapped Extension Bonnet Only) (not shown)	
27	Pipe Nipple (Used with Lubr./Iso. Valve)	

*Recommended spare parts

Inspection and Maintenance Schedules	2
Parts Ordering	2
Installation	3
Maintenance	4
Latest Published Instruction Manual	5

Introduction

The product covered in this document is no longer in production. This document, which includes the latest published version of the instruction manual, is made available to provide updates of newer safety procedures. Be sure to follow the safety procedures in this supplement as well as the specific instructions in the included instruction manual.

Part numbers in the included instruction manual should not be relied on to order replacement parts. For replacement parts, contact your [Emerson sales office](#).

For more than 30 years, Fisher products have been manufactured with asbestos-free components. The included manual might mention asbestos containing parts. Since 1988, any gasket or packing which may have contained some asbestos, has been replaced by a suitable non-asbestos material. Replacement parts in other materials are available from your sales office.

Safety Instructions

Please read these safety warnings, cautions, and instructions carefully before using the product.

These instructions cannot cover every installation and situation. Do not install, operate, or maintain this product without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. **To avoid personal injury or property damage it is important to carefully read, understand, and follow all of the contents of this manual, including all safety cautions and warnings.** If you have any questions about these instructions, contact your Emerson sales office before proceeding.

Specifications

This product was intended for a specific range of service conditions--pressure, pressure drop, process and ambient temperature, temperature variations, process fluid, and possibly other specifications. **Do not expose the product to service conditions or variables other than those for which the product was intended.** If you are not sure what these conditions or variables are, contact your [Emerson sales office](#) for assistance. Provide the product serial number and all other pertinent information that you have available.

Inspection and Maintenance Schedules

All products must be inspected periodically and maintained as needed. The schedule for inspection can only be determined based on the severity of your service conditions. Your installation might also be subject to inspection schedules set by applicable governmental codes and regulations, industry standards, company standards, or plant standards.

In order to avoid increasing dust explosion risk, periodically clean dust deposits from all equipment.

When equipment is installed in a hazardous area location (potentially explosive atmosphere), prevent sparks by proper tool selection and avoiding other types of impact energy.

Parts Ordering

Whenever ordering parts for older products, always specify the serial number of the product and provide all other pertinent information that you can, such as product size, part material, age of the product, and general service conditions. If you have modified the product since it was originally purchased, include that information with your request.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher product, because they may void your warranty, might adversely affect the performance of the product, and could cause personal injury and property damage.

Installation

⚠ WARNING

- Personal injury or equipment damage caused by sudden release of pressure or bursting of parts may result if the valve assembly is installed where service conditions could exceed the limits given in the applicable product literature, the limits on the appropriate nameplates, or the mating pipe flange rating. Use pressure-relieving devices as required by government or relevant industry codes and good engineering practices. If you cannot determine the ratings and limits for this product, contact your [Emerson sales office](#) before proceeding.
- To avoid personal injury, always wear protective gloves, clothing, and eyewear when performing any installation operations.
- To avoid personal injury or property damage, use proper lifting and rigging practices while lifting, installing or removing the valve assembly. Be sure to use lifting and rigging equipment properly sized and selected for the weight and configuration of the valve assembly or component being lifted.
- Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions.
- Many rotary shaft valves are not necessarily grounded to the pipeline when installed in a flammable, hazardous, oxygen service, or explosive atmospheres. An explosion is possible, due to the discharge of static electricity from the valve components. To avoid personal injury or property damage, make sure that the valve is grounded to the pipeline before placing the control valve assembly into service. Use and maintain alternate shaft-to-body bonding, such as a shaft-to-body bonding strap assembly.
- Rotary shaft valves are designed and intended for installation between flanges. Personal injury or property damage may result from improper installation. To avoid personal injury or property damage caused by the sudden release of pressure or bursting of parts, do not use or install rotary shaft valves (including single lug constructions) for dead-end service.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
- If installing into an existing application, also refer to the WARNING in the Maintenance section.
- When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. To avoid possible personal injury and because some valve/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your Emerson sales office.

CAUTION

- Ensure that the valve and adjacent pipelines are free of foreign material that could damage the valve seating surfaces.

Maintenance

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Always wear protective gloves, clothing, and eyewear.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure.
- Do not remove the actuator while the valve is pressurized.
- Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring pre-compression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box might contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids might spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug. Cautiously remove parts so that fluid escapes slowly and safely.
- Many valve parts that are moving can injure you by pinching, cutting, or shearing. To help prevent such injury, stay clear of any moving part.
- Never apply pressure to a partially assembled valve.
- To avoid personal injury or property damage caused by uncontrolled movement of a valve bonnet, loosen the bonnet by following these instructions: Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet. Loosen bonnet nuts approximately 3 mm (0.125 inch). Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and body. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, proceed with bonnet removal.
- As you remove parts, such as valve shafts, other parts, such as disks can fall from the valve body or suddenly move to another position in the valve. To avoid injury from falling or moving parts, be sure to support parts and be sure they are in a stable position as you disassemble the valve.
- Personal injury could result from packing leakage. Do not scratch the drive shaft or packing box wall while removing packing parts.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Neither Emerson, Emerson Automation Solutions, nor any of their affiliated entities assumes responsibility for the selection, use or maintenance of any product. Responsibility for proper selection, use, and maintenance of any product remains solely with the purchaser and end user.

Introduction

Scope of Manual

This instruction manual provides installation, operation, maintenance, and parts information for the Fisher Z500 Severe Service Ball Valve (see figure 1).

Do not install, operate, or maintain Z500 valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

The Z500 severe service ball valve is a split body bolted design, full or reduced port, with a blowout proof shaft. It can be lever operated, gear operated, or actuated. The Z500 severe service ball valve line is a simplistic two-piece floating ball design with integral metal seat meant to provide tight metal seating shutoff in high temperature, high pressure, corrosive, and erosive applications across all industries.

Specifications

Specifications for these valves are shown in table 1.

1. Valve bodies machined from forgings or forged bar.

1. Valve bodies machined from forgings or forged bar.

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed either the valve body rating or the mating pipe flange joint rating. To avoid such injury or damage, provide a relief valve for overpressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. To avoid possible personal injury and because some valve/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#) or Local Business Partner.

⚠ WARNING

The valve drive shaft is grounded to the pipeline via graphite packing. If the process fluid or atmosphere around the valve is flammable, this electrical bonding (graphite packing) must be used to avoid personal injury or property damage as a result of an explosion caused by a discharge of static electricity from valve components.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

When a valve is shipped bare shaft:

- a. Valve is shipped in the open position with exposed shaft
- b. Valve will include two shaft keys.

When a valve is shipped with mounting kit only:

- a. Valve will ship in the in open position
- b. Valve will have the mounting finger-tight to the valve
- c. Customer shall ensure proper mounting of the actuator

- d. Customer shall ensure valve shaft has not been pushed or forced down into the valve
- e. Customer shall ensure no binding occurs when mounting the actuator
 - i. Customer shall ensure the correct alignment is done when mounting the actuator
 - ii. No hammering or forcing down of the shaft adapter is allowed
- f. Customer shall ensure all bolts are torqued down appropriately
- g. Customer shall ensure the actuator mounting surface is completely flush with the mounting bracket. For additional information on actuator mounting, refer to the Actuator Mounting section in this instruction manual on page 14.
- h. Customer shall ensure the mounting can allow for or can accommodate expansion of the shaft or adapter at high temperatures. See table 7.

When a valve is shipped with actuator:

- a. Valve will be shipped in the required fail position
 - b. All bolting will be torqued as required
 - c. Emerson recommends that the customer not remove the actuator for final installation in the line
1. Inspect the valve prior to installation into the piping system to ensure there is no shipping damage. End protectors and shipping materials must be removed to allow a complete inspection.
 2. Inspect the actuator, if included, for damage and then cycle the valve with the actuator from open (the normal shipping position) to closed to open to ensure proper functioning.

CAUTION

Make sure the valve is installed in the correct orientation. Put the high pressure side (body side) on the upstream side. The arrow on the valve should point from the high pressure to low pressure side when the valve is closed. The valve could be damaged if installed incorrectly.

Weld End Valves

⚠ WARNING

Emerson Automation Solutions is not responsible for improper installation or inspection of any valve which falls outside the criteria presented in this instruction manual. Requests for additional information on unique situations should be directed to your [Emerson sales office](#) or Local Business Partner.

CAUTION

Weld fill between the valve and pipe should never be used to correct for improper pipe installation length or misalignment. Additional welding beyond what is required may cause the valve to reach higher temperatures and have a larger heat-affected zone, which can cause permanent damage to the valve or its components.

For additional information, refer to ASME Boiler and Pressure Vessel Code Section IX.

Procedure

Initial Preparation

1. Ensure the valve is in the fully open position so that vital sealing areas of the ball are not exposed to weld spatter.
2. Never make arc strikes on the valve body or end adapter except inside the groove intended for butt welding or inside the corner of the joint for socket welding. Arc strikes made on areas which are not intended to be welded can cause a localized increase in hardness and micro-cracks, and can otherwise compromise the intended mechanical properties of the material.
3. Attach the welding ground strap to the side of the valve being welded.
4. Install the valve into the piping system prior to welding in order to minimize piping loads. Orient the valve with the shaft vertical, if possible, and install the piping such that pipe loads are minimized on the valve.
5. Weld the valve into the line using welders and procedures fully qualified per ASME Boiler and Pressure Vessel Code Section IX.
6. Ensure that the valve body temperature always remains below 427°C (800°F).

Post-Weld Heat Treatment

CAUTION

Depending on valve body materials used, post weld heat treating may be required. If so, damage to internal parts is possible. Do not place the entire valve in a stress relief furnace, or cover the entire valve with stress relieving blankets, as this could damage the valve. Contact your [Emerson sales office](#) or Local Business Partner for additional information.

1. Weld the valve into the line using qualified welders and procedures per Section IX of the ASME Boiler and Pressure Vessel Code. If specific procedures are required, contact your Emerson sales office or Local Business Partner for written guidance based on pipe and valve materials.
2. Apply post weld heat treat in accordance with valve material and code requirements. Only local post weld heat treat on each end of the valve must be used.

Final Inspection after Post-Weld Heat Treatment

After post weld heat treat, verify valve body studs and packing studs are tight.

CAUTION

Before cycling the valve in the line, make sure the line is clean of weld slag and other debris that could damage the valve. Cycle the valve after installation to ensure proper functioning.

1. Cycle the valve to verify proper operation. Ensure that the torque required to cycle the valve has remained within acceptable limits.
2. Verify that the body and packing bolting are tightened to the correct torque per tables 5 and 6.
3. Install proper insulation as required for insulated piping systems.

Operation

1. No routine maintenance or lubrication is required. No tightening of body studs should be necessary. Packing bolting may be retightened if a shaft packing leak is noted during operation.

2. Actuators supplied with the valve may require maintenance per the actuator manufacturer's recommendations. For valves supplied with gears, the grease in the gearbox might need to be cleaned out and replaced periodically. Use only high temperature grease recommended for gearboxes.
3. Metal-seated ball valves have high torques. Consult your [Emerson sales office](#) or Local Business Partner for more information.
4. Valves operate clockwise to close and counterclockwise to open. Gears and actuators are marked with arrows and symbols to show valve position and operating direction. Lever operated valves have an integral lockplate so that only the correct operating direction is possible. The lockplate has the "O" for open and the "C" for closed marked to show proper position. The lever is always aligned with the ball bore for positive proof of ball position. Gears and actuators have adjustable stops for proper ball positioning.
5. The ball is mated to the end adapter seat. The top of the shaft is marked to show the proper orientation of the lapped side of the ball.
6. This valve should be either normally open or normally closed. Throttling with this valve is not recommended for extended periods. Throttling for brief periods during startup or shutdown is allowed.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations.
- The valve packing area may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

1. If valve maintenance is required, contact your [Emerson sales office](#) or Local Business Partner.

Troubleshooting

Operation

- **Shaft adapter/actuator may be misaligned--** Remove actuator and shaft adapter, then reassemble per assembly procedures for actuators.
- **Over-tightened shaft packing--** Loosen packing to hand tight, cycle valve and retighten per procedures following torque table 6.
- **Inadequate air supply--** Increase air supply or install larger solenoid or quick exhaust valve. Refer to actuator manufacturer's specifications.

Valve will not Rotate

- **Valve body ID or bore is clogged--** Flush or clean valve ID and try to cycle valve.
- **Actuator is not operating correctly or has failed--** Replace or repair actuator and try to cycle valve.
- **Shaft keys have sheared--** Remove shaft adapter and determine why keys sheared, insert new keys, reassemble and try to cycle valve.

Valve Shaft Packing Leaking

- **Packing flange bolting is loose--** Tighten packing bolting. See Packing Replacement section, step 7 on page 14 of this instruction manual.
- **Packing is damaged or improperly installed--** Depressurize valve, remove old packing and replace with new assembly per assembly instruction steps 3 to 5.
- **Actuator misalignment--** Check for actuator misalignment.

Valve Body Gasket Leaking

- **Body bolting is loose--** Tighten body bolting per table 5 and figure 2.
- **Body gasket damaged--** Contact your [Emerson sales office](#) or Local Business Partner.

1. Torque recommendations provided require lubrication of stud and nut with a Lithium Polymer Grease. Use of other lubricants may change torque recommendation. Contact your [Emerson sales office](#) or Local Business Partner if other bolting materials are used.

Figure 2. Bolting Tightening Pattern

Valve Leaking through Ball or Seating Area

- Valve body ID or bore is clogged-- Flush or clean valve ID and try to cycle valve.
- Valve is not fully closed-- Close valve, taking care not to over torque.
- Actuator travel stops are not set correctly-- Set stops and cycle, checking for leaks.
- Seat or Ball is damaged-- Contact your Emerson sales office or Local Business Partner for repair.
- Belleville spring is collapsed — Contact your Emerson sales office or Local Business Partner for repair.

Note

If you need additional trouble-shooting assistance, please contact your Emerson sales office or Local Business Partner.

Packing Replacement

⚠ WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
 - Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
 - Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
 - Vent the power actuator loading pressure and relieve any actuator spring precompression.
 - Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
 - Always wear protective gloves, clothing, and eyewear when performing any maintenance operations.
 - The valve packing area may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
 - Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
-

Figure 3. Z500 Construction Features

X1207

Note:

□ Seat holder is standard on welded and threaded end connections in 0.65, 1.15, 1.5, and 2 inch bores only. Bidirectional option must be specified for all other constructions.

1. Loosen the packing studs.
 2. Remove the packing rings from the packing box, being careful not to damage the packing box.
 3. Inspect the clean packing box to ensure all surfaces are clean and undamaged.
 4. Insert the zero clearance washer. Use the packing flange to press the washer into position.
 5. Insert the bottom end ring of the shaft packing. Use the packing flange to press the bottom end ring into position.
 6. Insert the die formed rings. Use the packing flange to press the ring into position.
-

Figure 4. Assembly Steps

Figure 5. Insert Top End Ring

7. Insert the top end ring of shaft packing. Use the packing flange to press the top end ring into position.

Figure 6. Use Packing Flange

8. Bolt up the packing flange. Use Belleville washers in the same orientation as removed. Contact your [Emerson sales office](#) or Local Business Partner for additional information. Make sure that the markings on the studs and nuts are facing out. Tighten the nuts in a star pattern (figure 2). Tighten the nuts with applicable torque (table 6).

Figure 7. Bolt Up the Packing Flange

Actuator Mounting

CAUTION

Never use a hammer or excessive force to install the shaft adapter on the valve. Improper installation can cause permanent damage to the valve.

1. Mount the shaft adapter on top of the shaft with the two keys. Make sure it fits onto the shaft easily without hammering.
2. Position the mounting bracket onto the body. Use anti-seize lubricant on the bracket studs and nuts. Make sure the markings on the studs and nuts are facing out. Leave the nuts.

Figure 8. Mount the Shaft Adapter

Figure 9. Position the Mounting Bracket

-
3. Place the actuator on top of the mounting bracket and shaft adapter, in the fail position. Make sure the actuator is properly aligned with the shaft adapter. If not, loosen the mounting bracket to assure proper alignment and retighten the mounting bracket. Use anti-seize lubricant on the actuator studs and nuts. Ensure the markings on the studs and nuts are facing out. Ensure the mounting can allow or can accommodate expansion of the shaft or adapter at high temperature. Reference table 7.
 4. Tighten the actuator and mounting bracket studs to the applicable torque after everything is aligned properly.
 5. Install the actuator hand wheel, if present, with key and retention plate. Install the indicator plate on top of the actuator.

Figure 10. Place the Actuator on Top of the Mounting Bracket

Figure 11. Install the Handwheel

Hand Lever

6. Position the mounting bracket onto the body. Use anti-seize lubricant on the bracket studs and nuts. Make sure the markings on the studs and nuts are facing out. Leave the nuts finger tight.
7. Insert the support bushing into the allotted slot of the mounting bracket.
8. Mount the shaft adapter on top of the shaft with the two keys. Make sure it fits onto the shaft easily without hammering. Make sure the mark is facing the lapped side of the ball/end adapter.

Figure 12. Shaft Adapter

-
9. Place the lock plate on top of the mounting bracket. Note the orientation of the open “O” and closed “C” markings.

Figure 13. Lock Plate

-
10. Thread on the socket head cap screws, using anti-seize lubricant, from the underside of the mounting bracket.
11. Tighten the mounting bracket and lockplate bolting to the applicable torque after everything is aligned properly.

Figure 14. Handlever Assembly

-
12. Insert the lever through the hole on the shaft adapter. Thread in the set screw on top of the shaft adapter to hold the lever in place.

1. Contact your [Emerson sales office](#) or Local Business Partner for additional sizes.

Parts Ordering

A serial number is assigned to each valve and stamped on the nameplate. Always refer to the valve serial number when corresponding with your [Emerson sales office](#) or Local Business Partner regarding spare parts or technical information.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they will void your warranty, might adversely affect the performance of the valve, and could give rise to personal injury and property damage.

Parts List

Note

Contact your Emerson sales office or Local Business Partner for part number information.

Installation	3
Parts Ordering	6
Retrofit Parts	7
Parts List	8

Figure 1. HIGH-SEAL ULF Live-Loaded Packing System

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for HIGH-SEAL ULF live-loaded packing systems (see figure 1). These systems are available for sliding-stem valves with 9.5, 12.7, 19.1, 25.4, 31.8 and 50.8 mm (3/8, 1/2, 3/4, 1, 1-1/4, and 2-inch) stem diameters. Refer to separate manuals for instructions covering valves and actuators. For rotary valve applications, contact your [Emerson sales office](#) or Local Business Partner or refer to your rotary valve instruction manual.

Do not install, operate, or maintain HIGH-SEAL ULF live-loaded packing systems without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all

safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

HIGH-SEAL ULF live-loaded packing systems combine the excellent sealing performance of the ENVIRO-SEAL Graphite ULF packing set with the high-performance of the HIGH-SEAL spring pack. The long-travel HIGH-SEAL Belleville springs accurately compensate for any packing consolidation or wear, keeping the packing stress nearly constant over the life of the packing set.

The HIGH-SEAL load scales ensure accurate initial packing adjustment and provide positive visual indication of the packing stress at any time. It is recommended that new packing sets be adjusted to the MAX level.

HIGH-SEAL ULF packing systems are intended for more-severe applications with pressure limits up to 290 bar (4200 psig), except for 9.5 mm (3/8 inch) stem size, which is restricted to 110 bar (1600 psig). If your application exceeds these limits, consult your Emerson sales office or Local Business Partner. For ratings on packing systems, refer to 59.1:062 Packing Selection Guidelines For Sliding Stem Valves ([D101986X012](#)). However, do not exceed the pressure/temperature limits of the valve. If the piping and valve are insulated, do not allow insulation to extend above the yoke boss surface, covering the HIGH-SEAL ULF packing arrangement. Keep the HIGH-SEAL ULF packing arrangement exposed to ambient air conditions.

Table 1. Packing Friction with HIGH-SEAL Graphite ULF Packing

VALVE STEM DIAMETER		HIGH-SEAL GRAPHITE ULF PACKING
mm	Inches	
Newtons		
9.5	3/8	935
12.7	1/2	1250
15.9	5/8	1680
19.1	3/4	2350
25.4	1	3740
31.8	1-1/4	4800
50.8	2	6000
Pounds (Force)		
9.5	3/8	210
12.7	1/2	230
15.9	5/8	380
19.1	3/4	530
25.4	1	840
31.8	1-1/4	1100
50.8	2	1350

The flange, Belleville springs, stud bolts and nuts, packing follower, and packing arrangement are an integral part of the HIGH-SEAL ULF system (see figure 6). For maximum packing life and to operate within the friction specified in table 1, do not interchange any other packing parts with the parts in the HIGH-SEAL ULF system.

⚠ WARNING

HIGH-SEAL ULF live-loaded packing systems are intended for a specific range of pressure, temperature and other service conditions. The valves for which these packing systems are available are also intended for a specific range of pressure, temperature and other service conditions. Do not expose the packing system or the valve to service conditions or variables other than those for which the packing system and valve are intended. If you are not sure what these conditions are, contact your Emerson sales office or Local Business Partner. Provide the product serial number (shown on the nameplate) and all other pertinent information. Applying different conditions could result in parts damage, malfunction of the valve or loss of control of the process, and could also result in personal injury or property damage.

Spring Selection

The Belleville springs for HIGH-SEAL ULF systems are rated by stem size (see table 1). Available materials for the Belleville springs are S17700 (17-7 PH stainless steel) and N07718.

It is important to match the appropriate load scale (see figure 2) to the stem size of the valve. Stem size is stamped on the load scale.

Figure 2. Typical Load Scale

A4990-2

Installation

HIGH-SEAL ULF packing systems are designed for quality performance over extended periods. This longevity allows packing maintenance to be performed as it should be, at regularly scheduled plant outages or turn-arounds.

⚠ WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If the valve is in service, isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut off all pressure lines to the power actuator and release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment. Refer to instructions in the appropriate valve and actuator instruction manuals.

If you are installing the HIGH-SEAL ULF packing system in a valve that is still connected to an actuator, it will be necessary to disconnect the valve from the actuator to provide sufficient space to install the packing assembly. Refer to appropriate valve and actuator instruction manuals. Remove old packing parts from the packing box by using the valve instruction manual procedures.

Figure 3. HIGH-SEAL ULF Packing Assembly Showing the Load Properly Adjusted for Decompressed Springs

The valve stem condition is critical to packing sealing performance and life. As-new surface finish ($0.1 \mu\text{m}$ [$4 \mu\text{in}$] R_a max) is recommended for best performance. Refer to the appropriate valve instruction manual for instructions on replacing the valve stem.

Check the condition of the packing bore after you have removed the packing. An easy method for cleaning debris and minor imperfections from the bore is to use a brake cylinder hone attached to an electric drill. This method will do a good job of cleaning the packing bore without changing the dimension of the bore.

Inspect the packing bore size and surface finish. If the packing bore is worn, pitted, damaged, or oversized more than 0.010 inch, replace the valve bonnet or have your Emerson Automation Solutions Service Center repair it.

Key number locations are shown in figure 6.

1. If a retrofit kit is being installed in place of the original packing, remove existing packing studs from the valve, and replace them with the longer studs (key 200).
2. Install the packing arrangement into the valve packing box.

Note

Be sure to install the packing rings in the sequence shown in figure 6. Identify parts by color or by the number stamped on the part.

- For valves with 9.5 mm (3/8 inch) valve stems, do not install the packing follower (key 203) at this time. (Note: the yoke boss will not slide over the packing follower. The packing follower must be installed while lowering the actuator yoke onto the valve.)
 - For valves with 12.5 mm (1/2 inch) or larger stem diameters, install the packing follower (key 203).
3. Refer to the appropriate valve and actuator instruction manuals when connecting the valve to the actuator. While lowering the actuator yoke onto the valve, install the packing follower [for a 9.5 mm (3/8 inch) valve stem size], indicator disk, springs, and flange (keys 203, 206, 202, and 201).

Figure 4. Load Scale Indicating Minimum Spring Compression

Figure 5. Load Scale Indicating Maximum Spring Compression

4. Place the packing follower against the packing as shown in figure 6.
5. Place the indicator disk (key 206) and the first Belleville spring (key 202) while guiding them onto the packing follower (key 203). Make certain the cone-shaped side of the Belleville spring is towards the indicator disk as shown in figure 3.
6. Place the second Belleville spring (key 202) with the coned-shaped side toward the flange (key 201); see figure 3. Position the flange on top of the spring, making sure the second spring fits into its guide in the flange.

CAUTION

Keep the packing follower and flange centered on the valve stem. If any metal part makes contact with the stem, it can cause damage to the stem surface. Vertical scratches or nicks on the stem surface can cause excessive leakage from the packing.

7. Lubricate the packing nuts with anti-seize lubricant and tighten them hand-tight.
8. The load scale (figure 2) is used to indicate compression on the Belleville springs. Position the load scale (key 205) by slightly loosening the mounting screws (key 204). Align the bottom edge of the load scale with the indicator disk and retighten the screws. Figure 3 illustrates the load scale properly adjusted before the nuts have been tightened and with the Belleville springs not compressed.
9. Tighten the packing nuts while observing the two load scales (key 205) to make sure the flange (key 201) is tightened evenly. Figure 4 indicates minimum spring compression with the indicator disk aligned with the minimum compression line on the load scale. Be sure to keep the follower centered on the stem while tightening the nuts. Tighten the nuts alternately and evenly, keeping the flange parallel with the valve (see figures 4 and 5), until the indicator disk aligns with the maximum compression line on the load scales, as shown in figure 5.
10. The packing is now properly loaded and the packing nuts do not need to be retightened unless the indicator begins to approach the minimum compression line (see figure 4). After the valve has been in service for awhile, visually check the load scale to determine loading. Under normal conditions, the packing nuts should not require retightening for the life of the packing.

Parts Ordering

Each valve assembly is assigned a serial number that can be found on the valve. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Refer to the serial number when contacting your [Emerson sales office](#) or Local Business Partner for technical assistance. When ordering replacement parts, refer to the serial number and to the 11-character part number for each part required from the following parts list.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Retrofit Parts

Retrofit parts meet requirements to convert existing Fisher A, CAV4, E, EH, HP, YD, and YS valves to the HIGH-SEAL ULF packing box construction.

⚠ WARNING

Stems and packing box constructions that do not meet Emerson Automation Solutions stem finish specifications, dimensional tolerances, and design specifications may adversely alter the performance of this packing retrofit, resulting in personal injury or property damage.

HIGH-SEAL Retrofit Kits

STEM SIZE DIAMETER, mm (Inch)	YOKE BOSS DIAMETER, mm (Inch)	RETROFIT KITS

X1597

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for the Fisher HP Control Valve Startup Trim for NPS 8 and larger.

Do not install, operate, or maintain HP valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The Fisher HP Startup Trim kits are available for NPS 8 and larger sizes and include options for hydro testing, flushing, and chemical cleaning of the system. The hydro kit is intended to be used so that the upstream piping can be tested at the required pressure for body and inlet piping pressure class without over pressurizing any attached lower pressure class piping or equipment downstream. The flushing kit allows for pipes to be cleaned upstream and downstream of the valve by allowing dirt, scale, or debris to pass through the valve without causing damage to the valve trim used in normal operation. The chemical cleaning kit is used when cleaning the pipeline with a low velocity, chemical flush of the pipeline.

Educational Services

For information on available courses for Fisher HP and HPA valves, as well as a variety of other products, contact:

Emerson Automation Solutions
Educational Services - Registration

E-mail: education@emerson.com
emerson.com/fishervalvetraining

Valve Installation

Observe all installation warnings, cautions and notes provided in the Fisher HP and HPA Control Valve Instruction Manual ([D101634X012](#)). Follow the instructions provided in the Fisher HP and HPA Control Valve Instruction Manual for valve assembly installation

Maintenance

WARNING

Avoid personal injury or property damage from sudden release of pressure or uncontrolled process fluid. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any spring precompression.
- Use lock-out procedures to be sure the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Trim Removal

Observe all maintenance warnings, cautions and notes in the Fisher HP and HPA Control Valve Instruction Manual ([D101634X012](#)). Follow the Trim Removal instructions provided in the Fisher HP and HPA Control Valve Instruction Manual. See figure 5 for the HP assembly drawing

Installation of Startup Trim Kits

Inspect the valve to ensure all parts and gaskets have been removed and the valve body is free from foreign debris. Inspect all parts for defects and cleanliness; remove any burrs on metal valve components. Visually inspect the interior of the valve for abnormal wear, signs of erosion, or scoring if the valve has been in service. Inspect the gasket surfaces of the valve body, bonnet, and trim to verify they are not damaged and are free of imbedded gasket material.

Installation of Flushing and Hydro Trim Kits

1. Install the seat ring flat sheet gasket (key 12) in the lower gasket groove in the valve body (key 1), making sure the gasket is centered in the groove and the bottom of the gasket is flush with the mating surface in the body. See figure 4.
2. For Flushing Trim: Install eyebolt (3/8-16 UNC-2B) in to the hole on the top of the cage (key 2), as shown in figure 2. Then proceed with step 3, lifting the cage using the eyebolt.

For Hydro Trim: Install threaded rods (1/4-20 UNC-2B) in to the holes on the top of the cage (key 2). Install hoist rings, nuts or eye bolt on to the threaded rod, as shown in figure 3. Then proceed with step 3, lifting the cage using the hoist rings on the threaded rods inserted in the top of the cage

Figure 2. Installation of Flushing Cage with Eyebolt

Figure 3. Installation of Cage with Hoist Rod and Nut

GH02761

3. Install the cage (key 2) into the valve body. When installing the cage (key 2), take care to lower the cage evenly and ensure that cage (key 2) will not damage the flat sheet gasket (key 12) during installation. See figures 4 and 5.

Figure 4. Install Cage to Seat on the Flat Sheet Gasket

4. Install three-cage spiral wound gasket (key 43) in the gasket groove on top of the cage (key 2), making sure the gaskets sit flush on the surface of the groove. See figure 5.
5. Install the bonnet spiral wound gasket (key 11) in the gasket groove on top of the body (key 1), making sure the gasket sits flush on the surface of the groove.
6. Threaded surfaces of the studs (key 13), faces of the nuts (key 14), washers (key 40) and nut seating surface on the bonnet (key 18) should be lubricated with nickel-based anti-seize lubricant prior to assembly.

Note

Take care not to introduce lubricant between the washer and the bonnet surface.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D104480X012

HP Control Valve Startup Trim

July 2019

7. Apply nickel-based anti-seize lubricant to stem (key 46) and two jam nuts (key 47). Lock nuts together by threading in opposite directions. See table 1 for recommended jam nut (key 47) torque values.
8. Install the stem/nut assembly (key 46, key 47) into the bonnet (key 18) such that the side with the two locked nuts is opposite of the packing box bore and will be inside the body cavity when fully installed.

Table 1. Recommended Nut Torque for Hex Jam Nuts (Key 47)

VALVE SIZE, NPS	STEM SIZE	NOMINAL TORQUE	
		N • m	ft • lbf
All	1	380	280
	1-1/4	750	550
	2	3025	2230

Figure 5. Body Assembly with Startup Trim Installed for NPS 8 and Larger

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D104480X012

HP Control Valve Startup Trim

July 2019

9. Install packing per Fisher HP and HPA Control Valve Instruction Manual ([D101634X012](#)).
10. Apply nickel-based anti-seize lubricant and install two jam nuts (key 47) onto the side of the stem (key 46) extruding from the packing box. Snug the nuts together, see table 1 for recommended jam nut (key 47) torque values. These will be removed after flushing/hydro testing.
11. Lower the bonnet (key 18) and stem/nut assembly (key 46, key 47) over the bonnet studs (key 13) and onto the valve body (key 1), making sure the bonnet (key 18) skirt will not damage the bonnet spiral wound gasket (key 11), or the three-cage spiral wound gaskets (key 43). When lowering the bonnet (key 18) into the body (key 1), take care to ensure that the bottom diameter guides properly with the cage (key 2) and the outside diameter of bonnet guides properly with body (key 1).

Note

The bonnet might not sit flush on the bonnet gasket until the bolts are completely tightened. Once tightened properly, the bonnet will contact metal-to-metal with the valve body.

For bolt sizes larger than 1-1/2 inch, install washers (key 40) over the bonnet studs, taking care not to introduce lubricant between the washer and the bonnet surface. Lubricant should be present between the seating surface of the bonnet stud nut and the washer. Turn the nuts (key 14) onto the studs (key 13) until hand tight.

12. Torque bonnet nuts (key 14) in a crisscross pattern with no more than 1/4 of the nominal torque specified in table 2. When all nuts are tightened to that torque, increase the torque by 1/4 of the specified nominal torque and repeat the crisscross pattern. Repeat the above until all nuts are tightened to the specified nominal torque value. If any nut still turns at the final torque, tighten every nut to the final torque again. For odd number of bolts, tighten the bonnet nuts following the pattern shown in figure 6.

Table 2. Recommended Bolt Torque for Alloy Steel Bolting Using Anti-Seize Lubricant (Keys 13 and 14)⁽¹⁾

STUD SIZE	NOMINAL TORQUE	
	Bolting Materials	
	B7, B16, B8M2, BD, S20910, N07718, and 660 Studs	
	N • m	ft • lbf
1-3/8	1270	935
1-1/2	1650	1220
1-5/8	2130	1570
1-3/4	2670	1970
2	4030	2970
2-1/4	5780	4260
2-1/2	7990	5890

1. For other bolting materials or lubricants, contact your [Emerson sales office](#) for torque information.

Figure 6. Nut Tightening Pattern

Installation of Chemical Cleaning Trim Kit

1. Install the bonnet spiral wound gasket (key 11) in the gasket groove on top of the body (key 1), making sure the gasket sits flush on the surface of the groove.
2. Threaded surfaces of the studs (key 13), faces of the nuts (key 14), washers (key 40) and nut seating surfaces on the bonnet (key 18) should be lubricated with nickel-based anti-seize lubricant prior to assembly.

Note

Take care not to introduce lubricant between the washer and the bonnet surface.

3. Apply nickel-based anti-seize lubricant to stem (key 46) and two jam nuts (key 47). Lock nuts together by threading in opposite directions. See table 1 for recommended jam nut (key 47) torque values.
4. Install the stem/nut assembly (key 46, key 47) into the bonnet (key 18) such that the side with the two jam nuts (key 47) is opposite of the packing box bore and will be inside the body when fully assembled.
5. Install packing per Fisher HP and HPA Control Valve Instruction Manual ([D101634X012](#)).
6. Apply nickel-based anti-seize lubricant and install two jam nuts (key 47) onto the side of the stem (key 46) extruding from the packing box. Snug the nuts together, see table 1 for recommended jam nut (key 47) torque values. These will be removed after chemical cleaning operation.
7. Lower the bonnet (key 18) and stem/nut assembly (key 46, key 47) over the bonnet studs (key 13) and onto the valve body (key 1), making sure the bonnet (key 18) skirt will not damage the bonnet spiral wound gasket (key 11) during assembly. When lowering the bonnet (key 18) in to the body (key 1), take care to ensure that the outside diameter of the bonnet guides properly with body (key 1).

Note

The bonnet might not sit flush on the bonnet gasket until the bolts are completely tightened. Once tightened properly, the bonnet will contact metal-to-metal with the valve body.

For bolt size larger than 1-1/2 inch, install washers (key 40) over the bonnet studs, taking care not to introduce lubricant between the washer and the bonnet surface. Lubricant should be present between the seating surface of the bonnet stud nut and the washer. Turn the nuts (key 14) onto the studs (key 13) until hand tight.

8. Torque bonnet nuts (key 14) in a crisscross pattern with no more than 1/4 of the nominal torque specified in table 2. When all nuts are tightened to that torque, increase the torque by 1/4 of the specified nominal torque and repeat the crisscross pattern. Repeat the above until all nuts are tightened to the specified nominal torque value. If any nut still turns at the final torque, tighten every nut to the final torque again. For odd number of bolts, tighten the bonnet nuts following the pattern shown in figure 6.

Disassembly of Startup Trim Kits

Disassembly of Flushing and Hydro Trim Kits

1. Loosen the bonnet nuts (key 14), using an even and opposing pattern, as specified in figure 6. This will prevent uneven loading of the bonnet flange studs which may cause binding.

Individual nuts should not be completely loosened while the remaining nuts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs.

2. Remove the bonnet from the valve by pulling straight up. If the bonnet seems to bind in the valve body, check the alignment of the hoist or rigging equipment. Ensure that the bonnet is lifted straight off the body to prevent parts damage.
3. Remove two jam nuts (key 47) from the side of the stem (key 46) extruding from the packing box.
4. Remove packing per Fisher HP and HPA Control Valve Instruction Manual ([D101634X012](#)).
5. Remove the stem/nut assembly (key 46, key 47).
6. Remove and discard the bonnet spiral wound gasket (key 11).
7. Remove and discard the three-cage spiral wound gaskets (key 43).
8. **For Flushing Trim:** Install eyebolt (3/8-16 UNC-2B) in to the hole on the top of the cage (key 2), as shown in figure 2. Then proceed with step 8.
For Hydro Trim: Install threaded rods (1/4-20 UNC-2B) in to the holes on the top of the cage (key 2). Install hoist rings, nuts or eye bolts on to the threaded rod, as shown in figure 3. Then proceed with step 8.
9. Remove the cage (key 2) from the valve body cavity.
10. Remove and discard the seat ring flat sheet gasket (key 12).

Disassembly of Chemical Cleaning Trim Kits

1. Loosen the bonnet nuts (key 14), using an even and opposing pattern, as specified in figure 6. This will prevent uneven loading of the bonnet flange studs which may cause binding.

Individual nuts should not be completely loosened while the remaining nuts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs.

2. Remove the bonnet from the valve by pulling straight up. If the bonnet seems to bind in the valve body, check the alignment of the hoist or rigging equipment. Ensure that the bonnet is lifted straight off the body to prevent parts damage.
3. Remove two jam nuts (key 47) from the side of the stem (key 46) extruding from the packing box.
4. Remove packing per Fisher HP and HPA Control Valve Instruction Manual ([D101634X012](#)).
5. Remove the stem/nut assembly (key 46, key 47).
6. Remove and discard the bonnet spiral wound gasket (key 11).

Cleaning

After removal of the chemical trim, the interior of the valve body and all internal parts should be properly cleaned prior to reassembly.

Trim Replacement and Valve Reassembly

After removal of the Startup Trim and proper cleaning, reassemble the valve by following the Trim Replacement instructions provided in the Fisher HP and HPA Control Valve Instruction Manual (D101634X012).

Parts Ordering

A serial number is assigned to each valve and stamped on the nameplate. Always refer to the valve serial number when corresponding with your [Emerson sales office](#) regarding spare parts or technical information. When ordering replacement parts, also specify the part name and desired material.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

KALREZ™ Packing System for Fisher™ Rotary-Shaft Valves

Contents

Introduction	1	Removing the Actuator	2
Scope of Manual	1	Installing a KALREZ Packing System	4
Description	1	Tightening Procedures	5
Installation	1	Other Considerations	5

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for KALREZ valve stem packing (KVSP) systems. These systems are available for Fisher rotary valves with 12.7 through 38.1 mm (1/2 through 1-1/2 inch) shaft diameters. The system can be used with many rotary valves, as shown in table 1. Refer to appropriate valve and actuator instruction manuals for necessary information relating to the disassembly and assembly of the valve and actuator.

Do not install, operate, or maintain a KALREZ packing system without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

See table 1 for valve designs and shaft diameters where KALREZ packing systems can be applied.

Emerson Automation Solutions offers KALREZ packing systems that you can easily install into your existing valves or that you can purchase with new valves. The KVSP 500 Series uses Vespe^l™ CR-6100 backup rings and KALREZ seal rings.

The external live-loading provides a constant load over the life of the packing material, which reduces the need for packing box adjustment and maintenance.

Installation

Use these instructions to install KALREZ packing in valves that have standard packing, or when inspecting or replacing KALREZ packing.

Table 2 lists part numbers for KALREZ packing sets only. When retrofitting valves to KALREZ packing, contact your Emerson Automation Solutions sales office for information on additional parts needed.

Table 1. Specifications

Applicable Valve Designs A41, 8510, 8510B (single arrangements only), 8550, and 8560 valves; V100, V150, V200, V300 and V500 Vee-Ball™ valves; and CV500 Cam-Vee-Ball valves. See table 2	(1/2, 5/8, 3/4, 7/8, 1, 1-1/4 and 1-1/2 inches). See table 2
Applicable Shaft Diameters <i>Vee-Ball and Eccentric Disc Valves:</i> ■ 12.7, ■ 15.9, ■ 19.1, ■ 22.2, ■ 25.4, ■ 31.8, and ■ 38.1 mm	Pressures and Temperatures⁽¹⁾ Maximum Application Temperature 260°C (500°F) Maximum Application Pressure Pressure is limited to the maximum valve rating
1. The pressure/temperature limits in this manual, in the valve literature, and any applicable code or standard limitation should not be exceeded.	

Removing the Actuator

WARNING

Avoid personal injury from sudden release of process pressure or uncontrolled movement of parts. Before performing any installation operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any other hazards that may be present from exposure to process media.

You must remove the actuator from the valve when you install KALREZ packing systems. To allow proper readjustment of the Vee-Ball, eccentric disc, or valve disc position, it is recommended that you remove the valve from the pipeline. Refer to appropriate valve and actuator instruction manuals.

WARNING

Avoid personal injury or equipment damage from uncontrolled movement of parts. If a spring-return actuator is used, be sure the actuator spring is resting on its travel stop. If something is obstructing shaft rotation, it is possible that disconnecting the shaft connector will allow the spring to force the actuator to the end of its rotation. Refer to the appropriate valve and actuator instruction manuals to remove the actuator.

Figure 1. KALREZ Packing Arrangements

Figure 2. Belleville Spring Stacking Order

Installing a KALREZ Packing System

Refer to figure 1.

Note

When installing a KALREZ packing system into an insulated valve, do not cover the Belleville packing springs with insulation.

CAUTION

Use caution when removing existing internal packing parts. Do not scratch, nick, or dent the valve shaft.

Note

The valve shaft surface condition is critical in obtaining a good seal. If the valve shaft surface is scratched, nicked, or worn, replace the valve shaft before installing the KALREZ Packing System.

1. Remove old packing parts from the packing box by using the valve instruction manual procedures. Refer to the appropriate valve instruction manual to replace the valve shaft and valve parts.
 2. If the piping and valve are insulated, do not allow the insulation to cover the KALREZ Belleville springs.
 3. If you are converting an existing valve to this packing, remove existing packing box studs from the valve body, and replace them with longer studs (as required).
-

Note

KVSP packing systems should be installed as a complete set, NOT AS INDIVIDUAL PIECES OR COMPONENTS.

Note

Ensure that the Belleville springs are stacked properly (see figure 2) and packing box parts are assembled in the correct order (see figure 1). Packing parts cannot function properly if the Belleville springs or other packing parts are not stacked correctly.

4. All kits include a single use packet of KRYTOX™ GPL 206 high performance fluorinated grease to maximize service life and ease of assembly. KRYTOX lubricants are chemically inert to the chemicals regulated under the U.S. Clean Air Act, non-reactive to gaseous and liquid oxygen and chlorine services, with chemical compatibility consistent with KALREZ and the KVSP Systems.
5. Apply the KRYTOX lubricant **liberally** to both the I.D. (inner diameter) and O.D. (outer diameter) surfaces of each KVSP component before installing. All exposed surfaces of the packing assembly should be fully covered.
6. With the shaft in place in the valve, install the packing parts into the valve packing box. Carefully slide the packing down the shaft while being careful not to force the packing and damage it on the shaft spline. Use figures 1 and 2 to ensure that the packing parts and spring pack are assembled in the correct order.
7. Be careful NOT to position the KVSP packing system adjacent to any lubrication holes in the packing box which could compromise its sealing performance.

Tightening Procedures

A modified tightening procedure is recommended for live-loading the KVSP System to help ensure the correct loading force is used during the life of the packing and to help avoid any overcompression of the packing. This procedure also creates open space within the spring set that allows dynamic movement of the packing system to compensate for any volumetric changes that occur during thermal cycling.

Note

The following tightening procedure will change the final loading force to about 1/2 of a fully compressed disc spring.

1. Hand tighten the gland nuts on the Belleville disc springs and measure the uncompressed or free height.
2. Fully compress the Belleville disc springs alternately and evenly to the flat condition. The flat condition will be evident by a sharp increase in the applied nut torque. Note that there may appear to be space left between the springs; this is due to friction between the springs. Measure the compressed height.
3. Back off the disc spring deflection by 1/3 or 33% of the difference between (1) the free, uncompressed spring height and (2) the fully compressed spring height.
4. The KVSP Systems are designed so the components move together during service to eliminate free space within the packing system. This is part of the system's design and will occur automatically during service without further adjustment from normal mechanical and thermal cycling. The resulting working height is then established half way between (1) the free, uncompressed height and (2) the fully compressed position; this also provides approximately 50% of the load force available from the fully compressed disc spring. This new set position helps give the system an ideal and balanced load, allowing for expansion and contraction due to temperature variations in the process and maximizing the service life.

Other Considerations

When retrofitting an existing packing system or repacking a valve with KALREZ packing that has been in service, check the condition of the packing bore after you have removed the packing. An easy method for cleaning debris and minor imperfections from the bore is to use a brake cylinder hone attached to an electric drill. This method will do a good job of cleaning the packing bore without changing the dimension of the bore.

When you have completed this exercise, a good guideline to use in checking the condition of the packing bore is the 20/20 rule. If less than 20% of the surface area of the bore is pitted and if there are no pits deeper than 0.020 inch, then your packing should work fine. This does not need to be an exact measurement; visual inspection is adequate. If the packing bore does not meet this criteria, however, you should replace the valve.

KALREZ™ Packing System for Fisher™ Sliding-Stem Valves

Contents

Introduction	1	Tightening Procedures	3
Scope of Manual	1	Other Considerations	4
Description	1	Parts Ordering	7
Installation and Maintenance	2		

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for KALREZ valve stem packing (KVSP) systems. These systems are available for Fisher sliding-stem valves with 9.5, 12.7, 19.1, 25.4, and 31.8 mm (3/8, 1/2, 3/4, 1, and 1-1/4 inch) diameter stems. The system can be used with many sliding-stem valves as shown in the Applications section of the Specifications. Refer to appropriate valve and actuator instruction manuals for necessary information relating to the disassembly and assembly of the valve and actuator.

Do not install, operate, or maintain KALREZ packing systems without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

Emerson Automation Solutions offers KALREZ packing systems that you can easily install into your existing valves or that you can purchase with new valves. The KVSP 500 Series uses Vespel™ CR-6100 backup rings and KALREZ seal rings. The KVSP Fire-Safe Series uses Vespel CR-6100 backup rings, KALREZ seal rings, and a die-formed flexible graphite ring located on top of the KALREZ packing set.

These packing systems help seal your process to conserve valuable fluids, and help protect the environment against the emission of toxic or polluting liquids and gases. The external live-loading provides a constant load over the life of the packing material, which reduces your need for packing box adjustment and maintenance.

If the piping and valve are insulated, do not allow insulation to extend above the yoke boss surface, covering the KALREZ packing arrangement. Keep the KALREZ packing arrangement exposed to ambient air conditions.

Table 1. Specifications

Applicable Valve Designs	Pressures and Temperatures ⁽²⁾
Fisher valves using CL125 through 600, ■ A, ■ easy-e™ valves (for example, EAT, EZ, ETR, EWD, etc.), ■ EH, ■ HP, ■ YD, and ■ YS⁽¹⁾ Applications Valve Stem Diameters: ■ 9.5, ■ 12.7, ■ 19.1, ■ 25.4, and ■ 31.8 mm (3/8, 1/2, 3/4, 1, and 1-1/4 inches)	Maximum Application Temperature <i>KVSP 500 Series: 260°C (500°F)</i> <i>KVSP Fire-Safe Series: 260°C (500°F)</i> Maximum Application Pressure <i>For Environmental Service: 31 bar (450 psig)</i> <i>For Non-Environmental Service: Pressure is limited to the maximum valve rating</i> Also see bulletin 59.1:062, Packing Selection Guidelines for Sliding-Stem Valves
1. For availability of a KALREZ packing system with a specific valve, contact your Emerson sales office or Local Business Partner. 2. The pressure/temperature limits in this manual, in the valve literature, and any applicable code or standard limitation, should not be exceeded.	

Installation and Maintenance

Use these instructions to install KALREZ packing in valves that have standard packing or when inspecting or replacing KALREZ packing.

⚠ WARNING

Avoid personal injury from sudden release of process pressure or uncontrolled movement of parts. Before performing any installation or maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any other hazards that may be present from exposure to process media.

If you are installing the packing system in a valve that is still connected to an actuator, remove the actuator from the valve to provide sufficient space to install the packing assembly. If a spring-return actuator is used, it is possible that disconnecting the stem connector will allow the spring to force the actuator to the end of its travel. Be sure the actuator spring is resting on its travel stop. Refer to the appropriate valve and actuator instruction manuals to remove the actuator.

Carefully remove the old packing parts from the packing box by using the valve instruction manual procedures. Both the valve stem surface condition and the packing bore are critical in obtaining a good seal. If the valve stem surface is

scratched, nicked, or worn, replace the valve stem before installing the KALREZ Packing System. Check the condition of the packing bore and clean or hone it out, as necessary. Refer to the appropriate valve instruction manual to replace the valve stem.

Figure 1. Belleville Spring Stacking Order

For key number locations refer to figure 3. Then proceed as follows:

1. The original packing flange studs used for standard packing arrangements should be long enough to accommodate the KALREZ packing parts. If you determine that the existing studs and nuts should be replaced however, due to their condition, replace them with new studs and nuts (keys 200 and 212).
2. Complete all valve maintenance before installing the KALREZ packing system into the bonnet.
3. Be careful NOT to position the KVSP packing system adjacent to any lubrication holes in the bonnet which could compromise its sealing performance.

Note

Ensure that the Belleville springs are stacked properly (see figure 1) and packing box parts are assembled in the correct order (see figure 3). Packing parts cannot function properly if the Belleville springs or other packing parts are not stacked correctly.

4. KVSP packing systems should be installed as a complete set, NOT AS INDIVIDUAL PIECES OR COMPONENTS.
5. All kits include a single use packet of KRYTOX™ GPL 206 high performance fluorinated grease to maximize service life and ease of assembly. KRYTOX lubricants are chemically inert to the chemicals regulated under the U.S. Clean Air Act, non-reactive to gaseous and liquid oxygen and chlorine services, with chemical compatibility consistent with KALREZ and the KVSP Systems.
6. Apply the KRYTOX lubricant **liberally** to both the I.D. and O.D. surfaces of each packing set component (key 215) before installing. All exposed surfaces of the packing assembly should be fully covered.
7. Carefully slide the packing down the stem while being careful not to force the packing and damage it on the stem threads. Use figure 3 to ensure that the packing parts and spring pack are assembled in the correct order.

Tightening Procedures

A modified tightening procedure is recommended for live-loading the KVSP System to ensure the correct loading force is used during the life of the packing and to avoid any overcompression of the packing. This procedure also creates open space within the spring set that allows dynamic movement of the packing system to compensate for any volumetric changes that occur during thermal cycling.

Figure 2. KVSP System Tightening Procedure

The following tightening procedure will change the final loading force to about 1/2 of a fully compressed disk spring.

1. Hand tighten the gland nuts on the Belleville disk springs and measure the uncompressed or free height as shown in figure 2.
2. Fully compress the Belleville disk springs alternately and evenly to the flat condition. The flat condition will be evident by a sharp increase in the applied nut torque. Note that there may appear to be space left between the springs; this is due to friction between the springs. Measure the compressed height. See figure 2.
3. Back off the disk spring load by 1/3 or 33% of the difference between (1) the free spring height and (2) the fully compressed spring height.

Other Considerations

When retrofitting an existing packing system or repacking a valve with KALREZ packing that has been in service, check the condition of the packing bore after you have removed the packing. An easy method for cleaning debris and minor imperfections from the bore is to use a brake cylinder hone attached to an electric drill. This method will do a good job of cleaning the packing bore without changing the dimension of the bore.

If any visible pits or defects remain in the packing bore, the bonnet should be replaced.

Parts Ordering

Each valve assembly is assigned a serial number that can be found on the valve body. Refer to this serial number when contacting your [Emerson sales office](#) or Local Business Partner for technical assistance. When ordering replacement parts, refer to this serial number and to the part description and part number from the following parts list. When ordering replacement parts, refer to the serial number and to the 11-character part number for each part required from the following parts list.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Introduction

Scope of Manual

This instruction manual includes installation, operation, maintenance, and parts ordering information for M Series manual handwheel gear actuators. Refer to separate manuals for instructions covering the valves used with these actuators.

Do not install, operate, or maintain an M Series handwheel gear actuator without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage it is important to carefully read, understand, and follow all of the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

M Series handwheel gear actuators (figure 1) are totally enclosed, weatherproof, worm gear actuators for reliable manual operation with Fisher A11, A31A and A41 High Performance Butterfly Valves. The M actuator consists of a body housing, cover, worm gear, input shaft, and handwheel. The housing is grease packed.

Specifications

Specifications for the M Series manual handwheel gear actuators are shown in table 1.

Table 1. Specifications

Actuator Sizes See tables 2, 3 and 4 Valve Compatibility ■ Accepts A11 valve square-end shafts from 10.3 to 34.9 mm (13/32 to 1-3/8 inches), keyed shafts from 38.1 to 44.5 mm (1-1/2 to 1-3/4 inches)⁽¹⁾ ■ Accepts A31A valve keyed shafts from 44.5 to 57.2 mm (1-3/4 to 2-1/4 inches) ■ Accepts A41 valve Double D shafts from 12.7 to 44.5 mm (1/2 to 1-3/4 inches) Maximum Torque Output See Bulletin 22.2:M Handwheel Rotation Clockwise handwheel rotation closes the valve (produces clockwise rotation of the valve shaft)	Construction Materials Housing and Cover: Cast iron Worm: Steel Worm Gear: Manganese Bronze Input Shaft: Steel (303 SST on request) Handwheel: Cast Iron Mounting Positions See figure 2 Dimensions and Approximate Weights See Bulletin 22.2:M Options ■ Locking plates with padlock for fixed positioning ■ Stops are typically set every 10°, but can be special ordered with stops set up to 45° from both ends ■ Handwheel extensions
---	---

1. As an option, CL600 NPS 10 (with 1-1/2 inch keyed shaft) and NPS 12 (with 1-3/4 inch shaft) A11 valves require a keyed connection if being used with size 9KE or 10KE-6 actuators.

Figure 1. M Series Handwheel Gear Actuator

W4715-1

Installation

⚠ WARNING

To avoid personal injury or property damage resulting from the sudden release of pressure, do not install the actuator where service conditions could exceed the limits given in this manual or on the appropriate nameplates. Use pressure-relieving devices as required by government or accepted industry codes and good engineering practices.

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

The M Series gear actuator is normally mounted on a valve at the factory. However, the actuator can be field mounted; it can be mounted in any position on the A11 or A31A and it can be mounted in positions 1 and 3 on the A41, as shown in figure 2. Make clearance considerations before mounting the actuator to determine the most suitable mounting position.

The M Series actuator has a direct stab-on design. Simply insert the valve shaft into the broached area of the body housing. Then attach the mounting bracket to the actuator, using the torques listed in table 5, and attach the mounting bracket to the valve.

Table 2. M Series Gear Actuator for A11 (CL600)

9KE/D7	3/4	258	190

Operation

After the actuator and control valve assembly are installed, the manual actuator is ready for operation.

CAUTION

Applying too much torque to the actuator and valve parts could cause damage to the parts. To avoid such damage, do not exceed the rim force listed in table 2, 3 and 4 or any other torque limitation of internal valve parts. Also, do not use wrenches or other devices on the handwheel or handwheel shaft to increase operating force.

Maintenance

⚠ WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If the rim force required to rotate the handwheel exceeds the rim force listed in table 2, 3, or 4, check for the following conditions:

- Insufficient lubrication
- Seized actuator parts
- Excessive pressure drop across the valve
- Obstruction to the valve disk rotation

If the manual actuator does not seem to control the process fluid, the worm or drive sleeve gear teeth may be broken, the handwheel pin may be sheared, or the valve parts may be broken. Purchase a replacement manual actuator if necessary. Refer to the valve instruction manual if valve maintenance is needed.

Lubrication

The interior parts of the M Series actuator should be lubricated on a regular schedule with a quality gear lubricant. The interior parts should also be lubricated whenever difficulty in handwheel rotation indicates a need for lubrication.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve.
2. Remove the cap screws that secure the gearbox cover plate and remove the gearbox cover plate.
3. Coat the worm, the drive sleeve gear teeth, and the bearing surfaces of the gearbox housing and worm with a quality gear lubricant.
4. Replace the cover plate and cap screws using the bolt torques listed in table 5.
5. Replace the manual actuator on the valve. Adjust the actuator travel stop to limit the open and closed positions of the valve disk following the steps in the appropriate valve instruction manual.

Parts Ordering

When corresponding with your [Emerson sales office](#) indicate the size of the M Series actuator. The size is stamped on the gearbox. You should also provide the serial number of the valve.

WARNING

Use only genuine Fisher™ replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they will void your warranty, might adversely affect the performance of the valve, and could give rise to personal injury and property damage.

Figure 2. Available Mounting Positions

NOTE:
ONLY POSITIONS 1 AND 3 ARE APPLICABLE TO A41.

Figure 3. Typical M Series Assembly

Service Instructions for Fisher™ 1068 Rotary Vane Actuator

This instruction manual was prepared by Kinetrol.

Do not install, operate or maintain this product without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance.

To avoid personal injury or property damage it is important to carefully read, understand, and follow all of the contents of this manual, including all safety cautions and warnings.

If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Fisher 1068 Rotary Vane Actuator

X1591

SPRING RETURN

X1590

DOUBLE ACTING

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations. Check with your process or safety engineer for any other hazards that may be present from exposure to process media.

⚠ WARNING

To avoid personal injury and parts damage, do not apply pressure that exceeds the Maximum Operating Pressure of 7 bar (100 psig). Use pressure-limiting or pressure-relieving devices to prevent the Operating Pressure from exceeding this value.

Actuator Mounting

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Safely vent the power actuator loading pressure.
- Use lock-out procedures to be sure the above measures stay in effect with you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, even with the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any other hazards that may be present from exposure to process media.

NOTICE

When adjusting the travel stop for the closed position of the valve ball or disk, refer to the appropriate valve instruction manual for detailed procedures. Undertravel or overtravel at the closed position may result in poor valve performance and/or damage to the equipment.

Neither Emerson, nor any of its affiliated entities assume responsibility for the selection, use or maintenance of any product. Responsibility for proper selection, use, and maintenance of any product remains solely with the purchaser and end user.

ROTARY 1/4 TURN PNEUMATIC ACTUATORS

Suitable for use in safe area and hazardous gas/dust atmospheres (ATEX)

Table of Contents

Section 1: Rotary 1/4 turn actuator / double acting & spring return models.

1.1 General Actuators & Spring Returns

- 1.1.1 Mounting Holes sizes
- 1.1.2 Mounting
- 1.1.3 Drive Coupling
- 1.1.4 Air / Gas Supply
- 1.1.5 Operation
- 1.1.6 Maintenance
- 1.1.7 Recommended Spare Parts
- 1.1.8 Labelling
- 1.1.9 Adjustment

1.2 Actuator Seal Replacement Instructions

- 1.2.1 Dismantling Actuator
- 1.2.2 Re-assembling Vane
- 1.2.3 Re-assembling Actuator
- 1.2.4 Exploded view of typical Actuator

1.3 Spring Return Units

- 1.3.1 Removal of Spring Return Unit
- 1.3.2 Re-fitting of Spring Return Unit

Section 2: Accessory mount for Fisher DVC2000 & DVC6200 Positioners

- 2.1.1 Mount kit for Fisher DVC Positioners
- 2.1.2 Accessory mount plate for size 12i/14i/15i Actuators

Section 3: Installation of Valve Yokes and anti-backlash couplings

- 3.1.1 Fitting anti-backlash couplings to Spring Return actuators
- 3.1.2 Mounting Yokes to Actuators & Spring Returns
- 3.1.3 Mounting Yokes to valves

ROTARY 1/4 TURN PNEUMATIC ACTUATORS

Suitable for use in safe area and hazardous gas/dust atmospheres (ATEX)

Section 1: Rotary 1/4 turn actuator / double acting & spring return models.

1.1 General Actuators & Spring Returns

1.1.1 Mounting Holes sizes

Table 1: Actuator (ANSI Threads)

Model	Number of Holes	ANSI Thread	Depth of Thread	PCD
7i	4	5/16-18 UNC	0.63"	2.00"
8i	4	5/16-18 UNC	0.63"	2.76"
9i	4	3/8-16 UNC	0.79"	2.56"
10i	4	3/8-16 UNC	0.63"	4.02"
12i	4	1/2-13 UNC	0.94"	3.06"
14i	4	5/8-11 UNC	1.12"	3.89"
15i	4	5/8-11 UNC	1.12"	5.51"

Table 2: Spring Return (ANSI Threads)

Model	Number of Holes	ANSI Thread	Depth of Thread	PCD
5i	4	5/16-18 UNC	0.51"	2.76"
7i	4	5/16-18 UNC	0.51"	2.76"
8i	4	5/16-18 UNC	0.63"	2.76"
9i	4	3/8-16 UNC	0.63"	4.02"
10i	4	3/8-16 UNC	0.63"	4.02"
12i	4	3/8-16 UNC	0.63"	4.02"
14i	4	1/2-13 UNC	0.94"	4.92"
15i	4	5/8-11 UNC	1.12"	5.51"

1.1.2 Mounting

Actuator / spring and driven unit must be correctly aligned, i.e. actuator vane / spring coupling and driven unit must be able to move in same direction from end stop when coupled together.

Figure 1.

Vane shown in mid-travel position.
 Identifying groove in top of output drive square shows position of vane.

ROTARY 1/4 TURN PNEUMATIC ACTUATORS

Suitable for use in safe area and hazardous gas/dust atmospheres (ATEX)

Note: Position of output shaft when vane at mid-travel position.

- 1) Take particular care in aligning model 5i actuator, 6-hole mounting means 30° misalignment possible if flange has 60° error and coupling 90° error.
- 2) There must be no end load on actuator drive shaft.
- 3) Check clearance between actuator and driven unit drive shaft, allowing for coupling to be used.
- 4) Care must be taken to ensure concentricity between actuator or spring return drive shaft and driven unit shaft.
- 5) Actuator can be mounted in any plane.
- 6) When side loading of actuator shaft is unavoidable, ensure load does not exceed guide lines given in Kinetrol Technical data sheet TD28.

1.1.3 Drive Coupling

- 1) Square hole drive coupling supplied for double acting actuators and anti-backlash drive coupling supplied with spring return actuators both in stainless steel.
- 2) In order to prevent rubbing and wear on the actuator / spring mount face, the actuator square should engage as deeply as reasonably practical into the coupling. However, a minimum gap of 0.5mm (0.02") between the coupling face and actuator / spring mount face should be maintained.

1.1.4 Air/Gas Supply

- 1) Operating air pressure should not exceed 7 bar (100 psi).
- 2) Supply medium must be clean, dry, oil-free, and non-corrosive and meet the requirements of ISA standard 7.0.01 or ISO 8573-1. Severe personal injury or property damage may occur from an uncontrolled process if the instrument supply medium is not clean, dry, oil-free, and non-corrosive. While use and regular maintenance of a filter that removes particles larger than 40 micrometers in diameter will suffice in most applications, further filtration down to 5 micrometer particle size is recommended. Lubricant content is not to exceed 1 ppm weight (w/w) or volume (v/v) basis. Condensation in the air supply should be minimised.
- 3) Plastic or other non-conductive tubing should not be used if unit is ATEX.
- 4) The actuator can be driven by a hazardous gas as long as the gas is not corrosive (e.g. natural gas "sweet" and not "sour" gas is used).
- 5) The actuator shall not be operated with flammable gas/air mixtures.
- 6) Air can be passed to the actuator from three different sets of air ports:
 - a) Through the side holes.
 - b) Through the two holes at the rear of the actuator by fitting a Namur adaptor.
 - c) Through the two holes in the top flange of the actuator.

ROTARY 1/4 TURN PNEUMATIC ACTUATORS

Suitable for use in safe area and hazardous gas/dust atmospheres (ATEX)

1.1.5 Operation

- 1) External stops are strongly recommended when actuator is operating a mechanism with cantilevered load. However, Kinetrol technical data sheet, TD37, can be used to ensure load inertia and travel speed remain within allowable limits.
- 2) Positioner end of drive shaft may be used for visual position indication, when indicator arrow fitted.
- 3) Spring units can only be fitted to the driven (square) end of the actuator.
- 4) Ambient operating temperature range of actuator and spring is -40°C to 80°C as standard and -54°C to 60°C with low temperature seals.
 Special care should be taken to ensure that heat conducted from, for example, a hot valve, does not increase the temperature above these limits.
 Refer to Kinetrol for guidance.
- 5) Ensure environmental conditions, such as corrosive environments, are compatible with the materials of construction and protective finishes (Kinetrol technical data sheet TD14 refers). If unsure, contact Kinetrol.
 Excessive corrosion of the actuator and spring may cause it to fail in service.
- 6) The maximum rubbing speed of any component within the actuator and spring return unit must not exceed 4m/s for Cat 2.
 See table below for minimum operating travel times:
- 7) Do not allow dust layers to build up on the apparatus.

Table 3: Minimum Actuator operating travel times

Model	Category 2 operating time for 90° travel (sec)
5i	0.027
7i	0.036
8i	0.042
9i	0.046
10i	0.047
12i	0.060
14i	0.081
15i	0.091

ROTARY 1/4 TURN PNEUMATIC ACTUATORS

Suitable for use in safe area and hazardous gas/dust atmospheres (ATEX)

1.1.6 Maintenance

- 1) Actuator maintenance is limited to replacement of seals when wear affects actuator performance.
- 2) Seal life will vary according to application, conditions of cycle frequency, temperature, condition of air supply, etc.
- 3) Detailed seal replacement instructions in next section.
- 4) Spring return units are not user serviceable and therefore no spare parts are available other than complete units, baseplate gasket / O-ring seals and keeper plates for safe spring removal.

1.1.7 Recommended Spare Parts

- 1) Standard seal kits, available for each actuator model, consist of the following:
 - 2 off vane seal - 2 off expander - 2 off shaft seal
 - Plus all necessary O-rings, screws, nuts and grease for all sizes.
 In addition, a tube of sealant will be required to seal case halves.

Table 4: Standard seal kit spare part ordering codes

Model	Act Seal Kit P/N	Vane P/N	Baseplate Seal P/N
5i	R1068KTX012	R1068KTX132	R1068KTX262
7i	R1068KTX022	R1068KTX142	R1068KTX272
8i	R1068KTX032	R1068KTX152	R1068KTX282
9i	R1068KTX042	R1068KTX162	R1068KTX292
10i	R1068KTX052	R1068KTX172	R1068KTX302
12i	R1068KTX062	R1068KTX182	R1068KTX312
14i	R1068KTX072	R1068KTX192	R1068KTX322
15i	R1068KTX082	R1068KTX202	R1068KTX332

1.1.8 Labelling

- 1) All Kinetrol actuators and spring return units that are approved for use in areas where explosives, dust and gases are present, are marked with the following labels:

			
STANDARD ACTUATOR		LOW TEMPERATURE ACTUATOR	

- 2) Ensure that the details on the label such as the ambient temperature range is suitable for the application. Also ensure that any other equipment fitted to the actuator and spring return unit (e.g. valve or positioner) does not restrict the use within the parameters shown on the above labels.

ROTARY 1/4 TURN PNEUMATIC ACTUATORS

Suitable for use in safe area and hazardous gas/dust atmospheres (ATEX)

1.1.9 Adjustment

1) Kinetrol Actuators come as standard with adjustable end stops.

Table 5: Standard stroke adjustments available

Models	Adjustment range available
5i/7i/8i/9i/14i/15i	10°
10i/12i	11°

2) Greater adjustment range possible with non-standard stops.
 Contact Kinetrol for details.

1.2 Actuator Seal Replacement Instructions

1.2.1 Dismantling Actuator

- 1) DISMANTLING ACTUATOR (see exploded view Figure 3)
 CAUTION: Before dismantling, check there are no burrs on square drive shafts. If there are, remove to avoid damage to bearings and shaft seals during removal of case halves. In the case of spring return actuators, remove spring unit (according to section 1.3.1) before opening actuator case. Ancillary equipment such as DVC mount plate / Yoke / coupling etc, will also need to be removed before dismantling actuator.
- 2) All models: loosen, but do not remove, all case screws.
- 3) Separate case halves by connecting air to inlet port and apply pressure to drive them apart. Procedure is safe although the separation is audible, ear defenders are recommended.
 Pull off one case half.
 CAUTION: Do NOT hammer diecast castings or shaft end. It will damage internal sealing surfaces.
- 4) Clean both case halves removing silicone rubber sealant.
 Clean joint surfaces of case flange with surgical spirit.
- 5) Replace and lubricate shaft seals.
- 6) Undo vane nuts and bolts and remove old expanders and seals from vane. Take care not to damage side plates.
- 7) Clean vane.

ROTARY 1/4 TURN PNEUMATIC ACTUATORS

Suitable for use in safe area and hazardous gas/dust atmospheres (ATEX)

1.2.2 Re-assembling vane

- 1) Check vane for any obvious defects and make sure it is free of burrs, then place vane face down on a bench or hold in a vice.
- 2) Fit Side plate Infill Insert into Side plates (7i only). Push hex headed bolts with plain washer through side plate, expander (teeth facing towards head of bolt) and seal (base of seal away from bolt head).
- 3) After checking that expander and seal are the right way round - expander has vane shaped hole, seal has shaft centre line marked.
- 4) While holding up side plate, expander and seal, apply a low strength anaerobic adhesive to bolt thread such as Loctite 222.
- 5) Thread first few threads of each bolt into vane.
- 6) Screw bolts down and tighten to torques given in table 6.
- 7) Turn vane over then fit seal, expander and side plate over end of bolts. Check orientation as before.
- 8) Screw nuts down thread.
- 9) Hold head of bolt with a spanner, torque up nuts to torque specified in table 6.

Table 6: Vane bolt and nut Tightening Torques

Model	Tightening Torque	
5i	8lbf.ins	0.90 Nm
7i	8lbf.ins	0.90 Nm
8i	20lbf.ins	2.26 Nm
9i	20lbf.ins	2.26 Nm
10i	15lbf.ins	1.70 Nm
12i	30lbf.ins	3.39 Nm
14i	30lbf.ins	3.39 Nm
15i	30lbf.ins	3.39 Nm

1.2.3 Re-assembling Actuator

- 1) Coat bearing bushes and inside both case halves with molybdenum disulphide grease or grease supplied by Kinetrol (usually as part of seal kit).
- 2) Lightly and evenly coat joint face on each case half with instant gasket sealant available from Kinetrol or Silastic 732 RTV sealant obtainable from ironmongers, etc. may be used as a substitute.
CAUTION: EXCESS SEALANT, if extruded inside case, WILL IMPAIR OPERATION OF SEALS.
 Remove all excess sealant especially from inside edge.
- 3) Insert vane into one case half, turning it to ease square on drive shaft through shaft seal. Watch that lip seals at ends of vane easily work down into case without damage.
- 4) Fit remaining case half on top of the other, turning it to ease positioner shaft through shaft seal.
- 5) **CAUTION:** Check that lip seals are not trapped at case joint face. Ensure minimal time delay to closing of case once sealant has been applied.
- 6) Tighten case bolts to torques given in table 7.

ROTARY 1/4 TURN PNEUMATIC ACTUATORS

Suitable for use in safe area and hazardous gas/dust atmospheres (ATEX)

Table 7: Case bolt Tightening Torques

Model	Tightening Torque	
5i	20lbf.ins	2.26 Nm
7i	20lbf.ins	2.26 Nm
8i	60lbf.ins	6.78 Nm
9i	60lbf.ins	6.78 Nm
10i	80lbf.ins	8.96 Nm
12i	100lbf.ins	11.3 Nm
14i	120lbf.ins	13.6 Nm
15i	225lbf.ins	25.4 Nm

- 7) Rotate vane manually to check movement and wipe away sealant extruded internally.
- 8) Allow setting time for sealant before applying test air pressure.

Figure 3. Exploded view of typical actuator

ROTARY 1/4 TURN PNEUMATIC ACTUATORS

Suitable for use in safe area and hazardous gas/dust atmospheres (ATEX)

1.3 Spring Return Units

1.3.1 Removal of spring return unit

- 1) **WARNING** – the wound-up steel springs are storing a large amount of energy which, if suddenly released, can be dangerous.
- 2) A keeper plate strong enough to take full spring torque must be fitted in order to remove S/R unit without releasing spring tension.
- 3) Keeper plates and screws available from Kinetrol.
 Refer to table 8 for spare part order Numbers.

Table 8: Keeper plate ordering codes

Model	Part Number
5i	GE98028X012
7i	GE98028X022
8i	GE98028X032
9i	GE98028X042
10i	GE98028X052
12i	GE98028X062
14i	GE98028X072
15i	GE98028X082

Figure 4. Typical spring return actuator

- 4) If the spring return actuator is installed as shown in figure 4, it will first be necessary to invert the assembly before removing or refitting the spring unit. (as shown in figure 5)

ROTARY 1/4 TURN PNEUMATIC ACTUATORS

Suitable for use in safe area and hazardous gas/dust atmospheres (ATEX)

- 5) Connect air line via pressure regulating valve to actuator air inlet.
Note DVC connecting port to be plugged.
- 6) Place keeper plate over square shaft protruding from S/R unit.
- 7) Increase air pressure slowly until actuator vane turns to mid-travel position.
(See Figure 1 of actuator section.)
- 8) Keeper plate holes will then line up with threaded holes in spring housing.
- 9) Insert all screws through keeper plate holes and tighten to lock keeper plate in position. Disconnect air supply.
- 10) Separate spring housing from base plate by removing holding screws. Then remove spring housing.
- 11) If necessary to gain access to actuator case fixing screws also remove base plate by removing base plate screws. Take care with gasket / O-ring between base plate and actuator. (Service actuator as required per Seal Replacement Instructions section 1.2).

Figure 5. Spring return unit section view

1.3.2 Re-fitting of Spring unit

- 1) If necessary replace base plate after replacing gasket or O-ring as appropriate.
Refer to table 4 for spare part order numbers. Ensure the 4 countersunk base plate fixing screws are all fitted with O-rings (8i models only).
- 2) Ensure actuator vane is in mid-travel position.
- 3) Locate spring housing on drive shaft, rotate it to line up holding screw holes with base plate and replace holding screws.
- 4) Connect air line via pressure regulating valve to actuator air inlet.
- 5) Adjust air pressure until it balances the spring tension.
- 6) Loosen keeper plate screws. If air pressure is correct balancing spring tension will not bind. If binding, adjust air pressure until balanced.
- 7) Remove keeper plate completely.
- 8) Disconnect air supply.

ROTARY 1/4 TURN PNEUMATIC ACTUATORS

Suitable for use in safe area and hazardous gas/dust atmospheres (ATEX)

Section 2: Accessory mount for Fisher DVC2000 & DVC6200 Positioners

2.1.1 Mount kit for Fisher DVC Positioners

- a) The Fisher DVC2000 & DVC6200 positioners can be direct mounted to actuator models 5i to 15i via a DVC mount kit.
- b) Two variants of the DVC mount kit are available one which fits to the model 05i actuator and another which fits to the 7i to 15i size actuators.
- c) Note, models 12i, 14i and 15i require an additional accessory mount plate (supplied with actuator as standard).

Figure 6. General arrangement of the DVC mount kit.

- d) Fitting DVC mount kit to Spring return actuator:
 Note: model 5i (only) has a separate coupling fastened to the shorter output square (supplied with actuator as standard) for the DVC array to fit into.
 - First remove one of the boss air port screws (according to the desired direction of travel).
 - Fit O-ring seals as shown in figure 6, apply a small amount of grease to seals to hold in place while fitting DVC plate to actuator.
 - Fit DVC magnet array into actuator round shaft.
 - Fit position indicator over magnet array and secure onto actuator shaft using screws provided.
 - Valve open/closed indication plate can be reversed.
- e) If fitting to a Double acting actuator first follow section 2.1.1d then remove the opposing flange air port blanking plug, this will need to be externally piped to the DVC positioner.
- f) Note all fasteners are to be chemically locked using Loctite 222 or equivalent.

ROTARY 1/4 TURN PNEUMATIC ACTUATORS

Suitable for use in safe area and hazardous gas/dust atmospheres (ATEX)

2.1.2 Accessory mount for size 12i, 14i & 15i actuators

- a) To mount the DVC mount kit to actuator models 12i to 15i an accessory plate first needs to be fitted to the actuator (supplied pre-fitted to spring return actuators and loose within coupling kit for double acting actuators).

Figure 7. Accessory plate for actuator models 12i to 15i

- b) O-rings seals are fitted in grooves as shown in figure 7.
 c) Plate fits to actuators in different orientations as shown in figure 7.
 d) DVC mount kit direct mounts to the accessory plate as per figure 6.

ROTARY 1/4 TURN PNEUMATIC ACTUATORS

Suitable for use in safe area and hazardous gas/dust atmospheres (ATEX)

Section 3: Installation of Valve Yokes and anti-backlash couplings

3.1.1 Fitting anti-backlash couplings to Spring Return actuators

A range of anti-backlash couplings are available to direct couple to Fisher valves. A complete list of available options can be seen in table 11.

Note: Double acting actuators are fitted with solid couplings a complete list of available options can be seen in table 12.

Figure 8. Anti-backlash coupling fitted to Spring return actuator

- a) Fit coupling to spring return actuator leaving approx 0.5mm (0.02") gap between coupling face and spring mount face as shown on figure 8 dimension "A".
- b) Apply a low strength anaerobic adhesive to actuator square clamp screw threads such as Loctite 222 and torque up screw / screws to value given in table 9.
- c) Double acting actuators do not use anti-backlash couplings due to clearance constraints a range of standard through square couplings are available.

Table 9. Anti-backlash coupling clamp screw tightening torques

Screw size	Tightening Torque	
M6	156 lbf.ins	17.6 Nm
M8	372 lbf.ins	42 Nm
M10	797 lbf.ins	90 Nm
M12	1416 lbf.ins	160 Nm

ROTARY 1/4 TURN PNEUMATIC ACTUATORS

Suitable for use in safe area and hazardous gas/dust atmospheres (ATEX)

3.1.2 Mounting Yokes to Actuators & Spring Returns

Figure 9. Yoke fitted to Spring return actuator

- a) First fit valve fasteners into yoke before fitting yoke to double acting / spring return actuator (some sizes lack the clearance to fit after).
- b) Apply a low strength anaerobic adhesive to yoke fastener screw threads such as Loctite 222 and torque up screws, consult TD111 for tightening torques.
- c) Note washers may not be supplied for some yoke and valve fasteners due to space constraints.

3.1.3 Mounting yokes to valves

Figure 10. Valve fitted to Spring return actuator

ROTARY 1/4 TURN PNEUMATIC ACTUATORS

Suitable for use in safe area and hazardous gas/dust atmospheres (ATEX)

- a) Ensure valve opening and closing direction matches the opening and closing direction of the double acting / spring return actuator.
- b) Do not apply any end loading to actuator output drive, and ensure the actuator output drive and valve square are concentric to each other.
- c) If possible for optimal setting and to reduce any misalignment between actuator drive and valve square, the unit should be assembled in mid position.
- d) The unit should be assembled in the vertical position as shown in figure 9 with the valve securely held in place.
- e) Apply a low strength anaerobic adhesive to valve fastener screw threads.
- f) Fit actuator assembly as shown in figure 10 to valve taking care to centrally locate anti-backlash coupling onto valve square and loosely tighten valve fasteners.
- g) Apply a low strength anaerobic adhesive to valve square clamp screw threads and torque up screw / screws to value given in table 9.
- h) Now torque up valves fasteners, see table 10 for tightening torques.

Table 10. Valve Fastener tightening torques

Yoke Size	Tightening Torque	
Yoke 1	920 lbf.ins	104 Nm
Yoke 2	920 lbf.ins	104Nm
Yoke 3	1770 lbf.ins	200 Nm

- i) Now operate assembly open and closed a few times to check correct function and look for any alignment issues.

3.1.4 Disassembly of Valve Yokes and anti-backlash couplings.

Follow stages 3.1.1 to 3.1.3 but in reverse order.

Warning – Any fasteners including anti-backlash coupling clamp screws, removed or loosened during disassembly, must be replaced with new ones of the same grade, original fasteners must NOT be re-used.

ROTARY 1/4 TURN PNEUMATIC ACTUATORS

Suitable for use in safe area and hazardous gas/dust atmospheres (ATEX)

Table 11. Spring return actuator anti-backlash couplings

Actuator Size	Part description	Shaft Diameter	Part Number

Introduction

Fisher Digital Isolation Solutions leverage Emerson's automation expertise with time-tested products to provide a complete and dependable isolation valve solution for your most critical isolation, SIS, and ESD valve applications.

Scope of Manual

This instruction manual includes the web links for product specifications, installation and maintenance instructions for each component.

Do not install, operate or maintain this product without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage it is important to carefully read, understand, and follow all of the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Component Specifications

For product specifications click on the following web link ([TOV Specs](#)) where you will find the technical specifications documents for the components used on Fisher Digital Isolation Solutions products.

Component Instruction and Maintenance manuals

For Component Instruction and Maintenance manuals click on the following links ([ASCO](#), [TopWorx](#), [DVC6200 SIS](#), [BETTIS](#)) where you will find the documents for the components used on Fisher Digital Isolation Solutions.

If a paper copy of component specifications or Instruction/Maintenance manuals is required please consult your Emerson sales office.

WARNING

Avoid personal injury and property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Depending on the actuator construction, it will be necessary to manage the pneumatic actuator spring pre-compression. It is essential to refer to the relevant actuator instructions in this manual to provide safe removal of the actuator from the valve.
- Use lock-out procedures to be sure the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Introduction

The product covered in this document is no longer in production. This document, which includes the latest published version of the instruction manual, is made available to provide updates of newer safety procedures. Be sure to follow the safety procedures in this supplement as well as the specific instructions in the included instruction manual.

Part numbers in the included instruction manual should not be relied on to order replacement parts. For replacement parts, contact your [Emerson sales office](#).

For more than 30 years, Fisher products have been manufactured with asbestos-free components. The included manual might mention asbestos containing parts. Since 1988, any gasket or packing which may have contained some asbestos, has been replaced by a suitable non-asbestos material. Replacement parts in other materials are available from your sales office.

Safety Instructions

Please read these safety warnings, cautions, and instructions carefully before using the product.

These instructions cannot cover every installation and situation. Do not install, operate, or maintain this product without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage it is important to carefully read, understand, and follow all of the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your Emerson sales office before proceeding.

Specifications

This product was intended for a specific range of service conditions--pressure, pressure drop, process and ambient temperature, temperature variations, process fluid, and possibly other specifications. **Do not expose the product to service conditions or variables other than those for which the product was intended.** If you are not sure what these conditions or variables are, contact your [Emerson sales office](#) for assistance. Provide the product serial number and all other pertinent information that you have available.

Inspection and Maintenance Schedules

All products must be inspected periodically and maintained as needed. The schedule for inspection can only be determined based on the severity of your service conditions. Your installation might also be subject to inspection schedules set by applicable governmental codes and regulations, industry standards, company standards, or plant standards.

In order to avoid increasing dust explosion risk, periodically clean dust deposits from all equipment.

When equipment is installed in a hazardous area location (potentially explosive atmosphere), prevent sparks by proper tool selection and avoiding other types of impact energy.

Parts Ordering

Whenever ordering parts for older products, always specify the serial number of the product and provide all other pertinent information that you can, such as product size, part material, age of the product, and general service conditions. If you have modified the product since it was originally purchased, include that information with your request.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher product, because they may void your warranty, might adversely affect the performance of the product, and could cause personal injury and property damage.

Installation

⚠ WARNING

- Personal injury or equipment damage caused by sudden release of pressure or bursting of parts may result if the valve assembly is installed where service conditions could exceed the limits given in the applicable product literature, the limits on the appropriate nameplates, or the mating pipe flange rating. Use pressure-relieving devices as required by government or relevant industry codes and good engineering practices. If you cannot determine the ratings and limits for this product, contact your [Emerson sales office](#) before proceeding.
- To avoid personal injury, always wear protective gloves, clothing, and eyewear when performing any installation operations.
- To avoid personal injury or property damage, use proper lifting and rigging practices while lifting, installing or removing the valve assembly. Be sure to use lifting and rigging equipment properly sized and selected for the weight and configuration of the valve assembly or component being lifted.
- Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions.
- Many rotary shaft valves are not necessarily grounded to the pipeline when installed in a flammable, hazardous, oxygen service, or explosive atmospheres. An explosion is possible, due to the discharge of static electricity from the valve components. To avoid personal injury or property damage, make sure that the valve is grounded to the pipeline before placing the control valve assembly into service. Use and maintain alternate shaft-to-body bonding, such as a shaft-to-body bonding strap assembly.
- Rotary shaft valves are designed and intended for installation between flanges. Personal injury or property damage may result from improper installation. To avoid personal injury or property damage caused by the sudden release of pressure or bursting of parts, do not use or install rotary shaft valves (including single lug constructions) for dead-end service.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
- If installing into an existing application, also refer to the WARNING in the Maintenance section.
- When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. To avoid possible personal injury and because some valve/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your Emerson sales office.

CAUTION

- Ensure that the valve and adjacent pipelines are free of foreign material that could damage the valve seating surfaces.

Maintenance

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Always wear protective gloves, clothing, and eyewear.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure.
- Do not remove the actuator while the valve is pressurized.
- Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring pre-compression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box might contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids might spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug. Cautiously remove parts so that fluid escapes slowly and safely.
- Many valve parts that are moving can injure you by pinching, cutting, or shearing. To help prevent such injury, stay clear of any moving part.
- Never apply pressure to a partially assembled valve.
- To avoid personal injury or property damage caused by uncontrolled movement of a valve bonnet, loosen the bonnet by following these instructions: Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet. Loosen bonnet nuts approximately 3 mm (0.125 inch). Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and body. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, proceed with bonnet removal.
- As you remove parts, such as valve shafts, other parts, such as disks can fall from the valve body or suddenly move to another position in the valve. To avoid injury from falling or moving parts, be sure to support parts and be sure they are in a stable position as you disassemble the valve.
- Personal injury could result from packing leakage. Do not scratch the drive shaft or packing box wall while removing packing parts.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Neither Emerson, Emerson Automation Solutions, nor any of their affiliated entities assumes responsibility for the selection, use or maintenance of any product. Responsibility for proper selection, use, and maintenance of any product remains solely with the purchaser and end user.

Introduction

Fisher Digital Isolation Solutions leverage Emerson's automation expertise with time-tested products to provide a complete and dependable isolation valve solution for your most critical isolation, SIS, and ESD valve applications.

Scope of Manual

This instruction manual includes the web links for product specifications, installation and maintenance instructions for each component.

Do not install, operate or maintain this product without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage it is important to carefully read, understand, and follow all of the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Component Specifications

For product specifications click on the following web link ([TMBV Specs](#)) where you will find the technical specifications documents for the components used on Fisher Digital Isolation Solutions products.

Component Instruction and Maintenance manuals

For Component Instruction and Maintenance manuals click on the following links ([ASCO](#), [TopWorx](#), [DVC6200 SIS](#), [BETTIS](#)) where you will find the documents for the components used on Fisher Digital Isolation Solutions.

If a paper copy of component specifications or Instruction/Maintenance manuals is required please consult your Emerson Sales office.

WARNING

Avoid personal injury and property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Depending on the actuator construction, it will be necessary to manage the pneumatic actuator spring pre-compression. It is essential to refer to the relevant actuator instructions in this manual to provide safe removal of the actuator from the valve.
- Use lock-out procedures to be sure the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

X1398

Introduction

Scope of Manual

This instruction manual includes installation, operation, and maintenance information for the Multiport Flow Selector.

Do not install, operate, or maintain a Multiport Flow Selector without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The Multiport Flow Selector offers an efficient solution for oil well testing. This valve has eight inlets, one test outlet, and one group outlet. Eight pipe lines can be connected to this valve and allows continuous flow while sampling/testing individual oil wells.

Educational Services

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D104239X012

Multiport Flow Selector

April 2022

Specifications

The Multiport Flow Selector specifications are given in tables 1 through 5.

Table 1. Valve Specifications NPS 2x4 and 3x6

SPECIFICATIONS	VALVE SIZE							
	2 x 4			3 x 6				
ASME Class Rating ⁽¹⁾	CL300	CL600	CL900	CL150	CL300	CL600	CL900	CL1500
Weight, kg (lb)	91 (200)	91 (200)	363 (800)	553 (1220)	630 (1390)	658 (1450)	680 (1500)	968 (2135)
Inlet Ports	NPS 2			NPS 3				
Test Outlet Port	NPS 2			NPS 3				
Group Outlet Port	NPS 4			NPS 6				
End Connections	Raised-face flanges (ASME B16.5) or threaded connections for NPS 2x4 constructions only							
Temperature Range ⁽²⁾	-1 to 204°C (30 to 400°F)							
Shutoff	Class IV per ANSI/FCI70-2 and IEC 60534-4							
1. The pressure/temperature limits in this instruction manual and any applicable standard or code limitation should not be exceeded. 2. Standard O-ring material established upper and lower temperature limits.								

Table 2. Valve Specifications NPS 4x8, 4x10, and 6x16

SPECIFICATIONS	VALVE SIZE							
	4 x 8			4x10	6 x 16			
ASME Class Rating	CL300	CL600	CL900	CL1500	CL300	CL600	CL900	CL1500
Weight, kg (lb)	959 (2115)	975 (2150)	1134 (2500)	1742 (3840)	1810 (3990)	2018 (4450)	3590 (7915)	5343 (11780)
Inlet Ports	NPS 4			NPS 4	NPS 6			
Test Outlet Port	NPS 4			NPS 4	NPS 6			
Group Outlet Port	NPS 8			NPS 10	NPS 16			
End Connections	Mates with raised-face flanges per ASME B16.5							
Temperature Range ⁽¹⁾	-1 to 204°C (30 to 400°F)							
Shutoff	Class IV per ANSI/FCI70-2 and IEC 60534-4							
1. The pressure/temperature limits in this instruction manual and any applicable standard or code limitation should not be exceeded. 2. Standard O-ring material established upper and lower temperature limits.								

Table 3. Actuator Specifications

SPECIFICATIONS	VALVE SIZE AND ASME CLASS RATING				
	NPS 2 x 4 CL300/600/900	NPS 3 x 6 CL150/300/ 600/900/1500	NPS 4 x 8 CL300/600/900	NPS 4 x 10 CL1500	NPS 6 x 16 CL300/600/ 900/1500
Max Torque Output, N • m (ft • lbf)	203 (150)	881 (650)	1085 (800)	1085 (800)	2034 (1500)
Actuator Speed, RPM	1.0	0.5-1.0	0.5-1.0	0.5-1.0	0.3-0.5
Actuator Weight, kg (lb)	82 (180)				
Plug Position Accuracy	± 1°				

Installation

Minimum Tools Required

A torque wrench, socket wrench, and Allen head wrenches are required to install the Multiport Flow Selector Valve and actuator assembly.

Table 4. Socket Size for Multiport Bonnet Studs and Nuts

VALVE SIZE, NPS	ASME CLASS RATING	SOCKET SIZE (in)
2 x 4	CL300	1-5/8
	CL600	
	CL900	
3 x 6	CL150	2
	CL300	
	CL600	
	CL900	
	CL1500	2-3/8
4 x 8	CL300	2-3/16
	CL600	
	CL900	
4 x 10	CL1500	2-3/4
6 x 16	CL300	2-9/16
	CL600	
	CL900	3-1/8
	CL1500	3-7/8

Other socket sizes (inch) required: 7/16, 1/2, 9/16, 3/4, 7/8, and 1-1/8.

Allen key sizes (inch) required: 5/32, and 1/4

Table 5. Wrench Sizes (Inch) for Multiport Inlet and Outlet Flanges

FLANGE SIZE, NPS	ASME CLASS RATING				
	CL150	CL300	CL600	CL900	CL1500
2	---	1-1/16	1-1/16	1-7/16	---
3	1-1/16	1-1/4	1-1/4	1-7/16	1-13/16
4	---	1-1/4	1-7/16	1-13/16	2
6	1-1/4	1-1/4	1-5/8	1-13/16	2-3/16
8	---	1-7/16	1-13/16	2-3/16	---
10	---	---	---	---	2-15/16
16	---	2	2-3/8	2-9/16	3-7/8

WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Avoid personal injury and property damage by keeping hands, tools, and other objects away from the plug while operating the valve.

Observe all WARNING decals and tags.

Key numbers in this procedure are shown in figure 2 and 3 unless otherwise indicated.

Before installing the unit, observe all warning tags and:

1. Check for external physical damage.
2. Check for any visible leakage of gear oil from the Multiport Electric Actuator (MPA).
3. Visually inspect the inside of the Multiport through the group outlet port checking for damage, rust, and/or debris.
4. Verify the voltage requirement of the MPA (AC/DC) and connect power supply and signal circuits to test the operation of the electric actuator and plug. Check for proper plug alignment at each port.
5. Inspect connecting pipelines to be certain they are free of foreign material such as pipe scale or weld slag that could damage the sealing surfaces of the Multiport Flow Selector valve.
6. Provide appropriate flange gaskets and install them between the pipe flanges and valve body flanges. Tighten flange bolting in a star pattern to ensure uniform compression of the gaskets.

Note

To prevent seal damage when hydrotesting external piping, position the plug midway between two inlet ports in order to equalize pressure between the plug and valve body.

The Multiport Flow Selector plug/port alignment is factory adjusted when supplied with an actuator and should not require further adjustment.

Field Technician Commissioning Activities

Refer to the Multiport Actuator (MPA) O&M Manual — Supplied by Bettis ([MPA-400-0711](#)). See page 19 for detailed commissioning activities.

CAUTION

Replace pipe plug with breather before operating unit. The valve body may be pressurized from hydrostatic testing. Do not remove any bolts or flanges for inspection until after the unit has been depressurized.

Circuit boards are susceptible to damage from static discharge when touched. Ensure that you ground yourself before touching the knobs on the electric actuator.

Reinstallation of the Actuator Assembly

1. Using a manual wrench, rotate the plug (key 2) a few revolutions to verify it turns freely. Initial effort required to rotate the plug could be high if the plug has not been rotated for an extended period of time.
2. Secure the actuator mounting bracket (key 43) to the bonnet using two cap screws (key 44), two travel indicator studs (key 54), and four lock washers (key 56). For the NPS 2x4 construction, secure the lower plate to the bonnet using two cap screws, two travel indicator studs and nuts, and four lock washers.

Regardless of size, apply an anti-seize lubricant (key 40) to the threaded portion of the fasteners. The cap screws should be spaced 180 degrees apart from one another and 90 degrees apart from the travel indicator studs.
3. Secure the travel indicator plate to the travel indicator studs by tightening two cap screws (key 55). Proper assembly has occurred if the lock washers have been placed between the travel indicator studs and travel indicator plate and if flat washers (key 57) have been placed between the cap screws and travel indicator plate. For the 2x4 construction, place travel indicator spacers over the travel indicator studs and secure the travel indicator plate

down by tightening the nuts. Proper assembly has occurred if there are flat washers between the travel indicator spacers and travel indicator plate and travel indicator plate and nuts.

Regardless of size, an anti-seize lubricant (key 40) shall be applied to the threaded portion of the fasteners and nuts.

4. To complete the assembly of the mounting kit for the NPS 2x4 construction, thread four spacer studs into the lower plate and secure the upper plate to the spacer studs using four cap screws. Proper assembly has occurred if there are lock washers between the lower plate and spacer studs and spacer studs and upper plate. An anti-seize lubricant (key 40) shall be applied to the threaded portion of the studs and fasteners.
5. Apply grease (key 41) to the surfaces on the key slot(s) found on the shaft coupler (key 47). Insert key(s) (key 48) into the shaft coupler key slot(s). Insert the shaft coupler with key(s) into the bottom of the Multiport Electric Actuator and hold in place by hand.
6. Slowly lower the actuator with shaft coupler (key 47) onto the mounting bracket (key 43). Align the shaft coupler with the square end of the plug (key 2). Position the shaft coupler such that the reference mark on the square end of the plug remains visible between the flats of the shaft coupler. This reference mark indicates the location of the seal assembly relative to the inlet ports of the body.
7. Attach the actuator to the mounting bracket (key 43) using four cap screws (key 45) and four lock washers (key 46). Tighten these fasteners finger tight only.
8. Apply an anti-seize lubricant (key 40) to the travel indicator holder (key 49) and thread on the jam nut (key 51), as well as the travel indicator pointer (key 50) and nut (key 52). Thread this assembly into the shaft coupler (key 47). The travel indicator pointer shall be on the same side as the reference mark found on the square end of the plug and shall be positioned such that it will not contact any parts of the travel indicator assembly while rotating.
9. Using the electric actuator, rotate the plug (key 2) a few revolutions to establish proper alignment between the shaft coupler (key 47) and plug. Visually check for any binding and adjust the position of the actuator as necessary. Once the proper alignment has been established, secure the actuator to the mounting bracket (key 43) by tightening the cap screws (key 46).

Home Port Calibration

Refer to the Multiport Electric Actuator (MPA) O&M Manual — Supplied by Bettis ([MPA-400-0711](#)) for detailed instructions on how to calibrate the home port position.

Multiport Electric Actuator Set Up

Refer to the Multiport Electric Actuator (MPA) O&M Manual — Supplied by Bettis ([MPA-400-0711](#)) for detailed instruction on:

1. Disabling port positions
2. Controller address
3. Control room MODBUS RTU operation
4. Installation and use of MPA software on laptop/PC

Maintenance

Refer to figure 2 and 3, typical Multiport assembly and mounting drawings.

⚠ WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly rotate the plug.
- Use bypass valves or completely shut off the process to isolate the Multiport from process pressure. Relieve process pressure from all parts of the valve. Drain the process media from all sides of the Multiport.
- Use lockout procedures to be sure the above measures stay in effect while you work on the equipment.
- Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.
- The tapered roller bearing area may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when separating the bonnet from the plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

The Multiport Flow Selector valve is shipped completely greased and lubricated. Routine maintenance of this valve is recommended, especially if it has been stored for an extended amount of time. Maintenance steps include:

1. Keeping the tapered roller bearing (key 3) greased. A high temperature silicone grease (key 39) can be injected into the bearing housing through the lube fitting (key 28).
2. Confirming proper alignment between the plug and inlet ports.
 - Verify the correct placement of the travel indicator pointer (key 50) onto the coupler (key 47).
 - Align the plug (key 2) with one of the inlet ports. Confirm the travel indicator pointer is in alignment with the selected inlet port.
3. Visual inspection of the seal insert (key 12). The sealing surface of this insert should be smooth and completely intact.
 - If the seal insert needs to be replaced, replace all o-rings (key 5, 7, 14, 20, 25, and 26), backup rings (key 6, 8, 15, and 21), rod seal (key 4), plug bushing (key 9), and wiper seals (key 24).
4. Rotate the plug (key 2) one complete revolution using the electric actuator to confirm the assembly is functioning properly. Check the local display unit on the electric actuator for any alarm codes.

Disassembly

Review warnings found in the Maintenance section of this manual.

Refer to figures 2 and 3 when disassembling the Multiport Flow Selector.

Note

The bonnet can be removed with the Multiport Electric Actuator still attached. If this is done, ensure proper orientation has been maintained between the actuator and valve body once the bonnet has been re-installed onto the valve body. If this orientation has not been maintained, recalibration of the actuator is required. One way to ensure proper orientation has been maintained is to place alignment marks between the plug (key 2) and coupler (key 47) prior to removal of the bonnet (key 19).

1. Rotate the plug (key 2) to any unused inlet port. Remove the blind flange from this inlet port to gain access to the seal assembly. Once the adjustment tool has been secured to the seal adjuster (key 18), rotate this tool clockwise until it stops. This action unloads the wave springs (key 11, 17) and removes the forces generated between the seal insert (key 12), valve body (key 1) and scraper (key 12)/valve body (key 1).
2. Remove the nuts (key 32) from the bonnet (key 19), lifting lugs (key 33), and the studs (key 31) from the body (key 31). Thread eye bolts into the jack screws holes provided in the bonnet. Raise the bonnet vertically until it clears the plug (key 2) and move it to the side.
3. Remove the plug (key 2) from the valve body (key 1). The seal components should still be installed inside of the plug.
4. Remove the seal assembly from the plug (key 2) using the adjustment tool as follows:
 - Once the adjustment tool has been inserted into the seal adjuster (key 18) and secured, rotate the tool counterclockwise until the seal adjuster disengages from the final thread on the plug.
 - With the adjustment tool still secured to the seal adjuster (key 18), pull it out of the plug. All components that make up the seal assembly are now outside of the plug.
5. Carefully remove the bearing cup (key 3) from the bonnet (key 19).
6. Inspect all components for damage. Replace any damaged parts and reassemble by following the Assembly procedure in this manual.

Assembly

Refer to figures 2 and 3 when assembling the Multiport Flow Selector.

Ensure all parts are clean and in good condition before assembling the Multiport Flow Selector. Refer to figure 2 to determine which components require lubrication.

Body (Key 1)

1. Visually inspect all internal and external surfaces and threads.
2. Install the plug bushing (key 9) into the lower section of the body.

Plug (Key 2)

1. Install the lower plug O-ring (key 8), with the correct number of backup rings (key 7). For ASME rated CL150, 300, 600, and 900 valves, install one backup ring above (on the side nearest to the bonnet) the O-ring. For CL1500 rated Multiports, install two backup rings one on either side of the lower plug O-ring.
2. Lubricate and install the seal adjuster (key 18) by turning it clockwise (i.e. viewing toward the plug centerline) until solid. Follow with the correct number of wave springs (key 17). For NPS 2x4, 3x6, and 6x16 constructions, install three wave springs. For NPS 4x8 and 4x10 constructions, install four wave springs. Ensure the wave springs are properly aligned and seated on the seal adjuster.

Note

If the wave springs are not properly aligned and seated then the seal assembly may not function properly.

3. Install the back up plate (key 16) against the shoulder in the plug (key 2).
4. Install the O-ring (key 14) onto the seal carrier (key 13). Install the seal assembly into the plug. Hand force should only be required for proper installation.
5. Install the correct number of wave springs (key 11) followed by the scraper (key 10) into the plug over the seal assembly. For NPS 2x4 constructions, install two wave springs and for NPS 3x6, 4x8, 4x10, and 6x16 constructions, install one wave spring. Ensure the scraper fits freely into the plug. Check by pushing the scraper into the plug using both hands then letting go to see if it returns to its original position.
6. Lower the plug (key 2) into the body ensuring that the seal insert (key 12) and scraper (key 10) clear the bore of the body (key 1). When installed, the plug rests on top of the plug bushing (key 9).
7. Lubricate the tapered bearing cone and rollers (key 3) using a high temperature silicone grease (key 39) and install onto the plug.

Bonnet (Key 19)

1. Lubricate and press fit the bearing cup (key 3) into the bonnet using a high temperature silicone grease (key 39). Lubricate the bearing cup and press fit it into the bonnet.
2. Install the backup ring (key 6), O-ring (key 5), and rod seal (key 4) into the bonnet bore. Rod seal is not required for NPS 2x4 or 3x6 CL300, 600, and 900 rated valves.
3. Install the bonnet O-ring (key 20) into the groove of the bonnet. For NPS 4x8, 4x10, and 6x16 constructions, install the backup ring above this O-ring.
4. Install the wiper seal (key 24), lube fitting (key 28), and vent plug (key 27). For NPS 4x10 and 6x16 constructions, install the wiper seal on an external wiper retainer (key 24) with two extra O-rings (key 25 and 26).
5. Using two eye bolts threaded into the jack screw holes found on the bonnet, slowly lower the bonnet onto the body. Be careful not to damage any soft parts when feeding the plug through the bonnet. The bonnet has been properly positioned onto the body when the following has been achieved:
 - The bolt holes in the bonnet have been aligned with the stud holes in the body.
 - The centerline of the bonnet vent port has been aligned with the centerline of the group outlet of the body.

Excessive force should not be required to properly seat the bonnet onto the body. For NPS 2x4, 3x6, and 4x8 constructions, use hoist rings or eye bolts with 1/2 UNC threads. For NPS 3x6 CL1500, 4x10, and 6x16 constructions, use hoist rings or eye bolts with 3/4 UNC threads.
6. Lubricate studs (key 31) with an anti-seize lubricant (key 40) and thread into valve body (key 1). Place the appropriate number of lifting lugs (key 33) over these studs. The placement of these lifting lugs should be equally spaced with one being located directly above the group outlet. The placement of these lifting lugs is as follows:
 - For NPS 2x4, 3x6, 4x8, and 4x10 constructions, place two lifting lugs equally spaced with one being located directly above the group outlet port.
 - For NPS 6x16 CL300, 600, and 900 constructions, place three lifting lugs equally spaced with two of them straddling the group outlet port.
 - For NPS 6x16 CL1500 constructions, place four lifting lugs equally spaced with two of them straddling the group outlet port.
7. Lubricate the threads and the bottom surface of the nuts (key 32) with an anti-seize lubricant (key 40) paste prior to threading them on to the studs (key 31). Once all nuts have been threaded hand tight, tighten two nuts spaced 180-degrees apart to the recommended torque values per table 6. Rotate the plug (key 2) one complete revolution to ensure that it rotates with minimal resistance. If the plug rotates smoothly, then proceed to tighten the remaining nuts using an appropriate tightening pattern.
8. Using the lube fitting (key 28), fill the bearing bore with grease.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Multiport Flow Selector

Instruction Manual

D104239X012

Table 6. Bonnet Bolting Torque

VALVE SIZE, NPS	ASME CLASS RATING	STUD SIZE		TORQUE	
		mm	Inch	N • m	ft • lbf
2 x 4	300 600 900	25.4	1	217	160
3 x 6	150 300 600 900	31.8	1-1/4	441	325
	1500	38.1	1-1/2	814	600
4 x 8	300 600 900	34.9	1-3/8	651	480
4 x 10	1500	44.5	1-3/4	1356	1000
6 x 16	300 600	41.3	1-5/8	1085	800
	900	50.8	2	2034	1500
	1500	63.5	2-1/2	4203	3100

Plug Seal Adjustment

1. Prior to adjusting the seal assembly (key 12 and 13), align the plug (key 2) with an open inlet port and insert the supplied adjustment tool. Once this tool has been secured to the seal adjuster (key 18), rotate this tool counter clockwise until the scraper (key 10) touches the inside surface of the body (key 1). The resistance to rotate the adjustment tool will increase once the scraper contacts the body. Remove the adjustment tool.
2. Rotate the plug (key 2) a few revolutions to check for binding or excessive turning torque. If the plug rotates smoothly, then insert, secure, and rotate the adjustment tool counter clockwise to tighten the seal adjuster (key 18) to the appropriate torque value listed in table 7.

Note

Do not exceed the torque values listed in table 7. Exceeding these values may cause the valve to not function as intended.

Table 7. Plug Seal Torque

VALVE SIZE, NPS	ASME CLASS RATING	TORQUE	
		N • m	ft • lbs
2 x 4	300 600 900	41	30
3 x 6	150 300 600	48	35
	900 1500	41	30
4 x 8	300 600 900	54	40
4 x 10	1500	54	40
6 x 16	300 600 900 1500	95	70

3. Rotate the plug (key 2) a few revolutions while checking for smooth movement. If the seal assembly is binding during rotation, then the seal assembly or the wave springs (key 17) are not in their proper position(s). See disassembly procedure, if required.
4. Install the appropriate amount of pipe plugs (key 27).
5. Perform any required functionality test(s).

Troubleshooting

Actuator Does Not Align Plug to Inlet Port

1. Check the shaft coupler for looseness.
2. Check the motor for stalling or overload.
3. Check the visual leakage or noisy gear.
4. Refer to the Multiport Electric Actuator (MPA) O&M Manual — Supplied by Bettis ([MPA-400-0711](#)) for port calibration procedures and troubleshooting.

Seal Leakage

1. Check the travel indicator plate (key 53) and travel indicator pin (key 50) to ensure the plug (key 2) is properly aligned with the inlet ports.
2. Check the seal insert (key 12) for damage. To visually inspect the seal insert, the blind flange from an unused inlet port needs to be removed. Prior to removing this flange, verify the Multiport Flow Selector valve has been depressurized to a value of zero. With the blind flange removed, rotate the plug until visual inspection of the seal insert can occur. The sealing surface of the seal insert should be smooth, completely intact, and free of deep groove marks.

WARNING

Ensure that all pressures in the Multiport body, group outlet, and test port are ZERO before visually checking the seal.

Recommended Periodic Multiport Maintenance Checklist Procedure

Half Yearly Check

1. Check the plug port position in the Local Display Module (LDM) and the mechanical indicator respectively and in remote feedback.
2. Check the plug travel sequence for smooth operation with local/remote.
3. Lubricate the bearing through the grease nipple with high temperature silicone grease.
4. Visual Inspection of Multiport Flow Selector (MPFS) valve.

Annual Check

1. Visual Inspection of MSV.
2. Lubricate the bearing through the grease nipple with high temperature silicone grease.
3. Check the seal torque (refer chart) and seal visual condition.
4. Check the plug position in LDM and the mechanical indicator respectively and in remote feedback.
5. Check the plug travel sequence for smooth operation with local / remote.
6. Check mechanical operation (using manual override).
7. Check electrical connections of Multiport Actuator (MPA) (power and communication port).
8. Check the Torque Encoder and Position Encoder.
9. Visual check of shaft penetrations for lubrication leakage.
10. Inspect stem nut or bushing for wear / damage of Multiport Actuator.
11. Run online seal integrity test.

Visual Seal Inspection

1. Local Shutdown should be take by end user to isolate the Multiport valve.
2. Check the plug alignment visually at home port (blind flange open condition).
3. If the seal visual inspection and seal torque are deemed acceptable, then assemble the home flange and run on line seal integrity test.

General

1. It is recommended to operate the Multiport, once in three weeks, at least one full rotation, if there is no well testing. Not recommended to keep Multiport idle for more than 3 to 4 weeks.
2. Recommended to replace the seat ring (complete Seal Kit Assembly) and all the soft seals every 5 years.

Multiport Actuator

O&M Manual — Supplied by Bettis

Document No. MPS-400-0711

⚠ WARNING

Use caution when working on, with, or around valves and actuators. High pressures, forces, voltages, and flammable media can be present.

Read this manual in its entirety before installing, operating, or performing maintenance on the MPA valve actuator.

Failure to follow instructions for proper electrical wiring, storage, setup, and maintenance may cause serious injury, damage equipment, or void the warranty. Refer to Manual E796 for instructions on storage, electrical hook-up, and maintenance.

Ensure that the installation is carried out in accordance with EN 60079-14 and IEC 60079-14.

Introduction

The Multiport Actuator (MPA) is a Bettis single turn actuator for control of Multiport Flow Selectors (MPFS) with 3 to 8 ports. A typical application is oil or gas well selection for well production testing as shown in figure 1. Typically the MPA is the actuator of a Multiport Flow Selector as shown in figure 2. There are applications in other processes where control of Multiport valves is required.

Figure 1. Typical Well Test Application

Figure 2. MPA Mounted on 6"x16" MPFS

Features

The actuator features several assemblies as shown in figure 3. Unique features of the actuator are listed below.

Figure 3. MPA Features

1. MPA uses Bettis's heavy duty gearbox with capacity of 3000 ft•lbs
 - a. Wide range of motors available for any voltage and torque
2. Configurable for Multiport flow selectors from 3 to 8 ports
 - a. Any port may be selected as home port and any port(s) may be skipped
 - b. Actuator calibrated at factory for exact match to alignment of flow selector ports
 - c. Calibration parameters stored in nonvolatile memory and available to DCS
3. 12-bit magnetic encoder coupled directly to valve stem for precision position feedback
 - a. Provides position measurement resolution of 0.088 degrees
4. Bettis's exclusive solid-state motor starter and control software provides precise positioning of flow selector within ± 0.26 degrees of selected port for the largest flow selector, and within ± 0.79 degrees for smallest flow selector, where accuracy is less of a concern because of reduced radius

5. High performance microcontroller updates motor control output every 4mS for precision motor control
6. 12-bit magnetic encoder coupled directly to torque pinion for torque feedback
 - a. Provides torque measurement resolution of 0.146% of full torque
7. MPA supports all network protocols available with all other Bettis actuators
 - ModbusRS485 Bus or E>Net ring available
 - Profibus Redundancy with Redcom
 - Foundation Fieldbus
 - DeviceNet
 - Ethernet Modbus TCP/IP
8. I/O and alarm monitoring include:
 - Integral circuit breaker/disconnect
 - Motor overload and motor thermal
 - Loss of control voltage
 - Encoder failure
 - Stall detection and alarming (detects mechanical faults)
 - 3-Phase monitoring and phase correction to insure correct motor rotation
 - ESD to send selector to home port (also goes to home port on fault)
 - Monitor relay for hardwired relay contact status on fault
9. Four models support five 8-port MPFS (Also see motor type on page 33)

Table 1.

MODEL	MPFS	CAPACITY		RPM			ACCURACY
		lb ft	Nm	1Ph	3Ph	DC	Degrees
MPA 150	2x4	150	203	1.0	1.0	1.0	0.79
MPA 650	3x6	650	881	0.7	1.0	0.5	0.49
MPA 800	4x8 and 4x10	800	1085	0.6	0.9	0.5	0.40
MPA 1500	6x16	1500	2034	0.3	0.4	0.3	0.26

Note: Accuracy based on worse case tests at 38% of maximum torque.

10. MPA includes local display module (LDM) standard
 - Uses rugged, high visibility LED display for port number, torque, and alarms (also displays setup menus and setup parameters)
 - Multiple color LEDs display
 - a. Port position within 1° of port

- b. Port position within 2° of port
 - c. Motor running
 - d. Alarm
 - e. Over torque
 - f. Position within 0.25° of home port
 - g. Local mode >
 - h. Off mode > Combined detection logic for two selector switches
 - i. Remote mode >
- Display blanking user setup option to conserve power in idle mode
 - Includes Local Off Remote selector switch
 - Local control knob for Port selection and Jog control when enabled by User

Figure 4. Local Display Module (LDM)

11. Remote display module (RDM) option available
 - a. RDM displays identical information and performs identical control as LDM
 - b. Bettis's patented combined switch logic allows detection of selector switch position on LDM and RDM
 - c. Allows remote control up to 4,000 feet (1,220 meters) away
 - d. Alarming includes loss of communication with RDM

Figure 5. MPA with Remote Display Module (RDM)

Mechanical and Electrical Installation

Do not connect power until you have gone through the following checklist:

1. Does the information given on the nameplate correspond with the application?
2. Have all wire terminations and the equipotential bonding system been connected correctly?
3. EEx d applications: are the cable entries, plugs and adaptors EEx d approved?
4. Are all cable entries of the correct internal diameter providing a good seal around the cable?
5. Do the ambient and process temperatures correspond to the ratings on the nameplate as shown below?

Wiring

All user wiring terminations are made inside the Electrical Enclosure shown in figure 3. Refer to wiring diagram located at the back of this manual for wiring connections. High voltage power connections are made to the disconnect/circuit breaker located inside the electrical enclosure. All low voltage connections, including network wiring, are made to the Termination Board Module (TBM) located inside the electrical enclosure. Use conduit and seals in accordance with National Electric Code (NEC) and local codes for all wiring entering the electrical enclosure.

Power Wiring

Connect power voltage leads to the circuit breaker located in the main electrical enclosure. Power wires must enter the electrical enclosure at the conduit entry on the lower right side of the enclosure to prevent water from entering. The controller provides automatic phase correction in case three-phase power is connected in the wrong phase rotation.

Network Wiring

If a single bus network connection, such as Foundation Fieldbus, is being made, connect to Network Port A at TBM terminals 24 (-) and 25 (+). If the cable is shielded, connect shield to TBM terminal 23. If redundant or repeater network connections such as Bettis E>Net are being made, connect the second network to Network Port B at TBM terminals 23 (+) and 24 (-). Connect cable shield of Port B to TBM terminal 25. Cable shields are isolated from earth in the actuator. Connect shields to only one earth ground point in the network, normally the host location.

Monitor Relay Wiring

The Monitor Relay is used for hardwiring an indication of availability of the actuator for remote control. When the selector switch is placed in the Remote mode and if there are no alarms present that prevent operation, the Monitor Relay is energized. If an alarm occurs or the selector switch is moved from the Remote position, the relay is deenergized. The Monitor Relay is a Form C relay with both normally open (N.O.) and normally closed (N.C.) contacts. Wire to either TBM terminals 31 and 32 if N.O. contacts are desired. Wire to TBM terminals 32 and 33 if N.C. contacts are desired. The relay is shown on the wiring diagram in the deenergized state, meaning that the actuator is not available for remote control.

Local ESD Wiring (Emergency Shutdown)

Remove jumper between TBM terminals 27 and 28. Connect Normally Closed (N.C.) dry contacts to terminals 27 and 28. When the contacts open, ESD is activated, causing the actuator to go to Home Port. The actuator will remain at the Home Port until the ESD contacts are closed and a new command is received from either Local or Remote control. The ESD circuit is a closed loop failsafe circuit. If the circuit is opened for any reason, broken wire, bad contact, 24VDC power supply failure, etc., the ESD function is activated. The closed loop circuit is powered by 24VDC from the actuator.

Optional Remote Display Module (RDM) Wiring

Connect twisted pair RS485 cable from the RDM to TBM terminals 18 (-) and 19 (+). If the RDM is being powered from the actuator 12VDC supply, wire the power wires from the RDM to TBM terminals 16 (-) and 17 (+). The RDM is polarity protected, preventing damage, but will not operate if polarity is reversed.

Local Display Module

Contains microprocessor controller, position encoder, and network interface. This is the main controller used to setup and operate the actuator.

This module displays operating parameters, port position, torque, and alarms. It also provides a means to configure the actuator by using the local controls.

To use the Local Control and Selector:

Note

Actuator moves in only the counterclockwise position.

Figure 6. Local Control and Selector

SELECTOR KNOB (right)	ROTATE	FUNCTION	RESULTS
OFF (Stop)	[return position]	Stop movement	Prevents motor operation
REMOTE (Auto)	Clockwise	Remote control	Allows control from remote location
LOCAL (Hand)	Counter-clockwise	Hand Operation	Allows Control from the local control knob or the control knob of the RDM, if connected.
SELECTOR KNOB (left) (while selector is in LOCAL (hand)mode)	ROTATE	FUNCTION	RESULTS
Spring return	Neutral position	No operation	Releases a local command when Local control is used
PORT (up)	Clockwise	Local command to go to next port	Commands actuator to move to the next port. Momentary knob control
Jog (dn)	Counter-clockwise	Local command to micro-step	Commands actuator to move only while knob is being held , i.e. maintained knob control.

Operation

Place the “Selector Knob” in the desired operating position –

LOCAL – hands on operation at the actuator by manipulation of Control Knob.

REMOTE – used within the context of plant operation, i.e. Remote Control Panel, PLC, DCS, etc. See wiring diagram for typical user wiring for remote control.

OFF (Stop) – to prevent local or remote operation.

Figure 7.

Local Operation

Place the “Selector Knob” in the “Local” position. If a remote display is connected, the remote selector switch must not be in the “Off” position. Verify that the selector “L” amber light is on. The actuator may now be operated using the port and jog Control Knobs. Jog control is normally disabled and must be enabled in the setup menu.

To jog or micro-step the actuator toward the next port, rotate the control knob in the counterclockwise direction. Jog to position and release when the desired position is reached. When using jog for calibrating the actuator, always stop short of the desired port and use the hand wheel to complete accurate positioning to center of the port.

To move only to the next port, momentarily rotate the control knob in the clockwise direction to the Port position and release.

To Stop or prevent actuator movement, move Selector knob to the OFF (Stop) position.

Operational Display

Operational indicators for RUN / ALARM / PORT position use long lasting LED's. Run torque and port position are shown on the digital readout during normal operation. Torque in percent of maximum is displayed as a 2-digit number only while the motor is running. Port position is displayed as a single digit when the motor stops. If the actuator stops between two ports, the two corresponding port numbers will alternate. Torque less than 10% is displayed as 0%.

RUN LED flashes Green while the actuator is moving to the next port and flashes Red while running within 2° of the selected port position.

PORT LED flashes Green when the actuator is within 2° and outside 1° prior to the setpoint of the selected port. The port LED flashes Red when within 2° and outside 1° beyond the setpoint. The port LED illuminates steady Green while within 1° of the selected port position.

ALARM (Yellow) LED flashes when any alarm is present. The LED is on solid when stopped between ports, otherwise it is off.

OVER TORQUE alarm condition is indicated when a torque alarm occurs in mid-travel. The over torque LED will flash so long as the over torque condition exists.

HOME PORT LED will light when the actuator is within 0.25° of the user selected Home Port position.

Selector switch LEDs are also made available for operational use in the bottom right corner. The selector LEDs are important when using a Remote Display Module (RDM) because these LEDs indicate the combined logic of the two selector switches, i.e. the selected mode of operation of the actuator. All three LOR LEDs flash while the actuator is in setup mode.

Display Blanking

The user has the option to have the display blank out (turn off) when not in use. This is a very important feature for solar power applications because power consumption is minimized. Option to enable or disable display blanking timeout is available by setup using MPA Config or the control knobs. See the field setup section for selecting the option. When control knobs are used for setup, the parameter is C9 as shown in the table on page 38. The default setting is display blanking timeout enabled for 24VDC versions and disabled for AC versions. If display blanking is enabled, the display will blank out after 60 seconds when left unattended while the selector switch is in Remote mode. The display will blank out after 3 minutes when left unattended while the selector switch is in Local mode. The display will not blank out while in setup mode. When selected, display blanking applies to both local (LDM) and remote (RDM) displays.

Alarms Display

When an alarm occurs, it is automatically displayed by the two character LED display. The yellow ALARM LED will flash while any alarm is present. The display will alternate between the current port position and the active alarm(s) except when stopped between parts. If more than one alarm is active, the display will cycle through a sequence of Port Position, newest alarm, Port Position, next oldest alarm and so on until all active alarms are displayed. The cycle is continuously repeated until all alarms are cleared. Each alarm is recorded in an Alarm History. The alarm history may be viewed by entering setup mode (see next section).

All possible alarms that may be displayed are listed on the name plate of the Local Display Module (LDM). Following are definitions of the listed alarms.

CE	Communication Error	Lost communication with the Remote Display Module (RDM) when configured.
SA	Stall Alarm	Actuator failed to move within 8 seconds after commanded by either local or remote controls.
LE	Local ESD	Hardwired Local Emergency Shut Down is active.
PH	Phase Alarm	Loss of one phase when configured for 3-Phase.
EF	Encoder Failed	Failure of either the position or torque encoders.
AF	Actuator Failed	A fault is detected by hardware electronics fault monitor. This is a non-recoverable condition that requires actuator service.
OL	Motor Overload	Motor thermals or motor overload relay has tripped.
LC	Lost Control Voltage	Loss of power to the motor control circuits. The control voltage supply has an automatic resetting fuse.

Note

Over torque alarm is displayed by dedicated LED. See Operational Display section above.

Field Setup Using DCMLink Software

DCMLink is an application for configuration, calibration, test, and operation of the MPA DCMLink is a licensed product. It is a Windows-based program. Compatible Windows Operating Systems are listed in the DCMLink IOM, DCM-402-0317.

Connection to the MPA to utilize DCMLink requires a RS485 link. The MPA supports several network protocols so it may be necessary to use a USB to RS485 converter for connection of a PC to the RDM port of the actuator. RDM port is at TBM terminals 18 (-) and 19 (+). DCMLink Software loaded to a laptop or other compatible PC device can connect the RS485 link to the TBM in the electrical enclosure. If opening the enclosure is undesirable, configuration may be performed using the local control knobs of the actuator as described in the next section of this manual. If the system is configured for Modbus networking, the PC may be connected to the local area network at any location in the network after disconnecting the Host system communication. The MPFS factory uses this software to configure and calibrate the MPA and saves the configuration to a “.mpa” file by MPFS serial number. Should loss of factory configuration or port calibration occur due to failure of a CPU module or user error, a copy of the file may be obtained from the MPFS factory and loaded to the actuator using DCMLink program.

DCMLink SetUp

HELP: Clicking the Menu Bar Help Tab button at the top of the screen will open linked documents or information. Passing the cursor across the Icons or Navigation Pane tabs will cause a description of that item to be displayed.

To setup communication and DCMLink Display Preferences, select the DCMLink Setup Tab in the Menu Bar as shown in figures 8b and 8c. To configure the network communication link select the Communication Tab in Preferences per figure 9.

Figure 8a.

Figure 8c.

Figure 8b.

Communications Setup

If connected to the RDM port, set the computer Baud Rate to 9600, Parity None and Stop Bits to 1. Set the Slave Address to 99. The RDM port configuration of the MPA is fixed at 9600,N,8,1 and may not be changed by the user.

If connected to a Modbus local area network, the baud rate and slave address configured for the actuator must be known in order to setup the computer communication port. Default configuration for the MPA network port is 19,200 baud and default address is 99.

Select the configured Com Port in Navigation Pane and Right Click to Scan for Devices. Set address and Start Scan. When device is detected stop scan and close the window .

Figure 9.

Figure 10.

Figure 11.

User Setup Menus

To configure the actuator, select (highlight) the Device Tag in the Navigation Pane per figure 12. Then Right Click or use the Icon in the Menu Bar to select Detailed Setup as shown in figure 13. The current Actuator configuration and the default MPA settings or opened Dataset settings are displayed. A Dataset is a file on DCMLink based on the Device type and Displayed Device Tag. A yellow Tab indicates there are differences between the displayed Actuator configuration and the displayed Dataset. Configuration can be changed between the Actuator and the Dataset and the actuator Configuration File and Dataset can be saved to the PC. No passcode is required to change User Configuration Settings (Detailed Setup & Home Port Calibration) when using DCMLink.

The Network Tab allows changes in configuration only for the network ports. It does not affect the RDM port. The Control Tab allows unused/unconnected Ports of the MPFS to be bypassed. If a pipeline is not connected to any one or more ports, or if it is desirable to skip any one or more ports, click on the “Delete Port” number. The deleted ports will be skipped when a next port command is issued in either local or remote control modes.

Notice: When configuration changes are made, clicking the Blue arrows “Writes” the configuration to the Actuator or Dataset. If there are no differences between the Actuator and Dataset, the arrows will be grey. Using the dropdown box arrow of the Dataset allows for parameter change selections to be made. The “Read” button may be used to refresh the screen to verify the parameters have been properly written for storage in the actuator. You can read or write entire configuration or just the opened page using the Arrows or tab in upper right hand of the page. Values are written to EEPROM when the Setup page or Device Tag is closed. On the MPA LDM, within several seconds of writing the configuration, the 3 LOR LEDs will simultaneously flash slowly. This slow flash is a signal that all new values were successfully written to EEPROM.

Figure 12.

Figure 13.

Selecting New Home Port

The user may select any port as the new “Home Port” in the field. When a new home port is selected, the new home port is identified as Port 0 or 8 and the MPA reassigns all other port numbers (1-7) in a counterclockwise sequence around the MPFS. The MPA recalculates the exact calibrated port position based on factory calibration values so no accuracy is lost.

To select a new home port, click on the desired selection in Detailed Setup for User Home Port and Label (0 or 8) as shown in figure 14.

Note

When a new home port is selected, it must be a port without piping connected and must be fitted with a blind cover to allow for future seal inspection and visual port alignment. Selecting a new home port will cause the MPA to recalculate all calibration parameters based on the factory calibration and store the new values to EEPROM.

Home port may be identified as either Port 0 or Port 8. The desired designation may be selected by the CA configuration parameter as shown on page 38.

Figure 14.

Home Port LED Function

The home port LED on the LDM will now identify the newly selected home port position. This LED is on when the actuator is within 0.25 degrees of the selected home port. When the blind cover of the home port is removed in the field to inspect the seals, the home zero may be verified and corrected if an error is detected.

Home Port Calibration

If maintenance is performed on the actuator that can cause loss of calibration, the home port must be recalibrated. Examples of maintenance that affect calibration are removal of the actuator from the MPFS and replacement of the position encoder. If a MPA is removed from one MPFS and installed on another or if a CPU module is replaced, the factory configuration (.mpa) file for the MPFS must be loaded to the new actuator and the selected home port calibrated.

To calibrate the home port position, remove the blind cover from the selected home port. Use the hand wheel of the MPA to position the plug seal over the port as precisely as possible. Open DCMLink and connect to Device. Right click Device Tag or select Calibration button on the Menu Bar. Select the “Home Port Calibration” as shown in Figure 15. To avoid accidental setting of a new home port, the user is required to enter a passcode of 43 to gain access. A Pop-Up will appear as shown in figure 16 providing a warning and allow entry of the passcode. The Port Raw Value should be displayed in the Home Port Calibration Box. Select Calibrate Home Port and review the value before closing. The Home Port should be indicated on the MPA LDM as the MPA is aligned with the Home Port.

Factory Settings

Factory Settings are only accessible by Factory Authorized Technicians with DCMLink License authorization. Factory Setup contains protected configuration items defining the application and motor control as well as the User Password and Port Calibration. These items are in the “.mpa” configuration file saved by the Factory and can be loaded to or saved from a PC during any service or CPU Replacement. See figure 17.

Factory Settings Items are displayed in figure 18.

Figure 15.

Figure 16.

Figure 17.

Factory Settings - Port Calibration

Port Calibrations are made by Factory Authorized Technicians through the Factory Menu only accessible by Factory Authorized Technicians with DCMLink License authorization.

Select Port Calibration from the Factory Menu Options. See figure 19.

For precise MPFS port alignment, the factory calibrates each actuator to each of the ports of the mated MPFS. These items are in the “.mpa” configuration file saved by the Factory and can be loaded to or saved from a PC during any service or CPU replacement.

The calibrated values are displayed on the Port Calibration screen and may be compared to the current position (Encoder Feedback) to determine accuracy. When a new home port is selected by the user, these calibration values are recalculated and stored to EEPROM. See figure 20.

Figure 18.

Figure 19.

Figure 20.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D104239X012

Multiport Flow Selector

April 2022

Motor Type

Motor Type is entered at the factory for the type of MPFS, power supply and motor horse power rating as shown in the table below. Motor type is displayed on the MPA Config Factory Setup Menu. If the motor type is changed, it is necessary to cycle power to the actuator after existing factory setup to ensure proper initialization.

Table 2. Motor Type

MPFS	Motor HP	1 Ph 115 VAC	1 Ph 230 VAC	3 Ph 220/230 VAC	3 Ph 380 VAC	3 Ph 415 VAC	3 Ph 460 VAC	3 Ph 575 VAC	24 VDC
2 x 4	1/12	2	6	10	14	18	22	26	---
2 x 4	1/6	---	---	---	---	---	---	---	30
3 x 6	1/6	3	7	11	15	19	23	27	31
4 x 8 / 4 x 10	1/6	4	8	12	16	20	24	28	32
6 x 16	1/6	5	9	13	17	21	25	29	33

Note

The user is not required to select motor type unless qualified to download firmware upgrade to the MPA. If a new HEX file for firmware upgrade is loaded to the MPA in the field, the motor type must be configured before the actuator will operate. When power is first applied to the MPA after a firmware upgrade, in order to know how to initialize the electronics, the Motor Type stored in the EEPROM will be examined. If a new HEX file was just downloaded, it will not yet have a Motor Type (it will be ZERO).

When firmware sees that the Motor Type is ZERO, firmware will immediately go to the display entry in the Factory Setup Menu for Motor Type. The user will NOT have to move the left control knob back and forth to go to Setup Mode or enter a passcode. The user will see alternate display of "F1" and "0". The "F1" is the abbreviation for Motor Type in the factory setup menu, and the current value is 0. Then the user (who just now completed the hex file download) will have to use the left hand control knob to increment the display number to the correct Motor Type (from 1 to 33 shown in the table above). Then a move of the right hand selector knob either left or right will force an exit out of the Setup Menu in this unusual one-time circumstance after a HEX file download.

Now the firmware will examine the Motor Type and know how to initialize the electronics. Normally when power is applied to the MPA, if it is NOT after a new download of the HEX file, the Motor Type will already be non-ZERO so the firmware will know how to initialize the electronics without forcing the user to use the knobs.

Table 3. MPA Model Selections and Capacities

Valve Size and Max Torque	Power Supply	Model Size	MOTOR DATA							
			Nominal Size (HP)	Start Current (amps)	Run Current		Speed (rpm)	Motor Torque		
					15 min (amps)	5 min (amps)		Start (ft•lb)	15 min (ft•lb)	15 min (ft•lb)
2 x 4 150 ft•lb	24 VDC	37RK-FJ	1/6	50	6.5	11.7	2000	2.58	0.42	0.76

	415/3/50	37DK-9J	1/6	1.54	0.54	1.0	1400	2.61	0.64	1.15
	460/3/60	37JK-3J	1/6	1.9	0.55	1.0	1725	2.48	0.53	0.95

Note: All valve torques are run torques.

Valve Status Monitor

The Status Monitor is a valuable tool for monitoring and commissioning the system. It provides a Dashboard for quick visual indication of status and provides tab for review of Alarm and ESD Status, as well as Device Info. This screen may be used to determine command and position status troubleshoot any problems should they occur. Red Tabs indicate an active alarm or event exists. Field diagnostic code or Alarms are displayed in the Monitor Tab. All active alarms may be viewed at a glance in the Alarms tab. See figures 21 through 23.

Mode displays the mode selected by the selector switch of the LDM or combined logic of both LDM and RDM selector switches.

Monitor provides a snapshot of the active conditions and and Logs displays the last 9 Alarms.

At Port displays the port number position of the actuator and whether the MPA is at the port within 1 degree or within 2 degrees.

Torque is displayed as percentage of the full torque rating of the actuator. Torque is displayed from 10% to 99% in 1% increments. Torque less than 10% is displayed as zero because torque between 0% and 10% cannot be accurately measured.

Tracking and trend graphics display Setpoint, Position, and Torque over travel time.

Encoder Value is the 12-bit raw data from the position encoder in the range of 0 to 4095. This value is the same as the value displayed during Port Calibration in the Factory on the Factory Setup screen so it can be compared to port calibration value of each port.

Figure 21.

Figure 22.

Figure 23.

Valve Control

Valve Control allows all functions of the system to be tested prior to commissioning with the DCS. It provides for a Dashboard for Controlling the MPA and providing Host ESD. It also includes a tab for Alarm Status.

Valve Control can be used to command the actuator to go to the next port or go to a desired port number. “Go to Port” is the new setpoint in the range of 0 to 8 for the 8 ports (including the Home Port).

Based on selections for general display preferences in DCMLink™ Setup, the Dashboard can display Digital indication of Setpoint, Port Position, and Torque.

Figure 24.

Figure 25.

Figure 26.

Figure 27.

Field Setup Using Local Controls

Use the Local Control (left) knob and Selector (right) knob to enter setup mode and to execute Setup functions. The table below outlines the knob functions for Setup mode.

To access the Field SETUP mode of operation ensure the Selector Knob is placed in the OFF (Stop) position. Once set, rotate the Control Knob to the “UP” and then to the “DOWN” position in right to left succession three times. Keep the knob in each position for at least ½ second but not more than 3 seconds. The display module will flash the (3) amber LOR selector LED’s when the SETUP mode is enabled.

Figure 28.

SELECTOR KNOB (right)	SETUP FUNCTION	RESULTS
OFF (Stop) [return position]	Neutral position	Allows entry to SETUP mode. Completes NEXT, or BACK entry cycle, except when knob is held for scrolling through various menus
Clockwise (REMOTE) (Auto)	NEXT	Advances to the next menu item. Displayed data is accepted
Counter-clockwise (LOCAL) (Hand)	BACK	Backs up to the last menu item
CONTROL KNOB (left)	SETUP FUNCTION	SETUP RESULTS
Spring return to Center	Neutral position	Completes UP or Down entry Cycle except when knob is held for continuous data entry update
Clockwise (CLOSE)	UP	Increments displayed data
Counter-clockwise (OPEN)	DOWN	Decrements displayed data

When the actuator LDM is placed in SETUP mode of operation it first displays the Field Diagnostics (Fd) menu item. The second menu item Alarm History (AH) menu. The field diagnostics and alarm history may be viewed without entering a passcode (See Field Diagnostics and Alarm History Display section).

Note

On any setup menu, use up/down to change a parameter and back/next to accept the displayed parameter. All menus and all parameters are wrap around, meaning they will advance from the highest or last value to the lowest or first value.

To view or change setup parameters of the actuator, Rotate the Selector Knob to the right or NEXT position to cycle through the alarm history display A1 through A8 until P1 is displayed. Alarm history (A1-A8) may be skipped by changing AH(1) to AH(0) and go directly to passcode menu. Passcode menu is displayed as two, 2-digit entries, P1 and P2. The actuator is shipped from the factory with the passcode disabled, meaning that the passcode is 00 00. Until the passcode is changed by the user, the passcode of 00 00 may be accepted by using the NEXT selector knob sequence to accept the passcode and continue to the setup menus. You will now be able to display and/or edit setup data. If you forget your configured passcode, factory trained technicians can reset the passcode back to 00 00.

Note

While in the SETUP mode the actuator will not turn on the motor control circuits and disables all control of discrete outputs until exiting the Setup Mode.

Alarm History Display

Setup always enters the main menu at the Field Diagnostics (Fd) and the next menu item is Alarm History (AH). The user may view the alarm history without having to enter a passcode. The AH menu will alternately display a value of 0 or 1. Use the Control Knob up or down to change the selection from 0 to 1 or 1 to 0. If display of the alarm history is desired, then the value must be 1. When AH with a value of 1 is displayed, use the Selector Knob REMOTE (NEXT) to advance through the alarms. If it is desirable to skip the alarm history and advance to the setup menus, use the control knob to select a value of 0 and then the Selector Knob Remote (Next) to advance directly to the P1 passcode entry. Alarms are displayed by a sequence number A1 through A8. The display alternates between the alarm sequence number (A1-A8) and the recorded alarm. A1 is the newest alarm and A8 is the oldest alarm. Use the NEXT and BACK selector positions to cycle through the alarms. Blanks are displayed for fewer than 8 alarms. The alarm history is cleared by cycling power to the actuator. If it is desirable to only display alarm history and not go into setup, use the LOCAL (BACK) selection repeatedly to back out of the alarm history and return to normal operating mode.

Setup Mode Display Sequence

The three (3) amber LED's for the LOR section flash to indicate Setup Mode. When in setup mode, the user must enter the REMOTE (NEXT) or LOCAL (BACK) within 120 seconds or the display will revert back to the normal display mode.

Setup data may be changed by using the Up and Down entries of the Control Knob. The Up and Down entries are active only after a valid pass-code is entered and the Selector Switch is in the STOP position. The default pass-code is P1 00 and P2 00. Once the correct passcode is entered and accepted at the actuator controls, the user will then be able to advance thru the displays shown in the Main Menu table on the following page.

The table on the following page shows the sequence of the setup menus. It also shows the selections, units, and defaults. Each time the REMOTE (NEXT) selector knob is selected, the display advances to the next menu item. Each time the LOCAL (BACK) selector knob is selected, the display backs up to the previous menu item. The Up and Down control knob is used to increment or decrement the value shown in the table.

Following is an example for changing the Torque Limit. In this example the current torque value is the default value of 60%.

1. Enter setup mode – Selector knob Off – Rock control knob back and forth until 3 selector LEDs begin to flash and Fd is displayed. When using the selector knob to advance to the next menu or back to the previous menu, always return the selector to the Off position to complete the cycle.
2. Use control knob to change the value of AH to 0 – Rotate selector knob clockwise to Remote (Next) to display P1 (1st passcode). The display will alternate between P1 and the value (default is 00). If the passcode has been changed, rotate the control knob clockwise to advance the display to the correct first passcode. Rotate the selector knob clockwise to advance to the next display, P2. The display will alternate between P2 and value of the second passcode (default is 00). If the passcode has been changed, rotate the control knob clockwise to increment the display to the correct second passcode.
3. Repeatedly cycle the selector knob clockwise to advance to the next menu item until C2 is displayed. This is the torque limit setting as shown in the following table. The display will alternate between C2 and the value of C2 which we have assumed to be 60.
4. Rotate the control knob clockwise to the “up” position to increase the torque limit setting. Rotate the control knob counterclockwise to the “dn” position to decrease the torque limit setting.
5. Repeatedly cycle the selector knob to the Remote (Next) position and the Off position to advance through the remaining menu items until the EP (Exit Program) is displayed.
6. If it is desirable to exit, use the control knob “up” to display a 1 value. Use the selector knob Remote (Next) to select exit. The system and display will return to normal operating mode.

Note

Use Selector Knob to select Menu and Use Control Knob to select Units.

EP	Exit Program?	0-1	0=No, Return to last menu 1=Yes, Exit	
Note: RDM port configuration is fixed at 9600,N,8,1 address 254 and may not be changed by the user. Only the network port configuration may be changed. The address programmed for the network port will be accepted by the RDM port in addition to address 254.				

Field Diagnostics

Should trouble occur, the Field Diagnostics feature may be used to help diagnose the problem. Field diagnostics provides more detailed and definitive feedback than the alarms, i.e. possible root cause(s) for the alarm. For example, there may be many causes for an Actuator Fail alarm. Field diagnostics may be displayed by MPA Config as shown here.

Field diagnostic may be displayed by the local display by entering setup mode. In Setup Mode, the first entry is Field Diagnostics having visible code “Fd”. Its value is 0 if there is no fault. If there is a fault, its code is from 1 to 28. If there are multiple faults, only the first of those faults in the following list will be seen. When that fault is corrected, the next fault will display if present.

In DCMLink the Field Diagnostics Code is indicated in the Status Monitor.

Figure 29.

Fd Fault Codes

1. MCP23 Chip will not initialize (pertains to a three phase AC motor type)
2. Motor is wired to turn in the wrong direction
3. Self-detected wiring fault (Emergency Shut Down - LE)
4. Host transmitted ESD command (Emergency Shut Down - LE)
5. Lost Phase, pertains to a three phase AC motor type - PH
6. Motor has over-heated or overload relay trip (Motor overload - OL)
7. Stall Alarm. No motor movement after excess time of power applied - SA
8. Lost Control Voltage (Loss of power for motor control - LC)
9. Contactor is engaged, but there is no AUX feedback (= Control Failure)
10. SPI communication failure for GPA chip
11. AUX feed-back alarm (= Incorrect AUX feedback from contactor)
12. Three consecutive overshoots of the port
13. RDM is not communicating and is required (Communication Error - CE)
14. No input from Torque Encoder. Check for cable connection problems or encoder failure
15. Torque OCF bit is low. Power supply to the Torque Encoder is likely at fault
16. Encoder reports that Torque Encoder value is invalid
17. Torque Encoder Parity error
18. Torque Encoder Magnet is out of range
19. Over-Torque. Torque value is greater than the Torque Limit
20. Value from the Torque Encoder is out of range (invalid instead of over-torque)
21. No input from Position Encoder. Check for cable connection problems or encoder failure

22. Position OCF bit is low. Power supply to the Position Encoder is likely at fault
23. Encoder reports that Position Encoder value is invalid
24. Position Encoder Parity error
25. Position Encoder Magnet is out of range
26. Encoder Position inconsistent consecutive times. Expect Position Encoder problem
27. Stopped between ports (non-critical)
28. Home Port is the last port reached (stopped at Home Port, non-critical and may be normal operation)

Remote Control Network

Modbus RTU

The native language of the MPA is Modbus RTU. If other network protocols such as Foundation Fieldbus are used, a Communication Adapter Module (CAM) module is installed to translate between the selected protocol and Modbus. The controller supports Modbus function codes 01,02,03,04,05,06,15,16. Following are the memory maps for discrete I/O and unsigned 16-bit Holding registers used in this application. All memory maps shown are zero based, i.e. register 1 = holding register 40002. reading Input Bit 0 using FC02 = 10001.

Discrete Input Map (Valve Status and Alarms)

Bit	Input	
0	16	At commanded port within 1 degree
1	17	At commanded port within 2 degrees
2	18	Flow selector moving
3	19	Wrong direction alarm
4	20	Selector switch Local/Manual Mode
5	21	Selector switch Remote/Auto Mode
6	22	Over torque alarm
7	23	Stop between ports alarm
8	24	Flow selector stall alarm
9	25	Power monitor alarm
A	26	Motor thermal overload alarm
B	27	Phase monitor alarm
C	28	Local ESD alarm
D	29	Actuator fail alarm
E	30	No input (always zero)
F	31	Unit alarm (above alarms are OR'ed)

These same status and alarm bits are duplicated in Modbus Registers 01, 06, 09 (40002, 40007, 40010) in the same bit sequence shown above.

Coil Map (Discrete Network Control)

There are only two coils used for discrete network control as follows. When Coil 10 is set by the host, the actuator resets the coil automatically when the command is executed. When Coil 11 is set, the host must reset the coil before the actuator will respond to any other command.

Coil

10 Go to next port

11 Host ESD command, Go to Home Port

Holding Register Map

These are the recommended registers to use. Other registers are active but the user is cautioned not to use the data or write to any other registers.

Monitor and Control Registers

Register

01 Actuator status and alarms in the bit sequence shown for the input map

06 Actuator status and alarms in the bit sequence shown for the input map

07 Last Port position reached (0-7 or 1-8) (See CA Home port number on page 38)

09 Actuator status and alarms in the bit sequence shown for the input map

11 Port position Setpoint (0-7 or 1-8) (Data must be a single digit between 0 and 7 or 1 and 8 depending on Home configuration) (See CA Home port number on page 38) (MPA returns 255 (0xFF) in register 11 when the commanded port is reached)

12 Field diagnostic code 0-28 (See Fd Fault Codes on page 22)

13 Raw 12-bit position encoder value (0-4095)

14 Port position (0-4095)

15 Torque (0-4095)

Configuration and Calibration Registers

Register

211 Port 0 calibration value (0-4095)

212 Port 1 calibration value (0-4095)

213 Port 2 calibration value (0-4095)

214 Port 3 calibration value (0-4095)

215 Port 4 calibration value (0-4095)

216 Port 5 calibration value (0-4095)

217 Port 6 calibration value (0-4095)

218 Port 7 calibration value (0-4095)

Note

After the HC command is executed, Register 211 will be zero and remain zero.

⚠ WARNING

Extreme caution must be used when writing port calibration values to registers 211 through 218 (40212 thru 40219). Only values read from these registers shall be written to them. The purpose of these registers is to allow the network host to store the port calibration values and then write them back to the actuator in case of replacement of the CPU module.

Foundation Fieldbus (FF)

The MPA uses a CAM18 to convert between Modbus and Foundation Fieldbus. Refer to Bettis M2CP CAM18 & TEC2000 CAM218 Installation, Operation and Instruction Manual for installation and setup of the FF link. Relations between the Modbus and FF maps are identified as follows.

Foundation Fieldbus

Modbus Discrete Input Map

<u>Input</u>	
16	At port within 1 degree
17	At port within 2 degrees
18	Flow selector moving
19	Wrong direction alarm

Actuator Readback (Channel 2)

Note: Channel 2 has only 1 value

<u>DI</u>	<u>PV / Out_D</u>

Torque AI (Channel 18)

SP / OUT
SP / OUT
SP / OUT

Modbus

Configuration and Calibration Registers

Foundation Fieldbus

MAO (Channel 19)

MAI (Channel 20)

Register		Parameter	Parameter
211	Port 0 calibration	IN_1	OUT_1
212	Port 1 calibration	IN_2	OUT_2
213	Port 2 calibration	IN_3	OUT_3
214	Port 3 calibration	IN_4	OUT_4
215	Port 4 calibration	IN_5	OUT_5
216	Port 5 calibration	IN_6	OUT_6
217	Port 6 calibration	IN_7	OUT_7
218	Port 7 calibration	IN_8	OUT_8

Note

Input and Output parameters are the number of hardware registers that are connected to the I/O block. They define the transducers to be used going to or from the physical world.

⚠ WARNING

Extreme caution must be used when writing port calibration values to registers 211 through 218. Only values read from these registers shall be written to them. The purpose of these registers is to allow the network host to store the port calibration values and then write them back to the actuator in case of replacement of the CPU module.

Note: The network host may write a Port Position Setpoint to Channel 3 (SP/OUT) as a 12-bit unsigned integer analog value corresponding to 0% to 8% where the percentage relates to the port number 0 to 8. The analog value is calculated as absolute value of Port Number / 100 * 4095. Example: Analog value for Port 6 = $6/100 * 4095 = 245.7 = 245$. The actuator will accept the percentage analog value within a tolerance as shown below:

Port 0 = 0
 Port 1 = 39 – 42
 Port 2 = 79 – 82
 Port 3 = 120 – 123
 Port 4 = 162 – 165
 Port 5 = 203 – 206
 Port 6 = 244 – 247
 Port 7 = 284 – 288

If CA is configured as 1 for Home Port = 8, the MPA will accept either 0 or 327 for setpoint of Home Port. The acceptable range for Port 8 is 325 to 329. (see page 21 for CA configuration)

Profibus DP Redundant Networks with Redcom

The MPA uses CAM20 to convert between Modbus RTU and Profibus DP. This section describes the data mapping between the Profibus DP host and MPA Modbus map. The mapping allows the Profibus DP host to control the Flow Selector and monitor the actuator status. The control information is mapped directly to words in the Profibus Output data and status information is mapped directly to words in the Profibus Input data.

Output Data

Location		Bit							
Word	Byte	7	6	5	4	3	2	1	0
1	1	Not used	Not used

Introduction	1
Safety Instructions	1
Specifications	2
Inspection and Maintenance Schedules	2
Parts Ordering	2
Installation	3
Maintenance	4
Latest Published Instruction Manual	5

Introduction

The product covered in this document is no longer in production. This document, which includes the latest published version of the instruction manual, is made available to provide updates of newer safety procedures. Be sure to follow the safety procedures in this supplement as well as the specific instructions in the included instruction manual.

Part numbers in the included instruction manual should not be relied on to order replacement parts. For replacement parts, contact your [Emerson sales office](#).

For more than 30 years, Fisher products have been manufactured with asbestos-free components. The included manual might mention asbestos containing parts. Since 1988, any gasket or packing which may have contained some asbestos, has been replaced by a suitable non-asbestos material. Replacement parts in other materials are available from your sales office.

Safety Instructions

Please read these safety warnings, cautions, and instructions carefully before using the product.

These instructions cannot cover every installation and situation. Do not install, operate, or maintain this product without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage it is important to carefully read, understand, and follow all of the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your Emerson sales office before proceeding.

Specifications

This product was intended for a specific range of service conditions--pressure, pressure drop, process and ambient temperature, temperature variations, process fluid, and possibly other specifications. **Do not expose the product to service conditions or variables other than those for which the product was intended.** If you are not sure what these conditions or variables are, contact your [Emerson sales office](#) for assistance. Provide the product serial number and all other pertinent information that you have available.

Inspection and Maintenance Schedules

All products must be inspected periodically and maintained as needed. The schedule for inspection can only be determined based on the severity of your service conditions. Your installation might also be subject to inspection schedules set by applicable governmental codes and regulations, industry standards, company standards, or plant standards.

In order to avoid increasing dust explosion risk, periodically clean dust deposits from all equipment.

When equipment is installed in a hazardous area location (potentially explosive atmosphere), prevent sparks by proper tool selection and avoiding other types of impact energy.

Parts Ordering

Whenever ordering parts for older products, always specify the serial number of the product and provide all other pertinent information that you can, such as product size, part material, age of the product, and general service conditions. If you have modified the product since it was originally purchased, include that information with your request.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher product, because they may void your warranty, might adversely affect the performance of the product, and could cause personal injury and property damage.

Installation

⚠ WARNING

- Personal injury or equipment damage caused by sudden release of pressure or bursting of parts may result if the valve assembly is installed where service conditions could exceed the limits given in the applicable product literature, the limits on the appropriate nameplates, or the mating pipe flange rating. Use pressure-relieving devices as required by government or relevant industry codes and good engineering practices. If you cannot determine the ratings and limits for this product, contact your [Emerson sales office](#) before proceeding.
- To avoid personal injury, always wear protective gloves, clothing, and eyewear when performing any installation operations.
- To avoid personal injury or property damage, use proper lifting and rigging practices while lifting, installing or removing the valve assembly. Be sure to use lifting and rigging equipment properly sized and selected for the weight and configuration of the valve assembly or component being lifted.
- Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions.
- Many rotary shaft valves are not necessarily grounded to the pipeline when installed in a flammable, hazardous, oxygen service, or explosive atmospheres. An explosion is possible, due to the discharge of static electricity from the valve components. To avoid personal injury or property damage, make sure that the valve is grounded to the pipeline before placing the control valve assembly into service. Use and maintain alternate shaft-to-body bonding, such as a shaft-to-body bonding strap assembly.
- Rotary shaft valves are designed and intended for installation between flanges. Personal injury or property damage may result from improper installation. To avoid personal injury or property damage caused by the sudden release of pressure or bursting of parts, do not use or install rotary shaft valves (including single lug constructions) for dead-end service.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
- If installing into an existing application, also refer to the WARNING in the Maintenance section.
- When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. To avoid possible personal injury and because some valve/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your Emerson sales office.

CAUTION

- Ensure that the valve and adjacent pipelines are free of foreign material that could damage the valve seating surfaces.

Maintenance

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Always wear protective gloves, clothing, and eyewear.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure.
- Do not remove the actuator while the valve is pressurized.
- Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring pre-compression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box might contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids might spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug. Cautiously remove parts so that fluid escapes slowly and safely.
- Many valve parts that are moving can injure you by pinching, cutting, or shearing. To help prevent such injury, stay clear of any moving part.
- Never apply pressure to a partially assembled valve.
- To avoid personal injury or property damage caused by uncontrolled movement of a valve bonnet, loosen the bonnet by following these instructions: Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet. Loosen bonnet nuts approximately 3 mm (0.125 inch). Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and body. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, proceed with bonnet removal.
- As you remove parts, such as valve shafts, other parts, such as disks can fall from the valve body or suddenly move to another position in the valve. To avoid injury from falling or moving parts, be sure to support parts and be sure they are in a stable position as you disassemble the valve.
- Personal injury could result from packing leakage. Do not scratch the drive shaft or packing box wall while removing packing parts.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Neither Emerson, Emerson Automation Solutions, nor any of their affiliated entities assumes responsibility for the selection, use or maintenance of any product. Responsibility for proper selection, use, and maintenance of any product remains solely with the purchaser and end user.

Figure 1. Vonk Choke Valves

Introduction

Scope of Manual

This instruction manual provides information on installation, adjustment, maintenance, and parts ordering for the Vonk choke valve. Refer to separate instruction manuals for information about the valve positioner and other accessories used with the valves.

Do not install, operate, or maintain a Vonk valve (see figure 1) without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

Vonk choke valves are of the rotary type. The valve can be used for tight shut off service to Class V of ANSI/FCI 70-2 standard for contaminated fluids and high-pressure drops. The throttling mechanism consists of two polished disks, each provided with an eccentric orifice. One disk is fixed into the body; the other one is rotated to achieve Class V seat leakage performance.

Educational Services

For information on available courses, contact:

Emerson Automation Solutions
Educational Services - Registration
Phone: 1-641-754-3771 or 1-800-338-8158
E-mail: education@emerson.com
emerson.com/fishervalvetraining

Specifications

Contact your Emerson sales office for additional information.

Temperature Range

Vonk choke valves are designed for three temperature ranges:

The **Standard** version (STD) equipped with O-rings.

The **Low Temperature** version (LT) equipped with special LT-seals.

The **High Temperature** version (HT) is the same as the LT version but has an extended bonnet construction to withstand high temperatures.

Each version is available with special fugitive emissions (FE) or fire safe (FS) seal option depending on application and choke valve type. Refer to table 1 for configurations covered in this manual.

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations.

To avoid personal injury or property damage resulting from the sudden release of process pressure or bursting of parts, do not install the valve assembly where service conditions could exceed the limits given in this manual or on the appropriate nameplates. Use pressure-relieving devices as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any other hazards that may be present from exposure to process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions indicated when the valve was ordered. Because some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

1. Carefully remove the valve from the shipping package (box or pallet) avoiding any damage to the valve or, in case of automated valves, to the electric or pneumatic / hydraulic actuator or instrumentation.
2. The valves are shipped with the ends protected with caps and a thin layer of protective grease. Before installing the valve, remove the protective caps from the valve. Clean carefully and then de-grease both surfaces with a solvent. Clean the inside of the valve to ensure there are no solid objects such as pieces of wood, plastic or packing materials within the valve or on the valve seat. The valve must be free of all foreign matter.
3. Confirm that the materials of construction listed on the valve nameplate are appropriate for the service intended and are as specified.

Vonk chokes valves can be mounted in any position. Installation of the valve must match the flow direction is indicated by the arrow on the valve-body.

Unless otherwise recommended by Emerson:

1. The pipe ends must be properly aligned and supported so as to prevent the valve being subjected to unnecessary stress induced by connecting piping.
2. It is recommended to perform piping flushing before installation of valve.
3. After the down-stream flange (outlet flange), the piping shall be straight over a certain length (depending on the flow medium, the fluid phase and the pressure drop over the valve), but at least 1 meter (39-inches).
4. For choke valves provided with pneumatic actuators, the air pressure to the actuator shall be at least 4.5 bar (65 psi), and a maximum of 8 bar (116 psi), unless specified otherwise. Clean, dry compressed air can be used for the actuator. If a valve positioner is used, instrument air has to be used; do not install a drip feed lubricator in the supply line to the positioner.
5. During the installation of the valve, materials, such as connecting flanges, gaskets and bolting shall be used, appropriate for the design conditions of the application.
6. If present, do not cover or stop up the drain channels located at the actuator top-flange of the bonnet.

CAUTION

Make sure that the operating limits of the valve are the same or higher than the operating limits of the piping system. See the nameplate of the choke valve.

In case of a HT version valve, the bonnet should not be insulated (this may over-heat the bonnet).

After installation, check the operation of the valve by stroking it to 'full open' and 'full close'. The position of the valve can be indicated in the following ways:

1. Mechanical, by a dial plate showing the position of the valve. The following methods are available:
 - a. Percent of the full stroke of the actuator
 - b. Percent opening of the valve
 - c. Equivalent bean size in 1/64-inch increments
2. Electrical limit switches indicating end of stroke of the actuator.
3. Electronic valve position transmitter, presenting the position of the valve:
 - a. As a 4-20 ma signal
 - b. As a 4-20 ma signal with 'smart' transmitter information (HART® protocol)
 - c. As a fieldbus signal (e.g. FOUNDATION™ fieldbus, PROFIBUS)

Figure 2. Vonk Choke Valves Open / Throttled / Shut

Operation

Manual: Manual shut-off valves are designed to 'shut' when the handwheel is turned clockwise and 'open' when the handwheel is turned counter-clockwise (including valves with gearbox operators). Handwheels of electric actuators (or pneumatic actuators) are for emergency operation only.

Pneumatic / Hydraulic: Choke valves fitted with a pneumatic or hydraulic actuator must be connected and operated in accordance with the actuator manufacturer instructions. Refer to the actuator instruction manual.

Electric: Choke valves fitted with an electrical actuator must be connected and operated in accordance with the actuator manufacturer instructions. Refer to the actuator instruction manual.

Positioner: Choke valves fitted with a positioner must be connected and operated in accordance with the positioner manufacturers instructions. Refer to the positioner instruction manual.

Maintenance of Valve Internals

Valve parts are subject to normal wear and must be inspected regularly and replaced when necessary. The frequency of inspection and replacement depends on the severity of service conditions.

WARNING

Avoid personal injury or property damage from sudden release of process pressure or uncontrolled movement of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring pre-compression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

WARNING

Follow instructions carefully to avoid damaging the valve sealing and packing surfaces, which could result in excessive leakage at shutoff or allow process fluid to leak to atmosphere.

Note

Whenever a gasket seal is disturbed by removing or shifting gasketed parts, install a new gasket during reassembly. This ensures a good gasket seal because the used gasket may not seal properly.

Figure 3. Vonk Choke Valve Internals

Prior to any inspection or maintenance, refer to the appropriate parts list and associated figure for the choke valve type and seal configuration.

After the choke valve has been disassembled, a new set of soft seals must be used. The trim and bonnet can be replaced and/or inspected without removing the body out of the line.

For inspection of the choke valve, an internal wrench tool is required.

Disassembly

⚠ WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

1. Isolate the choke valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator.
2. Unscrew the air tubing. In case of a conventional type valve positioner, check the cam in the valve positioner (zero position open when the actuator is spring to close, and zero position closed when the actuator is spring to open).
3. Unscrew the bonnet nuts and lift the bonnet and actuator from the body.

4. Check the position of the turning fork. If the mark on top of the turning fork is opposite the inlet flange, the valve is in the closed position. (See figure 3.)
5. Screw the bolts of the internal wrench tool into the thread holes of the body-protecting bush. (See figure 4.)
6. The complete trim can be removed out of the body by turning down the nuts of the internal wrench tool.
7. Disassemble the internals by removing the locking wire, and lift the protection bush from the bean.
8. Examine the internals for foreign material that may affect the operation of the choke.
9. Inspect the front disk and bean. The surface where the orifice is located should be smooth and free of any damage. If there is any visible damage, then the parts need to be replaced.
10. Clean the inside of the body very carefully. Special attention has to be given to places where soft seals are situated. Clean the sealing surfaces and inspect them for corrosion, pitting or scratches. After inspection, lightly grease the sealing faces (universal grease).

CAUTION

If a 'spring-energized seal' is used, use only a PTFE spray lubricant on the spring energized seal sealing face.

Assembly

1. Put one drop of light oil on the seating surface, and place the front disk on the bean.
2. Put the turning fork on the front disk, and ensure the mark on top of the turning fork is in the same position as the orifice in the front disk.
3. Install the scraper over the turning fork. Lightly grease it with an anti-seize lubricant.
4. Place the guide-strip of the internal and the scraper around the front disk. Mount the protecting bush. The protecting bush inlet hole should point to the same direction as the orifice of the bean. (See figure 3.)
5. Replace the locking-wire.
6. Using the turning fork, turn the orifice of the front disk and bean to a fully open position for valves with a spring-to-open actuator. For an actuator with a spring-to-close action, the orifice has to be put in a position of 180 degrees (90 degrees for NPS 1 choke valves) from the fully open position.
7. Mount the new seal around the bean.
8. Grease (universal grease) the seal slightly and insert the complete internal in the body.

CAUTION

If a 'spring-energized seal' is used, use only a PTFE spray lubricant on the spring energized seal sealing face.

9. Recheck the position of the turning fork and put spring in position.
10. Place the bonnet and the actuator on the body. Be sure that the adjusting pin is placed in the hole of the protecting bush.
11. Grease the stud bolts with anti-seize lubricant and tighten the nuts crosswise. See Retightening of Nuts Body Bonnet Connection in this manual for more information.
12. Connect the air tubing.
13. After assembling the choke valve, perform a functional test to check whether the valve functions properly.

Retightening Nuts Body Bonnet Connection

Due to the design of the choke valve, the nuts of the studs (body-bonnet connection) needs to be tightened sufficiently to provide a proper connection.

Valve Internals and Bonnet Maintenance

A replacement set of soft seals is required.

Disassembly

1. Complete steps 1 to 10 of the Maintenance of Valve Internals Disassembly section in this manual.
2. Take the shaft key out of the bonnet shaft and push the bonnet shaft out of the bonnet.
3. Remove all the seals, bearings, and scrapers.
4. Clean all the parts.
5. Clean all the sealing surfaces of bonnet and shaft very carefully and inspect them for corrosion, pitting or scratches.

Assembly

1. Complete steps 1 to 13 of Maintenance of Valve Internals Assembly section in this manual.
2. Grease all the sealing surfaces with PTFE spray lubricant.
3. Mount seals, bearings, and scrapers on the bonnet shaft. (For correct position, refer to applicable drawing and parts list.)

Note

For easy mounting, the O-ring needs to be pushed in (create a heart shaped form), to decrease the outer diameter. When the O-ring is in position push it back to its original shape.

4. Check if all the seals are mounted correctly (per applicable drawing and parts list) and fully in position.
5. Grease the seals with PTFE spray lubricant.

CAUTION

The seals are easily damaged. The right way to mount the seal holder is to carefully and gently push while turning it over the bonnet shaft.

6. Mount the remaining seals around the bonnet. Then mount bearings and grease all with PTFE spray lubricant.
7. Push the bonnet shaft gently to the bonnet.
8. Place the bonnet on the body. Be sure the adjusting pin is placed in the hole of the protecting bush.
(1-inch TS bonnet has no adjusting pin.)
9. Complete steps 11 to 13 of the Maintenance of Valve Internals Assembly section in this manual.

Figure 4. Vonk Choke Valve Service Procedure

1.

2.

TRIM INSPECTION

1. Undo body/bonnet bolting.
2. Take off bonnet assembly.

3.

4.

TAKE OUT INTERNALS

3. Attach internal wrench tool.
4. Pull out internals.

Parts Ordering

Each actuator has a serial number stamped on the nameplate. Always mention this number when corresponding with your [Emerson sales office](#) regarding technical information or replacement parts.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

SCV Valve, STD (figure 22)

Key	Description
10	Body
20.10	Bean
20.20	Front Disk
20.30	O-Ring, Bean
20.40	Locking Wire
20.50	Bearing
20.60	Turning Fork
20.70	Protecting Bush
20.80	V-Ring
30.10	Bonnet
30.20	O-Ring
30.30	Lip Seal
30.40	Bearing
30.50	Spring
30.60	Bearing
30.70	Shaft
30.80	Bearing
30.90	Scraper
30.100	Shaft Key
30.110	Pin
30.130	Spring Bush
40.10	Stud Bolt, qty 6
	Nut, qty 6
40.30	Nameplate
40.40	Rivets, qty 2

Technical drawing of a mechanical assembly, showing a cross-section (SECTION A-A) and a top view.

SECTION A-A: This view shows the internal components of the assembly. The central shaft is labeled with a dimension of 10.20. The housing is shown with a cross-hatched pattern. The shaft is supported by bearings, and the dimensions for the bearing inner diameters are 30.20, 30.70, 20.10, 30.50, 30.40, 20.90, 20.40, 20.120, 20.110, and 20.130. The shaft diameter is 10. The dimensions for the housing bore are 20.170, 20.140, 20.100, 20.20, 20.50, 20.180, and 30.60. The section line A-A is indicated by a vertical line with arrows pointing to the right.

Top View: This view shows the circular profile of the housing. The outer diameter is 30.10. The inner bore is shown with a cross-hatched pattern. The top view includes four mounting holes, each with a diameter of 10. The section line A-A is indicated by a vertical line with arrows pointing to the right.
