The actuator is normally shipped adjusted at the factory and you may refer directly to the following steps. If the actuator has been disassembled, it is necessary to adjust the travel stop. You may perform the Travel Stop Adjustment in accordance with the procedures in the Installation section.

9. Lift the actuator and place it onto the handwheel. Insert the cap screws (key 77) and tighten them.

WARNING

When moving the actuator stem with loading pressure applied, exercise caution to keep hands and tools out of the actuator stem travel path. If the loading pressure is accidentally disconnected, personal injury and property damage is possible if something is caught between the actuator stem and other control valve parts.

10. For an air-to-open actuator only: set the diaphragm loading pressure to approximately 0.5 bar over the upper bench set pressure. The actuator should be contacting the upper travel stop.
11. For sizes P900 and P460-200 only, screw the actuator stem locknut away from the from the connector half location.

12. Screw the stem connector half (key 124) onto the actuator stem.
13. Perform one of the following procedures as appropriate:
 - a. For an air-to-open actuator: position the bridge (key 112) at the lower location and wedge it by inserting the stoppage part (key 121) into the two holes. Rotate the connector half so that the distance between the bridge and the connector half is equal to the valve travel. Be sure that the actuator stem threads are engaging the threads of the stem connector by the distance of at least one diameter of the stem. Then slowly decrease the diaphragm pressure until the connector half is contacting the bridge and line up the stem connector half.
 - b. For an air-to-close actuator: position the bridge (key 112) at the upper location and wedge it by inserting the stoppage part (key 121) into the two holes. Rotate the connector half so that it is contacting the bridge and line it up.
14. Install the cap screws (key 125 or 137) and tighten them.
15. For the sizes P460 and P462, install the cap screw and nut (key 130 and 131) and tighten them. For the sizes P900 and P460-200, screw the actuator stem locknut against the stem connector half.
16. For an air-to-open actuator only: slightly pressurize the actuator diaphragm until movement of actuator stem is detected.

WARNING

To avoid personal injury due to sudden uncontrolled movement of parts, do not remove the stoppage part of the bridge when the connector has spring force applied to it.

17. Remove the stoppage part from the bridge and install it into the protective cover for the sizes P460, P462 and P900 or into the top holes of the handwheel yoke for the size P460-200.
18. For the size P460-200 only, Place the two bellows (keys 134, 135 and 133).
19. Install the travel indicator (key 113) by tightening the cap screw or nuts.
20. Lift the actuator and handwheel assembly and place it onto the yoke. For the sizes P460, P462 and P900 insert the cap screws (key 122). For the size P460-200 insert the cap screws and nuts (keys 122 and 132). Then tighten them.
21. Mount the actuator and handwheel assembly in accordance with the procedures in the Installation section.

Parts Ordering

Each actuator has a serial number stamped on the nameplate. Always mention this number when corresponding with your [Emerson sales office](#) regarding technical information or replacement parts. Also, reference the complete part number of each part needed as part as found in the following Parts List.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts List

Note

Part numbers are shown for recommended spares only. For part numbers not shown, contact your [Emerson sales office](#).

---	---

Introduction

Scope of Manual

This instruction manual includes operation, installation, and maintenance information for the following diffusers:

- 6010, 6011, and Whisper Disk Inline Diffusers. See figure 1
- 6012 and 6013 drilled-hole vent diffusers. See figures 2 and 3
- 6014 and 6015 WhisperFlo disc style vent diffusers. See figures 4 and 5

Do not install, operate, or maintain these diffusers without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

Inline and vent diffusers are installed to provide backpressure for control valves, which greatly reduces control valve noise generated by steam, gas, or vapor flow applications. Inline diffusers are placed downstream of the valve and are either placed in or between pipe. Vent diffusers are placed downstream of the valve and vent process to the atmosphere. Fisher inline and vent diffusers are used in gas, vapor, and steam applications.

Principle of Operation

Inline and vent diffusers are custom designed to match a wide range of valve outlet and/or pipeline size. Furthermore these diffusers are selected to match the application specific conditions including temperature, pressure, and flow capacity. The flexibility of the diffuser types and placement provide a range of installation possibilities. The diffuser is not required to be installed adjacent to the control valve.

The 6010 is an inline diffuser that fits between two different sizes of pipe to meet both downstream and upstream pipe sizes with an integral outlet head. The 6011 is a pipe-style inline diffuser that extends into existing pipe using a wafer flange connection. The Whisper Disk is a flat plate-style inline diffuser that is available with a raised-face flanged connection. The 6012, 6013, 6014, and 6015 are vent diffusers that are designed to reduce noise during process venting applications.

Piping Considerations

Upstream piping should be the same nominal diameter as the diffuser inlet connection and vice versa.

The drilled hole pattern of the Whisper Disk inline diffuser must be within the inside diameter of the mating flange schedule.

Reducers or elbows are not recommended downstream unless they are at least four to five downstream pipe diameters downstream of the diffuser outlet.

Installation

Before installation, all piping to the diffuser must be blown clean, so that no particles, such as welding beads, dirt or other foreign matter, are left in the pipeline. Keep foreign matter away from the line openings while preparing the diffuser for installation.

CAUTION

Cleanliness of the upstream piping is critical. Debris in the piping can damage the diffuser and severely restrict flow, causing overpressure.

Inspect the inside of the diffuser and clean if necessary.

Arrange a lifting sling around the diffuser to safely place it into the mounting position.

Note

To avoid flow interaction and reduce noise in 6012, 6013, 6014, and 6015 vent diffuser applications, do not install diffusers in close proximity to support structures and ensure that adjacent diffusers are installed at different heights.

6013 and 6015 diffusers with shell are provided with mounting brackets for wind and side loads. These mounting brackets also provide support, so the entire weight of the diffuser is not on the inlet connection. The end-user shall provide the necessary support structure to interface with the provided mounting brackets on the diffuser.

Flanged Connections—For high temperature applications, grease the flange connection bolts with a high temperature thread lubricant. Install flange gaskets and connection bolts per accepted practices and tighten securely.

Re-tighten bolts after the diffuser has been pressurized. Do not expose the diffuser to undue stresses by installing it in bent pipes or bent flanges.

Welded Connections—Welding procedures should be in accordance with the applicable codes and the base materials. For preheat, welding electrodes, and post-weld heat treatment, refer to the standard applicable codes and practices. Materials are specified on the diffuser specification sheet that is delivered together with the diffuser.

Maintenance

Servicing

The diffuser has no serviceable parts. However, during routine maintenance intervals it is important to inspect the diffuser for damaged or cracked welds (exclusive of the Whisper Disk diffuser). Your local Emerson Automation Solutions Instrument and Valve Services office can help determine the correct course of action if damage is present. The diffuser is normally welded or bolted in line and not removed unless it requires cleaning or replacement due to damage or wear.

In the event the diffuser is not performing as expected, a bore scope can be used to examine the flow passages for blockages without the need for disassembly and removal. If blockages are present, cleaning can be performed by removing the unit by either cutting of the welds or removal of bolting and using a pressurized water stream to clear any blockages. If blockages are still present after cleaning, the unit will need to be replaced.

Troubleshooting

Table 2 is intended as a basic first line troubleshooting guide. Contact your [Emerson sales office](#) or Local Business Partner for assistance if you are unable to resolve your field operation problem.

Table 2. Troubleshooting Guide

Problem	Possible Solution
Anticipated backpressure is not reached.	Review valve conditions and opening percentage
	Check for process flow changes and/or Inspect unit.
	Inspect flow passages in diffuser for blockage, clean if necessary
System noise and vibration have suddenly increased above previous levels.	Review operating history to check for process flow changes. Inspect unit.

Parts Ordering

There are no serviceable spare parts for this unit.

Note

Each diffuser is assigned a serial number that can be found on the unit. Refer to the serial number when contacting your [Emerson sales office](#) or Local Business Partner for technical assistance.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual provides installation, maintenance and parts ordering information for the NPS 2 through 12 Fisher WhisperTube modal attenuator.

1.2 Description

The WhisperTube is a passive reactive silencer designed for installation downstream of the control valve or other equipment contributing to system noise. Requiring negligible pressure drop across the device, the WhisperTube achieves system noise reduction across a wide range of fluid flow rates, pressures and temperatures.

Figure 1. Fisher 6060 WhisperTube

Table 1. Specifications

Valve Sizes and End Connection Style	Temperature Capability
NPS 2, 3, 4, 6, 8 and 12 with CL150, CL300 or CL600 raised-face flanges compatible with ASME B16.5	-46 to +371°C / -50 to +700°F
Maximum Inlet Pressure ⁽¹⁾	Weights and Threaded Lifting Provision Size
Consistent with CL150, CL300 or CL600 pressure-temperature ratings per ASME B16.34	See Table 3
Construction Materials	Design Standards

Section 2: Installation

WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage resulting from the sudden release of pressure, do not install the WhisperTube assembly where service conditions could exceed the limits given on the 6060 nameplate. Use pressure-relieving devices as required by accepted industry, local, state or federal codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

Use proper lifting and rigging practices while moving the WhisperTube. Failure to utilize safe lifting practices may result in equipment damage and/or personal injury.

Avoid personal injury or property damage caused by uncontrolled movement or dropping of the WhisperTube assembly.

The threaded lifting provisions are for installation of hoist rings or lifting eye bolts and are sized for lifting the 6060 only. Do not use lifting provisions to lift the WhisperTube if piping or other equipment is attached.

1. If the WhisperTube will be placed in storage prior to installation, protect the flanges and keep the inside of the body dry and clear of foreign material.
2. Install a three-valve bypass around the 6060 assembly if continuous operation will be necessary during inspection and maintenance.
3. Inspect the WhisperTube body for damage and be certain the body internal cavities are free of foreign material.
4. Be certain that adjacent pipelines are free of any foreign material, such as pipe scale or welding slag, that could damage the WhisperTube.
5. The standard flow direction is with the wave spring (key 4) facing upstream.
6. The WhisperTube may be installed in any orientation and achieve system noise reduction. The recommended orientation for a horizontal pipeline is with the pipe plug and drain port facing down to allow removal of any potential process liquid buildup.
7. Install suitable line flange gaskets and insert the 6060 assembly between the pipeline flanges.
8. Center the WhisperTube by making sure the mating flanges are aligned. Insert flange studs and tighten nuts in a star pattern to ensure the flange gaskets are compressed evenly.

Section 3: Maintenance

WARNING

Avoid personal injury or damage to property from sudden release of pressure or uncontrolled process fluid. Before starting disassembly:

- **Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.**
- **Use bypass valves or completely shut off the process to isolate the WhisperTube from process pressure.**
- **Remove process pressure and drain the WhisperTube if necessary.**
- **Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.**
- **Check with your process or safety engineer for any additional measures that must be taken to protect against process media.**

Disassembly

1. Isolate the WhisperTube from the process pressure, relieve all process pressure and drain any internal liquid buildup if necessary.
2. Remove the WhisperTube from the pipeline.

Follow steps 3 to 5 for a single piece body construction (NPS 2 to 6).

3. Remove the screen retainer (key 8) by loosening the two retainer screws (key 11).
4. Remove the wave spring (key 4) and perforated screen tube (key 2).
5. Inspect the perforated screen tube, wave spring and internal surfaces of the WhisperTube body (key 1) and replace damaged components as necessary. Visually inspect the flange serrated surfaces for any damage that may prevent proper sealing.

Follow steps 6 to 9 for the two-piece body construction (NPS 8 to 12).

6. Set the WhisperTube in a vertical position with one flange resting on a clean soft surface. Use caution to protect the flange serrated surfaces. Separate the two body halves by removing the body flange studs and nuts (keys 13 and 14).
7. Remove the spiral wound gasket (key 12) and perforated screen tube (key 3).
8. The wave spring (key 4) may be accessed and removed from the inlet flange end of the WhisperTube body.
9. Inspect the perforated screen tube, wave spring and internal surfaces of the WhisperTube body (key 1) and replace damaged components as necessary. Visually inspect the flange serrated surfaces for any damage that may prevent proper sealing.

Assembly

Follow steps 10 to 13 for a single piece body construction (NPS 2 to 6).

10. Ensure the old flat sheet gasket (key 9) is removed.
11. Re-insert the perforated screen tube into the body bore until the end of the tube seats against an internal ledge in the body at the outlet flange end.
12. Re-install the wave spring.
13. Center a new flat sheet gasket (key 9) on the screen retainer sealing surface and install on the body. Secure the retainer with washers (key 10) and retainer screws (key 11).

Follow steps 14 to 20 for the two-piece body construction (NPS 8 to 12).

14. Install the wave spring (key 4) in the groove at the flange end of the inlet body half.
15. Assembly is easiest if the parts are oriented vertically. Place the inlet body half flange end down on a clean soft surface. Use caution to protect the flange end serrated surfaces.
16. Install the perforated screen tube in the inlet body half until it contacts the wave spring.
17. Center the spiral wound gasket (key 12) on the inlet body flange serrated surface.
18. Lower the outlet body half over the screen. Ensure the drain pipe plugs and the threaded lifting lugs are aligned and located on the same side of the body in both the inlet and outlet halves.
19. Apply anti-seize lubricant compound to the face and threads of the hex nuts and to the threads of the studs. Install the nuts and studs. Use an appropriate torque device to apply the final torque specification (see Table 5). Tighten nuts in a star pattern to ensure the spiral wound gasket is compressed evenly.

Table 5. Body Flange Torque Specifications

Valve Size, NPS	Pressure Class	Stud Material	Stud Size, in.	Torque, ft-lbs
8	150, 300	B7M	1-1/8 to 8 x 6.75	525
	600		1-1/4 to 8 x 8.75	695
10	150, 300		1-1/4 to 8 x 7.50	695
	600		1-1/2 to 8 x 10.00	1220
12	150, 300		1-1/4 to 8 x 7.70	695
	600		1-5/8 to 8 x 10.75	1570

Section 4: Parts

4.1 Parts Ordering

Always mention the WhisperTube serial number when corresponding with your [Emerson sales office](#) regarding this equipment.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

4.2 Parts List

NOTE

Contact your [Emerson sales office](#) for Part Ordering information.

Table 6. Parts List

Key	Description	Key	Description
1	Body If a WhisperTube body is needed as a replacement part, order by size, pressure class, serial number and desired material.	10	Washer
2	Pipe plug	11	Socket head cap screw
3	Screen	12*	Spiral wound gasket
4	Wave spring	13	Stud

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual provides installation, maintenance and parts information for NPS 14 through 48 Fisher 8532 high-performance butterfly valves.

WARNING

Do not install, operate or maintain an 8532 valve without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

1.2 Description

The valve is available in either a wafer (flangeless), lugged (single-flange) or double flange body design, with a variety of seals and internal components. The pressure-assisted seal provides tight shutoff. The spline or keyed drive shaft combines with a variety of actuators. Maximum inlet pressure/temperature ratings are consistent with CL150 and CL300.

Figure 1. Fisher 8532 Valve with 1061 Actuator and FIELDVUE™ DVC6200 Digital Valve Controller

W9138-2

Table 1. Specifications

Valve Size and End Connection Styles	Flow Coefficients
■ NPS 14, ■ 16, ■ 18, ■ 20, ■ 24, ■ 30, ■ 36, ■ 42 or ■ 48 valves in wafer (flangeless), ■ lugged (single-flange) or ■ double-flange valve bodies with raised-face flanges, CL150 or CL300	See Fisher Catalog 12
Maximum Pressure Drop ⁽¹⁾	Flow Coefficient Ratio ⁽²⁾
Consistent with CL150 and CL300 pressure/temperature ratings per ASME B16.34 NPS 30 to 48: CL150/150 construction has CL150 rated pressure retaining parts and 150 psid rated trim	100 to 1
Shutoff Classification Per ANSI/FCI 70-2 and IEC 60534-4	Noise Levels
Standard Soft Seal: Bidirectional shutoff Class VI (bubble-tight) NOVEX Seal: Unidirectional shutoff Class IV (preferred flow direction only ⁽³⁾), Class VI optional (excluding NPS 42 and 48) Phoenix III Seal: Bidirectional shutoff Class VI (bubble-tight) Phoenix III Seal for Fire-Tested Applications: Unidirectional shutoff Class VI (reverse flow direction only) (bubble-tight). Fire Tested per API 607 Rev. 4. For more information contact your Emerson sales office . Cryogenic: For cryogenic seal applications, consult your Emerson sales office .	See Fisher Catalog 12 for sound/pressure level prediction
Available Seal Configurations	Valve Body Classification
Standard Constructions See Figure 2 and Table 2	Wafer and Lugged face-to-face dimensions are in compliance with MSS SP68 and API 609 standards through NPS 24. Double Flange valve bodies comply with API 609 short face-to-face dimensions. Valve bodies are designed for installation between ASME B16.5 CL150 and CL300 raised-face flanges
Standard Construction Materials	Disk Rotation
See Table 2	Clockwise to close (when viewing from the drive shaft end) through 90 degrees rotation
Flow Characteristic	Shaft Diameter and Approximate Weight
Modified equal percentage	See Tables 4 and 5
	ENVIRO-SEAL™ Packing
	This optional packing system provides improved sealing, guiding and transmission of loading force to control liquid and gas emissions. Contact your Emerson sales office for availability of ENVIRO-SEAL packing.
1. The pressure/temperature limits in this manual and any applicable code or standard limitation should not be exceeded. 2. Ratio of maximum flow coefficient to minimum usable flow coefficient may also be called rangeability. 3. For optimum seal performance, the preferred valve orientation at shutoff is with the retaining ring downstream from the high pressure side of the valve.

	Aramid with Neoprene	-254 to +538	-425 to +1000
1. NACE trim constructions are available; consult your Emerson sales office . 2. Special gasket retainer bolts are required for over 482°C / 900°F. 3. Special retaining ring screws for lugged valves over 538°C / 1000°F. 4. For a complete material description, contact your Emerson sales office . 5. UHMWPE stands for ultra high molecular weight polyethylene. 6. Special thrust bearings are required for high temp. applications over 343°C / 650°F (with 6- and 12-in. shaft extensions). Constructions with carbon steel valves and SST disks may require special thrust bearings at temperatures less than 343°C / 650°F. 7. Cast or wrought /plate grades used interchangeably, depending upon availability - unless requested by customer.			

Section 2: Installation

The valve is normally shipped as part of a control valve assembly, with the power actuator mounted on the valve. If the valve or actuator has been purchased separately or if the actuator has been removed for maintenance, mount the actuator on the valve and adjust actuator travel before installing the valve into the line. This is necessary due to the measurements that must be made during the actuator calibration adjustment process. Refer to the Actuator Mounting section of this manual and to the separate actuator instruction manual for mounting and adjusting instructions before proceeding.

WARNING

To avoid personal injury or property damage resulting from the sudden release of pressure:

- **Do not remove the actuator from the valve while the valve is still pressurized.**
- **Always wear protective gloves, clothing and eyewear when performing any maintenance operation.**
- **Do not install the valve assembly where service conditions could exceed the limits given in this manual or on the nameplates.**
- **Use pressure-relieving devices as required by government or accepted industry codes and good engineering practices to protect from over-pressurizing the system.**
- **Check with your process or safety engineer for any other hazards that may be present from exposure to process media.**
- **If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.**

WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop and controlled fluid conditions indicated when the valve was ordered. Because some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body and drain the process media from both sides of the valve. If using a power actuator, shut off all pressure lines to the power actuator, release pressure from the actuator and disconnect the pressure lines from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you are working on the equipment. See the WARNING at the beginning of the Maintenance section for more information before removing the valve from the pipeline.

2. Install a three-valve bypass around the control valve assembly if continuous operation is necessary during inspection and maintenance of the valve.
3. Inspect the valve to be certain that it is free of foreign material.
4. Be certain that adjacent pipelines are free of any foreign material, such as pipe scale or welding slag, that could damage the valve sealing surfaces.

NOTICE

Damage to the disk will occur if any pipe flanges or piping connected to the valve interfere with the disk rotation path. Minimum inside diameters for flanges or pipe mating with valves are shown in Tables 4 and 5.

2.1 Valve Orientation

The valve can be installed in any orientation, however it is recommended that the valve drive shaft be horizontal and the actuator vertical as shown in Figure 4.

Install the valve with the high-pressure shutoff side in the direction noted by the flow arrow for proper installation and see Figure 4 for more information.

2.2 Before Installing the Valve

WARNING

The edges of a rotating valve disk (key 2, Figure 10 or 11) close with a shearing, cutting motion. To avoid personal injury, keep hands, tools and other objects away from the disk while stroking the valve.

If the 8532 valve is equipped with a fail-open actuator, cycle the valve into the fully closed position. Ensure the valve cannot open during installation by using travel stops, a manual actuator, a constant supply pressure to the pneumatic actuator or other steps as necessary.

42	5.25	11.63	---	36.07	4989	6009	---
1. Face-to-face dimensions are in compliance with MSS SP68 and API 609 specifications. 2. Minimum I.D. is the minimum pipe or flange I.D. required for disk swing clearance. Applies to wafer and lugged valve bodies only.							

NOTICE

When using an actuator, the actuator travel stop (or actuator travel, for actuators without adjustable stops) must be adjusted so the disk stop in the valve does not absorb the output of the actuator. Failure to limit the actuator travel as described in the Adjusting the Actuator Travel Stops or Travel steps can result in damage to the valve, shaft(s) or other valve components.

An 8532 valve is normally shipped as part of an assembly with an actuator and other accessories such as a valve positioner. If the valve and actuator have been purchased separately or if the actuator has been removed for maintenance, properly mount the actuator and adjust valve/actuator travel and all travel stops before inserting the valve into the line.

NOTICE

Damage to the disk will occur if any pipe flanges or piping connected to the valve interfere with the disk rotation path. Be certain to align the valve accurately to avoid contact between the disk (key 2) and the flanges.

Figure 2. Available Seal Configurations

B2313-3

2.3 Adjusting the Actuator Travel Stops or Travel

Key number locations are shown in Figures 10 and 11, unless otherwise noted.

1. Refer to the actuator instruction manual to locate the actuator travel stop that controls the closed position of the valve disk (key 2). When adjusting the travel stop or travel, make sure that the disk is from 0 to 0.76 mm / 0 to 0.030 in. away from the internal stop in the valve body (see Figure 5). This adjustment is necessary to be certain that the actuator output torque is fully absorbed by the actuator travel stop or by the actuator. The internal travel stop in the valve body should not absorb any of the actuator torque.
2. Before installing the valve/actuator assembly in the process line, cycle the valve several times to be sure the valve disk returns to the proper position.

2.4 Installing the Valve

The maximum allowable inlet pressures for 8532 valves are consistent with the applicable ASME pressure/temperature ratings except where limited by the material capabilities as shown in Table 2 or Figure 2.

Refer to Table 6 for the quantity and size of line bolting required to install the valve in the pipeline.

NOTICE

To avoid damage to the valve disk during installation, the valve must be in the fully closed position. If the 8532 valve is equipped with a fail-open actuator, remove the actuator before installing the valve/actuator assembly or cycle the valve into the fully closed position. Then, take appropriate steps to be sure that the actuator does not cause the valve to open during installation.

1. Threaded engagement in accordance with ASME B31.3 "Chemical Plant and Petroleum Refinery Piping".
 2. Bolting lengths are base on installation of valve between standard raised face flanges utilizing flange gaskets with a final compression thickness of 0.125 in. When gaskets used have a final compression thickness less than 0.125 in., reduce bolting lengths shown by 0.25 in.

Figure 4. Installation of Wafer-Style Valves

A5557

1. See Figure 4 for recommended valve orientation.
 - For Wafer-Style Valves: Install the lower flange bolts first to form a cradle for the valve (see Figure 5). See Table 6 for flange bolt specifications.
 - For Lugged Valves: Position the valve between the flanges. Be sure to leave enough room for the flange gaskets. Install the lower flange bolts.
2. For all Valves: Select the appropriate gaskets for the application. Flat sheet, spiral wound or other gasket types, made to the ASME B16.5 standard or user's standard, can be used on 8532 valves depending on the service conditions of the application.
3. For Wafer-Style Valves: Properly orient the valve according to the specific application. Place the valve in the line so the flow properly enters the valve as indicated by the flow tag. Then, install the valve and the gaskets between the flanges into the cradle formed by the flange bolts.
4. Install the remaining flange bolts.
 - For Wafer-Style Valves: Make sure the gaskets are centered on the gasket sealing surfaces of the flange and body.
5. For all Valves: Tighten the flange bolts in an alternating criss-cross fashion to a torque value of one-fourth of the final bolting torque. Repeat this procedure several times, increasing the torque value each time by a fourth of the final desired torque. After applying the final torque value, tighten each flange bolt again to allow for gasket compression.

Packing Adjustment and Shaft Bonding

WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any other hazards that may be present from exposure to process media.

Figure 5. Proper Installation Steps

W6199-1

NOTICE

For non-ENVIRO-SEAL packing: Tighten the packing follower nuts only enough to prevent shaft leakage. Excessive tightening will accelerate wear of the packing and could produce higher friction loads on the valve stem.

1. For PTFE or graphite packing: Tighten standard packing follower nuts only enough to prevent shaft leakage. Excessive tightening of packing will accelerate wear and could produce higher rotating friction loads on the valve stem. If necessary, refer to the Packing Maintenance section.
2. The ENVIRO-SEAL Packing Systems will not require this initial re-adjustment. Refer to the separate instruction manual Fisher ENVIRO-SEAL Packing System for Rotary Valves (D101643X012) for repair and adjustment procedures.

3. For hazardous atmosphere or oxygen service valves, read the following warning and provide the bonding strap assembly mentioned below if the valve is used in an explosive atmosphere.

⚠ WARNING

The valve shaft is not necessarily grounded when installed in a pipeline unless the shaft is electrically bonded to the valve.

To avoid personal injury or property damage resulting from the effects of a static electricity discharge from valve components in a hazardous atmosphere or where the process fluid is combustible, electrically bond the drive shaft (key 3) to the valve according to the following step.

Figure 6. Optional Shaft-to-Valve Body Bonding Strap Assembly

**NOTE**

Standard PTFE packing is composed of a partially conductive carbon-filled PTFE female adaptor with PTFE V-ring packing. Standard graphite packing is composed of all conductive graphite ribbon packing. Alternate shaft-to-valve body bonding is available for hazardous service areas where the standard packing is not sufficient to bond the shaft to the valve (see the following step).

For oxygen service applications, provide alternate shaft-to-valve body bonding according to the following step.

4. Attach the bonding strap assembly (key 131, Figure 6) to the shaft with the clamp (key 130, Figure 6).
5. Connect the other end of the bonding strap assembly to the valve flange cap screws.
6. For more information, refer to the Packing Maintenance section.

Section 3: Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

Key numbers in this procedure are shown in Figures 10 and 11 unless otherwise indicated.

WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- **Do not remove the actuator from the valve while the valve is still pressurized.**
- **Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.**
- **Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.**
- **Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.**
- **Vent the power actuator loading pressure.**
- **Use lockout procedures to be sure that the above measures stay in effect while you work on the equipment.**
- **The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings or when loosening the packing box pipe plug.**
- **Check with your process or safety engineer for any other hazards that may be present from exposure to process media.**

3.1 Removing and Replacing the Actuator

Refer to the appropriate actuator instruction manual for actuator removal and replacement procedures. The actuator stops or travel stops must limit the rotation of the valve shaft. See the caution below.

NOTICE

When using an actuator, the actuator travel stop (or actuator travel, for actuators without adjustable stops) must be adjusted so the disk stop in the valve does not absorb the output of the actuator. Failure to limit the actuator travel can result in damage to the valve, shaft(s) or other valve components.

3.2 Packing Maintenance

The 8532 control valve is designed so the packing can be replaced without removing the valve from the process pipeline.

NOTICE

For non-ENVIRO-SEAL packing: Tighten the packing follower nuts only enough to prevent shaft leakage. Excessive tightening will accelerate wear of the packing and could produce higher friction loads on the valve stem.

Usually, packing leakage can be eliminated by merely tightening the hex nuts (key 15) located above the packing follower (key 11) while the valve is in the pipeline. However, if leakage continues, the packing must be replaced.

For PTFE ENVIRO-SEAL packing systems, refer to the separate instruction manual, Fisher ENVIRO-SEAL Packing System for Rotary Valves (D101643X012) (see Figure 12).

WARNING

Never use a wrench or pliers on the splined (upper) shaft (key 3). A damaged shaft could cut the packing and allow leakage.

1. Before loosening any parts on the valve, release the pressure from the pipeline. Then, remove the hex nuts (key 15) and lift off the packing follower (key 11).

2. Remove the hex jam nuts (key 17) and the anti-blowout flange (key 10). Remove the packing follower (key 12). Refer to Figure 8 for details of the anti-blowout design parts. The packing is now accessible.
3. Use a packing extractor to remove packing. Insert the corkscrew-like end of the tool into the first piece of packing and pull firmly to remove the packing. Repeat this process until all packing parts have been removed.

Figure 7. Blowout Protection NPS 14 through 24

A7090

Figure 8. Blowout Protection NPS 30 through 48

E1771

⚠ WARNING

Be careful when cleaning the packing box. Scratches to the upper shaft (key 3) or inside diameter of the packing bore might cause leakage.

4. Before installing new packing, clean the packing box.
5. Install new packing one ring at a time, using the packing follower as a driver. If using split-ring packing, stagger the splits in the rings to avoid creating a leak path.
6. Reinstall packing parts. Refer to Figures 10 and 11 for sequence of packing parts.

3.3 Removing the Valve

1. Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open the valve. Vent the power actuator loading pressure.
2. Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from either side of the valve.

NOTICE

Damage to the valve disk can occur if the disk is not closed when the valve is being removed from the pipeline. If necessary, stroke the actuator to place the disk in the closed position while removing the valve from the pipeline.

3. Loosen the flange bolting that holds the valve. Make sure the valve cannot slip or twist while loosening and removing the bolting.
4. Before removing the valve from the pipeline, make sure the valve disk is closed. Removing the valve with the disk open could cause damage to the disk, piping or pipe flanges.
5. After removing the valve from the pipeline, move the valve to an appropriate work area. Always support the valve properly.
6. When valve maintenance is complete, refer to the Installation procedures in this manual.

3.4 Seal Maintenance

NOTE

For larger valves, it is possible to replace the seal (key 5) while the actuator is mounted to the valve and can be accomplished by cycling the valve to 90 degrees open.

Key numbers in this procedure are shown in Figures 10 and 11 unless otherwise indicated.

1. After removing the valve from the pipeline, remove the manual or power actuator. Manually rotate the upper shaft (key 3) counterclockwise until the disk has moved a full 180 degrees away from the closed position.

WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping of a large valve. Support large valves during maintenance.

2. Lay the valve flat on a work bench in a secure position with the retaining ring (key 18) and retaining ring screws (key 19) facing up. Properly secure the valve on a suitable worktable so it cannot slip, twist or fall during maintenance. Remove all retaining ring screws.
3. Remove the retaining ring by placing a socket head cap screw from the retaining ring in each of the two retaining ring jacking screw holes. Slowly turn the screws until the retaining ring has been lifted from the valve body. Remove the retaining ring to expose the seal in the T-slot area of the valve body.

NOTE

The 8532 valve is available with different seal designs and components. See Figure 2 to identify the specific seal design.

NOTICE

In the following procedure, take care not to damage the seal or T-slot area of the valve body during removal of the seal.

4. Insert a regular screwdriver or other similar tool under the top edge of the seal and gently pry the seal out of the T-slot area in the valve body. Take care not to damage the seal or T-slot area of the valve body. After the seal has been removed, clean the T-slot area, retaining ring and, if required, polish the disk (key 2) thoroughly with fine steel wool or other appropriate material.

To install a new seal, O-ring (key 6) and retaining ring gasket, follow the appropriate instructions given below.

Table 7. Torque Values for Fasteners

FASTENER NOMINAL SIZE	RETAINING RING SCREWS		GASKET RETAINING BOLTS ⁽¹⁾	
	N•m	in•lbs	N•m	in•lbs
#10	4.6	41	4.0	35
1/4	11	100	9.2	81
5/16	25	220	19	167
3/8	45	400	33	295
Fastener Nominal Size	N•m	ft•lbs	N•m	ft•lbs
7/16	72	53	53	39
1/2	112	83	80	59
9/16	161	119	117	86
5/8	225	166	161	119
3/4	401	296	286	210
7/8	651	480	447	330
1	976	720	651	480
1-1/8	1356	1000	837	617
1. Torque values provided for gasket retaining bolting require lubrication of threads with a dry film lubricant. Use of other lubricants may change torque recommendation. Note: These values are based upon standard materials, S66286/N07718 screws and ASTM A193GRB6 bolts. For other special fastener materials, please contact your Emerson sales office .				

PTFE Seals

1. Locate the replacement seal ring (key 5) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter. Around the outside circumference is one wide groove.
Before installing the seal ring into the valve body, place the O-ring (key 6) into the wide, outer groove of the seal ring. Refer to Figure 9.
2. Install the seal ring and O-ring assembly in the valve body. The wider outside diameter of the seal ring goes into the T-slot area of the body (see Figure 5). Start the edge with the wider diameter into the T-slot of the valve body using a blunt-end screwdriver.
3. Carefully tuck the O-ring downward into the body T-slot until the seal ring is completely entrapped in the body T-slot and it completely covers the backup O-ring.
4. Re-install the retaining ring and the socket head cap screws. Tighten the cap screws just enough to eliminate any movement of the retaining ring. Do not over-tighten the retaining ring screws. Using a blunt-end tool, carefully tuck the lip of the seal ring under the retaining ring.

Figure 9. Typical Seal Installation

A5251-1

5. When the seal is under the lip of the retaining ring, continue to tighten the cap screws according to standard procedures. Do not fully torque the screws at this time. Final tightening of the screws is accomplished in step 7 of this procedure.
6. Manually rotate the upper shaft clockwise 180 degrees to return the disk (key 2) to its closed position.
7. The final seating of the retaining ring cap screws can now be done. For the screw torque values, refer to Table 7. The seal is now fully installed. Refer to the Installation procedures in this manual.

NOVEX, Phoenix III and/or Phoenix III Fire-Tested Seals

1. Locate the replacement seal ring (key 5) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter as shown in Figure 9. Around the outside circumference is one wide groove.

Install the seal ring (key 5) in the valve body by first placing the wider outside diameter of the seal ring into the T-slot area of the valve body which is shown in Figure 2.

The backup O-ring (key 6) for the Phoenix III seal will have to be installed after placement of the seal ring in the valve body using a blunt-end screwdriver. Do not use the screwdriver directly on the metal seat. Use tools on the O-ring only.

2. With the seal ring inserted all the way around the body T-slot now lay the O-ring into the opening between the valve body and the seal ring. Use the screwdriver to apply pressure to the O-ring and carefully tuck the O-ring down into the T-slot between the valve body and the seal ring.

NOTE

On larger valves, it may be more efficient to have someone hold down the seal ring while you push the O-ring into the T-slot.

3. Once the seal ring and backup O-ring have been fully installed into the body T-slot, the retaining ring gasket can be installed. This gasket is a thin graphite material. Punch one initial screw hole through the gasket for alignment, being careful not to cause additional damage to the gasket.
4. Install the retaining ring and align the screw holes in the retaining ring with the holes in the valve body. Install the first retaining ring screw through the punched hole in the ring gasket. Install the other ring screws by pushing the screws through the graphite gasket and threading them into the valve body.
5. Tighten the retaining ring socket head cap screws just enough to eliminate any movement of the retaining ring. Do not over-tighten the retaining ring screws.

**WARNING**

Avoid personal injury or property damage caused by the impact of a falling or tipping of a large valve. Support large valves during maintenance.

6. To complete this step, stand the valve up. Support the valve securely using methods appropriate for the valve size. If a vise or other clamps are being used, be sure to not damage the flange gasket sealing area of the valve body.
7. Manually rotate the upper shaft (key 3) to turn the disk clockwise to meet the seal.
8. Tap the disk with a rubber mallet to drive it against the internal travel stop. When the disk makes contact with the stop, manually rotate the disk counterclockwise back out of the seal to a 90-degree open position. Repeat steps 7 and 8 three times.

NOTE

When attaching the actuator to the valve, make sure the valve disk is not in contact with the valve internal travel stop (see Figure 9). The valve disk should be positioned from 0 to 0.76 mm / 0 to 0.030 in. away from the internal stop in the valve body (see Figure 9).

9. Use an appropriate tool (such as a feeler gauge) to position the disk (key 2) from 0 to 0.76 mm / 0 to 0.030 in. away from the internal stop in the valve body.
This adjustment is necessary to be certain that the actuator output torque is fully absorbed by the actuator travel stop or by the actuator. The internal travel stop in the valve body should not absorb any of the actuator torque.
10. The final seating of the retaining ring screws can now be done. For the screw torque values, refer to Table 7.

3.5 Anti-Blowout Design, Packing, Valve Shaft, Disk and Bearing Maintenance

NOTE

The 8532 valve has a two-piece shaft. In these procedures, the shaft (with the splined end) is called the upper shaft (key 3). The shaft opposite the upper shaft is called the lower (follower) shaft (key 4).

NOTICE

When using an actuator, the actuator travel stop (or actuator travel adjustment, for actuators without adjustable stops) must be adjusted so the disk stop in the valve does not absorb the output of the actuator. Failure to limit the actuator travel as described in the next step can result in damage to the valve, shaft(s) or other valve components.

NOTICE

When removing the actuator from the valve, do not use a hammer or similar tool to drive the lever off the valve shaft. Driving the lever or actuator off the valve shaft could damage the valve internal parts.

If necessary, use a wheel puller to remove the lever or actuator from the valve shaft. It is okay to tap the wheel puller screw lightly to loosen the lever or actuator, but hitting the screw with excessive force could also damage internal valve parts.

Key numbers in this procedure are shown in Figures 10 and 11 unless otherwise indicated.

1. Remove the valve from the pipeline. Remove the actuator from the valve.

WARNING

Never use a wrench, pliers or similar tool to turn the upper shaft. A damaged shaft can cut the packing and allow leakage.

NOTE

It is not necessary to remove the retaining ring and valve seal when removing the shaft(s) and disk.

⚠ WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping of a large valve. Support large valves during maintenance.

2. Properly secure the valve on a suitable worktable so it cannot slip, twist or fall during maintenance.
3. Removing the Anti-Blowout Design:
 - a. For PTFE or Graphite Packing: Remove the hex nuts (key 15) and pull off the packing follower (key 11). Remove the hex jam nuts (key 17) and the anti-blowout flange (key 10). Remove the anti-blowout gland (key 12). See Figure 8.
 - b. For ENVIRO-SEAL Packing System: Remove the hex nuts (key 101), the packing follower (key 102), jam nuts (key 17), anti-blowout flange (key 10) and the spring pack assembly (key 103). See Figure 12.
4. Remove the packing from around the upper shaft.
5. Remove the tangential pins or disk pins. Locate the pins (key 9) in the upper shaft (key 3) and the pin in the lower shaft (key 4), if the valve has a two-piece shaft.
 - a. If a maintenance kit is available, use the pin extractor to remove the disk pins. Select the correct size pin extractor tip with screws of proper thread size to match the thread size in the disk pins. If you do not have a kit, see steps c and d below.
 - b. Screw the pin extractor tip into the pin as far as possible. With an upward, straight sliding motion, pull out the pin. Repeat the same procedure for the other pins.
 - c. You can use a threaded rod with an appropriate spacer (tube) and nut as an extractor tool. If you use a threaded rod, choose a rod with threads that fit the inside thread of the pins. The rod should extend several inches above the disk when it is screwed into a pin.
 - d. After screwing the rod into the pin, slide the spacer over the rod and pin. Thread a nut onto the rod and tighten it. As you tighten the nut, the nut will drive the spacer against the disk. The increasing force will draw the pin from the disk.
6. The gasket retainer (key 20) on the side of the valve opposite the upper shaft must be removed before removing the lower shaft.

Remove the hex head bolts (key 23) and lockwashers (key 22) from the gasket retainer and remove the gasket retainer and gasket (key 21) to expose the end of the lower shaft.
7. Before removing the lower shaft (key 4), be sure the valve disk is properly supported. Pull the lower shaft from the valve body. Use a shaft extractor screwed into the puller hole in the end of the lower shaft.
8. Before removing the upper shaft (key 3), be sure the valve disk is properly supported. Pull out the upper shaft (key 3) by hand-pulling or by using a shaft extractor screwed into the end of the shaft.

NOTICE

To avoid damage to the disk, seal and T-slot area, do not force the disk past the seal or T-slot area. Remove the disk from the opposite side of the valve body.

NOTE

Both the upper shaft and the lower shaft have a thrust bearing (key 24) between the disk and the bearings (key 7). The thrust bearing is located outside of the bearing bore which holds the bearings. Use care when removing the valve disk to avoid loss of or damage to the thrust bearings.

9. After removing the shaft(s), remove the disk. Do not force the disk past the seal or T-slot area. Collect the thrust bearings.
10. Remove the bearings (key 7). Using a suitable punch or puller, drive or pull the bearings into the valve body bore from the upper shaft bearing bore. Remove the bearing from the lower shaft bearing bore.
11. Inspect the valve body bore, bearings, bearing bores and packing box for damage.

NOTE

In these instructions, the drive shaft (with splined end) is called the upper shaft (key 3). The shaft opposite the upper shaft is called the lower (follower) shaft (key 4).

Installing the Two-Piece Shaft

Key numbers in this procedure are shown in Figures 10 and 11 unless otherwise indicated.

⚠ WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping of a large valve. Support large valves during maintenance.

1. Properly secure the valve on a suitable worktable so it cannot slip, twist or fall during maintenance. Be prepared to support the valve disk.

NOTE

Replacement disk and shafts are provided as a matched set and both should be replaced at the same time.

2. Inspect all parts removed from the valve for wear or damage. Replace any worn or damaged parts. Clean the valve body and all parts to be installed with an appropriate solvent or degreaser.

NOTE

When installing the bearings, apply lubricant to the outside diameter of the bearing for ease of installation.

NOTICE

Premature valve failure and loss of process control may result if bearings are improperly installed or are damaged during installation.

3. When installing the lower bearings (key 4), insert one or more bearings into the lower shaft bearing bore so it is flush with the body bore.
The number of bearings required changes with valve size and construction. Two bearings are required in the upper shaft and two bearings in the lower shaft. If using an NPS 14 CL150 valve with metal bearings, four bearings in the upper and four in the lower shaft will be required.
4. Hold the lower shaft thrust bearing (key 24) in the valve body bore against the counterbore of the lower shaft bearing bore. Push the lower shaft into the bearing bore just enough to hold the thrust bearing.
5. When installing the upper bearing (key 7), insert one or more bearings into the upper shaft from the body bore into the bearing bore below the packing box. Use caution to prevent damage to the bearing.
6. Hold the upper shaft thrust bearing (key 24) in the valve body bore against the counterbore of the upper shaft bearing bore. Push the upper shaft through the packing box side into the bearing bore just enough to hold the thrust bearing.
7. When installing the lower bearing (key 4), insert one or more bearings into the lower shaft bearing bore so it is flush with the body bore.
8. Insert the lower shaft through the bore in the valve body uncovered by removal of the gasket retainer. Hold the lower shaft thrust bearing (key 24) in the valve body bore against the counterbore of the lower shaft bearing bore. Push the lower shaft into the bearing bore just enough to hold the thrust bearing.

NOTICE

To avoid damage to the disk, seal and T-slot area, do not force the disk past the seal or T-slot area. Install the disk from the opposite side of the valve body.

9. Place the flat side of the disk on a flat surface and insert wooden blocks to raise the disk approximately 51 mm / 2 in. from the worktable surface. Then, suspend the valve body over the disk so the seal/T-slot area is facing up. Align the shaft bores through the disk with the upper shaft and lower shaft bores. Lower the valve body over the disk using caution not to dislodge or damage the thrust bearings placed on the ends of the shafts.
10. With the disk (key 2) properly positioned in the valve body (key 1), push the upper shaft and lower shaft the rest of the way through the thrust bearings and into the shaft bores in the valve disk.
11. Align the holes in the shafts with the holes in the disk.

NOTICE

To avoid damage to the tangential pins, disk pins, valve disk or shaft(s) resulting from the application of excessive force, use appropriate care when driving the pins into the disk hub and shaft(s). Use the right tool. Do not use excessive force.

12. Install the appropriate tangential pins and disk pins. Use 2 tangential pins that will go through the upper shaft and 1 disk pin that will go through the lower shaft.
13. Refer to the Anti-Blowout Design, Packing, Valve Shaft, Disk and Bearing Maintenance procedures in this manual to re-install the packing and anti-blowout design.

3.6 Gasket Retainer

Valves with a two-piece shaft use a gasket retainer and gasket (keys 20 and 21) to cover the lower shaft opening in the valve body. The gasket is held in place by the gasket retainer and four hex head bolts and lockwashers (keys 23 and 22). When re-assembling the valve, use a new gasket.

Be sure to center the gasket over the lower shaft bore before retightening bolts. Tighten down bolts evenly in a crossover or star pattern. Refer to Table 7 for proper torque values.

Section 4: Parts

4.1 Parts Ordering

Typical parts are shown in Figures 10 and 11.

When corresponding with your [Emerson sales office](#) about an 8532 valve, identify the valve as a Fisher 8532 and provide the valve serial number. For valve/actuator combinations assembled at the factory, the valve serial number may be stamped on the nameplate attached to the actuator.

**WARNING**

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

Retrofit Kits

Retrofit kits include all parts required for installation of the ENVIRO-SEAL packing system into existing high-performance butterfly valves. Retrofit kits are available for single PTFE packing.

See Table 9 for retrofit kit part numbers.

Table 8. Retrofit Kits

RETROFIT KIT INCLUDED PARTS		
Key	Description	Quantity
10	Anti-blowout follower	1
17	Jam nut	1
100	Packing stud	2
101	Packing nut	2
102	Packing flange	1
103	Spring pack assembly	1
105	Packing set	1
106	Anti-extrusion washer	2 ⁽¹⁾
107	Packing box ring	2 ⁽²⁾
111	Tag	1
112	Cable	1
1. Not included in graphite packing kit.		
2. Only 1 req'd for NPS 18 CL300, NPS 20 CL150 and NPS 24 CL150.		

NOTE

Key 103, the spring pack assembly, is made up of the packing spring stack held in place by an O-ring on the packing follower.

Repair Kits

PTFE Repair kits include a single PTFE packing set and anti-extrusion washers. Graphite packing sets include graphite packing rings and carbon anti-extrusion rings. See Table 9 for PTFE repair kit part numbers.

Table 9. Retrofit and Repair Kit Part Numbers

VALVE SIZE, NPS	PRESSURE RATING	SHAFT DIAMETER ^(1, 2) , mm / in.	RETROFIT KITS	REPAIR KITS
			PTFE	PTFE
14	CL150	34.9 / 1-3/8	RRTYXRT0592	RRTYX000172

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for the Fisher 8540 valve, NPS 3 through NPS 12 or DN80 through DN300 (see figure 1). Refer to separate instruction manuals for information covering the actuator and accessories.

Do not install, operate, or maintain 8540 valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The seal design of the 8540 eccentric disk high performance butterfly valve provides excellent shutoff capability. This valve has a square drive shaft end and soft seal rings for use in a wide variety of applications.

		CL300	PN25-40	44.5	1-3/4	64	141

Installation

The valve is normally shipped as part of a control valve assembly, with the power actuator mounted on the valve. If the valve or actuator have been purchased separately, or if the actuator has been removed for maintenance, mount the actuator on the valve, and adjust actuator travel before inserting the valve body into the line. This is necessary due to the measurements that must be made during the actuator calibration adjustment process. Refer to the Actuator Mounting section of this manual to mount the actuator on the valve. Refer to the actuator instruction manual for mounting and adjusting instructions before proceeding.

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage resulting from the sudden release of pressure, do not install the valve assembly where service conditions could exceed the limits given in this manual, the limits on the appropriate nameplates, or the matching pipe flange rating. Use pressure-relieving devices as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. To avoid possible personal injury and because some valve/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

Table 3. Construction Material Temperature Limits⁽¹⁾

COMPONENTS AND MATERIALS OF CONSTRUCTION	TEMPERATURE LIMITS	
	°C	°F
Valve Body Material		
Carbon Steel	-29 to 427	-20 to 800
CF8M	-198 to 538	-325 to 1000
CF8M/1.4408	-196 to 580	-321 to 1076
WCC/1.0619	-10 to 480	-14 to 896

Bearing Material		
PEEK / PTFE lined	-46 to 232	-50 to 450
Packing Material		
PTFE V-Rings	-46 to 232	-50 to 450
Seal Ring		
PTFE (standard) Soft Seal Ring	-46 to 232	-50 to 450
1. Refer to Ordering Matrix for 8540 Valves. For selection temperatures not shown above, contact your Emerson sales office .		

1. Install a three-valve bypass around the control valve assembly if continuous operation is necessary during inspection and maintenance of the valve.
2. Inspect the valve to be certain that it is free of foreign material.

CAUTION

Be certain that adjacent pipelines are free of any foreign material, such as pipe scale or welding slag, that could damage the valve sealing surfaces.

Table 4. Maximum Allowable Pressure Drops at Temperature

TEMPERATURE		PRESSURE DROP	
°C	°F	bar	psi
-46	-50	52	750
-32	-25		
-18	0		
38	100		
66	150		
93	200	43	620
121	250	35	510
149	300	27	390
204	400	11	160
232	450	3	50

Valve Orientation

When installing the valve, it is recommended that the valve drive shaft be horizontal as shown in figure 1.

Valve Direction

The high performance butterfly valve is designed to allow flow in either direction when in the open position. When in the closed position, high pressure should be applied to a specific side of the disk to provide best performance and optimal valve life (see seal types below). See figure 2.

The PTFE soft seal is bi-directional under normal operating conditions can (at different times) experience pressure in both directions; the highest of the two pressures should be exerted on the preferred side of the disk. If the two pressures are equal, then the one lasting the longest period of time should be applied to the preferred side.

1. For PTFE seal ring: This seal is bidirectional. For optimal performance, high pressure should be applied to the front (retaining ring side) of the disk.

Figure 4. Stud Bolts for Installation (also see table 5)

Installing the Valve in the Pipeline

⚠ WARNING

The edges of a rotating disk have a shearing effect that may result in personal injury. To help prevent such injury, stay clear of the disk edges when rotating the disk (key 3, figure 12).

CAUTION

Damage to the disk will occur if any pipe flanges or piping connected to the valve interfere with the disk rotation path. If the piping flange has a smaller inner diameter than what is specified for schedule 80 piping, measure carefully to be certain the disk rotates without interference before putting the valve into operation.

CAUTION

Damage to the disk (key 3) sealing surfaces may occur if the disk is not closed when the valve is being installed or removed from the pipeline. If necessary, use a temporary pressure source on the actuator to retain the disk in the closed position while installing or removing the valve from the pipeline.

1. For Fail-Open Actuators: It will be necessary to provide a temporary loading pressure to the actuator diaphragm to move the valve disk to the closed position. Observe the above **Warning** when closing the valve. If a loading pressure is required, use caution when working with the valve. If the loading pressure is disconnected, the disk will open rapidly.
2. With the disk in the closed position, install line flange gaskets, and install the valve between the pipeline flanges.

Note

The wafer style valves use the standard size spiral wound gaskets.

Select the appropriate gaskets for the application. Gasket types made to ASME 16.5 group or a user's standards can be used for 8540 valves depending on the service conditions and applications.

3. Install the flange studs:

Note

Lubricate line flange studs or bolts before inserting them into flanges. If necessary, provide additional support for the control valve assembly because of its combined weight.

- **Flange studs:** Install two or more line flange studs into the line flanges to help hold the valve in position while centering the valve. Carefully center the valve on the flanges to ensure disk clearance.
 - Select and install two pipe line gaskets.
4. Install the remaining line flange bolting to secure the valve in the pipeline. Tighten the nuts to the line flange studs in a crisscross pattern to ensure proper alignment of valve, gaskets, and flanges.

Packing Adjustment and Shaft Bonding

WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

CAUTION

Use caution when tightening packing follower nuts because over-tightening the nuts will accelerate wear and could produce higher rotating friction loads on the valve stem.

- **PTFE packing:** tighten standard packing follower nuts only enough to prevent shaft leakage. Excessive tightening of packing will accelerate wear and could produce higher rotating friction loads on the valve stem. If necessary, refer to the Packing Maintenance section.

⚠ WARNING

The valve drive shaft is not necessarily grounded to the pipeline when installed. Personal injury or property damage could result from an explosion caused by a discharge of static electricity from the valve components if the process fluid or the atmosphere around the valve is flammable. To avoid personal injury or property damage, make sure the valve is grounded to the pipeline before placing the valve assembly into service.

Standard PTFE packing is composed of a partially conductive carbon-filled PTFE female adaptor with PTFE V-ring packing. Alternate shaft-to-valve body bonding is available for hazardous service areas where the standard packing is not sufficient to bond the shaft to the valve (see the following step).

1. Attach the bonding strap assembly (key 131, figure 5) to the shaft with the clamp (key 130, figure 5), and connect the other end of the bonding strap assembly to the valve with the cap screw (key 14, figure 5).
2. For more information, refer to the Packing Maintenance subsection below.

Figure 5. Optional Shaft-to-Valve Body Bonding Strap Assembly

GH14001

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions. Instructions are given in this section for replacing packing, seal ring, disk, shaft, bearings, and other valve parts. Also, instructions are provided for changing valve action, mounting, and adjusting the actuator. Refer to the actuator instruction manual for additional information for mounting and adjusting the actuator.

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
- It is possible to damage the valve if the actuator travel stops are not properly adjusted before stroking the valve.

CAUTION

During any of the following steps, do not rotate the disk past 90 degrees in the open direction. Rotating the disk past 90 degrees can damage the seal ring.

Packing Maintenance

PTFE-filled packing has a partially conductive packing ring (such as a carbon-filled PTFE female adaptor) to electrically bond the shaft to the valve body.

When replacing the packing, it is recommended to remove the control valve assembly from the pipeline because valve/actuator adjustments must be made with the valve out of the pipeline.

Disassembly

Key numbers and part locations are shown in figure 12 unless otherwise noted.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shutoff all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure the above measures stay in effect while you work on the equipment.
2. Note the position of the mark on the end of the valve shaft, and its relationship to the actuator shaft.
3. Remove the actuator per instructions in separate actuator instruction manuals, then remove the cap screws (key 14, figure 5). Remove the clamp if the strap is used.
4. Remove the packing nuts (key 101) and packing follower (key 114). For NPS12 CL300 and DN300 PN25 and PN40, remove the packing flange and follower (key 102 and 114).
5. Remove the old packing rings, using a formed hook.

CAUTION

Carefully use the hook. Avoid damaging the drive shaft or packing box wall. Scratches on valve surfaces can cause leakage. (Note: The packing box ring (key 107) can remain in place when replacing packing only.)

6. Clean all accessible metal parts and surfaces to remove particles that would prevent the packing from sealing.

Assembly

Inspect the shaft: If it is damaged, it cannot make a good seal with the packing, and it must be replaced. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches around the packing box wall. Inspect the packing box wall for nicks and scratches when performing the following procedures.

Figure 6. Typical Packing Arrangement

C0785*A

1. Install the new packing parts (see figure 6). Install the packing follower and finger tighten the packing flange nuts onto the studs only enough to stop leakage.
2. If the valve was equipped with a bonding strap assembly (figure 5), re-install the assembly.
3. Refer to the Actuator Mounting section of this manual. If necessary, refer to the separate actuator instruction manual for adjustment procedures.
4. When the control valve is being placed into operation, check around the packing follower for leakage.

Leakage from the PTFE packing can often be stopped by tightening the packing flange nuts just enough to stop the leak.

CAUTION

Use caution when tightening the nuts. Overtightening the nuts can damage packing box parts and result in increased drive shaft friction.

Seal Ring Maintenance

Perform this procedure if the control valve is not shutting-off properly (if it is leaking downstream). It is recommended, but not required, to remove the actuator for easier handling of the valve during the following procedures.

⚠ WARNING

The edges of a rotating disk close with a shearing effect that may result in personal injury. To help prevent such injury, stay clear of the disk edges when rotating the disk (key 3).

CAUTION

During any of the following steps, do not rotate the disk past 90 degrees in the open direction. Rotating the disk past 90 degrees can damage the seal ring.

Figure 7. Retainer Ring Knock-Out Flat

Key numbers are shown in figure 12 unless otherwise noted.

Disassembly

Most maintenance procedures will require the actuator to be removed.

1. Isolate the control valve from line pressure, and relieve pressure from the valve body. Shut off and disconnect all lines from the power actuator.
2. Be sure the disk is in the closed position before attempting to remove the valve from the pipeline or flanges.
 - For Fail-Open Actuators: It will be necessary to provide a temporary loading pressure to the actuator diaphragm to move the valve disk to the closed position. Observe the above Warning when closing the valve. If a loading pressure is required, use caution when working with the valve. If the loading pressure is disconnected, the disk will open rapidly.
3. With the disk in the closed position, remove line bolting, then remove the control valve assembly from the pipeline.
4. Remove the actuator as described in the Packing Maintenance section.
5. Remove the retainer ring (key 2, figure 8):

- Place the valve on blocks with the seal retainer facing down. (Note: Position blocks so they do not restrict the retainer ring removal.)
- Rotate the disk to the open position as shown in figure 7.
- Locate one of the knock-out points machined on the retainer ring. Using a hammer and flat end punch the knock-out point, pop out the retainer ring from the valve body.

CAUTION

When popping out the retainer ring, be very careful to hit only the knock-out points. Hitting anywhere else can cause non-repairable damage to the t-slot area.

- Clean all sealing surfaces and parts before re-assembly.
6. Remove the seal ring from the valve body seal ring slot. Remove the spring from the PTFE seal ring (key 5) as it may be necessary to re-install the spring into the new PTFE seal ring.
 7. If it is necessary to replace the disk, drive shaft, and the bearings, refer to that section below before proceeding with the assembly procedures for the seal ring and retainer. The seal ring could be damaged if it is in place while removing the disk.

Assembly

Place the valve on blocks with the seal retainer facing up. If the replacement disk, shaft, and bearings have not been installed in the valve body, go to the proper assembly procedures to install them.

CAUTION

Do not install the seal ring without the disk being in place. The seal ring could be damaged while installing the disk.

Figure 8. Disk Rotation Indication

NOTE:

1 SET ACTUATOR TRAVEL STOPS TO OBTAIN AN EQUAL DISTANCE TO DISK SURFACE AS SHOWN.

CAUTION

Do not rotate the disk past 90 degrees in the open direction. Rotating the disk past 90 degrees can damage the seal ring or other component parts.

Note

PTFE, NOVEX, and Phoenix III seal rings used in other valve types are not interchangeable with seal rings used in the 8540 valve. The 8540 seal rings are not interchangeable with seal rings in any other valve type. To order seal rings for this valve, provide the serial number on the valve.

1. Installing PTFE seal rings:

- The valve disk should be closed while installing the seal ring. If not, rotate the disk to the closed position as shown in figure 8.
- Hook the spring ends together, insert the spring (see figure 9) into the groove in the seal ring, and work the spring into the recess in the PTFE seal ring.

- c. Install the seal ring assembly into the slot in the valve body as shown in figure 9. Refer to Installing the retainer ring steps below.

Figure 9. Available Seal Configurations

2. Installing the retainer ring:

- a. Wipe excessive oil off the retainer ring outside diameter, and off the retainer counterbore in the valve body.
- b. Rotate the disk to the open position.
- c. Lay the retainer ring on the valve body.
- d. Use a press, or a soft-faced hammer to press the retainer ring into its groove in the valve body.

CAUTION

It takes a considerable amount of force with a hammer to drive the retainer ring into place. Be sure not to damage retainer ring surfaces when installing the ring.

- e. The retainer ring is properly seated when the face of the retainer ring is flush with the face of the valve body.
- f. To ensure proper seal performance for metal seals, you may need to use the hammer to drive the disk open for the first few times. When closing the valve, use the C-clamps discussed in the next few steps.

CAUTION

Do not damage the gasket seating surfaces on either the valve body or the retainer ring when installing or removing the C-clamps. Protect the gasket surface by using a soft material between the clamp and valve body/retaining ring serrations to avoid damage.

- g. Use three C-clamps to hold the retainer in place. Locate one of the C-clamps near the travel stop in the valve body, and the other two at 120 degrees from the stop.
- h. When cycling the disk for the first three times, use a dead-blow hammer with a soft head to drive the disk closed. Also, you may need to use the hammer to drive the disk open for the first few times.

3. Turn the disk into and out of the seal ring several times, to help break in the seal and reduce actuator torque requirements during adjustment.
4. If replacing the packing, remove all packing parts from the valve body. Upon re-assembly of the valve, refer to the Packing Maintenance procedures to replace the packing.

Disk, Drive Shaft, and Bearing Maintenance

This procedure is to be performed when replacing the valve disk, drive shaft, taper pins, hollow pins, and bearings due to wear or damage to one or more component parts.

Key numbers are shown in figure 12 unless otherwise noted.

Disassembly

1. Isolate control valve from line pressure, relieve pressure and drain process fluid, then remove control valve assembly from the pipeline as described in Seal Ring Maintenance section.
2. Loosen the packing flange nuts (key 101). This allows the drive shaft (key 8) to turn without the friction caused by the packing.
3. Remove the actuator using the steps provided in the Packing Maintenance section and separate actuator instruction manuals, and remove the seal ring using the steps provided in the seal ring maintenance procedures above.
4. Place the valve on a flat working surface with the seal ring slot facing down.
5. Use blocks to raise the valve body high enough to allow the disk to be rotated to the fully open position (see figure 8).
6. Rotate the disk (key 3) to the fully open position.
7. Locate the small ends of the taper pins. Drive the two taper pins (key 10) out towards the larger end of the pins. (Note: Attempting to drive the taper pins in the opposite direction only tightens the pins.) Also, remove the hollow pins (key 9) from the disk/shaft connection using the tool shown in figure 11.

Note

Make the tools for removal and installation of the hollow pin shown in figure 11.

8. Unscrew and remove the packing flange nuts (key 101), and the packing flange (key 102).

⚠ WARNING

Once the shaft has been removed in the following step, the disk may fall out of the valve body cavity. To avoid personal injury and property damage, support the disk to prevent it from falling as the shaft is being removed.

9. Pull the shaft out of the valve body, and remove the disk (key 3) from the valve body bore.
10. If the packing is to be replaced, remove all the packing parts from the valve body. Upon re-assembly of the valve, refer to the Packing Maintenance procedures to replace the packing parts.
11. Remove both of the bearings (key 6) from the valve body.
12. Clean all the sealing surfaces and parts, and inspect and/or obtain replacements before assembly.

Assembly

1. Install the bearings (key 6):

When installing the bearings in the opposite side of the valve body bore, repeat the following procedures.

- Position the bearing edge to match the valve body bore, and insert the one piece bearing/disk spacer into the bearing bore with the bearing tab facing away from the disk stop as shown in figure 10.

CAUTION

To avoid product damage, protect the disk sealing surfaces while inserting the disk into the valve body bore.

2. Position the disk to be certain that the holes in the disk are towards the actuator side of the valve. Carefully insert the disk into the valve body bore while protecting the disk sealing surfaces. Install the shaft (key 8):
3. Slide the shaft through the valve body bore and bearing. Position the disk as stated above and slide the shaft through the disk and outer bearing. Refer to step 4 below.

Installing the hollow pin and taper pin

4. Place the valve body on a flat working surface with the slot for the seal ring facing up. Block the valve body high enough to allow the disk to be rotated into the open position as shown in figure 11.

Figure 10. Orientation of Bearing/Spacer Tab

A6357-1

5. Rotate the disk to the open position. On the end of the drive shaft, locate the disk position mark on the end of the drive shaft. Rotate the shaft until it is in the appropriate disk position as shown in figure 11.

Note

Make sure the taper and hollow pins are free of particulate matter before continuing.

6. Line-up both holes in the disk hub with the holes in the drive shaft (key 8). (Note: The hole in the drive shaft is offset to prevent the shaft from being installed in the wrong position. Be sure the hole in the shaft is lined up with the hole in the disk hub.)
7. Insert the hollow pins (key 9), into the disk hub as shown in figure 11.
Using the tool shown in figure 11, tap the hollow pin down into the disk hub and shaft until the hollow pin bottoms on the stop in the disk.
8. Insert the taper pins (key 10) into the hollow pins. Using a flat end punch, drive the taper pins into the hollow pins until solid contact is felt. Anchor the pins in place by staking them with a center-punch and hammer. The disk and shaft should rotate smoothly.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D104709X012

8540 Valve

May 2023

9. Install the seal ring assembly using the appropriate instructions in the Seal Ring Maintenance procedures.
10. Install the packing parts using the appropriate instructions provided in the Packing Maintenance procedures. Refer to the Actuator Mounting procedures before installing the valve in the pipeline.

Figure 11. Taper Pin and Hollow Pin Removal and Installation

Actuator Mounting

Re-install the seal ring and packing rings using the appropriate procedures before installing the actuator on the valve. Mount the actuator on the valve body in accordance with the instructions in the actuator instruction manual and this section.

In the Packing Maintenance steps, you should have noted the position of the mark on the end of the valve shaft, and its relationship to the actuator shaft. If not, determine the configuration needed to match your application.

Be certain that the disk is rotating counterclockwise to open when viewed from the actuator side of the valve, and that the disk is not rotated beyond its limits.

1. Orientate the valve drive shaft correctly to match the actuator or handlever position, and install it into the actuator and actuator lever arm until the mounting pads mate with each other.
2. Tighten the actuator-mounting cap screws to the appropriate bolt torque from table 9.

CAUTION

The valve disk stop, in the valve body bore is not to be used as a power actuator travel stop (see figure 10). Use the actuator travel stops to limit the rotation of the valve disk. It is possible to damage the valve component parts if full actuator thrust is applied to the valve disk stop.

For actuators with an adjustable travel stop, the travel stop must be adjusted so that the valve is closed (determined by measuring as shown in figure 7) when the diaphragm or piston is against the actuator at the travel stop.

For manually operated actuators or actuators without adjustable linkage, make certain that the travel of the actuator stops before the disk rotates past the closed position.

8 and 10	200 and 250	135	100
12	300	183	135

Note

To obtain proper shutoff, the closed position of the 8540 valves must be set with the disk parallel to the retaining ring. Do not use the disk stop to set the actuator travel stops.

- Adjust the actuator travel stop to limit the open and closed positions of the valve disk. (If necessary, refer to the actuator instruction manual for more information about adjustments.) Do not use the disk stop as a actuator travel stop as discussed in the **Caution** above.
- For actuators with adjustable turnbuckles, adjust the turnbuckle to bring the disk to the fully closed position at the end of the actuator stroke. If necessary, refer to the appropriate actuator instruction manual for assistance.
- If using a manual handwheel or handlever actuator, refer to the appropriate actuator instruction manual for mounting positions and adjustments.
- To determine the fully closed disk position (zero degrees of disk rotation), measure the distances between the positions on the disk face as shown in figure 8. Use the actuator to rotate the disk while re-checking the two measurements. Repeat adjustment until the two measurements are equal.

Parts Ordering

When corresponding with your [Emerson sales office](#) about this equipment, always mention the valve serial number.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts List

Note

For part ordering information contact your [Emerson sales office](#).

Key Description

Figure 1. Fisher 8560 Valve with 1052 Actuator and DVC6000 Series Digital Valve Controller

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for NPS 2 through 12 8560 Eccentric Disk Butterfly Control Valves (see figure 1). Refer to separate instruction manuals for information covering the actuator and accessories.

Do not install, operate, or maintain 8560 valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The seal design of the 8560 eccentric disk high performance butterfly valve provides excellent shutoff capability. The valve includes PTFE-filled or graphite packing rings that electrically bond the shaft to the valve body. This valve has a spline drive shaft end, and soft or metal seal rings for use in a wide variety of applications.

Table 1. Specifications

Valve Size and End Connection Styles

NPS ■ 2, ■ 3, ■ 4, ■ 6, ■ 8, ■ 10, and ■ 12 valves and in Wafer or Single flanged style (NPS 2 available in wafer only)

Maximum Inlet Pressure⁽¹⁾

Carbon Steel and Stainless Steel Valve Bodies:
Consistent with CL150 and 300 pressure/temperature ratings per ASME B16.34 unless limited by material temperature capabilities. NPS 2 is also consistent with CL600.

Maximum Pressure Drops⁽¹⁾

Consistent with CL150 and 300 pressure-temperature ratings per ASME B16.34 except for PTFE, UHMWPE and Phoenix III seals which are derated at some higher pressure-temperature values. Refer to figure 2

Shutoff Classifications

■ PTFE, Reinforced PTFE, and UHMWPE⁽³⁾ Seals: Bidirectional shutoff to Class VI per ANSI/FCI 70-2 and IEC 60534-4.

■ NPS 2 Metal Seal: Bidirectional shutoff. 0.001% of maximum valve capacity (1/10) of Class IV per ANSI/FCI 70-2 and IEC 60534-4. Maximum Pressure drop is 51 bar (740 psi) forward and 6.9 bar (100 psi) reverse.

■ NOVEX Seal: For NPS 3 through 12. Unidirectional shutoff is 0.0001% of maximum valve capacity (1% of Class IV) in the reverse flow direction per ANSI/FCI 70-2 and IEC 60534-4.

■ Phoenix III Seal: For NPS 3 through 12. Bidirectional shutoff to Class VI per ANSI/FCI 70-2 and IEC 60534-4. For the optional Phoenix III Fire-Tested seal, consult your [Emerson sales office](#).

Flow Characteristics

Approximately linear

Disk Rotation

Clockwise to close (when viewing from the drive shaft end) through 90 degrees of disk rotation (see figure 10)

Flow Direction

See figure 3

Actuator/Valve Action

With the diaphragm or piston actuators, the valve action is field-reversible. Refer to information in the Installation section.

Valve Classification

Face-to-face dimensions of NPS 3 through 12 are in CL150 and 300, and meet API 609 or MSS-SP-68 standards for face-to-face dimensions of wafer-style and single flange valves.

Shaft Diameters

See table 2

Approximate Weights

See table 2

ENVIRO-SEAL Packing

This optional PTFE or graphite packing system provides excellent sealing, guiding, and transmission of loading forces to control liquid and gas emissions (see figure 8). See bulletin 59.3:041 ENVIRO-SEAL Packing System for Rotary Valves ([D101638X012](#)) for more information.

1. The pressure/temperature limits in this manual and any applicable standard or code limitation for valves should not be exceeded.

2. For components selection and applicable fire tested standards and codes, consult your Emerson sales office.

3. UHMWPE stands for ultra high molecular weight polyethylene.

Table 2. Valve Size, Shaft Diameter, and Approximate Weight

VALVE SIZE, NPS	CLASS	SHAFT DIAMETER		APPROXIMATE WEIGHT			
				Wafer-Style		Single-Flange	
		mm	Inches	kg	Pounds	kg	Pounds
2	150/300/600	12.7	1/2	4.3	9.5	---	---
3	150	12.7	1/2	4.5	10	6.4	14
	300	15.9	5/8	5.9	13	11	25
4	150	15.9	5/8	8.6	19	11	24
	300	19.1	3/4	10	23	18	39
6	150	19.1	3/4	13	29	16	35
	300	25.4	1	15	33	27	59
8	150	25.4	1	21	47	27	59
	300	31.8	1-1/4	24	53	42	93
10	150	31.8	1-1/4	34	75	40	88
	300	38.1	1-1/2	44	96	78	172
12	150	38.1	1-1/2	49	107	62	137
	300	44.5	1-3/4	64	141	131	288

Installation

The valve is normally shipped as part of a control valve assembly, with the power actuator mounted on the valve. If the valve or actuator have been purchased separately, or if the actuator has been removed for maintenance, mount the actuator on the valve, and adjust actuator travel before inserting the valve body into the line. This is necessary due to the measurements that must be made during the actuator calibration adjustment process. Refer to the Actuator Mounting section of this manual to mount the actuator on the valve. Refer to the actuator instruction manual for mounting and adjusting instructions before proceeding.

WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage resulting from the sudden release of pressure, do not install the valve assembly where service conditions could exceed the limits given in this manual, the limits on the appropriate nameplates, or the matching pipe flange rating. Use pressure-relieving devices as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

WARNING

The valve configuration and construction materials are selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some valve body/trim material combinations are limited in their pressure drop and temperature range capabilities, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

8560 Valve

February 2019

Instruction Manual

D102013X012

Table 3. Maximum Allowable Inlet Pressure for M35-1 and CW2M Valve Bodies⁽¹⁾

TEMPERATURE	M35-1			CW2M		
	150	300	600 ⁽²⁾	150	300	600 ⁽²⁾
°C	Bar					
-46 to 38	15.8	41.3	82.7	20.0	51.7	103.4
93	13.8	36.5	72.7	17.9	51.7	103.4
149	13.1	34.1	68.2	15.9	50.3	100.3
204	12.7	33.1	65.8	13.8	48.6	97.2
260	11.7	32.8	65.5	11.7	45.9	91.7
°F	Psig					
-50 to 100	230	600	1200	290	750	1,500
200	200	530	1055	260	750	1,500
300	190	495	990	230	730	1,455
400	185	480	955	200	705	1,410
500	170	475	950	170	665	1,330

1. M35-1 and CW2M valve material are not included in ASME B16.34 pressure/temperature ratings. The designations 150 and 300 for this valve material are used only to indicate relative pressure/retaining capabilities and are not ASME pressure/temperature rated classes.
2. CL600 is only available in the NPS 2.

Table 4. Construction Material Temperature Limits⁽¹⁾

COMPONENTS AND MATERIALS OF CONSTRUCTION	TEMPERATURE LIMITS	
	°C	°F
Valve Body Material / Disk / Shaft Material		
Carbon Steel / CF8M / S17400	-29 to 427	-20 to 800

Fluorocarbon backup ring	-40 to 232	-40 to 450
Phoenix III Fire-Tested ⁽²⁾ Metal Seal Ring	-40 to 232 ⁽²⁾	-40 to 450 ⁽²⁾
Fluorocarbon backup ring (Specify metal bearings and graphite packing)	-40 to 232 ⁽²⁾	-40 to 450 ⁽²⁾

1. Refer to Ordering Matrix for 8560 Valves. For selection temperatures not shown above, contact your [Emerson sales office](#).
2. For component selection and applicable fire-tested standards and codes, consult your Emerson sales office.

1. Install a three-valve bypass around the control valve assembly if continuous operation is necessary during inspection and maintenance of the valve.
2. Inspect the valve to be certain that it is free of foreign material.

CAUTION

Be certain that adjacent pipelines are free of any foreign material, such as pipe scale or welding slag, that could damage the valve sealing surfaces.

Figure 2. Maximum Pressure/Temperature Ratings

NOTE:

TEMPERATURE LIMITATIONS DO NOT ACCOUNT FOR THE ADDITIONAL LIMITATIONS IMPOSED BY THE BACKUP RING USED WITH THIS SEAL. TO DETERMINE THE EFFECTIVE TEMPERATURE LIMITATION OF THE APPROPRIATE SEAL/BACKUP RING COMBINATION, REFER TO TABLE 4.

Valve Orientation

When installing the valve, it is recommended that the valve drive shaft be horizontal as shown in figure 1.

Note

Due to its weight, the 1052 size 70 actuator must be externally supported when mounted in a horizontal position.

Valve Direction

The high performance butterfly valve is designed to allow flow in either direction when in the open position. When in the closed position, high pressure should be applied to a specific side of the disk to provide best performance and optimal valve life (see list of seal types below). See figure 3.

Applications with bi-directional seals, such as soft or Phoenix III, under normal operating conditions can (at different times) experience pressure in both directions; the highest of the two pressures should be exerted on the preferred side of the disk. If the two pressures are equal, then the one lasting the longest period of time should be applied to the preferred side.

1. For PTFE, Reinforced PTFE, and UHMWPE seal rings: This seal is bidirectional. For optimal performance, high pressure should be applied to the front (retaining ring side) of the disk.
2. For metal seal rings:
 - a. NOVEX seal: The NOVEX seal is uni-directional. High pressure at the closed position MUST be at the back (waterway side) of the disk.
 - b. Phoenix III Seal: This seal is bidirectional. For best performance, high pressure at the closed position should be applied to the back (waterway side) of the disk.
 - c. NPS 2 Seal: The preferred direction of installation is with high pressure at the front (retaining ring side) of the disk. Reverse shutoff is permissible at lower pressure (see the specifications table).

Figure 3. Flow Direction

NOTES:

1. BY Emerson Automation Solutions DEFINITION:
- FORWARD FLOW IS INTO THE FACE SIDE OF THE DISK.
 - REVERSE FLOW IS INTO THE HUB SIDE OF THE DISK.

75B1181-A
A6882

Table 5. Special Spiral Wound Gasket Dimensions, Inches

3	4	5/8-11	5.75	8	3/4-10	6.5	8	5/8-11	1.875	16	3/4-10	2
4	8	5/8-11	6	8	3/4-10	7	16	5/8-11	2	16	3/4-10	2.25
6	8	3/4-10	6.5	12	3/4-10	7.5	16	3/4-10	2	24	3/4-10	2.5
8	8	3/4-10	7	12	7/8-9	9	16	3/4-10	2.25	24	7/8-9	3
10	12	7/8-9	8	16	1-8	10	24	7/8-9	2.5	32	1-8	3.5
12	12	7/8-9	8.5	16	1-1/8-8	11	24	7/8-9	2.75	32	1-1/8-8	3.75

1. Thread engagement in accordance with ASME B31.3.
2. The NPS 2 valve is only available in wafer style and is multirated to CL150, 300 and 600. The CL600 stud bolts require 8 bolts, have a dia. of 5/8-11, and are 6 inches long.

Figure 4. Stud Bolts and Cap Screws for Installation (also see table 6)

Installing the Valve in the Pipeline

⚠ WARNING

The edges of a rotating disk have a shearing effect that may result in personal injury. To help prevent such injury, stay clear of the disk edges when rotating the disk (key 3, figure 14).

CAUTION

Damage to the disk will occur if any pipe flanges or piping connected to the valve interfere with the disk rotation path. If the piping flange has a smaller inner diameter than what is specified for schedule 80 piping, measure carefully to be certain the disk rotates without interference before putting the valve into operation.

CAUTION

Damage to the disk (key 3) sealing surfaces may occur if the disk is not closed when the valve is being removed from the pipeline. If necessary, use a temporary pressure source on the actuator to retain the disk in the closed position while removing the valve from the pipeline.

1. For Fail-Open Actuators: It will be necessary to provide a temporary loading pressure to the actuator diaphragm to move the valve disk to the closed position. Observe the above Warning when closing the valve. If a loading pressure is required, use caution when working with the valve. If the loading pressure is disconnected, the disk will open rapidly.
2. With the disk in the closed position, install line flange gaskets, and install the valve between the pipeline flanges.

⚠ WARNING

If spiral wound gaskets are to be used with an NPS 3 or 4 CL150 or 300 single flange valve, special spiral wound gaskets conforming to the dimensions listed in the table 5 MUST be used. Improperly sized gaskets may increase the likelihood of 1) excessive seat leakage, 2) damage due to contact with valve internals, and 3) external leakage; which may result in personal injury and/or property damage due to a sudden increase or decrease of pressure within - or release of pressure from - the pipeline. The special dimension spiral wound gaskets can be obtained from your local spiral wound gasket vendor.

Note

The remaining single flange valve sizes (NPS 6 through 12) and all wafer style valves (NPS 2 through 12) use the standard size spiral wound gaskets. Only the single flange valves in the sizes and pressures listed in table 5 require special spiral wound gaskets.

Select the appropriate gaskets for the application. Flat sheet, spiral wound (NPS 6 through 12), or other gasket types made to ASME 16.5 group or a user's standards can be used for 8560 valves depending on the service conditions and applications.

3. Install the flange studs:

Note

Lubricate line flange studs or bolts before inserting them into flanges. If necessary, provide additional support for the control valve assembly because of its combined weight.

- **Flange studs:** Install two or more line flange studs into the line flanges to help hold the valve in position while centering the valve. Carefully center the valve on the flanges to ensure disk clearance.

Figure 5. Optional Shaft-to-Valve Body Bonding Strap Assembly

82434

- Select and install two pipe line gaskets.
 - **Flange Cap Screws:** If line flange cap screws are used, be certain the cap screw threads engage the tapped holes to a depth equal to the flange cap screw diameter.
4. Install the remaining line flange bolting to secure the valve in the pipeline. Tighten the nuts to the line flange studs, or cap screws, in a crisscross pattern to ensure proper alignment of valve, gaskets, and flanges.

Packing Adjustment and Shaft Bonding

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

CAUTION

Use caution when tightening packing follower nuts because over-tightening the nuts will accelerate wear and could produce higher rotating friction loads on the valve stem.

1. For PTFE or graphite packing: tighten standard packing follower nuts only enough to prevent shaft leakage. Excessive tightening of packing will accelerate wear and could produce higher rotating friction loads on the valve stem. If necessary, refer to the Packing Maintenance section.
2. ENVIRO-SEAL Packing System will not require this initial re-adjustment. Refer to the separate ENVIRO-SEAL Packing System for Rotary Valves instruction manual (D101643X012) for repair and replacement procedures.
3. For hazardous atmosphere or oxygen service valves, read the following Warning, and provide the bonding strap assembly mentioned below if the valve is used in an explosive atmosphere.

⚠ WARNING

The valve drive shaft is not necessarily grounded to the pipeline when installed. Personal injury or property damage could result from an explosion caused by a discharge of static electricity from the valve components if the process fluid or the atmosphere around the valve is flammable. To avoid personal injury or property damage, make sure the valve is grounded to the pipeline before placing the valve assembly into service.

Standard PTFE packing is composed of a partially conductive carbon-filled PTFE female adaptor with PTFE V-ring packing. Standard graphite packing is composed of all conductive graphite ribbon packing rings. Alternate shaft-to-valve body bonding is available for hazardous service areas where the standard packing is not sufficient to bond the shaft to the valve (see the following step).

For oxygen service applications it is necessary to provide alternate shaft-to-valve body bonding according to the following step.

4. Attach the bonding strap assembly (key 131, figure 5) to the shaft with the clamp (key 130, figure 5), and connect the other end of the bonding strap assembly to the valve with the cap screw (key 22, figure 5).
5. For more information, refer to the Packing Maintenance subsection below.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions. Instructions are given in this section for replacing

packing, seal ring, disk, shaft, bearings, and other valve parts. Also, instructions are provided for changing valve action, mounting, and adjusting the actuator. Refer to the actuator instruction manual for additional information for mounting and adjusting the actuator.

CAUTION

It is possible to damage the valve if the actuator travel stops are not properly adjusted before stroking the valve.

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- The edges of a rotating disk have a shearing effect that may result in personal injury. To help prevent such injury, stay clear of the disk edges when rotating the disk (key 3).
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

CAUTION

During any of the following steps, do not rotate the disk past 90 degrees in the open direction. Rotating the disk past 90 degrees can damage the seal ring.

Stopping Leakage

For PTFE-filled or graphite standard packing arrangements covered in this manual, often leakage from the packing can be stopped by tightening the packing flange nuts just enough to stop the leak.

CAUTION

Use caution when tightening the nuts because over-tightening the nuts can damage packing box parts.

- If tightening the packing flange nuts does not stop the leakage, use the following procedures to remove the control valve assembly from the pipeline. Remove the actuator when removing and replacing packing parts.
- If the leakage comes from the outside diameter of the packing box, it is possible that the leakage is caused by nicks or scratches on the packing box wall. Carefully inspect the packing box bore and valve drive shaft when the packing is removed. Use the following steps to remove the actuator and to remove and replace the packing parts.

Removing the Actuator

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut off all pressure lines to the power actuator, and release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

CAUTION

Damage to the disk (key 3) sealing surfaces may occur if the disk is not closed when the valve is being removed from the pipeline. If necessary to overcome spring force, use a temporary pressure source on the actuator to close the disk. Also, maintain the pressure to retain the disk in the closed position while removing the valve from the pipeline.

2. Be sure the disk is in the closed position before attempting to remove the valve from the pipeline or flanges.

⚠ WARNING

The edges of a rotating disk close with a shearing effect that may result in personal injury. To help prevent such injury, stay clear of the disk edges when rotating the disk (key 3).

For Fail-Open Actuators: It will be necessary to provide a temporary loading pressure to the actuator diaphragm to move the valve disk to the closed position. Observe the above Warning when closing the valve. If a loading pressure is required, use caution when working with the valve. If the loading pressure is disconnected, the disk will open rapidly.

Figure 6. Lever-Shaft Orientation

C0784

3. With the disk in the closed position, remove line bolting, remove the control valve assembly from the pipeline, and place it on a flat working surface with the seal retainer ring facing up.
4. If a grounding strap is used (see figure 5), remove the hex nut to release the end of the strap. Remove the clamp (key 130) and strap (key 131).
5. Note the orientation of the actuator with respect to the valve body (see figure 6), and remove the actuator cover to note the lever orientation with respect to the valve drive shaft (see figure 7).

When re-assembling the control valve assembly, you will need to correctly position the marks on the end of the valve drive shaft and the valve body with respect to the actuator case and lever arm. Refer to the Actuator Mounting section and figure 7 for the location of the marks on the valve drive shaft end. Additional information is provided in the actuator manual to assist with disassembly, re-assembly, and travel adjustments. When removing the valve drive shaft from the actuator lever, do not loosen the actuator turnbuckle adjustment. Remove the cap screw from the actuator lever (figure 7).

CAUTION

When removing the actuator from the valve, do not use a hammer or similar tool to drive the actuator lever off the valve shaft. Driving the lever off the valve shaft could damage the disk, seal ring, bearings or valve body.

If necessary, use a wheel puller to remove the actuator lever from the valve shaft. It is okay to tap the wheel puller screw lightly to loosen the lever, but hitting the screw with excessive force could damage the disk, seal ring, bearings or valve body.

6. Remove the actuator mounting screws (key 14, figure 14).
7. Remove the valve from the actuator.

Packing Maintenance

Standard graphite packing is composed of all conductive packing rings. PTFE-filled packing has a partially conductive packing ring (such as a carbon-filled PTFE female adaptor) to electrically bond the shaft to the valve body.

If the valve is equipped with the optional ENVIRO-SEAL Packing System, refer to the separate ENVIRO-SEAL Packing System for Rotary Valves instruction manual ([D101643X012](#)) for packing maintenance procedures.

When replacing the packing, it is recommended to remove the control valve assembly from the pipeline because valve/actuator adjustments must be made with the valve out of the pipeline.

Disassembly

Key numbers and part locations are shown in figure 8 unless otherwise noted.

1. Remove the packing flange nuts (key 101) and the packing flange (key 102).
2. Remove the old packing rings, using a formed hook.

CAUTION

Carefully use the hook. Avoid damaging the drive shaft or packing box wall. Scratches on valve surfaces can cause leakage. (Note: the packing box ring (Key 107) can remain in place when replacing packing only.)

3. Clean all accessible metal parts and surfaces to remove particles that would prevent the packing from sealing.

Figure 7. Actuator Mounting Styles and Positions

C0784

Assembly

Inspect the shaft: If it is damaged, it cannot make a good seal with the packing, and it must be replaced. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches around the packing box wall. Inspect the packing box wall for nicks and scratches when performing the following procedures.

If the valve is equipped with the ENVIRO-SEAL packing system refer to the ENVIRO-SEAL Packing System for Rotary Valves instruction manual for assembly.

Note

Except with oxygen service, lightly lubricate new PTFE V-rings with a silicone-base lubricant to aid in assembly.

⚠ WARNING

Do not lubricate parts when used in oxygen service, or where the lubrication is incompatible with the process media. Any use of lubricant can lead to the sudden explosion of media due to the oil/oxygen mixture, causing personal injury or property damage.

 RIBBON PACKING ONLY

1185895-A
 1086817-A
 4238445-B
 C0785-1

ENVIRO-SEAL GRAPHITE PACKING SYSTEM

1. Install the new packing parts (see figure 8). Install the packing follower and finger tighten the packing flange nuts onto the studs only enough to stop leakage.
2. If the valve was equipped with a bonding strap assembly (figure 5), re-install the assembly.
3. Refer to the Actuator Mounting section of this manual. If necessary, refer to the separate actuator instruction manual for adjustment procedures.
4. When the control valve is being placed into operation, check around the packing follower for leakage.

For PTFE-filled or graphite standard packing arrangements covered in this manual, leakage from the packing can often be stopped by tightening the packing flange nuts just enough to stop the leak.

CAUTION

Use caution when tightening the nuts. Overtightening the nuts can damage packing box parts and result in increased drive shaft friction.

Seal Ring Maintenance for NPS 3 through 12

Perform this procedure if the control valve is not shutting-off properly (if it is leaking downstream). It is recommended, but not required, to remove the actuator for easier handling of the valve during the following procedures.

CAUTION

During any of the following steps, do not rotate the disk past 90 degrees in the open direction. Rotating the disk past 90 degrees can damage the seal ring.

Figure 9. Retainer Ring Knock-Out Flat

Key numbers are shown in figure 14 unless otherwise noted.

Disassembly

Refer to the Removing the Actuator section. Most maintenance procedures will require the actuator to be removed.

1. Remove the retainer ring (key 2, figure 10):

For valves with press-fit retainer rings:

- Place the valve on blocks with the seal retainer facing down. (Note: Position blocks so they do not restrict the retainer ring removal.)
- Rotate the disk to the open position as shown in figure 9.
- Locate one of the knock-out points machined on the retainer ring. Using a hammer and flat end punch on the knock-out point, pop out the retainer ring from the valve body.

CAUTION

When popping out the retainer ring, be very careful to hit only the knock-out points. Hitting anywhere else can cause non-repairable damage to the t-slot area.

- Clean all sealing surfaces and parts before re-assembly.

For valves with screwed retainer rings

- Place the valve on blocks with the seal retainer facing up.
- Remove the retainer ring screws (key 17). If necessary, use two of the retainer screws in the tapped holes in the retainer ring (key 2, figure 14) to jack the retainer ring loose from the valve body surface.

2. Remove the seal ring from the valve body seal ring slot.

For valves with PTFE seal rings, remove the spring (key 5) as it may be necessary to re-install the spring into the new PTFE seal ring.

For valves with metal seals, remove the gasket (key 16) from the valve body surface, and discard it as replacement is recommended.

- 3. If it is necessary to replace the disk, drive shaft, and the bearings, refer to that section below before proceeding with the assembly procedures for the seal ring and retainer. The seal ring could be damaged if it is in place while removing the disk.

Assembly

Place the valve on blocks with the seal retainer facing up. If the replacement disk, shaft, and bearings have not been installed in the valve body, go to the proper assembly procedures to install them.

CAUTION

Do not install the seal ring without the disk being in place. The seal ring could be damaged while installing the disk.

⚠ WARNING

Do not lubricate parts when used in oxygen service, or where the lubrication is incompatible with the process media. Any use of lubricant can lead to the sudden explosion of media due to the oil/oxygen mixture, causing personal injury or property damage.

Figure 10. Disk Rotation Indication

CAUTION

Do not rotate the disk past 90 degrees in the open direction. Rotating the disk past 90 degrees can damage the seal ring or other component parts.

Note

PTFE, NOVEX, and Phoenix III seal rings used in other valve types are not interchangeable with seal rings used in the 8560 valve. The 8560 seal rings are not interchangeable with seal rings in any other valve type. To order seal rings for this valve, provide the serial number on the valve.

1. Installing PTFE seal rings:

- The valve disk should be open while installing the seal ring. If not, rotate the disk to the open position as shown in figure 10.
- Hook the spring ends together, insert the spring (see figure 11) into the groove in the seal ring, and work the spring into the recess in the PTFE seal ring.
- Install the seal ring assembly into the slot in the valve body as shown in figure 11. Refer to Installing the retainer ring steps below.

Figure 11. Available Seal Configurations

2. Installing metal seals:

Note

For metal seals only, it may be necessary to apply a dry film lubricant or equivalent moly disulfide to the sealing surfaces of the disk, seal and the seal retainer groove. Prior to applying the lubricant the sealing surfaces should be inspected for injurious defects. Surfaces can be polished using a scuffing hand pad or equivalent. The edge of the seal that contacts the retaining ring groove should also be inspected and polished if necessary.

Note

Use the appropriate lubrication on parts when used in oxygen service, or where the lubrication is incompatible with the process media.

- a. Rotate the disk to the open position as shown in figure 10.

CAUTION

The seal ring will be damaged if the disk remains in the closed position during seal and retainer ring assembly.

b. Install the metal seal ring assembly (see figure 11).

3. Installing the retainer ring:

a. Valves with PTFE seal rings do not require a retainer ring gasket (key 16).

b. Valves with metal seals require a retainer ring gasket (key 16).

CAUTION

When handling the new retainer ring gasket, be sure to avoid kinking, cracking, or breaking the gasket. Damage to the gasket can cause leakage between the seal retainer and valve body.

c. Lay the gasket (key 16) down so that it is accurately centered on the valve body.

4. For valves with press-fit retainer rings

a. Wipe excessive oil off the retainer ring outside diameter, and off the retainer counterbore in the valve body.

b. Rotate the disk to the open position.

c. Lay the retainer ring on the valve body.

d. Use a press, or a soft-faced hammer to press the retainer ring into its groove in the valve body.

CAUTION

It takes a considerable amount of force with a hammer to drive the retainer ring into place. Be sure not to damage retainer ring surfaces when installing the ring.

e. The retainer ring is properly seated when the face of the retainer ring is flush with the face of the valve body.

f. To ensure proper seal performance for metal seals, you may need to use the hammer to drive the disk open for the first few times. When closing the valve, use the C-clamps discussed in the next few steps.

CAUTION

Do not damage the gasket seating surfaces on either the valve body or the retainer ring when installing or removing the C-clamps. Protect the gasket surface by using a soft material between the clamp and valve body/retaining ring serrations to avoid damage.

- g. Use three C-clamps to hold the retainer in place. Locate one of the C-clamps near the travel stop in the valve body, and the other two at 120 degrees from the stop.
 - h. When cycling the disk for the first three times, use a dead-blow hammer with a soft head to drive the disk closed. Also, you may need to use the hammer to drive the disk open for the first few times.
5. For valves with screwed retainer rings
 - a. Match the retainer ring with the holes in the valve by punching two holes in the gasket to locate where the screw holes are in the valve.
 - b. Lay the retainer ring over the gasket, while lining it up with the punched holes. Also insert two retainer screws (key 17). Finger tighten them.
 - c. Press the remaining screws through the gasket material and finger tighten them. When all retainer screws are in place, tighten them in a crisscross pattern.
 - d. The retainer ring is properly seated when the retainer face is nearly flush with the face of the valve.
6. Turn the disk into and out of the seal ring several times, to help break in the seal and reduce actuator torque requirements during adjustment.
7. If replacing the packing, remove all packing parts from the valve body. Upon re-assembly of the valve, refer to the Packing Maintenance procedures to replace the packing.

Seal Ring Maintenance for NPS 2

This procedure is to be performed if the control valve is not shutting off properly (that is, leaking downstream). This procedure does not require removing the actuator from the valve body. Part key numbers are shown in figure 15.

⚠ WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

1. Isolate the control valve from line pressure, and relieve pressure from the valve body. Shut off and disconnect all lines from the power actuator.

⚠ WARNING

The edges of a rotating disk have a shearing effect that may result in personal injury. To help prevent such injury, stay clear of the disk edges when rotating the disk (key 3).

CAUTION

Damage to the disk (key 3) may occur if the disk is not closed when the valve is being removed from the pipeline. If necessary, pressure the actuator temporarily to retain the disk in the closed position while removing the valve from the pipeline.

2. Unscrew the flange bolts, and remove the valve from the pipeline.

3. Unscrew the machine screws (key 17), and remove the seal retainer (key 2). Also remove the retainer clip (key 30).
4. Remove the seal ring or seal ring assembly (key 4). The spring (key 5) is removed with a PTFE seal ring.
5. For 316 stainless steel seal ring assemblies, replace the gaskets (key 4C) if the entire seal ring assembly is not replaced. Scrape off the old gaskets from both sides of the seal ring and the seal ring sides of the valve body (key 1) and seal retainer. Clean the gasket surfaces.
6. Reconnect or mount the actuator (if it was removed) before proceeding.

For an actuator with adjustable travel, also adjust the actuator before proceeding. This is necessary due to the measurements that must be made during the actuator adjustment process.

Refer to the Actuator Mounting section of this manual and to the separate actuator instruction manual for mounting and adjusting instructions.

7. The valve should be closed during seal ring installation to permit accurate centering of the seal. To install the new seal ring:

For a PTFE seal, if the spring (key 5) was disassembled, hook the spring ends together. Work the spring into the recess in the seal ring (key 4). Install the seal ring and spring assembly into the recess in the valve body as shown in figure 15. For a complete 316 stainless steel seal ring assembly, install the seal ring assembly as shown in figure 15.

CAUTION

New seal ring gaskets (key 4C) are very fragile and must be handled very carefully to avoid gasket kinking, cracking, or breakage that can cause leakage between the seal ring, seal retainer, and valve body. To avoid gasket damage, make sure that the valve body is lying flat so that the gaskets do not shift before the following steps are completed.

8. For a 316 stainless steel seal ring on which the gaskets will be replaced, lay the following parts down in order so that they are accurately centered on the valve body: one new gasket; the seal ring oriented as shown in figure 15; and the second new gasket.
9. Attach the seal retainer and, if used, the retainer clips and washers to the valve body and secure with the machine screws. Tighten the machine screws evenly so as not to crack or break the 316 stainless steel seal ring gaskets, if used.

Be certain the disk is closed before installing the valve according to the Installation section of this instruction manual.

Disk, Drive Shaft, and Bearing Maintenance for NPS 3 through 12

This procedure is to be performed when replacing the valve disk, drive shaft, taper pins, hollow pins, and bearings due to wear or damage to one or more component parts.

Key numbers are shown in figure 14 unless otherwise noted.

Disassembly

1. Loosen the packing flange nuts (key 101). This allows the drive shaft (key 8) to turn without the friction caused by the packing.
2. Remove the actuator using the steps provided in the Removing the Actuator procedures above, and remove the seal ring using the steps provided in the seal ring maintenance procedures above.
3. Place the valve on a flat working surface with the seal ring slot facing down.
4. Use blocks to raise the valve body high enough to allow the disk to be rotated to the fully open position (see figure 10).

5. Rotate the disk (key 3) to the fully open position.
6. Locate the small ends of the taper pins. Drive the two taper pins (key 10) out towards the larger end of the pins. (Note: Attempting to drive the taper pins in the opposite direction only tightens the pins.) Also, remove the hollow pins (key 9) from the disk/shaft connection using the tool shown in figure 13.

Note

Make the tools for removal and installation of the hollow pin shown in figure 13.

7. Unscrew and remove the packing flange nuts (key 101), and the packing flange (key 102).

⚠ WARNING

Once the shaft has been removed in the following step, the disk may fall out of the valve body cavity. To avoid personal injury and property damage, support the disk to prevent it from falling as the shaft is being removed.

8. Pull the shaft out of the valve body, and remove the disk (key 3) from the valve body bore.
9. If the packing is to be replaced, remove all the packing parts from the valve body. Upon re-assembly of the valve, refer to the Packing Maintenance procedures to replace the packing parts.
10. Remove both of the bearings (key 6) from the valve body. For CL150 valves with metal bearings, refer to the following note.

Note

CL150 valves with metal bearing assemblies have three parts. A disk spacer, bearing, and bearing spacer (keys 7, 6, and 13) are used in place of a single piece bearing. The disk spacers may fall out of the valve when the disk is removed. If needed for re-assembly, retain disk spacer and bearing spacer parts.

11. Clean all the sealing surfaces and parts, and inspect and/or obtain replacements before assembly.

Assembly

1. Install the bearings (key 6):

When installing the bearings in the opposite side of the valve body bore, repeat the following procedures.

- For PEEK/PTFE CL150 and CL300 metal bearings, one piece bearings: Position the bearing edge to match the valve body bore, and insert the one piece bearing/disk spacer into the bearing bore with the bearing tab facing away from the disk stop as shown in figure 12.
- For CL150 metal bearings, three piece assemblies: Bearings for CL150 valves are an assembly made up of three parts: disk spacer, bearing, and bearing spacer (keys 7, 6, and 13) as shown in the metal bearing detail shown in figure 14.
 - a. Install the bearing spacer (key 13) into the bearing bore.
 - b. Install the bearing into the bearing bore until the bearing is flush with the valve body bore.

- c. When installing the disk spacer (key 7) position the curved side to match the valve body bore, and position it with the tab on the spacer pointing away from the disk stop as shown in figure 12.

Note

The disk spacer will have to be held in place when installing the disk and inserting the shaft through the valve body, bearings, bearing spacer, and disk. To help hold the spacer in place, apply some lubricant.

CAUTION

To avoid product damage, protect the disk sealing surfaces while inserting the disk into the valve body bore.

2. Position the disk to be certain that the holes in the disk are towards the actuator side of the valve. Carefully insert the disk into the valve body bore while protecting the disk sealing surfaces.
3. Install the shaft (key 8):
 - For PEEK/PTFE CL150 and CL300 metal bearings, one piece bearings: Slide the shaft through the valve body bore and bearing. Position the disk as stated above and slide the shaft through the disk and outer bearing. Refer to step 4 below.
 - For CL150 metal bearings, three piece assemblies: Slide the shaft into the valve body bore and bearing spacer. Position the disk spacer as stated above and hold it in place. Slide the shaft through the bearing and into the disk. Position the second disk spacer, and hold it in place. Slide the shaft through the disk spacer and into the outer bearing.

Installing the hollow pin and taper pin

4. Place the valve body on a flat working surface with the slot for the seal ring facing *up*. Block the valve body high enough to allow the disk to be rotated into the open position as shown in figure 13.

Figure 12. Orientation of Bearing/Spacer Tab

A6357-1

5. Rotate the disk to the open position. On the end of the drive shaft, locate the disk position mark on the end of the drive shaft. Rotate the shaft until it is in the appropriate disk position as shown in figure 13.

Note

Make sure the taper and hollow pins are free of particulate matter before continuing.

6. Line-up both holes in the disk hub with the holes in the drive shaft (key 8). (Note: The hole in the drive shaft is off-set to prevent the shaft from being installed in the wrong position. Be sure the hole in the shaft is lined up with the hole in the disk hub.)
7. Insert the hollow pins (key 9), into the disk hub as shown in figure 13.

Using the tool shown in figure 13, tap the hollow pin down into the disk hub and shaft until the hollow pin bottoms on the stop in the disk.
8. Insert the taper pins (key 10) into the hollow pins. Using a flat end punch, drive the taper pins into the hollow pins until solid contact is felt. Anchor the pins in place by staking them with a center-punch and hammer. The disk and shaft should rotate smoothly.
9. Install the seal ring assembly using the appropriate instructions in the Seal Ring Maintenance procedures.
10. Install the packing parts using the appropriate instructions provided in the Packing Maintenance procedures. Refer to the Actuator Mounting procedures before installing the valve in the pipeline.

Disk, Shaft Assembly and Bearing Maintenance for NPS 2

This procedure is to be performed to replace the valve disk, shaft, and taper pin assembly if the disk does not rotate in response to rotation of the actuator end of the valve shaft. Unless otherwise indicated, part key numbers are shown in figure 15.

Disassembly

1. Remove the seal ring according to steps 1 through 5 of the Replacing Seal Ring section.

CAUTION

Use a wheel puller to separate actuator parts from the valve shaft. Driving the parts off the valve shaft could move the valve bearings and disk away from the centered position, damaging the disk and valve body.

2. Remove the cap screws and, if used, the hex nuts. Remove the clamp if the strap is used. Remove the actuator from the valve body while referring to the separate actuator instruction manual for assistance.
3. Rotate the disk (key 3) to the fully open position.
4. Locate the half of the disk that has two C markings cast into it as shown in figure 10. Drive the two taper pins (key 3C) out toward the C-marked side of the disk. Attempting to drive the taper pins in the opposite direction only tightens the pins.
5. Unscrew and remove the packing flange nuts (key 101), packing followers (key 114), and packing flanges (key 102) if used, from both sides of the valve.

⚠ WARNING

Once the shaft has been removed in the following step, the disk may fall from the valve. To avoid personal injury and disk damage, support the disk to prevent it from falling as the shaft is being removed.

6. Pull the shaft out through the actuator side of the valve.
7. Remove the disk from the valve body.
8. Remove the packing rings (key 108), the packing washers (key 115) if used, and the packing box ring (key 107).

9. If either of the bearings (key 6) require maintenance or replacement, remove them.

CAUTION

When replacing a valve disk or shaft, a new disk/shaft/taper pin assembly (key 3) should be used. Using a new disk with a used shaft requires drilling and reaming new taper pin holes in the shaft. The extra set of taper pin holes weakens the shaft and may cause it to fail in service.

10. Clean the packing boxes and metal packing box parts.

Assembly

1. Drop in the new bearings. Make sure to orient the tab in the bearing with the slot in the seal.
2. Insert the disk into the valve body. Be certain the taper pin holes in the disk are on the actuator side of the valve. Also be certain the letter C stamped on either face of the disk is on the same side of the valve as the letter C stamped on the outside of the valve (figure 10).
3. Slide the shaft through the valve body and disk.
4. Install the disk and spacers into the valve body. Insert the shaft into the valve body and through the disk.
5. Slide the shaft all the way into the valve body.
6. To ensure that the direction of taper in the shaft taper pin holes matches that of the disk taper pin holes, temporarily install the packing follower (key 114) or, if used, the packing flange (key 102) with rotation tag (key 19). With the disk fully opened, rotate the shaft until the line on the end of the shaft indicates the open position, as shown in figure 10. Insert the taper pins (key 3C), small end first, into the taper pin holes on the C-marked side of the disk. Do not drive in the pins. Remove the packing follower or flange.

Actuator Mounting

Re-install the seal ring and packing rings using the appropriate procedures before installing the actuator on the valve. Mount the actuator on the valve body in accordance with the instructions in the actuator instruction manual and this section.

In the Packing Maintenance/Removing the Actuator steps, you should have noted the position of the mark on the end of the valve shaft, and its relationship to the actuator shaft. If not, determine the configuration needed to match your application.

Be certain that the disk is rotating counterclockwise to open when viewed from the actuator side of the valve, and that the disk is not rotated beyond its limits.

1. Orientate the valve drive shaft correctly to match the actuator or handlever position, and install it into the actuator and actuator lever arm until the mounting pads mate with each other.
2. Tighten the actuator-mounting cap screws (key 14, figure 14) to the appropriate bolt torque from table 7.

CAUTION

The valve disk stop, in the valve body bore is not to be used as a power actuator travel stop (see figure 9). Use the actuator travel stops to limit the rotation of the valve disk. It is possible to damage the valve component parts if full actuator thrust is applied to the valve disk stop.

For actuators with an adjustable turnbuckle, such as the 1051, 1052, or 1061 actuator, the turnbuckle must be adjusted so that the valve is closed (determined by measuring as shown in figure 7) when the diaphragm or piston is against the actuator travel stop.

For manually operated actuators or actuators without adjustable linkage, such as the 1066 or 1066SR actuator, make certain that the travel of the actuator stops before the disk rotates past the closed position.

8 & 10	135	100
12	183	135

1. Value for NPS 2 also applies to CL600 Valves.

Note

To obtain proper shutoff, the closed position of the A41/8560 valves must be set with the disk parallel to the retaining ring. Don't use the disk stop to set the actuator travel stops.

3. Adjust the actuator travel stop to limit the open and closed positions of the valve disk. (If necessary, refer to the actuator instruction manual for more information about adjustments.) Do not use the disk stop as a actuator travel stop as discussed in the **Caution** above.
4. For actuators with adjustable turnbuckles, adjust the turnbuckle to bring the disk to the fully closed position at the end of the actuator stroke. If necessary, refer to the appropriate actuator instruction manual for assistance.
5. If using a manual handwheel or handlever actuator, refer to the appropriate actuator instruction manual for mounting positions and adjustments.
6. To determine the fully closed disk position (zero degrees of disk rotation), measure the distances between the positions on the disk face as shown in figure 10. Use the actuator to rotate the disk while re-checking the two measurements. Repeat adjustment until the two measurements are equal.

Parts Ordering

When corresponding with your [Emerson sales office](#) about this equipment, always mention the valve serial number.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

ENVIRO-SEAL Packing Arrangements

Retrofit kits and repair kits are listed in the tables below. For additional parts and repair information, refer to the ENVIRO-SEAL Packing System for Rotary Valves instruction manual ([D101643X012](#)) or contact your Emerson sales office for assistance.

Repair Kits for ENVIRO-SEAL Packing

Repair Kits include replacement parts for key 105 and 106 for the shaft diameters listed below.

ENVIRO-SEAL Packing Repair Kits

SHAFT DIAMETER ⁽¹⁾	
mm	Inches

Parts List

Note

For part ordering information contact your [Emerson sales office](#).

Key	Description
1	Valve Body If you need a new valve body, order by valve size, serial number and desired material.
2*	Seal Retainer
3	Valve Disk, NPS 3 through 12
3	Disk/Shaft Assembly, NPS 2 only
3A	Shaft, NPS 2 only
3B	Valve Disk, NPS 2 only
3C	Taper Pin, NPS 2 only (2 req'd)
4*	Seal Ring
4C	Gasket, Included in 2-inch NOVEX Seal Ring
5*	Spring
6*	Bearing (2 req'd)
7*	Disk Spacer (2 req'd) w/ Metal Bearings, CL150 only
8*	Drive Shaft
9*	Hollow Pin
10*	Taper Pin
11	Adaptor Plate
12	Socket Head Cap Screw (4 req'd)
13*	Bearing Spacer (2 req'd) w/ Metal Bearings, CL150 only
14	Hex Head Cap Screw (4 req'd)
14	Stud Bolt (4 req'd)
15*	Backup Ring
16*	Gasket, w/ Metal and Phoenix III seals
17	Hex Socket Cap Screw
18	Mfg Label
19	Drive Screw, w/ nameplate
20	Hex Nut (4 req'd)
21	Nameplate
22	Lead Seal & Wire
23	Bottom Cap, 12-inch only
24	Bottom Cap Stud, 12-inch only
25	Bottom Cap Hex Nut, 12-inch only
27	Bottom Cap Gasket, 12-inch only
29	Flow Arrow, 3- through 12-inch
30	Retainer Clip, 2-inch only

Packing

Note

Parts in this section are listed by shaft diameter (inches).

SHAFT DIAMETER	VALVE SIZE	
	CL150	CL300

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for the Fisher 8580 valve, DN50 through DN300 or NPS 2 through NPS 12 (figure 1). Refer to separate instruction manuals for information covering the power on-off actuator and accessories.

Do not install, operate, or maintain an 8580 valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The 8580 rotary valve offers excellent throttling and quarter-turn performance. An approximately linear flow characteristic provides precise throttling control. The 8580 valve offers high cycle life and rugged reliability.

Retainer clips provide for versatility to mount and align the same wafer style valve body in different piping configurations (ASME and EN ratings). The valve body is compatible with PN 10 through PN 40, CL150, and CL300 ratings. Face-to-face dimensions meet EN 558, API 609, and MSS-SP68 standards.

The 8580 rotary valve features an eccentrically-mounted, double-offset disk with either soft or metal seal, providing capability for enhanced shutoff. The interchangeable sealing technology allows for the same valve body to accept both soft and metal seals.

Table 1. Fisher 8580 Valve Specifications

Specifications		EN	ASME
Valve Body Size		DN 50, 80, 100, 150, 200, 250, and 300	NPS 2, 3, 4, 6, 8, 10, and 12
Pressure Rating		PN 10 to 40 per EN 12516-1	CL150 / 300 per ASME B16.34, CL150 - 600 for NPS 2
Valve Body Materials		EN 1.0619 steel	WCC steel
		EN 1.4409 stainless steel	CF3M (316L) stainless steel
		CW2M ⁽¹⁾	CW2M ⁽¹⁾
		M35-2 ⁽⁴⁾	M35-2
Disk Materials	PTFE or RPTFE Seal ⁽³⁾	EN 1.4409 stainless steel	CF3M stainless steel
		CW2M	CW2M
		M35-2	M35-2
	Metal or UHMWPE ⁽²⁾ Seal	Chrome-plated EN 1.4409 Stainless Steel	Chrome-plated CF3M Stainless Steel
		Chrome-carbide EN 1.4409 Stainless Steel	Chrome-carbide CF3M Stainless Steel
End Connections		Mates with raised-face flanges per EN 1092-1	Mates with raised-face flanges per ASME B16.5
Valve Body Style		Lugged with threaded or through holes, Double-Flange with through holes, and Wafer (for select sizes)	
Face-to-Face Dimensions		Meets MSS SP68, API 609, and EN 558 standards	
Shutoff		PTFE, RPTFE, or UHMWPE seal ring - Class VI per ANSI/FCI 70-2 and IEC 60534-4	
		S31600 (316 SST) seal ring - Class IV per ANSI/FCI 70-2 and IEC 60534-4	
Flow Direction		Standard (forward flow) is with the seal retainer facing upstream; reverse flow is permissible for soft seals only	
Flow Characteristic		Approximately linear	
Disk Rotation		Counterclockwise to open (when viewed from actuator side of valve body) through 90 degrees of disk rotation	
1. This material is not listed in EN 12516-1 or ASME B16.34. See table 4 for pressure/temperature ratings. 2. UHMWPE stands for ultra high molecular weight polyethylene. 3. RPTFE is a reinforced PTFE seal. 4. This material is not listed in EN 12516-1. See table 4 for pressure/temperature ratings.			

Table 2. Valve Size, Shaft Diameter, and Approximate Weight

VALVE SIZE		PRESSURE RATING		SHAFT DIAMETER		APPROXIMATE WEIGHT

M35-2	N05500	PEEK / PTFE	PTFE or RPTFE	PTFE	-46 to 232	-50 to 450

1. Minimum allowable temperature for PN series flanges is -10°C (14°F). See requirements of EN 13445-2 Annex B for applications below -10°C (14°F) with PN series flanges.

2. For applications exceeding 427°C (800°F), consult your [Emerson sales office](#) for appropriate disk edge coating material selection.

Table 4. Maximum Allowable Inlet Pressure for CW2M and M35-2 Valves

450	185	680	133	212	331	530	130	210	325	525

1. This material is not listed in EN 12516-1 or ASME B16.34. Also see the Installation section.
2. The designations PN or 150 and 300 are used only to indicate relative pressure-retaining capabilities and are not EN or ASME pressure-temperature rating class designations.
3. This material is not listed in EN 12516-1. Also see the Installation section.

Installation

Key numbers in this procedure are shown in figure 11 unless otherwise indicated.

⚠ WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage resulting from the bursting of pressure retaining parts, be certain the service conditions do not exceed either the valve body rating or the flange joint rating, or other limits given in table 1 or on the nameplate. Use pressure-relieving or pressure-limiting devices to prevent the service conditions from exceeding these limits.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section on page 8 in this manual.

CAUTION

The valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions specified in the customer's order. Because some valve body/trim material combinations are limited in their pressure drop and temperature range capabilities, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

The maximum allowable inlet pressures for steel and stainless steel valve bodies are consistent with the pressure-temperature ratings shown in table 1, except where further limited by the trim and packing material temperature capabilities given in table 3. Valves are also available in CW2M and M35-2 valve body materials. The CW2M valve body material is not listed in EN 12516-1 or in ASME B16.34. The M35-2 valve body material is listed in ASME B16.34, but is not listed in EN 12516-1. Valve bodies constructed of these materials mate with EN and ASME flanges, but must not be installed in systems requiring conformance to EN or ASME standards if not included in EN or ASME pressure/temperature ratings. Maximum allowable inlet pressures for 8580 valve bodies made of CW2M or M35-2 construction materials are shown in table 4.

1. Install a three-valve bypass around the control valve assembly if continuous operation is necessary during inspection and maintenance of the valve body.
2. Inspect the valve body to be certain it is free of foreign material.
3. The valve is normally shipped as part of a control valve assembly, with an actuator mounted on the valve body.

If the valve body and actuator have been purchased separately or if the actuator has been removed for maintenance, mount the actuator, and adjust actuator travel before inserting the valve body into the line. This is necessary due to the measurements that must be made during the actuator adjustment process. Refer to the Actuator Mounting section on page 17 of this manual and to the separate actuator instruction manual for mounting and adjusting instructions before proceeding.

4. Inspect adjacent pipelines to be certain they are free of any foreign material, such as pipe scale or welding slag, that could damage the valve body seating surfaces.

CAUTION

Damage to the disk (key 3) will occur if any pipe flanges or piping connected to the valve body interfere with the disk rotation path. However, the disk can be rotated without interference when the valve body is installed between adjacent pipe flanges or piping that has an inside diameter equal to or greater than either schedule 80 pipe or compatible EN pipe

sizes. If piping with a smaller inner diameter than specified above is connected to the valve, measure carefully to be certain the disk rotates without interference before putting the valve into operation.

5. Flow is in the standard direction when the seal retainer (key 2) is facing upstream. Standard flow direction is also indicated by the flow direction arrow cast into the valve body. Flow in the reverse direction is permissible within allowable pressure drop limits for the soft seal. The metal seal is forward flow only.

CAUTION

8580 disk rotation is counterclockwise to open (when viewed from the actuator side of the valve body, see figure 8) through 90 degrees of disk rotation. Rotating the disk (key 3) past either the open or closed position could damage the seal and disk sealing surfaces and could cause the disk to jam in the seal retainer.

6. With the disk in the closed position, install line flange gaskets, and insert the valve between the pipeline flanges. Use either flat sheet gaskets or spiral-wound gaskets with compression-controlling centering rings. Spiral-wound gaskets without compression-controlling centering rings are not recommended for this purpose.
 7. Depending on valve size and pressure rating, the wafer style valve is centered in the pipeline using either retainer clips or the flange bolt holes. (For valves that have four flange bolt holes in the valve body (key 1), each hole engages one corresponding line flange stud.) Insert the valve between the flanges and use either the retainer clips or install two or more line flange studs into the line flanges to help hold the valve in position while centering the valve. Carefully center the valve on the flanges to ensure disk clearance.
- Select and install two pipeline gaskets.

Note

Lubricate line flange studs before inserting them into flanges. If necessary, provide additional support for the control valve assembly because of its combined weight.

⚠ WARNING

For lugged valve bodies with threaded line bolt holes, personal injury and property damage could result from sudden release of process pressure if line bolts are not properly installed. To ensure proper line bolt thread engagement, line studs must be centered in the threaded section of the valve body so that each stud has equal thread engagement in the body. See figure 2.

8. After centering the valve body, first lubricate and then install the remaining line flange bolting to secure the valve in the pipeline. Tighten the nuts to the line flange studs in a crisscross pattern to ensure proper alignment of valve, gaskets, and flanges.

⚠ WARNING

An 8580 valve body is not necessarily grounded when installed in a pipeline. If the valve is used in a flammable or hazardous atmosphere or for oxygen service, an explosion could result due to a discharge of static electricity from the valve components. To avoid personal injury or property damage, always make sure the valve body is grounded to the pipeline before putting the control valve assembly into operation in a flammable or hazardous atmosphere.

Figure 3. Stud Bolts for Installation (also see table 6)

Figure 4. Optional Shaft-to-Valve Body Bonding Strap Assembly

Note

Standard packings for the 8580 valve are composed of all conductive packing rings (graphite ribbon packing) or partially conductive packing rings (such as a carbon-filled PTFE female adaptor with PTFE V-ring packing) to electrically bond the shaft to

the valve body for hazardous area service. For oxygen service applications, provide alternate shaft-to-valve body bonding according to the following step.

9. For oxygen service applications, attach the bonding strap assembly (key 131, figure 4) to the shaft with the clamp (key 130, figure 4), and connect the other end of the bonding strap assembly to the valve body with the cap screw (key 35). Secure each cap screw with a hex nut (key 36).

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however, the packing might require some re-adjustment to meet specific service conditions.

Valves with ENVIRO-SEALT™ packing systems will not require this initial re-adjustment. See ([D101643X012](#)) for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the parts kit sub-section on page 20 of this manual.

Maintenance

Valve body parts are subject to normal wear and must be inspected regularly and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions. Instructions are given in this section for: replacing trim components, changing disk rotation or valve action, and mounting and adjusting the actuator.

As used in these instructions, actuator refers to power actuators (such as pneumatic diaphragm, piston actuators, and rack and pinion actuators).

⚠ WARNING

Avoid personal injury and property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any spring precompression.
- Use lock-out procedures to be sure the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Packing Maintenance

Refer to figure 5 for available packing configurations. All maintenance operations in this section may be performed with the valve in the line. Packing may be PTFE V-ring or graphite.

An ENVIRO-SEAL packing system is also available with the 8580 valve. To install the ENVIRO-SEAL packing system in an existing valve, follow the instructions in the instruction manual included with the packing system ([D101643X012](#)). To remove packing parts in a valve with the ENVIRO-SEAL packing system, follow the procedures for valves with the ENVIRO-SEAL packing system in this section. Install the replacement packing following the instructions in the packing system instruction manual (D101643X012).

Stopping Leakage

For valves with PTFE or graphite packing:

CAUTION

Tighten the packing flange only enough to prevent shaft leakage. Excessive tightening will only accelerate wear of the packing and could produce higher torques on the valve.

Leakage around the packing followers can be stopped by tightening the packing flange nuts (key 28, figure 11).

If the packing is relatively new and tight on the shaft, and if tightening the packing flange nuts does not stop leakage, the shaft may be worn or nicked so that a seal cannot be made. If the leakage comes from the outside diameter of the packing, the leakage may be caused by nicks or scratches around the packing box wall. Inspect the shaft and packing box wall for nicks and scratches when performing the packing replacement procedures.

For valves with the ENVIRO-SEAL packing system:

Optimum performance of the ENVIRO-SEAL packing system is obtained when the Belleville springs are tightened to their “target load.” The target load is the point where the springs are compressed to 85% of their maximum deflection, or nearly flat. Maximum deflection is when the springs are 100% compressed, or completely flat.

Under normal conditions, the packing nuts should not require re-tightening. However, when servicing, if the springs do not remain at the target load of 85% compression, retighten the packing box nuts according to the following procedure:

Figure 5. Packing Arrangement Details

NOTES:

1. WITH CONDUCTIVE PACKING, THE FEMALE ADAPTOR IN PTFE V-RING PACKING IS CARBON-FILLED PTFE.
2. APPLY LUBRICANT.
3. THESE TWO SURFACES SHOULD REMAIN PARALLEL AS YOU ALTERNATELY AND EVENLY TIGHTEN THE PACKING NUTS (KEY 28).

1. Tighten the packing flange nuts alternately and evenly, keeping the packing flange parallel with the valve flange (see figure 5), until the Belleville springs are compressed 100% (or completely flat).

- For PTFE packing, loosen each packing flange nut one half turn (180° of rotation).
- For Graphite packing, loosen each packing flange nut one quarter turn (90° of rotation).

The target load of 85% compression has now been reached. If leakage continues, replace the packing components as described in the following procedures.

Replacing the Packing

To replace the packing, the actuator must be removed. Also, the valve should be removed from the pipeline to allow proper readjustment of the disk position.

⚠ WARNING

The edges of a rotating disk have a shearing effect that may result in personal injury. To help prevent such injury, stay clear of the disk edges when rotating the disk (key 3).

CAUTION

Damage to the disk (key 3) may occur if the disk is not closed when the valve is being removed from the pipeline. If necessary, apply operating pressure to the actuator temporarily to retain the disk in the closed position while removing the valve from the pipeline.

For valves with PTFE or graphite packing:

Key numbers in this procedure are shown in figure 11 unless otherwise indicated.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shutoff all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure the above measures stay in effect while you work on the equipment.

CAUTION

When removing the actuator in the following step, use a wheel puller to separate the actuator parts from the valve shaft. Do not drive the actuator parts off the valve shaft because this could damage valve trim components.

2. Remove the actuator per instructions in separate actuator instruction manuals, then remove the cap screws and nuts (keys 35 and 36). Remove the clamp (key 130, figure 4) if the strap (key 131, figure 4) is used.
3. Remove the packing flange nuts and the packing flange (key 26) if used and pull out the packing follower (key 25).
4. Remove the anti-blowout ring (key 40) from the drive shaft (key 10).
5. Remove the old packing rings (key 24) and, if used, the packing washers (key 31). Carefully avoid scratching the shaft or packing box wall to avoid damage that could cause leakage around the shaft. Clean all accessible metal parts and surfaces to remove particles that would prevent the packing from sealing.

⚠ WARNING

Do not lubricate parts when used in oxygen service, or where the lubrication is incompatible with the process media. Any use of lubricant can lead to the sudden explosion of media due to the oil/oxygen mixture, causing personal injury or property damage.

6. Use the appropriate procedures below for installing packing.

- Install the packing as shown in figure 5.
- With graphite ribbon packing, stack the packing rings and packing washers together, and slide the stack into the packing box as far as it will go while carefully avoiding trapping air between the rings.

- Install the anti-blowout ring (key 40) in the groove on the drive shaft (key 10).
 - Install the packing follower and, if used, the packing flange.
 - Install the packing flange nuts, and tighten them only far enough to stop leakage under normal operating conditions.
 - For oxygen service applications, attach the bonding strap assembly (key 131, figure 4) to the shaft with the clamp (key 130, figure 4), and connect the other end of the bonding strap assembly to the valve body with a cap screw (key 35). Secure each cap screw with a hex nut (key 36).
7. Mount the actuator and adjust the closed position of the valve, per the Actuator Mounting section on page 17 of this manual, before returning the valve to service.
 8. When placing the control valve into operation, check around the packing follower for leakage; retighten the packing flange nuts as required according to accepted bolting procedures.

For valves with ENVIRO-SEAL packing systems:

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shutoff all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

CAUTION

When removing the actuator, use a wheel puller to separate the actuator parts from the valve shaft. Do not drive the actuator parts off the valve shaft because this could damage valve trim components.

2. Remove the actuator per instructions in separate actuator instruction manuals, then remove the cap screws and nuts (keys 35 and 36). Remove the clamp (key 130, figure 4) if the strap (key 131, figure 4) is used.
3. Loosen the two packing hex nuts evenly to remove spring tension, then remove the nuts.
4. Remove the packing flange and spring pack assembly. The spring pack assembly consists of the spring stack and packing follower. The spring stack is retained on the packing follower by an O-ring. Remove the anti-blowout ring (key 40) from the driveshaft (key 10). Remove the anti-extrusion washer, the packing set, and the packing ring.

CAUTION

The valve shaft surface condition is critical in making and maintaining a good seal. If the valve shaft surface is scratched, nicked, dented, or worn, replace the valve shaft before replacing the packing system.

5. Inspect the existing valve shaft. If necessary, replace the valve shaft as described in the Replacing the Disk, Shafts, or Bearings section.
6. Install the new packing system components as described in the ENVIRO-SEAL Packing System for Rotary Valves Instruction Manual ([D101643X012](#)).
7. Install the anti-blowout ring (key 40) onto the drive shaft (key 10) before installing the packing follower.
8. Mount the actuator and adjust the closed position of the valve, per the Actuator Mounting section on page 17 of this manual, before returning the valve to service.

Replacing the Seal Ring Assembly

Perform this procedure only if the control valve is not shutting off properly (that is, leaking downstream). This procedure does not require removing the actuator from the valve body.

Key numbers in this procedure are shown in figure 11 unless otherwise indicated.

1. Isolate the control valve from line pressure, and relieve pressure from the valve body. Shut off and disconnect all lines from the power actuator.

⚠ WARNING

The edges of a rotating disk have a shearing effect that may result in personal injury. To help prevent such injury, stay clear of the disk edges when rotating the disk (key 3).

CAUTION

Damage to the disk (key 3) may occur if the disk is not closed when the valve is being removed from the pipeline. If necessary, apply operating pressure to the actuator temporarily to retain the disk in the closed position while removing the valve from the pipeline.

2. Unscrew the flange bolts, and remove the valve from the pipeline.
3. Unscrew the machine screws (key 14), remove the retainer clip (key 13), and remove the seal retainer (key 2).
4. Remove the seal ring assembly (key 4).
5. The valve must be closed during seal ring installation to permit accurate centering of the seal. To install the new seal ring assembly:
 - For a soft seal, if the spring (key 5) was disassembled, hook the spring ends together. Work the spring into the recess in the seal ring (key 4). Place the seal ring assembly onto the disk. Set the retainer onto the seal, making sure proper alignment between the seal and retainer has been achieved.
 - For the metal seal ring assembly, place the seal ring assembly onto the disk. Set the retainer onto the seal, making sure proper alignment between the seal and retainer has been achieved.
6. Attach the seal retainer (key 2) and the retainer clips (key 13) to the valve body and secure with the machine screws (key 14).
7. Be certain the disk is closed before installing the valve according to the Installation section on page 4 of this manual.

Replacing the Disk, Shafts, or Bearings

Key numbers in this procedure are shown in figure 11 unless otherwise indicated.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shutoff all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

CAUTION

When removing the actuator in the following step, use a wheel puller to separate the actuator parts from the valve shaft. Do not drive the actuator parts off the valve shaft because this could damage valve trim components.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

8580 Valve

April 2020

Instruction Manual

D103300X012

- Remove the actuator per instructions in separate actuator instruction manuals, then remove the cap screws and nuts (keys 35 and 36). Remove the clamp (key 130, figure 4) if the strap (key 131, figure 4) is used.
- Remove the packing flange nuts and the packing flange (key 26) if used and pull out the packing follower (key 25).

Figure 6. Orientation of Bearing Tabs

Table 6. Follower Shaft Internal Threads

VALVE SIZE		THREAD SIZE
DN	NPS	
50	2	M8 X 1.25
80	3	M10 X 1.50
100	4	M12 X 1.75
180	6	M16 X 2.00
200	8	M20 X 2.50 ⁽¹⁾
250	10	M20 X 2.50 ⁽¹⁾
300	12	M24 X 3.00 ⁽¹⁾

1. For valves with a two-piece, split-shaft design only. DN200 – 300 (NPS 8–12) valves changed to a one-piece, through-shaft design in 2015.

Table 7. Recommended Blind Flange Bolt Torque

VALVE SIZE		TORQUE	
DN	NPS	N•m	lbf•ft
50 to 150	2 to 6	9.5	7.0
200, 250	8, 10	23	17
300	12	45	33

Disassembly

1. Remove the seal ring assembly according to steps 3 and 4 of the Replacing Seal Ring section on page 12 of this manual.
2. Remove hex nuts, blind flange, gasket, spacer (if present), follower spring seats, and follower spring (keys 19, 17, 16, 15, 9, and 12).
3. Clean the gasket surfaces on the blind flange (key 17) and on the end of the valve body (key 1).
4. Rotate the disk (key 3) to the fully open position.
5. Refer to figure 7 and determine the location of the smaller end of the taper pins (key 8). Drive out the taper pins and expansion pins (key 7) towards the larger end.

⚠ WARNING

Once the shafts have been removed in the following step, the disk may fall from the valve body. To avoid personal injury and disk damage, support the disk to prevent it from falling as the shafts are being removed.

6. For valves with a two-piece, split shaft, pull the follower shaft (key 11) out through the outboard end of the valve body. If the follower shaft cannot be pulled free, the end of the follower shaft is internally threaded (see table 6) for screwing in a bolt or stud to aid in pulling the follower shaft.
7. Pull the drive shaft (key 10) out through the actuator end of the valve body and remove the anti-blowout ring (key 40) from the drive shaft.
8. Remove the disk (key 3) from the valve body.
9. Remove the packing (key 24, figure 5) and the packing box ring (key 23, figure 5).
10. If either of the bearings (key 6) require replacement, remove them.
11. Clean the packing box and [metal packing box parts].

Assembly

⚠ WARNING

Do not lubricate bearings that will be used for oxygen service, or where the lubrication is incompatible with the process media. Any use of lubricant can lead to the sudden explosion of media due to the oil/oxygen mixture, causing personal injury or property damage.

CAUTION

To avoid possible product damage, ensure the bearing tabs are oriented correctly when installing in the following procedure. See figure 6 for proper orientation of the bearings.

1. If new bearings (key 6) are required, install and orient them in the valve body, as shown in figure 6. Ensure the bearings are fully seated, contacting the inside diameter of the valve body.
2. Insert the disk into the valve body as shown in figure 7, ensuring the “T” stamped on the disk hub is oriented toward the actuator end of the valve body.
3. Install the drive shaft (key 10) through the valve body into the disk. The disk/shaft connection utilizes taper and expansion pins. The hole for the drive shaft connection is slightly off-center to prevent the drive shaft from being

installed in the wrong orientation. Orient the position indication mark on the end of the shaft with the face of the disk as shown in figure 8. For assemblies using a two-piece, split shaft, the hole for the follower shaft connection is on-center. Insert the expansion pins into the disk until they are seated, as shown in figure 7. Once in place, insert the taper pins. The taper pins must be driven into the disk/shaft/expansion pin assemblies until “solid contact” is felt. “Solid contact” can be identified by the sound of the hammer blow and the bounce felt in the hammer. NPS 8-12 valves changed to a one-piece, through-shaft design in October 2015 and utilize only one pin connection. NPS 8-12 valves shipped prior to October 2015 used a two-piece, split-shaft design with two pin connections - same as the NPS 2-6 valves.

Figure 7. Taper / Expansion Pin Installation

NOTES:
1 INSTALL THE PINS FROM THIS SIDE OF THE DISK.

4. Reinstall the follower spring/spring seat assembly (keys 9, 12, and 9, figure 9) inside the follower shaft or follower side of the drive shaft for valves with a one-piece, through-shaft design.
5. Install the spacer (key 15) if used, and the gasket, blind flange, and hex nuts (keys 16, 17, and 19). Ensure the blind flange is oriented so the serrations face the gasket and valve body. Tighten the hex nuts (key 19) per table 7.
6. The valve must be closed during seal ring installation to permit accurate centering of the seal. To install the new seal ring assembly or flow ring:

Table 8. Recommended Actuator-Mounting Bolt Torque

VALVE SIZE		TORQUE	
DN	NPS	N•m	lbf•ft.
50, 80, 100, and 150	2, 3, 4, and 6	120	88
200, 250, and 300	8, 10, and 12	250	185

- For a soft seal, if the spring (key 5) was disassembled, hook the spring ends together. Work the spring into the recess in the seal ring (key 4). Place the seal ring assembly onto the disk. Set the retainer onto the seal, making sure proper alignment between the seal and retainer has been achieved.
 - For the metal seal ring assembly, place the seal ring assembly onto the disk. Set the retainer onto the seal.
 - For the flow ring construction, place the gasket (key 41) onto the valve body. Set the retainer onto the gasket.
7. Attach the seal retainer (key 2) and the retainer clips (key 13) to the valve body and secure with the machine screws (key 14).
 8. Insert a packing box ring (key 23) into the packing box.

Figure 8. Sectional of Typical Valve Body

9. For **standard packing**, install the packing according to the appropriate instructions presented in step 5 of the Replacing Packing section on page 11 of this manual.
For **ENVIRO-SEAL packing**, install the new packing system components as described in [D101643X012](#).
10. Install the anti-blowout ring (key 40) in the groove in the drive shaft.
11. Rotate the disk to the approximate closed position.
12. Mount and adjust the actuator per the following Actuator Mounting section on page 17 of this manual.

Actuator Mounting

With the valve body out of the line, mount the actuator on the valve body in accordance with the instructions in the actuator instruction manual. Mount the actuator yoke to the valve body, and tighten the actuator-mounting cap screws and nuts (keys 35 and 36) to the appropriate torque from table 8.

Key numbers in this procedure are shown in figure 11 unless otherwise indicated.

1. Determine the actuator mounting style and position from figure 10.

Figure 9. Follower Spring/Spring Seat Assembly

CAUTION

8580 valve disk rotation is counterclockwise to open (when viewed from the actuator side of the valve body, see figure 8). Rotating the disk (key 3) past the fully closed position will damage the seal ring (key 4). To prevent this damage, use the following procedures:

- For actuators with adjustable travel stops, such as a Fisher 2052, 1051/1052 size 33, 1066 or 1066SR actuator, make certain the actuator travel stop prevents the disk from rotating past the fully closed position.
- For actuators with an adjustable turnbuckle, such as the Fisher 1051/1052 size 40, 60, and 70, or 1061 actuator, the turnbuckle must be adjusted so that the valve is closed when the diaphragm plate or piston is against the actuator travel stop.

2. Adjust the actuator to bring the disk to the fully closed position at the end of the actuator stroke. To determine the fully closed disk position, measure the distances between the disk face and the seal retainer face at the top and bottom of the valve (X1 and X2) as shown in figure 8. Adjust the travel stops or turnbuckle to rotate the disk slightly until the two measurements are within 0.8 mm (0.032 inch) of each other. Refer to the appropriate actuator instruction manual for assistance.

Parts Ordering

When corresponding with your [Emerson sales office](#) about this equipment, always mention the valve serial number.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts Kits

Retrofit Kits for ENVIRO-SEAL Packing

Retrofit kits are available for replacing the packing in an existing valve with an ENVIRO-SEAL packing system. These kits are available for single PTFE or graphite packing. All parts required for installation of the ENVIRO-SEAL packing system into an existing 8580 valve are included in the kits.

Worn shafts, packing box damage, or other components that do not meet Emerson Automation Solutions finish specifications, dimensional tolerances, and design specifications, may adversely alter the performance of the retrofit kit.

ENVIRO-SEAL Packing System Retrofit Kits

SHAFT DIAMETER		SINGLE PTFE PACKING	GRAPHITE PACKING
mm	Inches		
12.7	1/2	RPACKXRT482	RPACKXRT422
15.9	5/8	RPACKXRT492	RPACKXRT432

X0955-1

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for the Fisher 8590 valve, NPS 3 through NPS 24 (figure 1). Refer to separate instruction manuals for information covering the power actuator and accessories.

Do not install, operate, or maintain an 8590 valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. **To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings.** If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The Fisher 8590 High-Performance Butterfly Valve maintains tight shutoff, and can be specified for a wide range of pressure and temperature conditions.

The 8590 valve is available in a lugged or double flanged body design. A splined shaft can combine with a variety of spring-and-diaphragm or pneumatic piston actuators. A square or keyed shaft can combine with a variety of hand levers, handwheels, or pneumatic piston actuators. These combinations help make the 8590 valve a reliable, high-performance butterfly valve for both throttling and on-off applications in the process industries.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

8590 Valve

January 2019

Instruction Manual

Table 1. Fisher 8590 Valve Specifications

Specifications	ASME
Valve Body Size	NPS 3, 4, 6, 8, 10, 12, 14, 16, 18, 20, 24
Pressure Rating	CL600 per ASME B16.34
Valve Body Materials	WCC or CF8M (std)
	LCC, CD3MN, M35-2, and CW2M
Disk Materials	CF8M (std), CD3MN, M35-2, and CW2M
Disk Edge Coating	Chrome Plate (std)
	Chrome Coat
	Chromium Carbide Coating
End Connections	Mates with RF Flanges per ASME B16.5 Optional construction mates with RTJ Flanges per ASME B16.5
Valve Body Style	Lugged (Single Flange), Lugged with drilled through flange holes, Double Flanged with through holes
Shaft Connection Style	NPS 3-24: Splined (std) NPS 3-12: Square NPS 14-24: Keyed
Face-to-Face Dimensions	Meets MSS SP68, API 609, ASME B16.10, and EN 558 standards
Shutoff	Soft Seal: Class VI
	Metal Seal: Class IV, reverse direction only
	Phoenix III Seal: Class VI; reverse direction preferred, forward direction optional
	High Pressure Seal: Class VI, reverse direction only
Flow Direction	Standard (reverse flow) is with the flow into the shaft side of the disk
Flow Characteristic	Linear
Disk Rotation	Clockwise (CW) to close

1. Fisher actuator

Figure 2. Available Seal Configurations

E0578

Notes:

- ① This unidirectional seal must be installed so that the retaining ring is downstream from the high pressure side of the valve at shutoff, as shown.
- ② For this bidirectional seal, the "preferred" valve orientation places the retaining ring downstream from the high pressure side of the valve at shutoff.
- ③ NPS 3 only.

Table 3. Maximum Allowable Inlet Pressure for CW2M Valves

TEMPERATURE	CW2M ⁽¹⁾
	600 ⁽²⁾
	Bar
°C	
-29 to 38	103.4
93	103.4
149	100.3
204	96.2
260	91.7
316	83.4
371	78.3
427	70.0
482	62.1
538	50.0
°F	Psig
-20 to 100	1500
200	1500
300	1455
400	1395
500	1330
600	1210
700	1135
800	1015
900	900
1000	725

1. This material is not listed in ASME B16.34. Also see the Installation section.

2. The designation 600 is used only to indicate relative pressure-retaining capabilities and is not an ASME pressure-temperature rating class designation.

	ENVIRO-SEAL Graphite	-198 to 371	-325 to 700

1. The maximum temperature for a standard design of the 8590 valve is 538°C (1000°F). Contact your [Emerson sales office](#) for use in higher temperature applications.
2. For use with soft seal only.

Installation

Key numbers in this procedure are shown in figures 13, 14, and 15 unless otherwise indicated.

⚠ WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage resulting from the bursting of pressure retaining parts, be certain the service conditions do not exceed either the valve body rating or the flange joint rating, or other limits given in table 4 or on the nameplate. Use pressure-relieving or pressure-limiting devices to prevent the service conditions from exceeding these limits.

If installing into an existing application, also refer to the warning at the beginning of the Maintenance section on page 10 in this manual.

CAUTION

The valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions specified in the customer's order. Because some valve body/trim material combinations are limited in their pressure drop and temperature range capabilities, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

The maximum allowable inlet pressures for steel and stainless steel valve bodies are consistent with the pressure-temperature ratings shown in table 1, except where further limited by the trim and packing material temperature capabilities given in table 4. Valves are also available in CW2M valve body materials. The CW2M valve body material is not listed in ASME B16.34. Valve bodies constructed of this material mates with ASME flanges, but must not be installed in systems requiring conformance to ASME standards if not included in ASME pressure/temperature ratings. Maximum allowable inlet pressures for 8590 valve bodies made of CW2M construction materials are shown in table 3.

1. Install a three-valve bypass around the control valve assembly if continuous operation is necessary during inspection and maintenance of the valve body.
2. Inspect the valve body to be certain it is free of foreign material.
3. The valve is normally shipped as part of a control valve assembly, with an actuator mounted on the valve body.

If the valve body and actuator have been purchased separately or if the actuator has been removed for maintenance, mount the actuator, and adjust actuator travel to close the valve before inserting the valve body into the line. This is necessary due to the measurements that must be made during the actuator adjustment process. Refer to the Actuator Mounting section on page 22 of this manual and to the separate actuator instruction manual for mounting and adjusting instructions before proceeding.

4. Inspect adjacent pipelines to be certain they are free of any foreign material, such as pipe scale or welding slag, that could damage the valve body seating surfaces.

CAUTION

Damage to the disk (key 6) will occur if any pipe flanges or piping connected to the valve body interfere with the disk rotation path. However, the disk can be rotated without interference when the valve body is installed between adjacent pipe flanges or piping that has an inside diameter equal to or greater than either schedule 80 pipe or compatible EN pipe sizes. If piping with a smaller inner diameter than specified above is connected to the valve, measure carefully to be certain the disk rotates without interference before putting the valve into operation.

5. Flow is in the standard direction when the seal retainer (key 16) is facing downstream. Standard flow direction is also indicated by the flow direction arrow cast into the valve body. Flow in the forward direction is permissible within allowable pressure drop limits with the proper seal.

CAUTION

8590 disk rotation is counterclockwise to open (when viewed from the actuator side of the valve body, see figure 12) through 90 degrees of disk rotation.

6. With the disk in the closed position, install line flange gaskets, and insert the valve between the pipeline flanges. Use either flat sheet gaskets or spiral-wound gaskets with compression-controlling centering rings. Spiral-wound gaskets without compression-controlling centering rings are not recommended for this purpose.

Lifting Guidelines

Threaded holes for lifting are standard on the NPS 3 - 24 valve bodies. It is required that swivel hoists rings be used to lift the valve or valve and actuator assembly. An eyebolt cannot accommodate all lifting angles required to install or maintain the valve. The load carrying capability of an eyebolt decreases dramatically if used in any other orientation than axially. Therefore, the use of eyebolts is not permitted.

CAUTION

Care must be taken when lifting the valve/actuator assembly to ensure the accessories and tubing are not damaged in the process. The valve weight is listed in table 2. For the actuator weight, refer to the appropriate instruction manual. Make sure to use appropriate lifting straps/hoists capable of lifting this combined weight.

⚠ WARNING

Avoid personal injury or property damage caused by uncontrolled movement or dropping of the valve assembly.

Ensure the disk is secure from rotating during lifting process. Failure to do so could result in personal injury if the disk rotates uncontrolled during lifting.

Swivel Hoist rings are sized to lift only the valve and actuator. Do not attach piping or other structures to the valve and actuator assembly when lifting with swivel hoists rings.

Take appropriate precautions to avoid unbalanced loading which may result in sudden swinging or movement of the assembled unit, including additional lifting and/or support methods when necessary.

Do not use eyebolts when lifting the valve or valve and actuator assembly due to variable loading angles inherent to valve maintenance and installation.

Failure to utilize safe lifting practices may result in equipment damage and/or personal injury.

Lifting Valve/Actuator Assembly

To lift the assembly, install swivel hoist rings into one or two of the threaded holes on the valve body (see figure 3). Thread sizes are listed in table 5. When lifting the valve and actuator assembly, a strap around the actuator may be required to ensure lifting stability. If straps are used on the actuator, ensure the lifting location is above the center of gravity (CG) for the actuator to prevent load shifting during lifting. Refer to the appropriate assembly drawings for the CG for your assembly.

Lifting Valve Only

To lift the valve, insert two swivel hoist rings into the body. Thread sizes are listed in table 5. Ensure the valve is closed and that the packing is tightened to prevent shaft rotation during lifting. Without an actuator, the valve disk is free to rotate if enough momentum is generated during the lifting process by a sudden stop. The packing and seal friction should prevent the disk from rotating; however take proper precaution when lifting the valve.

7. Insert the valve between the flanges and install two or more line flange studs into the line flanges to help hold the valve in position while centering the valve. Carefully center the valve on the flanges to ensure disk clearance.

Note

Lubricate line flange studs before inserting them into flanges. If necessary, provide additional support for the control valve assembly because of its combined weight.

Figure 5. Stud Bolts for Installation (also see table 7)

Figure 6. Double Flange Stud Bolts for Installation (also see table 8)

⚠ WARNING

For lugged valve bodies with threaded line bolt holes, personal injury and property damage could result from sudden release of process pressure if line bolts are not properly installed. To ensure proper line bolt thread engagement, line studs must be centered in the threaded section of the valve body so that each stud has equal thread engagement in the body. See figure 5.

8. After centering the valve body, first lubricate and then install the remaining line flange bolting to secure the valve in the pipeline. Tighten the nuts to the line flange studs in a crisscross pattern to ensure proper alignment of valve, gaskets, and flanges.

⚠ WARNING

An 8590 valve body is not necessarily grounded when installed in a pipeline. If the valve is used in a flammable or hazardous atmosphere or for oxygen service, an explosion could result due to a discharge of static electricity from the valve components. To avoid personal injury or property damage, always make sure the valve body is grounded to the pipeline before putting the control valve assembly into operation in a flammable or hazardous atmosphere.

Note

Standard packings for the 8590 valve are composed of all conductive packing rings (graphite ribbon packing) or partially conductive packing rings (such as a carbon-filled PTFE female adaptor with PTFE V-ring packing) to electrically bond the shaft to the valve body for hazardous area service. For oxygen service applications, provide alternate shaft-to-valve body bonding according to the following step.

9. For oxygen service applications, attach the bonding strap assembly (key 34, figure 7) to the shaft with the clamp (key 33, figure 7), and connect the other end of the bonding strap assembly to the valve body with the cap screw (key 31).

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however, the packing might require some readjustment to meet specific service conditions.

Figure 7. Optional Shaft-to-Valve Body Bonding Strap Assembly

Valves with ENVIRO-SEAL packing systems will not require this initial re-adjustment. See ENVIRO-SEAL Packing System for Rotary Valves Instruction Manual ([D101643X012](#)) for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the parts kit sub-section on page 23 of this manual.

Maintenance

Valve body parts are subject to normal wear and must be inspected regularly and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions. Instructions are given in this section for: replacing trim components, changing disk rotation or valve action, and mounting and adjusting the actuator.

As used in these instructions, actuator refers to power actuators (such as pneumatic diaphragm, piston actuators, and rack and pinion actuators).

⚠ WARNING

Avoid personal injury and property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any spring precompression.
- Use lock-out procedures to be sure the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Figure 8. Packing Arrangement Details

NOTES:

1. WITH CONDUCTIVE PACKING, THE FEMALE ADAPTOR IN PTFE V-RING PACKING IS CARBON-FILLED PTFE.

Packing Maintenance

Refer to figure 8 for available packing configurations. All maintenance operations in this section may be performed with the valve in the line. Packing may be PTFE V-ring or graphite.

An ENVIRO-SEAL packing system is also available with the 8590 valve. To install the ENVIRO-SEAL packing system in an existing valve, follow the instructions in the instruction manual included with the packing system ([D101643X012](#)). To remove packing parts in a valve with the ENVIRO-SEAL packing system, follow the procedures for valves with the ENVIRO-SEAL packing system in this section. Install the replacement packing following the instructions in the packing system instruction manual (D101643X012).

Stopping Leakage

For valves with PTFE or graphite packing:

CAUTION

Tighten the packing flange only enough to prevent shaft leakage. Excessive tightening will only accelerate wear of the packing and could produce higher torques on the valve.

Leakage around the packing followers can be stopped by tightening the packing flange nuts (key 27).

If the packing is relatively new and tight on the shaft, and if tightening the packing flange nuts does not stop leakage, the shaft may be worn or nicked so that a seal cannot be made. If the leakage comes from the outside diameter of the packing, the leakage may be caused by nicks or scratches around the packing box wall. Inspect the shaft and packing box wall for nicks and scratches when performing the packing replacement procedures.

For valves with the ENVIRO-SEAL packing system:

Optimum performance of the ENVIRO-SEAL packing system is obtained when the Belleville springs are tightened to their “target load.” The target load is the point where the springs are compressed to 85% of their maximum deflection, or nearly flat. Maximum deflection is when the springs are 100% compressed, or completely flat.

Under normal conditions, the packing nuts should not require re-tightening. However, when servicing, if the springs do not remain at the target load of 85% compression, retighten the packing box nuts according to the following procedure:

1. Tighten the packing flange nuts alternately and evenly, keeping the packing flange parallel with the valve flange (see figure 8), until the Belleville springs are compressed 100% (or completely flat).
 - For PTFE packing, loosen each packing flange nut one half turn (180° of rotation).
 - For Graphite packing, loosen each packing flange nut one quarter turn (90° of rotation).

The target load of 85% compression has now been reached. If leakage continues, replace the packing components as described in the following procedures.

Replacing the Packing

To replace the packing, the actuator must be removed. Also, the valve should be removed from the pipeline to allow proper readjustment of the disk position.

⚠ WARNING

The edges of a rotating disk have a shearing effect that may result in personal injury. To help prevent such injury, stay clear of the disk edges when rotating the disk (key 6).

CAUTION

Damage to the disk (key 6) may occur if the disk is not closed when the valve is being removed from the pipeline. If necessary, apply operating pressure to the actuator temporarily to retain the disk in the closed position while removing the valve from the pipeline.

For valves with PTFE or graphite packing:

Key numbers in this procedure are shown in figures 13, 14, and 15 unless otherwise indicated.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shutoff all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure the above measures stay in effect while you work on the equipment.

CAUTION

When removing the actuator in the following step, use a wheel puller to separate the actuator parts from the valve shaft. Do not drive the actuator parts off the valve shaft because this could damage valve trim components.

2. Remove the actuator per instructions in separate actuator instruction manuals, then remove the cap screws (key 31). Remove the clamp (key 33, figure 7) if the strap (key 34, figure 7) is used.
3. Remove the packing flange nuts (key 27) and the packing flange (key 25) and pull out the packing follower (key 24).
4. Remove the anti-blowout ring, if used (NPS 3-8) (key 23) from the drive shaft (key 7).
5. Remove the old packing rings (key 22) and the packing box ring (key 21). Carefully avoid scratching the shaft or packing box wall to avoid damage that could cause leakage around the shaft. Clean all accessible metal parts and surfaces to remove particles that would prevent the packing from sealing.

⚠ WARNING

Do not lubricate parts when used in oxygen service, or where the lubrication is incompatible with the process media. Any use of lubricant can lead to the sudden explosion of media due to the oil/oxygen mixture, causing personal injury or property damage.

6. Use the appropriate procedures below for installing packing.
 - Install the packing as shown in figure 8. For NPS 3-8, two packing box rings (key 21) are used on the top and bottom of the packing set (see figures 8, 13, and 14 for details). For NPS 10-24, only one packing box ring (key 21) is used on the bottom of the packing set, at the end closest to the disk (see figure 15 for details).
 - With graphite ribbon packing, stack the packing rings and packing washers together, and slide the stack into the packing box as far as it will go while carefully avoiding trapping air between the rings.
 - Install the anti-blowout ring, if used (NPS 3-8) (key 23) in the groove on the drive shaft (key 7).
 - Install the packing follower and the packing flange.
 - Install the packing flange nuts, and tighten them only far enough to stop leakage under normal operating conditions.
 - For oxygen service applications, attach the bonding strap assembly (key 34, figure 7) to the shaft with the clamp (key 33, figure 7), and connect the other end of the bonding strap assembly to the valve body with a cap screw (key 31).
7. Mount the actuator and adjust the closed position of the valve, per the Actuator Mounting section on page 22 of this manual, before returning the valve to service.
8. When placing the control valve into operation, check around the packing follower for leakage; retighten the packing flange nuts as required according to accepted bolting procedures.

For valves with ENVIRO-SEAL packing systems:

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shutoff all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

CAUTION

When removing the actuator, use a wheel puller to separate the actuator parts from the valve shaft. Do not drive the actuator parts off the valve shaft because this could damage valve trim components.

2. Remove the actuator per instructions in separate actuator instruction manuals, then remove the cap screws (key 31). Remove the clamp (key 33, figure 7) if the strap (key 34, figure 7) is used.
3. Loosen the two packing hex nuts evenly to remove spring tension, then remove the nuts.
4. Remove the packing flange and spring pack assembly. The spring pack assembly consists of the spring stack and packing follower. The spring stack is retained on the packing follower by an O-ring. Remove the anti-blowout ring, if used (NPS 3-8) (key 23) from the drive shaft (key 7). Remove the anti-extrusion washer, the packing set, and the packing ring.

CAUTION

The valve shaft surface condition is critical in making and maintaining a good seal. If the valve shaft surface is scratched, nicked, dented, or worn, replace the valve shaft before replacing the packing system.

5. Inspect the existing valve shaft. If necessary, replace the valve shaft as described in the Replacing the Disk, Shafts, or Bearings section.
6. Install the new packing system components as described in the ENVIRO-SEAL Packing System for Rotary Valves Instruction Manual ([D101643X012](#)). For NPS 3-8, two packing box rings (key 21) are used on the top and bottom of the packing set (see figures 8, 13, and 14 for details). For NPS 10-24, only one packing box ring (key 21) is used on the bottom of the packing set, at the end closest to the disk (see figure 15 for details).
7. Install the anti-blowout ring, if used (NPS 3-8) (key 23) onto the drive shaft (key 7) before installing the packing follower.
8. Mount the actuator and adjust the closed position of the valve, per the Actuator Mounting section on page 22 of this manual, before returning the valve to service.

Replacing the Seal Ring Assembly

Perform this procedure only if the control valve is not shutting off properly (that is, leaking downstream). This procedure does not require removing the actuator from the valve body.

Key numbers in this procedure are shown in figures 13, 14, and 15 unless otherwise indicated.

1. Isolate the control valve from line pressure, and relieve pressure from the valve body. Shut off and disconnect all lines from the power actuator.

⚠ WARNING

The edges of a rotating disk have a shearing effect that may result in personal injury. To help prevent such injury, stay clear of the disk edges when rotating the disk (key 6).

CAUTION

Damage to the disk (key 6) may occur if the disk is not closed when the valve is being removed from the pipeline. If necessary, apply operating pressure to the actuator temporarily to retain the disk in the closed position while removing the valve from the pipeline.

2. Unscrew the flange bolts, and remove the valve from the pipeline.
3. Rotate the disk 180° from the closed position per figure 10.
4. Unscrew the retainer screws (key 17) and remove the seal retainer (key 16).
5. Thread the retainer screws into the jack screw retainer holes to unseat the retainer. These threaded holes may be used to lift the retainer. The thread size is listed in table 9.
6. Remove the retainer gasket and clean the body gasket groove and retainer surface.
7. Remove the seal ring assembly (key 19).

Soft Seal Installation

1. Locate the replacement seal ring (key 19) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter as shown in figure 9. Around the outside circumference is one wide groove.

Before installing the seal ring into the valve body, the backup ring (key 20) must first be placed onto the wide, outer groove of the seal ring.

2. The seal ring and backup ring assembly must be installed in the valve. The wider outside diameter of the seal ring goes into the T-slot area of the valve body, shown in figure 9. Start the wider diameter edge of the seal ring into the T-slot of the valve body using a blunt end screwdriver.

Figure 9. Seal Installation Orientation

3. Carefully tuck the backup ring downward into the valve body T-slot until the seal ring and backup ring are completely entrapped in the valve body T-slot. Install the anti-extrusion ring per figure 2 (for NPS 3 only).
4. Place the retainer gasket (key 18) in the groove in the valve body.

CAUTION

The retainer gasket (key 18) is a thin graphite material. Take care to avoid damaging the gasket during handling.

- When the seal and gasket are seated, re-install the seal retainer (key 16) and screws (key 17). Tighten the retainer screws just enough to eliminate vertical movement of the seal retainer. With the use of the blunt end tool, carefully tuck the lip of the seal ring under the seal retainer.
- When the seal is under the lip of the seal retainer, tighten the screws according to table 9. Manually rotate the valve shaft clockwise 180° to return the disk to its closed position. Ensure these screws are tightened prior to installation.
- Be certain the disk is closed before installing the valve according to the Actuator Mounting section of this manual.

Metal Seal Installation

- With the disk in the closed position, place the seal ring (key 19) onto the disk (key 6). Set the retainer onto the seal, making sure proper alignment between the seal and retainer has been achieved. Install the anti-extrusion ring per figure 2 (for NPS 3 Phoenix III seal only).
- Place the retainer gasket (key 18) in the groove in the valve body.

CAUTION

The retainer gasket (key 18) is a thin graphite material. Take care to avoid damaging the gasket during handling.

- Attach the seal retainer (key 16) to the valve body and tighten the retainer screws (key 17). Tighten just enough to eliminate vertical movement of the retainer.
- Rotate the valve shaft 90° open/closed 3 times.
- With the disk in the closed position, tighten the retainer screws per table 9.
- Be certain the disk is closed before installing the valve according to the Actuator Mounting section of this manual.

Replacing the Disk, Shafts, or Bearings

Key numbers in this procedure are shown in figures 13, 14, and 15 unless otherwise indicated.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shutoff all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

CAUTION

When removing the actuator in the following step, use a wheel puller to separate the actuator parts from the valve shaft. Do not drive the actuator parts off the valve shaft because this could damage valve trim components.

2. Remove the actuator per instructions in separate actuator instruction manuals, then remove the cap screws (key 31). Remove the clamp (key 33, figure 7) if the strap (key 34, figure 7) is used.
3. Remove the packing flange nuts (key 27) and the packing flange (key 25) and pull out the packing follower (key 24 or 29).

Disassembly

1. Remove the seal ring assembly according to steps 3 through 7 of the Replacing Seal Ring Assembly section of this manual.
2. Remove hex nuts, blind flange, gasket, when used (keys 5, 2, and 3).
3. Clean the gasket surfaces on the blind flange (key 2) and on the end of the valve body (key 1).
4. Rotate the disk (key 6) 180° from the closed position, as shown in figure 10.
5. Remove shaft pins (key 9) from the disk. Pins can be removed by their internal thread tapping in table 11.

20	
24	

⚠ WARNING

Once the shafts have been removed in the following step, the disk may fall from the valve body. To avoid personal injury and disk damage, support the disk to prevent it from falling as the shafts are being removed.

6. Pull the follower shaft (key 8), when used, out through the outboard end of the valve body. If the follower shaft cannot be pulled free, the end of the follower shaft is internally threaded (see table 10) for screwing in a bolt or stud to aid in pulling the follower shaft.
7. Pull the drive shaft (key 7) out through the actuator end of the valve body and remove the anti-blowout ring, when used (key 23), from the drive shaft. The end of the shaft is internally threaded (shown in table 10) for screwing in a bolt or stud to aid in pulling the drive shaft.
8. Remove the disk (key 6) from the valve body through the side opposite the seal.
9. Remove the packing (key 22, figure 8) and the packing box ring (key 21, figure 8).
10. If any of the bearings (keys 14 and 15) require replacement, remove them.
11. Clean the packing box.

Assembly

⚠ WARNING

Do not lubricate bearings that will be used for oxygen service, or where the lubrication is incompatible with the process media. Any use of lubricant can lead to the sudden explosion of media due to the oil/oxygen mixture, causing personal injury or property damage.

Table 12. Required Blind Flange Bolt Torque

24					

1. Stud and nut threads must be lubricated to achieve proper preload.

Figure 10. Disk Orientation for Pin Removal and Soft Seal Installation

CAUTION

To avoid possible product damage, ensure the NPS 3, 4, and 6 thrust bearings are oriented correctly when installing in the following procedure. See figure 11 for proper orientation of the thrust bearings.

Figure 11. Orientation of NPS 3, 4, and 6 Thrust Bearings

1. If new bearings (keys 14 and 15) are required, install them in the valve body. Install the journal bearings (key 14) before installing the thrust bearing (key 15). If installing a thrust bearing into NPS 3-6 valves, ensure the thrust bearing flat is oriented under the seal cavity, as shown in figure 9. If installing a NPS 8-24 thrust bearing, ensure the circular thrust bearing is fully seated in the body thrust bearing counterbore. For NPS 3-6 valves, three journal bearings (key 14 in figure 11) and two thrust bearings (key 15 in figure 11) are required per assembly. For NPS 8-24 valves, four journal bearings (key 14 in figures 12 and 13) and two thrust bearings (key 15 in figures 12 and 13) are required per assembly.
2. Insert the disk (key 6) into the valve body as shown in figure 10, ensuring the drive side pins are oriented toward the actuator end of the valve body.
3. Install the drive shaft (key 7) and the follower shaft (key 8, when used) through the valve body and into the disk.
4. Align the holes in the shafts with the pin holes in the disk and drive the disk pins (key 9) into the disk. Once the pins are fully seated in the disk, use a punch or small chisel to stake the pins at three points.

CAUTION

To prevent the disk pin from sliding out during operation, ensure the staking operation deforms the disk pin hole diameter sufficiently.

5. Install the blind flange gasket, blind flange, and hex nuts (keys 2, 3, and 5). Ensure the blind flange is oriented so the serrations face the gasket and valve body. Tighten the hex nuts (key 5) per table 12.

CAUTION

Once the final preload torque is applied, do not loosen or remove the blind flange nuts (key 5). If nut removal is necessary, a new gasket is required.

Soft Seal Installation

1. Locate the replacement seal ring (key 19) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter as shown in figure 9. Around the outside circumference is one wide groove, as shown in figure 2.

Before installing the seal ring into the valve body, the backup ring (key 20) must first be placed onto the wide, outer groove of the seal ring. Rotate the disk 180° from closed before installing the seal ring (shown in figure 10).

2. The seal ring and backup ring assembly must be installed in the valve. The wider outside diameter of the seal ring goes into the T-slot area of the valve body, shown in figure 9. Start the wider diameter edge of the seal ring into the T-slot of the valve body using a blunt end screwdriver.
3. Carefully tuck the backup ring downward into the valve body T-slot until the seal ring and backup ring are completely entrapped in the valve body T-slot. If installing for NPS 3, install the anti-extrusion ring per figure 2.
4. Place the retainer gasket (key 18) in the groove in the valve body.
5. When the seal and gasket are seated, install the seal retainer (key 16) and screws (key 17). Tighten the retainer screws just enough to eliminate vertical movement of the seal retainer. With the use of the blunt end tool, carefully tuck the lip of the seal ring under the seal retainer.
6. When the seal is under the lip of the seal retainer, tighten the screws according to table 9. Manually rotate the valve shaft clockwise 180° to return the disk to its closed position.

Figure 12. Sectional of Typical Valve Body

Metal Seal Installation

1. With the disk in the closed position, place the seal ring (key 19) onto the disk (key 6). Set the retainer (key 16) onto the seal, making sure proper alignment between the seal and retainer has been achieved.
2. Place the retainer gasket (key 18) in the groove in the valve body.
3. Attach the seal retainer (key 16) to the valve body and tighten the retainer screws (key 17) just enough to eliminate the vertical movement of the retainer.
4. Rotate the valve shaft 90° open/closed 3 times.
5. Tighten the retainer screws per table 9.
6. Be certain the disk is closed before installing the valve according to the Actuator Installation section of this manual.

General Valve Assembly

1. For **standard packing**, install the packing according to the appropriate instructions presented in step 5 of the Replacing Packing section of this manual.
For **ENVIRO-SEAL packing**, install the new packing system components as described in the ENVIRO-SEAL Packing System for Rotary Valves Instruction Manual ([D101643X012](#)).
2. Install the anti-blowout ring (key 23) when used, in the groove in the drive shaft.

Actuator Mounting

With the valve body out of the line, mount the actuator on the valve body in accordance with the instructions in the actuator instruction manual. Mount the actuator yoke to the valve body, and tighten the actuator-mounting cap screws (key 31) to the appropriate torque from table 13.

Table 13. Required Actuator-Mounting Bolt Torque

24			

1. Screws must be lubricated to achieve proper preload.

CAUTION

8590 valve disk rotation is counterclockwise to open (when viewed from the actuator side of the valve body, see figure 12). Rotating the disk (key 6) past the fully closed position will damage the seal ring (key 18).

Adjusting the Valve Closed Position

Adjust the actuator to bring the disk to the fully closed position at the end of the actuator stroke. To determine the fully closed disk position, measure the distances between the disk face and the seal retainer face at the top and bottom of the valve (X1 and X2) as shown in figure 12. Adjust the travel stops or turnbuckle to rotate the disk slightly until the two measurements are equal, but are allowed to be within 0.25 mm (0.010 inch) of each other. Refer to the appropriate actuator instruction manual for assistance.

Parts Ordering

When corresponding with your [Emerson sales office](#) about this equipment, always mention the valve serial number. When ordering replacement parts, also specify the key number, part name, desired material, using the Parts List.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts Kits

Retrofit Kits for ENVIRO-SEAL Packing

Retrofit kits are available for replacing the packing in an existing valve with an ENVIRO-SEAL packing system. These kits are available for single PTFE or graphite packing. All parts required for installation of the ENVIRO-SEAL packing system into an existing 8590 valve are included in the kits.

Worn shafts, packing box damage, or other components that do not meet Emerson finish specifications, dimensional tolerances, and design specifications, may adversely alter the performance of the retrofit kit.

W9224-2

Introduction

Scope of Manual

This manual provides installation, adjustment, and maintenance information for Fisher 9500 butterfly valves. These valves use splined shafts with actuator-mounted brackets and linear-motion actuators (see figure 1). Refer to separate manuals for instructions covering the power actuator or the manual handwheel actuator, positioner, and other accessories.

Do not install, operate, or maintain 9500 valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The 9500 valve is a fully lined butterfly valve for use with corrosive process fluids or wherever stringent shutoff is required. The nitrile or PTFE liner completely isolates the valve body and shaft from the process fluid. The valve is available with conventional or FISHTAIL™ disk designs.

Table 1. Specifications

Valve Sizes NPS ■ 2, ■ 3, ■ 4, ■ 6, ■ 8, ■ 10, or ■ 12 Valve Body Style Flangeless (wafer-type) valve body to be installed between pipeline flanges End Connection Styles Flangeless (wafer-style) valve body mates with CL125 flat-face flanges per ASME B16.1, with CL150 and 300 raised-face flanges per ASME B16.34, or EN flanges Maximum Allowable Inlet Pressure⁽¹⁾ Consistent with applicable pressure/temperature ratings for ■ CL125B per ASME B16.1, or ■ CL150 and 300 per ASME B16.34 unless limited by maximum allowable pressure drop specification or by material temperature capabilities in table 2 Vacuum Service The valve is suitable for vacuum service to approximately 10^{-7} mm Hg absolute (3.4×10^{-12} mbar, absolute) Maximum Shutoff Pressure Drop⁽¹⁾ Standard Operation Cast Iron Valve: 12.1 bar (175 psi) Steel or Stainless Steel Valve: 15.2 bar (220 psi) Material Temperature Capabilities⁽¹⁾ See table 2 Flow Characteristic Conventional Disk: Approximately equal percentage through 60 degrees of disk rotation	FISHTAIL Disk: Approximately equal percentage through 90 degrees of disk rotation Flow Direction Conventional Disk: Bidirectional FISHTAIL Disk: Forward flow - The tail of the disk opens into the downstream end of the valve (see figure 2). ---	--

1. The pressure/temperature limits in this manual and any applicable standard or code limitation should not be exceeded.

Table 2. Operative Temperature

Disk Type	Liner Material	Operative Temperature
Conventional or FISHTAIL	Nitrile	-7 to 93°C (20 to 200°F)
	PTFE	-18 to 121°C (0 to 250°F)

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

These valves may be installed in many positions by referring to the Actuator Mounting procedures and figure 6 in this manual. For conventional disks, flow may be in either direction. For FISHTAIL disks, the leading edge of the disk must be located in the upstream end of the valve (see figure 2).

CAUTION

As noted in the following paragraphs, improper use of additional gasketing materials will damage the valve liner.

The valve body liner extends past or overlaps the valve face producing the partial O-ring shown in figure 3. It also acts as the flange gasket. Improper use of additional gasketing materials will damage the valve liner.

Care must be taken during installation to ensure that the pipe flanges are properly supported. Pipe flange support is required to avoid liner flange joint leakage or problems during valve operation. Slip-on pipe flanges may be used with NPS 2, 3, or 4 valves. An NPS 6 valve or larger will require flange adapters for complete liner support.

Mating flanges or pipe flanges with inside diameters smaller than the minimum shown (see table 3) may interfere with the opening of the disk. Flanges or pipes with an inside diameter larger than the maximum shown (see table 3) may not be in full contact with the liner. Install flange adapters in each case, either to provide disk clearance or to fully contact the liner.

Flexible, plastic flanges, fiberglass, slip-on, or weld-neck with other than standard inside diameters may not provide adequate support for the liner. Also, flexible mating flanges can be warped with excessive line bolt load. They may fail to support the liner at the inside diameter of the valve body. Use flange adapters, available from Emerson Automation Solutions, during installation to avoid these problems. Whenever a flange adapter is used, a standard flange gasket must be installed between the line flange and flange adapter. Do not use a flange gasket between the valve and flange adapter. The partial O-ring on the liner acts as the flange gasket and any additional gasket here will damage the liner.

The 9500 valve may be used as part of a three-way valve assembly. The actuator-valve linkage is adjusted at the factory; you won't need to adjust the linkage before placing the valve in service. If the valve and actuator are being re-installed, after removal, or if you suspect that the linkage is out of adjustment, refer to the Linkage portion of the Adjustments section before installing the valve in the pipeline. If the valve has been purchased separately, or if the actuator has been removed, complete the procedures in the Actuator Mounting section of this manual before proceeding.

Table 3. Maximum and Minimum Allowable Mating Flange Diameters

VALVE SIZE, NPS	MAXIMUM AND MINIMUM DIAMETER OF MATING PIPING OR FLANGES			
	Minimum		Maximum	
	mm	Inches	mm	Inches
2	30	1.20	64	2.50
3	64	2.50	92	3.62
4	89	3.50	117	4.62
6	145	5.70	171	6.75
8	196	7.70	222	8.75
10	246	9.70	273	10.75
12	297	11.70	330	13.00

Figure 2. Valve Shaft Marking

[1] EQUAL MEASUREMENTS BETWEEN VALVE FACE AND DISK EDGE AT TOP AND BOTTOM ENSURE FULLY CLOSED DISK.

[2] FOR FISHTAIL DISK, PARTIAL KEYWAY OR FLAT SPOT IS ON SAME SIDE AS NOSE OF DISK.

A2755-1

⚠ WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.

Figure 3. Partial O-Ring Location

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If continuous operation is required during inspection or maintenance, install a three-valve bypass around the control valve assembly.
2. Be certain the pipeline flanges are in line with each other and supported.

CAUTION

To avoid damaging valve seating surfaces, make sure the adjacent piping is free of pipe scale, welding slag, and any other damaging material.

3. Inspect the valve body to be sure it is free of foreign material. Make sure the adjacent piping is free of pipe scale, welding slag, and any other material that could damage valve seating surfaces.
4. Measure to be sure the distance between the pipeline flanges is approximately 1/4 inch greater than the valve face-to-face dimension. This will ensure easy installation without distorting the liner (figure 3).
5. For conventional disks, flow may be in either direction; for FISHTAIL disks, flow must be such that the tail of the disk (as shown in figure 2) will rotate into the downstream side of the valve.

CAUTION

To avoid damaging valve parts, observe the following precautions before inserting the valve in the line.

- a. The inside diameter of the mating piping or flanges must be large enough to allow the valve disk to rotate freely into the upstream and downstream piping, or the disk could be damaged. Do not use piping or flanges having an inside diameter smaller than the minimum shown in table 3.
- b. The inside of the mating flange must also be small enough to be in full contact with the partial O-rings on the liner faces. Leakage through the flange connections and damage to the liner could result if the partial O-ring

faces are not properly supported. Do not use flanges having an inside diameter larger than the maximum shown in table 3.

NPS 6 to 10 valves must not be used with slip-on flanges unless flange adaptors are used to support the liner. When using slip-on flanges with other sizes, be certain the valve is carefully centered to ensure that the partial O-ring faces are in full contact with the adjacent flanges.

- c. When a flange adapter is necessary, a flange gasket must be installed between the line flange and the flange adapter. Do not use a flange gasket between the valve and the flange adapter. Additional gasketing material at this location could damage the liner.
 - d. The valve disk must be in the closed position when the valve is being inserted into the pipeline. If the valve disk is not closed, it could be damaged against the mating piping or flanges.
6. Insert the valve into the pipeline. Insert four flange studs or bolts through the flanges to support the valve.
 7. Center the valve carefully on the flanges by measuring equal distances at the top and bottom and equal distances at the sides.
 8. Insert the remaining flange studs or bolts. Tighten the studs or bolts evenly. Normal flange bolt torques may be used because liner compression is limited by metal-to-metal contact between flanges and the valve body.
 9. Rotate the valve disk manually to be certain the disk clears the adjacent piping or flanges as it opens. If necessary, disconnect the power actuator-valve linkage, but do not disturb the adjustment of the turnbuckle or adjustable linkage. If the disk hits the flange, loosen flange bolting temporarily while re-centering the valve. If the problem cannot be corrected in this manner, it will be necessary to use line flanges with larger inside diameters adjacent to the valve.
 10. For hazardous atmosphere or oxygen service valves, read the following Warning, and provide the following bonding strap assembly if the valve is used in an explosive atmosphere.

⚠ WARNING

The valve drive shaft is not necessarily grounded to the pipeline when installed. Personal injury or property damage could result, if the process fluid or the atmosphere around the valve is flammable, from an explosion caused by a discharge of static electricity from the valve components. If the valve is installed in a hazardous area, electrically bond the drive shaft to the valve.

11. Attach the bonding strap assembly (key 131, figure 4) to the shaft with the clamp (key 130, figure 4).
12. Connect the other end of the bonding strap assembly to the valve flange cap screws.

Adjustments

Hub Seals

Key number locations are shown in figure 7.

Thrust sleeve assemblies (key 6) seal the disk hubs. In time, especially with frequent valve disk rotation, these seals may require adjustment.

Adjust the seals if there is leakage through the valve body around the valve shaft. A small amount of leakage downstream (between the bushings and disk hubs) may also indicate a need for hub seal adjustment.

Figure 4. Grounding Assembly

To adjust the hub seals:

1. Tighten both thrust-plate cap screws (key 10) 1/4 turn on one side (the side where shaft leakage is occurring).

CAUTION

To avoid excessive side thrust on the disk and possible liner damage, tighten cap screws on both sides of the valve alternately and in 1/4-turn increments. Do not over-tighten by continuous turning or by tightening one side only. Over-tightening the cap screws will cause the liner to fail.

2. Tighten both thrust-plate cap screws 1/4 turn on the other side of the valve.
3. Repeat steps 1 and 2 until leakage stops.

Note

If this adjustment is being performed to stop minor leakage past the disk, check the leakage after turning the cap screws enough to move the thrust plates 0.8 mm (1/32 inch) closer to the valve body. If leakage has not stopped or diminished, the leakage is probably due to incorrect linkage adjustment or damaged valve parts. Refer to the Linkage section to check linkage adjustment; refer to the Maintenance section to inspect and replace parts.

4. If leakage around the shaft cannot be stopped by adjusting hub seals, refer to the Maintenance section to inspect and replace damaged parts.

Figure 5. Tandem Linkage Adjustment for Three-Way Valve Assemblies

Linkage

If the linkage between the power actuator and valve is improperly adjusted, the actuator may reach the end of travel before (or after) the disk reaches the fully closed position. This could result in leakage past the disk. The linkage adjustment is set at the factory, and it should not be necessary to adjust linkage unless the actuator and valve have been separated and the adjustment altered.

To check the linkage adjustment on FISHTAIL disks, the flat is on the same side of the shaft as the nose or leading edge of the valve disk (as shown in figure 2). When the valve disk is at the fully closed position, the flat will be either top-dead-center or bottom-dead-center in relation to the valve body. The top-dead-center position is shown in figure 2. A more accurate check of the fully closed disk position is obtained by removing the valve from the pipeline.

⚠ WARNING

To avoid personal injury and damage to the process system caused by the sudden release of pressure, isolate the control valve from all pressure and relieve pressure from the valve body before removing the valve from the line. Be sure the disk is closed so that it will not hit the mating flanges when being removed from the line.

With the valve removed from the line, position the actuator to the valve-closed end of the travel. Measure the distance between the valve face and the top and bottom edges of the disk as shown in figure 2. The disk is at the fully closed position if the two measurements are equal.

To adjust linkage, refer to the actuator instruction manual.

Three-Way Valve Tandem Linkage

If the valve is used as part of a three-way valve assembly, adjustment of the tandem linkage (see figure 5) may be necessary to ensure proper rotation of the slave valve disk.

If the adjustment is being performed with the three-way valve assembly out of the line, temporarily bolt the valve bodies to the tee to compress the liner faces until there is metal-to-metal contact between the valve bodies and the tee.

Check the rotation of the power valve disk per instructions in the Linkage section. If necessary, adjust the linkage between the actuator and the power valve.

To check the fully closed position of the slave valve disk, use the partial keyway on the slave valve shaft or measure equal distances between the slave valve face and the top and bottom of the slave valve disk as described in the Linkage section. Tighten the locknuts on the tandem linkage when adjustment is complete.

Maintenance

Use table 4 to locate and correct possible leakage or mechanical linkage problems with the valve.

⚠ WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve.

Disassembly

Key numbers locations are shown in figure 7.

1. Loosen all flange studs or bolts. Remove all but the bottom flange studs or bolts.

CAUTION

To avoid damage to the valve disk caused by the disk hitting the mating flange, be certain the disk is closed before removing the valve from the pipeline.

Table 4. Troubleshooting Guide

Fault	Possible Cause	Correction
1. Leakage out sides of valve (at thrust plates) between thrust bushings and shaft.	a. Hub seals require adjustment. b. Taper pins are not sealed.	a. Adjust using Hub Seals portion of Adjustments procedures. b. Remove valve from line and re-seat taper pins or install new taper pins using Maintenance procedures.
2. Leakage out sides of valve (at thrust plates) between valve body and thrust bushings, leakage at flanges, faces, or both	a. Flange gaskets used. b. Partial O-ring bead on liner faces damaged.	a. Check to see if flange gaskets are being used; if so, remove gaskets. b. Replace liner using Maintenance procedures.
3. Leakage through disk/liner seal	a. Hub seals require adjustment. b. Linkage requires adjustment. c. Actuator has insufficient torque output to close disk against pressure drop. (Actuators are selected to have sufficient torque output to shut off the flow against a specific pressure drop, not necessarily against the maximum allowable pressure drop. Be sure that the pressure drop for which the actuator is selected is not being exceeded.) d. Liner has been damaged by flowing medium or other valve parts damaged by being subjected to service conditions beyond those for which valve is designed.	a. Adjust seals using Hub Seals portion of Adjustments procedures. b. Refer to Linkage portion of Adjustments procedures. c. If possible, check shutoff at lower pressure drops. If shutoff is obtained at low pressure drops, but actuator stalls and does not produce full disk rotation at service pressure drop, actuator output torque is too low. For piston actuators, it may be possible to increase output torque by increasing supply pressure. Do not exceed maximum allowable supply pressure of actuator. d. Inspect and replace parts using Maintenance procedures.
4. Valve shaft will not rotate	a. If actuator does not stall, but shaft does not rotate, the spline teeth on the valve shaft are sheared. b. If actuator stalls, shaft is binding in bushings due to linkage misalignment caused by excessive wear of linkage parts. c. If actuator stalls and linkage is not misaligned, actuator may have insufficient output torque to rotate disk against flow.	a. Refer to the actuator instruction manual to remove actuator cover plate. Replace valve shaft using Maintenance procedures if spline teeth are sheared. b. Replace linkage parts. c. Check actuator operation with no pressure applied to the valve. If valve now functions properly, actuator is too small.
5. Valve shaft rotates, but valve does not control process fluid	Taper pins (or drive shaft spline for coated-disk constructions) have been sheared due to obstruction to disk rotation or other internal parts damaged by being subjected to service conditions beyond those for which the valve was designed.	Inspect and replace parts using the Maintenance procedures.

- If necessary, pry flanges apart so that liner faces will not be damaged when the valve is being removed. Inspect the disk (key 3) and liner (key 2) for wear or damage.
- Remove the actuator from the valve. Follow instructions in the appropriate actuator instruction manual.
- From both sides of valve, unscrew thrust-plate cap screws (key 10) and remove thrust plates (key 9).
- If taper pin (key 15) ends are peened, grind off the peened portions. Driving from the smaller end of the pins, drive the pins out of the disk (key 3) and shaft (key 4).

⚠ WARNING

Once the shaft has been removed, the disk may fall from the valve body, causing personal injury or disk damage. Support the disk before removing the shaft.

- Pull the shaft out of the valve body. If the shaft cannot be pulled from the valve body, drive the shaft out but use care to avoid upsetting the end of the shaft.
- Remove the disk from the valve body.

8. Remove the liner (key 2) from the valve body.

Some 9500 valves have the liner bonded to the valve body. If the valve has a bonded liner, burn or chip out the liner.

To strip the liner out with solvent, use Dynasolve 185, or equivalent solvent. (Dynasolve is a product of DYNALLOY™ Inc.). Cover the valve with solvent bath or enclose the solvent bath around the liner. Remove all adhesive after the liner has been removed.

Table 5. Taper Pin Details for 9500 Series Valves

VALVE SIZE, NPS	SHAFT DIAMETER mm (Inches)	AMERICAN STANDARD TAPER PIN SIZE	DRILL SIZE
2	12.7 (1/2)	2	#20 (0.161 Inches)
3, 4	15.9 (5/8)	3	#16 (0.177 Inches)
6	19.1 (3/4)	4	13/64 Inches
8, 10	25.4 (1)	6	9/32 Inches
12	31.8 (1-1/4)	7	21/64 Inches

Reassembly

Before reassembling the valve, clean and inspect all parts. Key number locations are shown in figure 7. Refer to the Parts List section to obtain replacement parts.

WARNING

Do not lubricate parts when used in oxygen service, or where the lubrication is incompatible with the process media. Any use of lubricant can lead to the sudden explosion of media due to the oil/oxygen mixture, causing personal injury or property damage.

1. Insert the liner (key 2) into the valve body. A small amount of silicone grease applied to the outside surface of the liner will aid insertion of the liner. However, do not use grease if the valve is to be used for oxygen service.

In vacuum service applications, upon customer request, you may use Eccobond® 285/24LV bonding agent (Fisher part number G1414006992) to bond the liner to the valve. Though bonding is not required, use the lettered steps below when bonding the liner to the valve body. If a different agent is to be used, follow instructions furnished by the bonding agent manufacturer. In absence of instructions, consult your [Emerson sales office](#).

- a. Roughen bonding surface of liner with a stiff wire brush. De-grease bonding surfaces of the liner and valve body with solvent.
 - b. Mix the two epoxy components thoroughly and spread a thin coat [approximately 0.38 mm (0.015 inches) thick] of the mixture over all bonding surfaces of the valve body and liner.
 - c. Insert the liner into the valve body. Align the liner shaft holes with valve body shaft holes. Remove excess bonding agent from shaft holes and exposed liner surfaces.
 - d. Insert the disk (key 3), thrust sleeve assemblies (key 6), and shaft (key 4) into the valve body. Be sure the thrust sleeve assemblies engage the liner recesses to ensure proper liner positioning. Rotate the disk to the closed position.
 - e. Lay the valve on one valve face and add weights to the other face to ensure a tight bond. Allow to cure for 24 hours. Then, proceed with the following reassembly steps.
2. Insert the thrust sleeve assemblies into the valve body. Be sure that the thrust sleeve assemblies enter the liner recesses to align the shaft holes, by temporarily inserting the shaft(s) (key 4).

3. A new disk and shaft should be installed if the taper pin holes have been widened by loosening of the taper pins (key 15).

Omit the following steps 4 through 8 if a new disk and shaft assembly is to be installed or if the old disk and shaft are to be reused. Use new taper pins whenever the disk has been removed.

CAUTION

If a new disk is required, a complete disk/shaft assembly must be purchased to avoid damage to valve parts. The old valve shaft cannot be used with a new disk.

If a new shaft (without disk) has been purchased, be sure to mark the shaft to indicate the disk position as shown in figure 2.

4. Making certain the taper pin holes are on the actuator side of the valve body, insert the disk into the valve body. Position the disk at the fully closed position.
5. Installing splined shaft:
 - a. If the old shaft is available, insert it into the valve body and disk. Line up the taper pin holes in the disk and shaft; measure and record the distance between the valve body and the splined end of the shaft. Remove the old shaft and insert the new, un-drilled shaft. Position the shaft so that there is the same distance between the valve body and the end of the shaft as noted above.
 - b. If installing a new shaft, insert the new shaft into the valve body and disk. Measure between the valve body and the splined end of the shaft. Make certain that the distance is correct to engage the actuator coupling lever.

Be certain that the flat spot or index mark on the end of the shaft is positioned as shown in figure 2.

6. Use a drill or center punch to mark the taper pin holes in the shaft. Remove the shaft and disk from the valve body.
7. Taper pins used in the 9500 valve shaft and disk are American Standard taper pins, as shown in table 5. Using the disk as a guide, drill taper pin holes through the shaft using drill size shown in table 5.
8. Use an American Standard taper pin reamer to ream the shaft holes. Be certain the reamer is of sufficient length for the disk hub thickness. Insert the shaft into the disk when reaming so the disk holes can be used as a gauge for reaming. Allow the reamer to just begin reaming the disk holes. This will ensure proper seating of the pins.
9. Install the disk and shaft into the valve body. Be sure the splined end of the shaft is on the actuator side of the valve body, that the direction of taper in the taper pin holes match, and that the flat spot or zero mark is positioned as shown in figure 2.
10. Using a metal sealing compound on the pins for a positive seal, insert the taper pins into the larger end of the taper pin holes. Drive the pins with a hammer to seat the pins.
11. Attach the thrust plates (key 9) with cap screws (key 10). When tightening the cap screws, do so in small increments, alternating from one cap screw to another and from one valve side to the other. Tighten the cap screws until the thrust plates contact the thrust sleeve assemblies snugly. Then rotate the cap screws enough to move the thrust plates 0.8 mm (1/32 inch) closer to the valve body.
12. Re-attach the actuator according to the steps in the Actuator Mounting section; then install the valve according to the steps in the Installation section.

Actuator Mounting

1. Refer to the appropriate actuator instruction manual to determine the desired actuator mounting style and position. With the valve out of the line, mount the actuator on the valve per instructions in the actuator instruction manual.
2. To determine the fully closed disk position, measure the distances between the valve face and the top and bottom edges of the disk as shown in figure 2. The disk is at the fully closed position when the two measurements are equal. Rotate the disk slightly if necessary to make the measurements equal.
3. Refer to figure 6 and locate the view that depicts the mounting style and position that is being used. In the appropriate view on the right of figure 6, note the positions of the index marks on the end of the valve shaft and actuator lever. For all positions and styles with 90-degree disk rotation, the shaft index mark is to be aligned with the appropriate lever index mark as shown in figure 6. This is also true for push-down-to-open action with 60-degree maximum disk rotation. However, for push-down-to-close action with 60-degree maximum disk rotation, the appropriate lever index mark must be offset one or two spline teeth counterclockwise from the shaft index mark.

Refer to the appropriate actuator instruction manual for instructions covering attaching the lever and adjusting the turnbuckle. For FISHTAIL disks, be certain that the direction of rotation will be such that the tail of the disk (see figure 2) will rotate into the downstream side of the valve.

Changing Disk Rotation and Action

Disk rotation can be changed from 0-90 degrees or vice versa by changing travel stops in the actuator and, if necessary, changing the position of the lever on the splined valve shaft. Action can be changed from push-down-to-open to push-down-to-close by removing the actuator and remounting it in the alternate mounting style. Refer to the appropriate actuator instruction manual for assistance in disassembly and reassembly to change travel stops and for instructions to change mounting style.

Note

Action for valves using a splined valve shaft can also be changed, without changing mounting style, by repositioning the actuator lever on the valve shaft. For FISHTAIL disks, it will be necessary to rotate the disk 180 degrees so that the tail of the disk will rotate into the downstream side of the valve.

Use the following procedure.

1. Refer to the appropriate actuator instruction manual for assistance in disconnecting and removing the actuator lever. Avoid disturbing the actuator turnbuckle adjustment, if possible.
2. If the valve disk is a FISHTAIL disk, rotate the disk 180 degrees from the original position.
3. Position the disk in its fully closed position. To ensure that disk is fully closed, measure equal distances between valve face and top and bottom of the disk as shown in figure 2 or check to be sure that the flat spot or index mark on the valve shaft is in top-dead-center or bottom-dead-center in relation to the valve.

WARNING

To avoid personal injury, keep hands away from the actuator rod in the following procedure.

4. Note the position of the valve shaft index mark. Index mark alignments for reversed action are not shown in figure 6. To determine proper index mark alignment, proceed as follows:
 - a. Stroke the actuator to the valve-closed end of travel and retain that position while performing the next step.
 - b. Keeping hands away from the actuator rod, hold the actuator lever up to the valve shaft so that the lever end is in line with the actuator rod end bearing. The lever index mark that is most nearly in line with the valve shaft index mark is the index mark that must be used during reassembly. If changing to push-down-to-close action with 60-degree operation, the lever index mark will be offset 1 spline tooth from the valve shaft index mark for 12.7 through 19.1 mm (1/2 through 3/4-inch) valve shafts and 2 spline teeth from the valve shaft index mark for 25.4 and 31.8 mm (1 and 1-1/4 inch) valve shafts. This offset must be maintained during reassembly.
5. Record the alignment determined in step 4, remove the actuator lever, and shut off operating pressure to actuator.
6. Reassemble the lever to the actuator and adjust the actuator travel, if necessary, referring to the steps in the appropriate actuator instruction manual. Be sure to use the index mark alignment determined above rather than those shown in figure 6.

Parts Ordering

A serial number is assigned to each valve body and stamped on the nameplate. Always refer to the serial number when corresponding with your [Emerson sales office](#) regarding spare parts or technical information. When ordering replacement parts, also specify the complete 11-character part number from the parts list information.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts List

Note

Contact your [Emerson sales office](#) for parts ordering information.

Key Description

1	Valve Body
	If you need a valve body as a replacement part, order by valve size, serial number, and desired material.
2*	Liner Assy
3	Disk
4*	Shaft

Figure 1. Fisher A11 Valve

W9570-1

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for the Fisher A11 High-Performance Butterfly Valves (figure 1) in CL900 and 1500. For CL2500 valves, contact your [Emerson sales office](#).

For information about the actuator and accessories, please refer to the separate instruction manuals for these items.

Do not install, operate, or maintain an A11 valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage it is important to carefully read, understand, and follow all of the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your Emerson sales office before proceeding.

Description

A11 High-Performance Butterfly Valves are available in a lugged body design, with a variety of seal, valve body, and internal components. These valves feature a dynamic sealing design that is used in a variety of demanding applications.

Specifications

Specifications are listed in table 1 and the specifications for a given valve are stamped on a nameplate attached to the valve.

Educational Services

For information on available courses for the A11 High Pressure valve, as well as a variety of other products, contact:

Installation

WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

Note

When installing a valve after it has been in long-term storage, cycle the valve at least ten times to re-energize the dynamic seal. Please contact your [Emerson sales office](#) if you have any questions about preparing a valve for storage or if you are planning to put into service a valve that has been stored for some time.

Adjusting the Travel Stops

CAUTION

When using manual or power actuators, adjust the actuator travel stops so the disk stop in the valve body does not absorb the output of the actuator.

For actuators without travel stops, the actuator must be properly mounted to prevent it from driving the valve disk against the valve disk travel stop.

Failure to limit actuator travel as described in this section can result in damage to the valve shafts or other valve parts

Note

An "S" is visible on both the valve shaft and valve body. When the valve disk is closed, the "S" on the shaft aligns with the "S" on the valve body.

1. Locate the actuator travel stop that establishes the closed position of the valve disk. When adjusting the travel stop make sure that the disk is from 0 to 0.76 mm (0 to 0.030 inch) away from the internal stop in the valve body. This adjustment is necessary to be certain that the actuator output torque is fully absorbed by the actuator travel stop rather than the stop in the valve body.

For actuators without travel stops, the actuator must be properly mounted to prevent it from driving the valve disk against the valve disk travel stop.

2. To mount an actuator without travel stops, first, if necessary, remove the actuator from the valve. Then, position the valve disk from 0 to 0.76 mm (0 to 0.030 inch) away from the internal stop in the valve body.
3. Now, travel the actuator to the maximum position. Keep the actuator in the maximum travel position. Return the actuator to the valve, taking care not to disturb the position of the valve disk.
4. Mount the actuator on the valve using proper bolts with locking washers to achieve a secure fit.
5. Before installing the valve/actuator assembly in the process line, cycle the valve several times to be sure the valve disk returns to the proper position.

Preparing for Installation

⚠ WARNING

If the A11 valve is equipped with a fail-open actuator, remove the actuator before installing the valve/actuator assembly or cycle the valve into the fully closed position. Then, to avoid possible personal injury or property damage, take appropriate steps to ensure that the actuator does not cause the valve to open during installation.

1. If the valve and actuator have been purchased separately or if the actuator has been removed for storage, travel stop adjustment, or maintenance, mount the actuator before inserting the valve/actuator assembly into the line. Refer to the actuator instruction manual for mounting and adjustment procedures.

CAUTION

To avoid product damage, inspect the valve before installation for any damage or any foreign material that may have collected in the valve body. Also remove any pipe scale, welding slag, or other foreign material from the pipeline.

- Remove the protective end covers from the valve and inspect the valve body to be certain that it is free of foreign material. Also, be certain that adjacent pipelines are free of any foreign material, such as pipe scale or welding slag that could damage the valve seating surfaces.

⚠ WARNING

The A11 valve is designed for use with the appropriate piping schedule for the ASME class. However, before putting the valve into operation, measure carefully to ensure disk rotation without interference from piping or flanges. Be certain to center the valve accurately to prevent interference of the disk with the flanges.

The edges of a rotating disk have a shearing effect that may result in personal injury. To help prevent such injuries, stay clear of the disk edges when rotating the disk.

Damage to the disk will occur if any pipe flanges or piping connected to the valve interfere with the disk rotation path. Compare the disk chordal swing diameter from the dimensional tables in Bulletin 51.6:A11 CL900-2500 A11 High Performance Butterfly Valve ([D104222X012](#)) to the ID of the pipe to be certain the disk rotates without interference before putting the valve into operation. Consult with your [Emerson sales office](#) for any constructions not listed in the bulletin.

- Select the appropriate gaskets for the application. flexible graphite, spiral wound, or other gasket types, made to ASME B16.5 group or user's standard, can be used on A11 valves depending on the service conditions of the application. Note: spiral wound gaskets, when properly centered, will cover more than 60 percent of the gasket area at the retaining ring screws.

For metal-seated and cryogenic valve gasket recommendations, please contact your Emerson sales office.

- Refer to the appropriate table for the quantity and size of flange bolts required (table 3) and proceed with the following instructions.

Valve Orientation

A11 valve bodies are designed for installation with the shaft in any orientation around the pipeline: horizontal, vertical, or at an angle. However, when installing an A11 valve, please follow these recommendations.

Table 3. Cap Screw Data for Lugged Valves

Figure 2. View of Stud Bolts

E0179 / IL

- In certain services (process fluids with high concentrations of entrained solids, abrasive slurries, or polymerizing media), valve performance will be enhanced by installing the valve with the shaft horizontal to the pipeline.
- Valves supplied for unidirectional shutoff should be installed with the high pressure at the back (shaft side) of the disk. A flow tag with an arrow is provided for proper installation.

The High Performance Butterfly Valve is designed to allow flow in either direction when in the open position. When in the closed position, high pressure should be applied to a specific side of the disk to provide best performance and optimal service life.

- Valves supplied for bidirectional shutoff, such as soft seal constructions, under normal operating conditions can (at different times) experience pressure in both directions; the highest of the two pressures should be exerted on the preferred side of the disk. If the two pressures are equal, then the one lasting the longest period of time should be applied to the preferred side. A flow tag with an arrow is provided for proper installation.

If you have questions about proper valve orientation in a specific application, contact your [Emerson sales office](#).

Installing the Valve

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage resulting from the sudden release of pressure, do not install the valve assembly where service conditions could exceed the limits given in this manual, the limits on the appropriate nameplates, or the matching pipe flange rating. Use pressure-relieving devices as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user.

Because some valve/body trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

Figure 3. Proper Installation Procedure

For Lugged Valves:

1. Position the valve between the flanges. Be sure to leave enough room for the flange gaskets; then install the lower flange bolts.
2. Install the gaskets and align the valve and the gaskets.
3. Install the remaining bolts.
4. Tighten the flange bolts in an alternating criss-cross fashion to a torque value of one-fourth of the final bolting torque. Repeat this procedure several times increasing the torque value each time by a fourth of the final desired torque. When the final torque value has been applied, tighten each flange bolt again to allow for gasket compression.

Packing Adjustment and Shaft Bonding

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

1. For PTFE or graphite packing: Tighten standard packing follower nuts only enough to prevent shaft leakage. Excessive tightening of packing will accelerate wear and could produce higher rotating friction loads on the valve shaft. If necessary, refer to the Packing Maintenance section.
2. For ENVIRO-SEAL Packing Systems: These packing systems will not require this initial re-adjustment. Refer to the separate ENVIRO-SEAL Packing System for Rotary Valves Instruction Manual ([D101643X012](#)).
3. For hazardous atmosphere or oxygen service valves, read the following Warning, and provide the bonding strap assembly mentioned below if the valve is used in an explosive atmosphere.

⚠ WARNING

The valve drive shaft is not necessarily grounded to the pipeline when installed. Personal injury or property damage could result, if the process fluid or the atmosphere around the valve is flammable, from an explosion caused by a disk's charge of static electricity from the valve components. If the valve is installed in a hazardous area, electrically bond the drive shaft to the valve body.

Note

The packing is composed of all conductive packing rings (graphite ribbon packing) or partially conductive packing rings (carbon-filled PTFE female adaptor with PTFE V-ring packing or graphite-composition packing ring with PTFE/composition packing) to electrically bond the shaft to the valve for hazardous area service. For oxygen service applications, and hazardous area service where the standard packing doesn't provide sufficient shaft-to-valve body bonding, provide alternate shaft-to-valve body bonding according to the following step.

4. Attach the bonding strap assembly (key 131, figure 4) to the shaft with the clamp (key 130, figure 4).
5. Connect the other end of the bonding strap assembly to the valve flange cap screws.
6. For more information, refer to the Packing Maintenance section below.

Figure 4. Optional Shaft-to-Body Bonding Strap Assembly

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

⚠ WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure.
- Use lockout procedures to be sure the above measures stay in effect while you work on the equipment.
- Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.
- The valve packing area may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

CAUTION

When using an actuator, the actuator travel stop (or actuator, for actuators without adjustable stops) must be adjusted so the disk stop in the valve does not absorb the output of the actuator. Failure to limit the actuator travel can result in damage to the valve, shaft(s), or other valve components.

Removing the Valve

⚠ WARNING

Using the procedures listed in the above WARNING, loosen the flange bolting that holds the valve. Make sure the valve cannot slip or twist while the bolting is being loosened and removed.

For field repair, remove the valve from the pipeline.

CAUTION

Damage to the disk can occur if the disk is not closed when the valve is being removed from the pipeline. If necessary, stroke the actuator to place the disk in the closed position while removing the valve from the pipeline.

7. Before removing the valve from the pipeline, make sure the valve disk is closed. See figure 3. Rotate the shaft clockwise until the disk makes contact with the internal stop or actuator travel stop (if still installed). The “S” stamped on the shaft should be aligned with the “S” on the valve body.
8. After removing the valve from the pipeline, move it to an appropriate work area. Remove the actuator from the valve.

Packing Maintenance

The A11 valve is designed so the shaft packing can be replaced without removing the valve from the process pipeline.

CAUTION

The packing flange should be tightened only enough to prevent shaft leakage. Excessive tightening will only accelerate wear of the packing and could produce higher torques on the valve.

In most cases, packing leakage can be eliminated by merely tightening the hex nuts located above the packing flange while the valve is in the pipeline. However, if leakage continues, the packing must be replaced.

1. Before loosening any parts on the valve, be sure the pipeline has been depressurized. Then, remove packing nuts (key 16), lift off the packing flange (key 12) and packing follower (key 13). The packing (key 14) is now accessible.
2. Use a packing extractor to remove packing. Insert the corkscrew-like end of the tool into the first piece of packing and firmly remove. Repeat this process until all has been removed.

CAUTION

Be careful when cleaning the packing bore. Scratches to the valve shaft (key 4) or inside diameter of packing bore may cause leakage.

3. Before installing new packing, clean the packing bore.
4. Install new packing one ring at a time, using the packing follower as a driver. If split packing is used, stagger seams every 90°.
5. Reinstall the packing follower and packing flange, secure nuts, and tighten as needed.

Figure 5. Standard Packing Configurations

Note:

1 With conductive packing, the female adaptor in PTFE v-ring packing is carbon-filled PTFE.

Figure 6. 7-Ring, Reverse, Leak-off, and Lubricated Packing Configurations

THE FOLLOWING PACKING CONFIGURATIONS
ARE AVAILABLE FOR SPECIFIC APPLICATIONS:

**CODE 1: PTFE STANDARD ON SOFT SEATED
AND CRYOGENIC VALVES**

**STANDARD 'V'
TYPE PACKING**

**CODE 2: GRAPHITE STANDARD ON METAL
SEATED AND FIRE SAFE VALVES**

**CODE 3: PTFE STANDARD ON SOFT
SEATED VALVES**

**STANDARD SQUARE
TYPE JAM PACKING**

GREASE CONNECTIONS ARE
REQUIRED

**STANDARD SQUARE
TYPE JAM PACKING
WITH LANTERN RING/
BEARING LUBRICATION
CONNECTION**

Seal Maintenance

1. After the valve has been removed from the line and the manual or power actuator has been removed, manually rotate the shaft (key 4) counter-clockwise until the disk has moved a full 180°. Note the “S” on the shaft is 180° from the “S” on the valve body.

Figure 7. Seal Configurations

E1701

Notes:

- ① This unidirectional seal must be installed so the ring is downstream from the high pressure side of the valve at shutoff, as shown.

2. Lay the valve flat on a work bench in a secure position with the retaining ring (key 2) and retaining ring screws (key 22) facing up. Use blocks or other appropriate techniques to support the valve. Remove all retaining ring screws.
3. Remove the retaining ring by placing a retaining ring screw in each of the two retaining ring jack screw holes. With the appropriate tool, slowly rotate the screws until the retaining ring has been lifted from the valve body.

CAUTION

In the following step, use the appropriate tool to avoid damage to the seal or T-slot area of the valve.

4. Different valve types have different seal designs and components. To see the appropriate seal, refer to figure 7. Insert the appropriate tool under the top edge of seal and gently pry the seal out. Take care not to damage the seal or T-slot area of the valve body. After the seal has been removed, clean the T-slot area, retaining ring and, if required, polish the disk thoroughly with fine steel wool or other appropriate material.

Figure 8. Typical Seal Ring (Sectional)

Soft Seal Installation

1. Locate the replacement seal ring (key 8) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter as shown in figure 8. Around the outside circumference is one wide groove.

Before installing the seal ring into the valve body, the backup ring (key 9) must first be placed onto the wide, outer groove of the seal ring.

2. The seal ring and backup ring assembly must be installed in the valve. The wider outside diameter of the seal ring goes into the T-slot area of the valve body, shown in figure 9. Start the wider diameter edge of the seal ring into the T-slot of the valve body using a blunt end screwdriver.
3. Carefully tuck the backup ring downward into the valve body T-slot until the seal ring and back-up ring are completely entrapped in the valve body T-slot.
4. When the seal is thoroughly seated, re-install the retaining ring and screws. Tighten the retaining screws just enough to eliminate vertical movement of the retaining ring. With the use of the blunt end tool, carefully tuck the lip of the seal ring under the retaining ring.
5. When the seal is under the lip of the retaining ring, tighten the screws according to standard procedures. Manually rotate the valve shaft clockwise 180° to return the disk to its closed position against the internal stop.
6. The final seating of the retaining ring screws can now be done. For the screw torque values, refer to table 6. The seal is now fully installed and the valve may be closed for installation or storage.

Seal Installation

For HPS seal installation:

Locate the replacement seal ring (key 8) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter as shown in figure 8. Around the outside circumference is one wide groove.

Install the seal ring (key 8) into the valve body by first placing the wider outside diameter of the seal ring into the T-slot area of the valve body which is shown in figure 9.

Figure 9. Typical Seal Installation

A5251/JL

For Soft seal installation:

1. Locate the replacement seal ring (key 8) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter as shown in figure 8. Around the outside circumference is one wide groove.

Install the seal ring in the valve body by first placing the wider outside diameter of the seal ring, as marked in figure 8, into the T-slot area of the valve body which is shown in figure 9. Seal rings without a back-up ring will fall into place. The back-up ring will have to be installed after placing the seal ring in the valve using a blunt end screwdriver. Do not use the screwdriver or seal tool directly on the seal ring. Use a tool only on the backup ring.

2. With the seal ring inserted all the way around the valve body T-slot now lay the backup ring into the opening between the valve body and the seal ring. Use the seal tool to apply pressure to the backup ring and carefully tuck the backup ring down into the T-slot between the valve body and the seal ring. Note: On larger valves, it may be more efficient to have someone hold down the seal ring while the backup ring is pushed into the T-slot.
3. Once the seal ring or seal and backup ring has been fully installed into the valve body T-slot, the retaining ring gasket (key 17) can be installed.

CAUTION

This gasket is a thin graphite material. Take care to avoid damaging the gasket. However, punch one initial screw hole through the gasket for alignment purposes.

4. Install the retaining ring and align the screw holes in the retaining ring with the holes in the valve body. Install the first retaining ring screw through the punched hole in the ring gasket. Install the other ring screws by pushing the screws through the graphite gasket and threading them into valve body.
5. Tighten the retaining ring screws just enough to eliminate vertical movement of the retaining ring. Do not tighten the retaining ring screws.

⚠ WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping large valve. Large valves must be properly supported during maintenance.

6. To complete this step, stand the valve up. Support the valve securely using methods appropriate for the valve size.

CAUTION

If a vise or other clamps are being used, be sure damage is not done to the flange gasket sealing area of the valve body.

7. Manually rotate the valve shaft to turn the disk clockwise to meet the seal.
8. Tap the disk with a rubber mallet to drive it against the internal travel stop. When the disk makes contact with the stop, manually rotate the disk counter-clockwise back out of the seal to a 90° open position. Repeat steps 7 and 8 three times.
9. The final seating of the retaining ring screws can be done. For the screw torque values, refer to table 6. The seal is now fully installed and the valve may be closed for installation or storage.

Cryogenic Seal Installation

1. Locate the replacement seal ring (key 8) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter as shown in figure 8. Around the outside circumference is one wide groove.

For Kel-F seals with aluminum backup rings only: Now, locate the replacement V-ring. Please notice that the V-ring is similar in diameters to the seal ring. Place the V-ring down onto the seal ring with the larger diameter of the V-ring going first. Be sure the larger diameters on both rings are down.

2. **For all types:** Install the seal ring (or seal ring and V-ring) in the valve body by first placing the wider outside diameter of the seal ring into the T-slot area of the valve body. The seal ring with or without a back-up ring will fall into place.
3. Once the seal ring (or seal ring and V-ring) have been fully installed into the valve body T-slot, the retaining ring gasket can be installed.

CAUTION

This gasket is a thin graphite material. Take care to avoid damaging the gasket. However, punch one initial screw hole through the gasket for alignment purposes.

4. Install the retaining ring and align the screw holes in the retaining ring with the holes in the valve body. Install the first retaining ring screw through the punched hole in the ring gasket. Install the other ring screws by pushing the screws through the graphite gasket and threading them into the screw holes in the valve body.
5. Tighten the retaining ring screws just enough to eliminate vertical movement of the retaining ring. Do not tighten the retaining ring screws.

⚠ WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping large valve. Large valves must be properly supported during maintenance.

6. To complete this step, stand the valve up. Support the valve securely using methods appropriate for the valve size.

CAUTION

If a vise or other clamps are being used, be sure damage is not done to the flange gasket sealing area of the valve body.

7. Manually rotate the valve shaft to turn the disk clockwise to meet the seal.
8. Tap the disk with a rubber mallet to drive it against the internal travel stop. When the disk makes contact with the stop, manually rotate the disk counter-clockwise back out of the seal to a 90° open position. Repeat steps 7 and 8 three times.
9. The final seating of the retaining ring screws can be done. For the screw torque values, refer to table 4. The seal is now fully installed and the valve may be closed for installation or storage.

Valve Shaft/Disk Pin Unit Maintenance

Valve Shaft/Disk Pin Unit Removal

1. Rotate the disk (key 3) 180° counterclockwise from the full closed position.
2. Place the open valve horizontally on a suitable work surface with the retaining ring (key 2) facing upward. Be sure to properly support the valve with blocks while the shaft is being removed.

Note

The disk must be removed from the waterway side of the valve body, which is the side opposite the T-slot area. Support the valve and disk so the disk can be easily removed from the valve when the shaft is removed.

3. Use a pin extractor to remove the disk pins (key 6). Select the proper pin extractor tip with screws of proper thread size to match the thread size in the disk pins.
4. Screw the pin extractor tip into the pin as far as possible. With an upward, straight sliding motion, extract the pin. Repeat the same procedure for the other pins.

A threaded rod with an appropriate spacer and nut can also be used as an extractor tool. If using a threaded rod, choose a rod with threads that fit the inside threads of the pins. The rod should extend several inches above the disk when screwed into a pin.

5. After screwing the rod into the pin, slide the spacer over the rod and pin. Thread the nut onto the rod and tighten. As the nut is tightened, it will drive the spacer against the disk and the increasing pressure will draw the pin from the disk.
6. Loosen the packing nuts (key 16).

7. Extract the shaft (key 4) by hand-pulling or by using the pin extractor screwed into the end of the shaft.

Table 4. Torque Values for Fasteners

Fastener Nominal Size	N•m	In•lb	Ft•lb
#10	4	35	---
1/4	9	81	---
5/16	19	167	---
3/8	33	295	---
7/16	53	---	39
1/2	80	---	59
9/16	117	---	86
5/8	161	---	119
3/4	286	---	211
7/8	447	---	330
1	651	---	480
1-1/8	837	---	617

CAUTION

In the following step, remove the disk from the waterway side of the valve to avoid damage to the disk or T-slot area.

8. Remember: the disk must be removed from the waterway side of the valve. Do not try to force the disk through the seal side of the valve. This could cause severe damage to the disk and T-slot area.

After removing the shaft, remove the disk.

Valve Shaft/Disk Pin Unit Installation

Note

Replacement disk and shaft(s) are provided as a matched set. When replacing either the disk or shaft(s), a matched set is required.

To replace the disk pin assembly (key 6), reverse the removal steps used above.

Before placing disk into a valve body, properly align the top of the disk with the top of the valve. A "T" is stamped on the disk to indicate alignment. Be sure holes in the shaft are exactly aligned with the holes in the disk before re-installing pins. After pins are fully seated in the disk, use a punch or small chisel to stake the pins at three points. This will prevent the pins from working free and out of the disk due to vibration.

Bearing Maintenance

Bearing Removal

To get access to the bearings (key 10), the disk and shaft assembly (keys 3, 4 and 5) must be removed from the valve. The bearings (key 10) may be removed by using a brass drift punch and lightly tapping them out. In valves without lower bonnets, the lower bearing is removed by grasping it and pulling upwards. Also, cryogenic valves have an outboard bearing under the packing. Refer to the Packing Maintenance section for instructions.

Bearing Installation

Before installation of the bearings, bearing bores should be solvent cleaned and bearings will slip in.

Parts Ordering

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher instrument. The use of components not manufactured by Emerson Automation Solutions may void your warranty, might adversely affect the performance of the instrument, and could result in personal injury or property damage.

Parts List

Note

Contact your [Emerson sales office](#) for Part Ordering information.

Key	Description

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for Fisher A11 High Performance Butterfly Valves (figure 1) in CL150 and 300. For information about the actuator and accessories, please refer to the separate instruction manuals for these items.

Do not install, operate, or maintain an A11 valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Table 1. Specifications

Available Configurations**Valve Sizes**

CL150 and 300: Size ■ 30, ■ 36, ■ 42 and ■ 48-inch

Valve Body: Wafer-style and lugged style in ■ CL150/150, ■ 150, and ■ 300

Consult your [Emerson sales office](#) for larger sizes.

Maximum Inlet Pressure

Consistent with applicable ASME class pressure/temperature ratings per ASME B16.34 unless such ratings are limited by material temperature capabilities.

Construction Materials

Refer to Bulletin 51.6:A11, A11 High-Performance Butterfly Valve, NPS 30-72, (D104165X012)

Disk Rotation

Clockwise (CW) to close

Valve Body Classification

Valve bodies are designed for installation between standard pipe flanges: ASME B16.47 Class A and

MSS-SP-44

NPS 30 through 48: CL150 and 300

Consult your Emerson sales office for ASME B16.47 Series B (API 605).

Seal Temperature Capabilities

PTFE (Standard) Seal: For application ranges from -62 to 232°C (-80 to 450°F)

Phoenix III Seal: For application ranges from -73 to 232°C (-100 to 450°F)

High-Temperature Seals:

Standard: Metal or NOVEX to 820°C (1500°F)

Optional: 17-4PH H1150M to 454°C (850°F)

Cryogenic Seals:

CTFE: -254 to 149°C (-425 to 300°F)

NOVEX: -254 to 260°C (-425 to 500°F)

Approximate Weights

See table 2

Available Actuators

- Spring-return pneumatic actuators,
- double-acting pneumatic actuators,
- electric actuators, and
- handwheel

Description

A11 High Performance Butterfly Valves are available in either a flangeless wafer or a lugged design, with a variety of seal, valve body, and internal components. These valves feature a dynamic sealing design that is used in a variety of demanding applications.

1. Consult your Emerson Automation Solutions sales office for information.

Specifications

Specifications are shown in table 1 and the specifications for a given valve are stamped on a nameplate attached to the valve.

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

Note

When installing a valve after it has been in long-term storage, cycle the valve at least ten times to re-energize the dynamic seal.

Please contact your [Emerson sales office](#) if you have any questions about preparing a valve for storage or if you are planning to put into service a valve that has been stored for some time.

Adjusting the Travel Stops

NOTICE

When using manual or power actuators, adjust the actuator travel stops so the disk stop in the valve body does not absorb the output of the actuator.

For actuators without travel stops, the actuator must be properly mounted to prevent it from driving the valve disk against the valve disk travel stop.

Failure to limit actuator travel as described in this section can result in damage to the valve shafts or other valve parts.

Note

An “S” is visible on both the valve shaft and valve body. When the valve disk is closed, the “S” on the shaft aligns with the “S” on the valve body.

Locate the actuator travel stop that establishes the closed position of the valve disk. When adjusting the travel stop make sure that the disk is from 0 to 0.76 mm (0 to 0.030 inch) away from the internal stop in the valve body. This adjustment is necessary to be certain that the actuator output torque is fully absorbed by the actuator travel stop rather than the stop in the valve body.

For actuators without travel stops, the actuator must be properly mounted to prevent it from driving the valve disk against the valve disk travel stop.

1. To mount an actuator without travel stops, first, if necessary, remove the actuator from the valve. Then, position the valve disk from 0 to 0.76 mm (0 to 0.030 inch) away from the internal stop in the valve body.
2. Now, travel the actuator to the maximum position. Keep the actuator in the maximum travel position. Return the actuator to the valve, taking care not to disturb the position of the valve disk.
3. Mount the actuator on the valve using proper bolts with locking washers to achieve a secure fit.
4. Before installing the valve/actuator assembly in the process line, cycle the valve several times to be sure the valve disk returns to the proper position.

Preparing for Installation

⚠ WARNING

If the A11 valve is equipped with a fail-open actuator, remove the actuator before installing the valve/actuator assembly or cycle the valve into the fully closed position. Then, to avoid possible personal injury or property damage, take appropriate steps to ensure that the actuator does not cause the valve to open during installation.

1. If the valve and actuator have been purchased separately or if the actuator has been removed for storage, travel stop adjustment, or maintenance, mount the actuator before inserting the valve/actuator assembly into the line. Refer to the actuator instruction manual for mounting and adjustment procedures.

NOTICE

To avoid product damage, inspect the valve before installation for any damage or any foreign material that may have collected in the valve body. Also remove any pipe scale, welding slag, or other foreign material from the pipeline.

- Remove the protective end covers from the valve and inspect the valve body to be certain that it is free of foreign material. Also, be certain that adjacent pipelines are free of any foreign material, such as pipe scale or welding slag that could damage the valve seating surfaces.

NOTICE

The A11 valve is designed for use with the appropriate piping schedule for the ASME class. However, before putting the valve into operation, measure carefully to ensure disk rotation without interference from piping or flanges. Be certain to center the valve accurately to prevent interference of the disk with the flanges.

Damage to the disk will occur if any pipe flanges or piping connected to the valve interfere with the disk rotation path. Measure carefully to be certain the disk rotates without interference before putting the valve into operation.

⚠ WARNING

The edges of a rotating disk have a shearing effect that may result in personal injury. To help prevent such injuries, stay clear of the disk edges when rotating the disk.

- Select the appropriate gaskets for the application. flexible graphite, spiral wound, or other gasket types, made to ASME B16.5 group or user's standard, can be used on A11 valves depending on the service conditions of the application. Note: spiral wound gaskets, when properly centered, will cover more than 60 percent of the gasket area at the retaining ring screws.

For metal-seated and cryogenic valve gasket recommendations, please contact your [Emerson sales office](#).

- Refer to the appropriate table for the quantity and size of flange bolts required (table 3 or 4) and proceed with the following instructions.

Valve Orientation

A11 valve bodies are designed for installation with the shaft in any orientation around the pipeline: horizontal, vertical, or at an angle. However, when installing an A11 valve, please follow these recommendations.

Figure 2. View of Stud Bolts

- In certain services (process fluids with high concentrations of entrained solids, abrasive slurries, or polymerizing media), valve performance will be enhanced by installing the valve with the shaft horizontal to the pipeline.
- Valves supplied for unidirectional shutoff should be installed with the high pressure at the back (waterway side) of the disk. A flow tag with an arrow is provided for proper installation.

The High Performance Butterfly Valve is designed to allow flow in either direction when in the open position. When in the closed position, high pressure should be applied to a specific side of the disk to provide best performance and optimal service life.

- Valves supplied for bidirectional shutoff, such as soft or Phoenix III, under normal operating conditions can (at different times) experience pressure in both directions; the highest of the two pressures should be exerted on the preferred side of the disk. If the two pressures are equal, then the one lasting the longest period of time should be applied to the preferred side. A flow tag with an arrow is provided for proper installation.

If you have questions about proper valve orientation in a specific application, contact your [Emerson sales office](#).

Table 3. Stud Bolt and Cap Screw Data for Wafer Style Valves

CL150 and 150/150				
Valve Size, NPS	30	36	42	48
Number of Stud Bolts	24	28	32	40
Number of Cap Screws	8	8	8	8

B-Length of Cap Screw, Inch	5-3/4	6-1/2	6	8-1/4

Installing the Valve

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage resulting from the sudden release of pressure, do not install the valve assembly where service conditions could exceed the limits given in this manual, the limits on the appropriate nameplates, or the matching pipe flange rating. Use pressure-relieving devices as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions indicated when the valve was ordered. Because some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

Figure 3. Proper Installation Procedure

For Wafer Style Valves:

1. See figure 3. Install the lower flange bolts first to form a cradle for the valve.
2. Properly orient the valve according to the specific application. Be sure the valve is placed in the line so the flow properly enters the valve. Then, install the valve and the gaskets between the flanges into the cradle formed by the flange bolts.
3. Install the remaining flange bolts, making sure that the gaskets are centered on the gasket sealing surfaces of the flange and valve body.
4. Tighten the flange bolts in an alternating criss-cross fashion to a torque value of one-fourth of the final bolting torque. Repeat this procedure several times increasing the torque value each time by a fourth of the final desired torque. When the final torque value has been applied, tighten each flange bolt again to allow for gasket compression.

For Lugged Valves:

1. Position the valve between the flanges. Be sure to leave enough room for the flange gaskets; then install the lower flange bolts.
2. Install the gaskets and align the valve and the gaskets.
3. Install the remaining bolts.
4. Tighten the flange bolts in an alternating criss-cross fashion to a torque value of one-fourth of the final bolting torque. Repeat this procedure several times increasing the torque value each time by a fourth of the final desired torque. When the final torque value has been applied, tighten each flange bolt again to allow for gasket compression.

Packing Adjustment and Shaft Bonding

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

1. For PTFE or graphite packing: Tighten standard packing follower nuts only enough to prevent shaft leakage. Excessive tightening of packing will accelerate wear and could produce higher rotating friction loads on the valve shaft. If necessary, refer to the Packing Maintenance section.
2. For live-loaded packing: These packing systems will not require this initial re-adjustment.
3. For hazardous atmosphere or oxygen service valves, read the following Warning, and provide the bonding strap assembly mentioned below if the valve is used in an explosive atmosphere.

⚠ WARNING

The valve drive shaft is not necessarily grounded to the pipeline when installed. Personal injury or property damage could result, if the process fluid or the atmosphere around the valve is flammable, from an explosion caused by a discharge of static electricity from the valve components. If the valve is installed in a hazardous area, electrically bond the drive shaft to the valve body.

Note

The packing is composed of all conductive packing rings (graphite ribbon packing) or partially conductive packing rings (carbon-filled PTFE female adaptor with PTFE V-ring packing or graphite-composition packing ring with PTFE/composition packing) to electrically bond the shaft to the valve for hazardous area service. For oxygen service applications, and hazardous area service where the standard packing doesn't provide sufficient shaft-to-valve body bonding, provide alternate shaft-to-valve body bonding according to the following step.

4. Attach the bonding strap assembly (key 131, figure 4) to the shaft with the clamp (key 130, figure 4).
5. Connect the other end of the bonding strap assembly to the valve flange cap screws.
6. For more information, refer to the Packing Maintenance section below.

Figure 4. Optional Shaft-to-Body Bonding Strap Assembly

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

⚠ WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure.
- Use lockout procedures to be sure the above measures stay in effect while you work on the equipment.
- Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.
- The valve packing area may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

NOTICE

When using an actuator, the actuator travel stop (or actuator, for actuators without adjustable stops) must be adjusted so the disk stop in the valve does not absorb the output of the actuator. Failure to limit the actuator travel can result in damage to the valve, shaft(s), or other valve components.

Removing the Valve

For field repair, remove the valve from the pipeline.

⚠ WARNING

Using the procedures listed in the above **WARNING**, loosen the flange bolting that holds the valve. Make sure the valve cannot slip or twist while the bolting is being loosened and removed.

NOTICE

Damage to the disk can occur if the disk is not closed when the valve is being removed from the pipeline. If necessary, stroke the actuator to place the disk in the closed position while removing the valve from the pipeline.

7. Before removing the valve from the pipeline, make sure the valve disk is closed. See figure 3. Rotate the shaft clockwise until the disk makes contact with the internal stop or actuator travel stop (if still installed). The “S” stamped on the shaft should be aligned with the “S” on the valve body.
8. After removing the valve from the pipeline, move it to an appropriate work area. Remove the actuator from the valve.

Packing Maintenance

The A11 valve is designed so the shaft packing can be replaced without removing the valve from the process pipeline. Refer to figure 8 for available packing configurations and figure 9 for part key numbers.

NOTICE

The packing flange should be tightened only enough to prevent shaft leakage. Excessive tightening will only accelerate wear of the packing and could produce higher torques on the valve.

In most cases, packing leakage can be eliminated by merely tightening the hex nuts located above the packing flange while the valve is in the pipeline. However, if leakage continues, the packing must be replaced.

1. Before loosening any parts on the valve, be sure the pipeline has been depressurized. Then, remove packing nuts (key 16), lift off the packing flange (key 12) and packing follower (key 13). The packing (key 14) is now accessible.
2. Use a packing extractor to remove packing. Insert the corkscrew-like end of the tool into the first piece of packing and firmly remove. Repeat this process until all has been removed.

⚠ WARNING

Be careful when cleaning the packing bore. Scratches to the valve shaft (key 4) or inside diameter of packing bore may cause leakage.

Figure 5. Available Seal Configurations

E0578

Note:

⏏ This unidirectional seal must be installed so that the retaining ring is downstream from the high pressure side of the valve at shutoff, as shown.

- Before installing new packing, clean the packing bore.
- Install new packing one ring at a time, using the packing follower as a driver. If split packing is used, stagger seams every 90°.
- Reinstall the packing follower and packing flange, secure nuts, and tighten as needed.

Seal Maintenance

- After the valve has been removed from the line and the manual or power actuator has been removed, manually rotate the shaft (key 4) counter-clockwise until the disk has moved a full 180°. Note that the “S” on the shaft is 180° from the “S” on the valve body.
- Lay the valve flat on a work bench in a secure position with the retaining ring (key 2) and retaining ring screws (key 22) facing up. Use blocks or other appropriate techniques to support the valve. Remove all retaining ring screws.
- Remove the retaining ring by placing a retaining ring screw in each of the two retaining ring jack screw holes. With the appropriate tool, slowly rotate the screws until the retaining ring has been lifted from the valve body.

NOTICE

In the following step, use the appropriate tool to avoid damage to the seal or T-slot area of the valve.

- Different valve types have different seal designs and components. To see the appropriate seal, refer to figure 5. Insert the appropriate tool under the top edge of seal and gently pry the seal out. Take care not to damage the seal or T-slot area of the valve body. After the seal has been removed, clean the T-slot area, retaining ring and, if required, polish the disk thoroughly with fine steel wool or other appropriate material.

Soft Seal Installation

1. Locate the replacement seal ring (key 8) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter as shown in figure 6. Around the outside circumference is one wide groove.

Before installing the seal ring into the valve body, the backup ring (key 9) must first be placed onto the wide, outer groove of the seal ring.

2. The seal ring and backup ring assembly must be installed in the valve. The wider outside diameter of the seal ring goes into the T-slot area of the valve body, shown in figure 7. Start the wider diameter edge of the seal ring into the T-slot of the valve body using a blunt end screwdriver.
3. Carefully tuck the backup ring downward into the valve body T-slot until the seal ring and back-up ring are completely entrapped in the valve body T-slot.
4. When the seal is thoroughly seated, re-install the retaining ring and screws. Tighten the retaining screws just enough to eliminate vertical movement of the retaining ring. With the use of the blunt end tool, carefully tuck the lip of the seal ring under the retaining ring.
5. When the seal is under the lip of the retaining ring, tighten the screws according to standard procedures. Manually rotate the valve shaft clockwise 180° to return the disk to its closed position against the internal stop.
6. The final seating of the retaining ring screws can now be done. For the screw torque values, refer to table 6. The seal is now fully installed and the valve may be closed for installation or storage.

Metal and Phoenix III Seal Installation

For metal seal installation:

Locate the replacement seal ring (key 8) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter as shown in figure 6. Around the outside circumference is one wide groove.

Install the seal ring (key 8) into the valve body by first placing the wider outside diameter of the seal ring into the T-slot area of the valve body which is shown in figure 7. Metal seals without a back-up ring will fall into place. Metal seals with a back-up ring (key 9) will have to be installed following the instructions given below for the Phoenix III seal with back-up ring.

Figure 6. Typical Seal Ring (Sectional)

Figure 7. Typical Seal Installation

For Phoenix III seal installation:

1. Locate the replacement seal ring (key 8) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter as shown in figure 6. Around the outside circumference is one wide groove.

Install the seal ring in the valve body by first placing the wider outside diameter of the seal ring, as marked in figure 6, into the T-slot area of the valve body which is shown in figure 7. Phoenix III seal rings without a back-up ring will fall into place. If the Phoenix III seal uses a back-up ring (key 9), the back-up ring will have to be installed after placing the seal ring in the valve using a blunt end screwdriver. Do not use the screwdriver directly on the metal seat. Use a tool only on the backup ring.

2. With the seal ring inserted all the way around the valve body T-slot now lay the backup ring into the opening between the valve body and the seal ring. Use the screwdriver to apply pressure to the backup ring and carefully tuck the backup ring down into the T-slot between the valve body and the seal ring. Note: On larger valves, it may be more efficient to have someone hold down the seal ring while the backup ring is pushed into the T-slot.
3. Once the seal ring or seal and backup ring has been fully installed into the valve body T-slot, the retaining ring gasket (key 17) can be installed.

NOTICE

This gasket is a thin graphite material. Take care to avoid damaging the gasket. However, punch one initial screw hole through the gasket for alignment purposes.

4. Install the retaining ring and align the screw holes in the retaining ring with the holes in the valve body. Install the first retaining ring screw through the punched hole in the ring gasket. Install the other ring screws by pushing the screws through the graphite gasket and threading them into valve body.
5. Tighten the retaining ring screws just enough to eliminate vertical movement of the retaining ring. Do not tighten the retaining ring screws.

⚠ WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping large valve. Large valves must be properly supported during maintenance.

6. To complete this step, stand the valve up. Support the valve securely using methods appropriate for the valve size.

NOTICE

If a vise or other clamps are being used, be sure damage is not done to the flange gasket sealing area of the valve body.

7. Manually rotate the valve shaft to turn the disk clockwise to meet the seal.
8. Tap the disk with a rubber mallet to drive it against the internal travel stop. When the disk makes contact with the stop, manually rotate the disk counter-clockwise back out of the seal to a 90° open position. Repeat steps 7 and 8 three times.
9. The final seating of the retaining ring screws can be done. For the screw torque values, refer to table 6. The seal is now fully installed and the valve may be closed for installation or storage.

Cryogenic Seal Installation

1. Locate the replacement seal ring (key 8) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter as shown in figure 6. Around the outside circumference is one wide groove.

For Kel-F seals with aluminum backup rings only: Now, locate the replacement V-ring. Please notice that the V-ring is similar in diameters to the seal ring. Place the V-ring down onto the seal ring with the larger diameter of the V-ring going first. Be sure the larger diameters on both rings are down.

2. **For all types:** Install the seal ring (or seal ring and V-ring) in the valve body by first placing the wider outside diameter of the seal ring into the T-slot area of the valve body. The seal ring with or without a back-up ring will fall into place.
3. Once the seal ring (or seal ring and V-ring) have been fully installed into the valve body T-slot, the retaining ring gasket can be installed.

NOTICE

This gasket is a thin graphite material. Take care to avoid damaging the gasket. However, punch one initial screw hole through the gasket for alignment purposes.

4. Install the retaining ring and align the screw holes in the retaining ring with the holes in the valve body. Install the first retaining ring screw through the punched hole in the ring gasket. Install the other ring screws by pushing the screws through the graphite gasket and threading them into the screw holes in the valve body.
5. Tighten the retaining ring screws just enough to eliminate vertical movement of the retaining ring. Do not tighten the retaining ring screws.

Figure 8. Packing Configurations

Note:

1 With conductive packing, the female adaptor in PTFE v-ring packing is carbon-filled PTFE.

⚠ WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping large valve. Large valves must be properly supported during maintenance.

6. To complete this step, stand the valve up. Support the valve securely using methods appropriate for the valve size.

NOTICE

If a vise or other clamps are being used, be sure damage is not done to the flange gasket sealing area of the valve body.

7. Manually rotate the valve shaft to turn the disk clockwise to meet the seal.
8. Tap the disk with a rubber mallet to drive it against the internal travel stop. When the disk makes contact with the stop, manually rotate the disk counter-clockwise back out of the seal to a 90° open position. Repeat steps 7 and 8 three times.
9. The final seating of the retaining ring screws can be done. For the screw torque values, refer to table 5. The seal is now fully installed and the valve may be closed for installation or storage.

Valve Shaft/Disk Pin Unit Maintenance

Valve Shaft/Disk Pin Unit Removal

1. Rotate the disk (key 3) 180° counterclockwise from the full closed position.
2. Place the open valve horizontally on a suitable work surface with the retaining ring (key 2) facing upward. Be sure to properly support the valve with blocks while the shaft is being removed.

Note

The disk must be removed from the waterway side of the valve body, which is the side opposite the T-slot area. Support the valve and disk so the disk can be easily removed from the valve when the shaft is removed.

3. Use a pin extractor to remove the disk pins (key 6). Select the proper pin extractor tip with screws of proper thread size to match the thread size in the disk pins.
4. Screw the pin extractor tip into the pin as far as possible. With an upward, straight sliding motion, extract the pin. Repeat the same procedure for the other pins.

A threaded rod with an appropriate spacer and nut can also be used as an extractor tool. If using a threaded rod, choose a rod with threads that fit the inside threads of the pins. The rod should extend several inches above the disk when screwed into a pin.

5. After screwing the rod into the pin, slide the spacer over the rod and pin. Thread the nut onto the rod and tighten. As the nut is tightened, it will drive the spacer against the disk and the increasing pressure will draw the pin from the disk.
6. Loosen the packing nuts (key 16).
7. Valves with a two-piece shaft use a gasket retainer, which must be removed before removing the lower shaft.
8. Extract the shaft (key 4) by hand-pulling or by using the pin extractor screwed into the end of the shaft.

Table 5. Torque Values for Fasteners

Fastener Nominal Size	N•m	In•lb	Ft•lb
#10	4	35	---
1/4	9	81	---
5/16	19	167	---
3/8	33	295	---
7/16	53	---	39
1/2	80	---	59
9/16	117	---	86
5/8	161	---	119
3/4	286	---	211
7/8	447	---	330
1	651	---	480
1-1/8	837	---	617

NOTICE

In the following step, remove the disk from the waterway side of the valve to avoid damage to the disk or T-slot area of the valve.

9. Remember: the disk must be removed from the waterway side of the valve. Do not try to force the disk through the seal side of the valve. This could cause severe damage to the disk and T-slot area.

After removing the shaft, remove the disk.

Valve Shaft/Disk Pin Unit Installation

Note

Replacement disk and shaft(s) are provided as a matched set. When replacing either the disk or shaft(s), a matched set is required.

To replace the disk pin assembly (key 6), reverse the removal steps used above.

Before placing disk into a valve body, properly align the top of the disk with the top of the valve. A “T” is stamped on the disk to indicate alignment. Be sure holes in the shaft are exactly aligned with the holes in the disk before re-installing pins. After pins are fully seated in the disk, use a punch or small chisel to stake the pins at three points. This will prevent the pins from working free and out of the disk due to vibration.

Gasket Retainer

A gasket retainer assembly must be used. The gasket is held in place by a gasket retainer and four hex head bolts and lockwashers. When re-assembling the valve, this gasket should always be replaced. Be sure the gasket is centered over the shaft bore before retightening bolts. Tighten down bolts evenly in a cross over pattern or in a star pattern. Refer to table 5 for proper torque values.

Bearing Maintenance

Bearing Removal

To get access to the bearings (key 10), the disk and shaft assembly (keys 3, 4 and 5) must be removed from the valve. The bearings (key 10) may be removed by using a brass drift punch and lightly tapping them out. In valves without lower bonnets, the lower bearing is removed by grasping it and pulling upwards. Also, cryogenic valves have an outboard bearing under the packing. Refer to the Packing Maintenance section for instructions.

Bearing Installation

Before installation of the bearings, bearing bores should be solvent cleaned and bearings will slip in.

Figure 9. Typical Fisher A11 Valve Assembly

Note:

¹ Required for fire safe, metal seated and cryogenic valves.

² Gasket, gasket retainer, and thrust bearings are not shown.

Parts Ordering

When corresponding with your [Emerson sales office](#) about an A11 valve, please mention the valve serial number which is stamped on the nameplate.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts List

Note

Contact your Emerson sales office for Part Ordering information.

W7451 / IL

Introduction

Scope of Manual

This instruction manual provides installation, maintenance, and parts ordering information for the POSI-SEAL A31A Cryogenic high-performance butterfly valves (see figure 1). The Series C (3- through 6-inch Class 150 & 300 and 8-inch Class 150) feature a cast one-piece extension. The 8-inch Class 300, and 10- through 24-inch Class 150 & 300 designs have a two-piece extension. For information regarding actuators and accessories, refer to separate instruction manuals.

Do not install, operate, or maintain an A31A Cryogenic valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all of the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#).

Table 1. Specifications

Available Valve Configurations ■ Flangeless, wafer-style or ■ single-flange (lugged) control valve with a one-piece extension housing and either NOVEX seal (standard), Kel-F seal (optional) or Kel-F seal with Aluminum backup V-ring (optional) Valve Sizes ■ 3, ■ 4, ■ 6, ■ 8, ■ 10, ■ 12, ■ 14, ■ 16, ■ 18, ■ 20, or ■ 24-inch End Connection Style ■ Flangeless, wafer-style or ■ single flange valve body designed to fit between raised-face mating flanges per ASME B16.5 Class 150 or 300 Maximum Inlet Pressure/Temperature⁽¹⁾ Consistent with ANSI Class ■ 150 and ■ 300 pressure/temperature ratings per ASME B16.34, except that 38°C (100°F) rating is applicable to -254°C (-425°F). NOVEX seal maximum	pressure/temperature rating is the same as the valve body. See figure 2 for rating of Kel-F seal. Valve Classification Face-to-face dimensions are in compliance with MSS SP68 and API 609 standards; valve bodies are designed for installation between ASME B16.5 Class 150 or 300 raised-face flanges Materials of Construction See Bulletin 21.1:Cryogenic-Rotary Installed Valve Orientation See figure 3 for orientation guidelines Available Actuators ■ 1035, ■ Bettis Pneumatic or ■ 1051/1052 Disk Rotation Clockwise to close
--	--

1. The pressure/temperature limits in this manual, and any applicable code or standard limitation, should not be exceeded.

Description

The A31A Cryogenic Series C (3- through 6-inch Class 150 & 300 and 8-inch Class 150) High Performance Butterfly Valve features either a double D drive shaft to allow direct coupling to the 1035 actuator or keyed shaft (optional). The A31A Cryogenic is a reliable, high-performance butterfly valve for cryogenic applications.

The A31A Cryogenic is available in either a flangeless (wafer) or a single-flange (lugged) valve body style and a variety of seals.

The standard seal for the A31A Cryogenic valve is the NOVEX™ metal seal which provides tight shutoff, low operating torques and the ruggedness required for cryogenic service. Kel-f and Kel-f/aluminum seals are also available.

Installation

⚠ WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid injury.

To avoid personal injury or property damage resulting from the sudden release of pressure, do not install the valve assembly where service conditions could exceed the limits given in this manual or on appropriate nameplates. Use pressure-relieving devices as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

Responsibility for the safety of process media and compatibility of valve materials rests solely with the purchaser and end-user. When ordered, the valve configuration and construction materials were selected to meet particular pressure, pressure drop, temperature, and controlled fluid conditions. Because pressure drop and temperature range capabilities limit some combinations of materials, do not apply any other conditions to the valves without first contacting your [Emerson sales office](#).

Before installation check the maximum allowable inlet pressures for A31A Cryogenic valves shown in figure 2 and the Specifications table.

A3715-2 / IL

Adjusting the Actuator Travel Stops

⚠ WARNING

The edges of a rotating valve disk have a shearing effect that may result in personal injury. To avoid personal injury, keep clear of the disk edges when rotating the disk.

CAUTION

When using an actuator, the actuator travel stops or the actuator travel (for actuators without adjustable stops) must be adjusted so that the disk stop in the valve body does not absorb the output of the actuator. Failure to limit actuator travel as described in the next step can result in damage to the valve shaft or other valve parts.

1. Locate the actuator travel stop that establishes the closed position of the valve disk. When adjusting the travel stop or travel, make sure that the disk is from 0.03 to 0.76 mm (0.001 to 0.030 inch) away from the internal stop in the valve body. This adjustment is necessary to be certain that the actuator output torque is fully absorbed by the actuator travel stop or by the actuator. The internal travel stop in the valve body should not absorb any of the actuator torque.
2. Before installing the valve/actuator assembly in the process line, cycle the valve several times to be sure the valve disk returns to the proper position.

Valve Orientation

Note

When the process flow is gas, install the valve with the shaft in the horizontal position.

When the process flow is liquid the valve should be installed at an incline above horizontal of at least 20 degrees, as shown in figure 3. Inclined installation can enhance valve performance by preventing direct cryogenic liquid contact with the packing.

The A31A Cryogenic valve is designed for installation with the shaft(s) in any orientation around the pipeline: horizontal, vertical, or at an intermediate angle. However, when installing the valve in cryogenic service, follow the recommendations below, which are based on application experience:

- Installing the valve with the extension housing or bonnet four to six inches beyond the cold box (see figure 3) provides space for slight boil-off of cryogenic liquids.
- When installed with the extension stem inclined 20 degrees above horizontal, the vapor pocket resulting from cryogenic liquid boil-off prevents the colder liquid from contacting the stem packing area.
- Recommended installation for optimum seal performance of the NOVEX and Kel-F seals is reverse flow (into the back of the disk).
- A flow tag with an arrow is provided for proper installation.

Preparing for Installation

CAUTION

To avoid damage to the valve disk during installation, the valve must be in the fully-closed position. If the A31A Cryogenic valve is equipped with a fail-open actuator, remove the actuator before installing the valve/actuator assembly or cycle the

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D500242X012

A31A Cryogenic-Rotary Valve

February 2019

valve into the fully closed position. Then, take appropriate steps to ensure that the actuator does not cause the valve to open during installation.

1. The A31A Cryogenic valve is normally shipped as part of an assembly with an actuator and other accessories. If the valve and actuator have been purchased separately or if the actuator has been removed for maintenance, properly mount the actuator and adjust valve/actuator travel and all travel stops before inserting the valve into the line.

Follow the instructions in this manual for Adjusting Travel stops. Also, refer to a separate actuator instruction manual for detailed actuator mounting and adjustment procedures.

2. If not previously removed, remove the protective end covers from the valve and inspect the valve body to be certain that it is free of foreign material. Also, be certain that adjacent pipelines are free of any foreign material, such as pipe scale or welding slag that could damage the valve seating surfaces.

CAUTION

The A31A Cryogenic valve is designed for use with the appropriate piping schedule for the specified ANSI class. Minimum inside diameters for flanges or pipe mating with valves are shown in tables 2 and 3. Be certain to align the valve accurately to avoid contact between the disk and the flanges. Improper alignment or insufficient space for disk rotation could result in damage to the disk.

Additionally, be certain that the valve body and any adjacent pipelines are free of foreign material, such as pipe scale or welding slag that could damage the valve seating surfaces.

1. Face-to-face dimensions are in compliance with MSS SP68 and API 609 specifications. 2. Minimum I.D. is the minimum pipe or flange I.D. required for disk swing clearance.					

3. Select the appropriate gaskets for the application. Flat sheet, spiral wound, or other gasket types, made to ANSI B16.5 group or user's standard, can be used on the valves depending on the service conditions of the application.
4. Refer to table 4 for the quantity and size of flange bolts required.

Installing Wafer-Style Valves

WARNING

The edges of a rotating valve disk have a shearing effect that may result in personal injury. To avoid personal injury, keep clear of the disk edges when rotating the disk.

1. See figure 3 for recommended valve orientation. See table 4 for flange bolt specifications. Install the lower flange bolts first to form a cradle for the valve.

1. Thread engagement in accordance with ANSI B31.3 "Chemical Plant and Petroleum Refinery Piping".

2. Properly orient the valve according to the specific application. For optimum performance, install the valve so that the shaft will be on the high pressure side of the valve at shutoff (reverse flow). Install the valve and the gaskets between the flanges into the cradle formed by the flange bolts.
3. Install the remaining flange bolts, making sure to center the gaskets on the gasket sealing surfaces of the flange and valve body.
4. Tighten the flange bolts in an alternating criss-cross fashion to a torque value of one-fourth of the final bolting torque. Repeat this procedure several times increasing the torque value each time by a fourth of the final desired torque. When the final torque value has been applied, tighten each flange bolt again to allow for gasket compression.

Note

The optional graphite ribbon packing and metal bearings are composed of all conductive material to electrically bond the shaft to the valve for hazardous area service, as opposed to the non-conductive PTFE packing and bearings.

5. For more information, refer to the Packing Maintenance section below.

Installing Single-Flange Valves

⚠ WARNING

The edges of a rotating valve disk have a shearing effect that may result in personal injury. To avoid personal injury, keep clear of the disk edges when rotating the disk.

1. See figure 3 for recommended valve orientation. See table 4 for hex head cap screw specifications.
2. Properly orient the valve according to the specific application. For optimum shutoff, install the valve for reverse flow.
3. Position the valve between the flanges. Be sure to leave enough room for the flange gaskets. Install the lower flange bolts.
4. Select the appropriate gaskets for the application. Flat sheet, spiral wound, or other gasket types, made to the ANSI B16.5 group standard or user's standard, can be used on the valve depending on the service conditions of the application. Install the gaskets and align the valve and the gaskets.
5. Install the remaining bolts.
6. Tighten the flange bolts in an alternating criss-cross fashion to a torque value of one-fourth of the final bolting torque. Repeat this procedure several times increasing the torque value each time by a fourth of the final desired torque. When you get to the final torque value, tighten each flange bolt again to allow for gasket compression.

Note

The optional graphite ribbon packing and metal bearings are composed of all conductive material to electrically bond the shaft to the valve for hazardous area service, as opposed to the non-conductive PTFE packing and bearings.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

⚠ WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from either side of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.

- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Figure 3. Properly Installed Cryogenic Valve

Replacing Packing

The A31A Cryogenic valve is designed so the packing can be replaced without removing the valve from the process pipeline, provided there is no internal pressure. Packing may be PTFE V-rings or graphite.

Key numbers for the parts in this section may be found in figures 7 and 8.

CAUTION

Tighten the packing flange only enough to prevent shaft leakage. Excessive tightening will only accelerate wear of the packing and could produce higher torques on the valve than expected.

Usually, packing leakage can be eliminated by merely tightening the hex nuts (key 15) located above the packing flange while the valve is in the pipeline. However, if leakage continues, replace the packing.

CAUTION

Never use a wrench or pliers on the valve shaft. A damaged shaft could cut the packing and allow leakage.

1. Before loosening any parts, isolate the valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve.
2. Then, remove the hex nuts (key 18) and lift off the packing follower (key 11). The packing (key 13) is now accessible. Refer to figure 6 for details of the blowout protection.
3. Use a packing extractor to remove the packing. Insert the corkscrew-like end of the tool into the first piece of packing and pull firmly to remove the packing. Repeat this process until all packing has been removed.

Note

For valves equipped with non-metallic (PTFE composition) bearings, perform the following step to inspect and/or replace the outboard bearing (key 10).

4. Using a formed hook or probe, carefully remove the packing ring (key 12) and inspect the outboard bearing (key 10) for excessive intrusion or wear. Outboard bearings are only found on the 3- through 12-inch sizes. If necessary, remove the bearing carefully using needle-nose pliers and install a new bearing and existing packing ring using the packing follower (key 11) as a driver.

CAUTION

Be careful when cleaning the packing box. Scratches to the shaft or inside diameter of packing bore might cause leakage.

5. Before installing new packing, clean the packing box.
6. Install new packing (key 13) one ring at a time, using the packing follower (key 11) as a driver. If using split-ring packing, stagger the splits in the rings to avoid creating a leak path.
7. Reinstall all parts. Tighten the packing follower nuts (key 18) as needed to stop leakage under operating conditions.

Removing the Valve from the Pipeline

1. Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open the valve. Vent the power actuator loading pressure.
2. Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from either side of the valve.

CAUTION

Damage to the valve disk, piping or pipe flanges can occur if the disk is not closed when the valve is being removed from the pipeline. If necessary, stroke the actuator to place the disk in the closed position while removing the valve from the pipeline.

3. Loosen the flange bolting that holds the valve. Make sure the valve cannot slip or twist while loosening and removing the bolting.
4. Make certain the valve disk is closed and remove the valve from the pipeline. Support the valve properly and move the valve to an appropriate work area.

Removing/Installing the Seal Ring

Unless otherwise indicated, key numbers and part names are listed in figures 7 and 8.

Note

For valves large enough to be safely placed on a flat surface without tipping, it is possible to replace the seal ring (key 7) while the actuator is mounted to the valve and can be accomplished by cycling the valve to 90 degrees open.

1. After removing the valve from the pipeline, remove the manual or power actuator. Manually rotate the drive shaft (key 4) counterclockwise until the disk has moved a full 180 degrees away from the closed position.
2. Lay the valve flat on a work bench in a secure position with the retaining ring (key 2) and retaining ring screws (key 19) facing up. Properly secure the valve on a suitable worktable so it can not slip, twist, or fall during maintenance. Remove all retaining ring screws.
3. Remove the retaining ring by placing a socket head retaining ring screw from the retaining ring in each of the two retaining ring jacking screw holes. Slowly turn the screws until the retaining ring has been lifted from the valve body. Remove the retaining ring to expose the seal ring in the T-slot area of the valve body.

Note

The A31A Cryogenic valve is available with different seal designs and components. See figure 4 to identify the specific seal design.

CAUTION

To avoid possible leakage, be careful not to damage the gasket sealing surface, the seal ring, or the T-slot area in the valve body while performing the next two steps.

4. Remove and discard the retaining ring gasket (key 16). Be careful to not scratch the gasket seating surface.
5. Insert a regular screw driver or other similar tool under the top edge of the seal ring (key 7), and gently pry it out of the T-slot area in the valve body. Take care not to damage the seal ring or T-slot area of the valve body. After the seal ring has been removed, clean the T-slot area, retaining ring, and, if required, polish the disk thoroughly with fine steel wool or other appropriate material.

Figure 4. Available Seal Configurations

1685083 / DOC

NOVEX Seal Installation

Unless otherwise indicated, key numbers and part names are listed in figures 7 and 8. Seal installation is shown in figure 5.

A maintenance kit with installation tools is available through your [Emerson sales office](#).

1. Locate the replacement seal ring (key 7) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter. Also, note the wide groove around the outside circumference.

Before installing the seal ring into the valve body, place the backup ring, if applicable, (key 8) into the wide, outer groove of the seal ring.

2. Install the seal ring and backup ring assembly in the valve body. The wider outside diameter of the seal ring goes into the T-slot area of the valve body as shown in figure 5. Start the edge with the wider diameter into the T-slot of the valve body.

CAUTION

Use extreme care to avoid damaging the gasket while punching one initial screw hole through the gasket for alignment in the following step.

3. Once the seal ring and backup ring have been fully installed into the valve body T-slot, the retaining ring gasket can be installed. This gasket is a thin graphite material. Use extreme care to avoid damaging the gasket while punching one initial screw hole through the gasket for alignment.
4. Install the retaining ring, and align the screw holes in the retaining ring with the holes in the valve body. Install the first retaining ring screw through the punched hole in the retaining ring gasket. Install the other retaining ring screws by pushing them through the graphite gasket and threading them into the valve body.
5. Tighten the retaining ring screws just enough to eliminate any movement of the retaining ring. Do not over-tighten the retaining ring screws.

⚠ WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping valve. Support large valves during maintenance.

6. To complete this step, stand the valve up. Support the valve securely using methods appropriate for the valve size. If a vise or other clamps are being used, make certain the flange gasket sealing area of the valve body is not damaged.
7. Manually rotate the drive shaft (key 4) to turn the disk clockwise to meet the seal ring.
8. Place a piece of rubber, or other soft material, between the disk and internal travel stop to protect the disk. With a rubber mallet, tap the disk until it contacts the internal travel stop. When the disk makes contact with the stop, manually rotate the disk counterclockwise back out of the seal ring to a 90-degree open position.
9. The final seating of the retaining ring screws can now be done. For the screw torque values, refer to table 5.
10. Repeat steps 8 and 9 two more times.

Note

When attaching the actuator to the valve, make sure the valve disk is not in contact with the internal travel stop. The valve disk should be positioned from 0.03 to 0.76 mm (0.001 to 0.030 inch) away from the internal stop in the valve body.

CAUTION

When using an actuator, the actuator travel stops or the actuator travel (for actuators without adjustable stops) must be adjusted so that the disk stop in the valve body does not absorb the output of the actuator. Failure to limit actuator travel as described in the next step can result in damage to the valve shaft or other valve parts.

11. Use an appropriate tool (such as a feeler gauge) and position the disk from 0.03 to 0.76 mm (0.001 to 0.030 inch) away from the internal stop in the valve body.

This adjustment is necessary to be certain that the actuator output torque is fully absorbed by the actuator travel stop or by the actuator. The internal travel stop in the valve body should not absorb any of the actuator torque.

Kel-F and Kel-F/Aluminum Seal Installation

Unless otherwise indicated, key numbers and part names are listed in figures 7 and 8.

A maintenance kit with installation tools is available through your [Emerson sales office](#).

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

A31A Cryogenic-Rotary Valve

February 2019

Instruction Manual

D500242X012

1. Locate the replacement seal ring (key 7) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter. Also, note the wide groove around the outside circumference. If an aluminum backup ring (key 8) is provided, fit this over the back of the seal ring (matching seal and backup ring angles) prior to installation in the valve.

Table 5. Torque Values for Fasteners

FASTENER NOMINAL SIZE	RETAINING RING SCREWS		GASKET RETAINING BOLTS	
	N•m	In•lbs	N•m	In•lbs
#10	4.6	41	4.0	35
1/4	11	100	9.2	81
5/16	25	220	19	167
3/8	45	400	33	295
	N•m	ft•lbs	N•m	ft•lbs
7/16	72	53	53	39
1/2	112	83	80	59
9/16	161	119	117	86
5/8	225	166	161	119
3/4	401	296	286	210
7/8	651	480	447	330
1	976	720	651	480
1-1/8	1356	1000	837	617

Note: These values are based upon standard materials, S66286/Inconel screws and ASTM A193GRB6 bolts. For other special fastener materials, please contact your Emerson sales office.

2. Install the seal ring, and if applicable back-up ring, in the valve body by first placing the wider outside diameter of the seal ring into the T-slot area of the valve body as shown in figure 5.

Figure 5. Typical Seal Installation

3. Once the seal ring has been fully installed into the valve body T-slot, the retaining ring gasket can be installed. This gasket is a thin graphite material. Use extreme care to avoid damaging the gasket while punching one initial screw hole through the gasket for alignment.

4. Install the retaining ring, and align the screw holes in the retaining ring with the holes in the valve body. Install the first retaining ring screw through the punched hole in the retaining ring gasket. Install the other retaining ring screws by pushing them through the graphite gasket and threading them into the valve body.
5. Tighten the retaining ring screws just enough to eliminate any movement of the retaining ring. Do not over-tighten the retaining ring screws.

⚠ WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping valve. Support large valves during maintenance.

6. To complete this step, stand the valve up. Support the valve securely using methods appropriate for the valve size. If a vise or other clamps are being used, make certain the flange gasket sealing area of the valve body is not damaged.
7. Manually rotate the drive shaft (key 4) to turn the disk clockwise to meet the seal ring.
8. Place a piece of rubber, or other soft material, between the disk and internal travel stop to protect the disk. With a rubber mallet, tap the disk until it contacts the internal travel stop. When the disk makes contact with the stop, manually rotate the disk counterclockwise back out of the seal ring to a 90-degree open position.
9. The final seating of the retaining ring screws can now be done. For the screw torque values, refer to table 5.
10. Repeat steps 7 and 8 two more times.

Note

When attaching the actuator to the valve, make sure the valve disk is not in contact with the internal travel stop. The valve disk should be positioned from 0.03 to 0.76 mm (0.001 to 0.030 inch) away from the internal stop in the valve body.

CAUTION

When using an actuator, the actuator travel stops or the actuator travel (for actuators without adjustable stops) must be adjusted so that the disk stop in the valve body does not absorb the output of the actuator. Failure to limit actuator travel as described in the next step can result in damage to the valve shaft or other valve parts.

11. Use an appropriate tool (such as a feeler gauge) and position the disk from 0.03 to 0.76 mm (0.001 to 0.030 inch) away from the internal stop in the valve body.

This adjustment is necessary to be certain that the actuator output torque is fully absorbed by the actuator travel stop or by the actuator. The internal travel stop in the valve body should not absorb any of the actuator torque.

Anti-Blowout Protection, Packing, Valve Shaft(s), Disk, and Bearing Maintenance

Note

The 10- through 24-inch Class 150 valves and 8- through 24-inch Class 300 valves have a two-piece shaft. The shaft with the double D or keyed end is called the drive shaft.

The 3- through 8-inch Class 150 valves and 3 through 6-inch Class 300 valves have a one-piece shaft.

Figure 6. Anti-Blowout Protection Detail

16B5082 / DOC

Disassembly

⚠ WARNING

The edges of a rotating valve disk (key 3) have a shearing effect that might result in personal injury. To avoid personal injury, keep clear of the disk edges when rotating the disk.

CAUTION

When removing the actuator from the valve, do not use a hammer or similar tool to drive the lever off the valve shaft. Driving the lever or actuator off the valve shaft could damage the valve internal parts.

If necessary, use a wheel puller to remove the lever or actuator from the valve shaft. It is okay to tap the wheel puller screw lightly to loosen the lever or actuator, but hitting the screw with excessive force could also damage internal valve parts.

Never use a wrench or pliers on the drive shaft. A damaged shaft could cut the packing and allow leakage.

Unless otherwise indicated, key numbers and part names are listed in figures 7 and 8.

1. Remove the actuator and valve, as an assembly, from the pipeline, and then remove the actuator from the valve.

Note

It is not necessary to remove the retaining ring and seal ring when removing the shaft(s) and disk.

2. Secure the valve in an upright position. Rotate the disk (key 3) 180 degrees counterclockwise from the fully closed position by manually turning the drive shaft.
3. Remove the Anti-Blowout Protection (refer to figure 6). Remove the hex nuts and pull out the packing follower.

Note

Class 150 and 300 3- through 24-inch valve sizes have a bearing stop pressed into the bearing bore of the valve body below the extension housing.

Do not attempt to remove the bearing stop. If the bearing stop needs replacement, contact your [Emerson sales office](#) for more information.

4. Remove the packing from around the drive shaft.

Note

Different valves require slightly different procedures because different valve sizes/ pressure classes have different methods of connecting the disk and shaft(s). To identify the proper procedures, refer to the list below.

- Class 150, 3- through 8-inch sizes: One-piece shaft with 1 taper key.
 - Class 150, 10- and 12-inch sizes: Two-piece shaft. 1 taper key in the drive shaft; 1 disk pin in the follower shaft.
 - Class 300, 3- through 6-inch sizes: One-piece shaft with 1 taper key.
 - Class 300, 8- and 10-inch sizes: Two-piece shaft. 1 taper key in the drive shaft; 1 disk pin in the follower shaft.
 - Class 300, 12-inch size: Two-piece shaft with 2 tangential pins in the drive shaft; 1 disk pin in the follower shaft.
 - Class 150 and 300, 14- through 24-inch sizes: Two-piece shaft with 2 tangential pins in the drive shaft; 1 disk pin in the follower shaft.
-

5. Proceed as appropriate, using the following instructions.

For valves with taper key(s), locate the taper key(s) (key 6) which runs through the drive shaft boss on the back of the valve disk. Using a pin punch on the smaller end of the key, drive it out of the disk and shaft. Driving a taper key in the wrong direction will tighten it.

Note

Certain valve sizes may have a taper key that is arc spot welded in place. To remove the key, use a punch on the smaller end of the taper key and drive it out of the disk and shaft, breaking the weld.

For valves with tangential pins and/or disk pins, locate the tangential pins (key 6) in the drive shaft (key 4) and the disk pin (key 6) in the follower shaft (key 5).

- a. If a maintenance kit is available, use the pin extractor to remove the disk pins. Select the correct size pin extractor tip with screws of proper thread size to match the thread size in the disk pins. If a maintenance kit is not available, see steps c and d below.
- b. Screw the pin extractor tip into the pin as far as possible. With an upward, straight sliding motion, pull out the pin. Repeat the same procedure for the other pins.

- c. Use a threaded rod with an appropriate spacer and nut as an extractor tool. If using a threaded rod, choose a rod with threads that fit the inside thread of the pins. The rod should extend several inches above the disk when it is screwed into a pin.
- d. After screwing the rod into the pin, slide the spacer over the rod and pin. Thread the nut onto the rod and tighten it. As the nut is tightened, the nut will drive the spacer against the disk. The increasing force will draw the pin from the disk.
6. Valves with a two-piece shaft have a gasket retainer and gasket (keys 14 and 15) on the follower shaft side of the valve. Remove the hex head bolts and lockwashers (keys 21 and 20) from the gasket retainer and remove the gasket retainer and gasket to expose the end of the follower shaft.
7. Support the valve disk properly, and remove the follower shaft. Pull the follower shaft from the valve body. Use a shaft extractor screwed into the puller hole in the end of the follower shaft.
8. Support the valve disk properly, and remove the drive shaft. Pull out the drive shaft (key 4) by hand-pulling or by using a shaft extractor screwed into the end of the shaft. Keep the packing box ring (key 12) which will come out with the drive shaft.

CAUTION

To avoid damage to the disk, seal ring, and T-slot area, do not force the disk past the seal or T-slot area. Remove the disk from the opposite side of the valve body.

9. After removing the shaft(s), remove the disk and the thrust bearings (key 28). Do not force the disk past the seal ring or T-slot area.
10. Remove the journal bearings (key 9). Using a suitable punch or puller, drive or pull the journal bearing(s) into the valve body bore from the drive shaft bearing bore. Do not attempt to remove the bearing stop. Remove the journal bearing from the follower shaft bearing bore. Also, remove the outboard bearing from the extension housing (if applicable).
11. Inspect the valve body bore, bearings, bearing bores and packing box for damage.

Installing a One-Piece Shaft

Unless otherwise indicated, key numbers and part names are listed in figures 7 and 8.

1. Secure the valve in an upright position. Allow for easy access to the valve body bore. Allow for easy access to the drive shaft bearing bore.
2. Inspect all parts removed from the valve for wear or damage. Replace any worn or damaged parts. Clean the valve body and all parts to be installed with an appropriate solvent or degreaser.

CAUTION

Premature valve failure and loss of process control may result if bearings are improperly installed or are damaged during installation.

3. Using caution to prevent damage to the bearing, insert one journal bearing (key 9) from the valve body bore into the drive shaft bearing bore until it hits the bearing stop. When properly installed, a portion of the journal bearing will extend into the valve body bore.
4. Insert one journal bearing from the valve body bore into the shaft bearing bore opposite the journal bearing installed in step 3. When correctly installed, this journal bearing will be flush with the valve body bore.

5. Insert the outboard journal bearing (key 10) into the bore on top of the extension housing.
6. Install the valve disk by placing the disk into the valve body bore so the curved side of the disk passes through the end of the valve body that does not contain the T-slot. Align the shaft bore in the disk with the bearing bores.
7. Insert the drive shaft end opposite the double D or keyed end into the valve body through the packing box. Push the shaft through the bearing stop. Taking care not to dislodge the journal bearing, push the shaft through the journal bearing and the valve disk and into the bore on the opposite side of the valve body.

CAUTION

To avoid damage to the taper key, tangential pins, disk pins, valve disk, or shaft(s) resulting from the application of excessive force, use appropriate care when driving the key or pins into the disk hub and shaft(s). Use the right tool. Do not use excessive force.

8. Be sure the taper key disk shaft joint is free of oil or grease. If necessary, remove any excess welding material from the taper key.
9. Align the taper key hole in the shaft with the holes in the shaft boss on the disk. Insert the taper key. Use a flat-end punch to drive the taper key until solid contact is felt. Measure the depth of the taper key head for a reference during the following steps.
 - a. Drive the taper key in farther as follows:

Valve Size, Inches	Minimum Depth to Drive Taper key After Initial Solid Contact, mm (Inches)
ANSI Class 150 and 300, size 3, 4, 6-inch valves, and 8-inch ANSI Class 150 valves	5 (0.188)

- b. The disk, shaft, and taper key assembly must be inspected to verify that the taper key spans the entire shaft flat width. If so, this procedure is complete. If not, the taper key must be driven in farther until this condition is satisfied. However, do not exceed the following depth limits:

Valve Size, Inches	Maximum Allowable Depth to Drive Taper key After Initial Solid Contact, mm (Inches)
3, and 4-inch ANSI Class 150/300	7 (0.281)
6-inch ANSI Class 300, and 8-inch ANSI Class 150	8 (0.312)

10. After driving the taper key in place, arc spot weld the head of the taper key to the disk. For valve sizes 3-, 4-, and 6-inch, use an arc spot weld bead of 1/8-inch diameter. For valve sizes 8-, 10-, and 12-inch sizes, use an arc spot weld bead of 3/16-inch diameter.
11. Install the packing as described in the Packing Replacement section.

Installing a Two-Piece Shaft

Unless otherwise indicated, key numbers and part names are listed in figures 7 and 8.

1. Secure the valve in an upright position. Allow for easy access to the valve body bore. Allow for easy access to the drive shaft bearing bore and the follower shaft bearing bore.
2. Inspect all parts removed from the valve for wear or damage. Replace any worn or damaged parts. Clean the valve body and all parts to be installed with an appropriate solvent or degreaser.

CAUTION

Premature valve failure and loss of process control may result if bearings are improperly installed or are damaged during installation.

3. Using caution to prevent damage to the bearings, insert the required number of journal bearings (key 9) from the valve body bore into the drive shaft bearing bore. When properly installed, one end of the journal bearing(s) will be flush with the interior end of the extension housing, the other end of the journal bearing(s) will be flush with the valve body bore.

The drive shaft thrust bearing (key 28) will be installed in step 6.

4. Insert one journal bearing from the valve body bore into the follower shaft bearing bore so it is flush with the valve body bore.
5. Insert the outboard journal bearing (key 10) into the bore on top of the extension housing.
6. Insert the drive shaft into the valve body through the extension housing. Push the drive shaft through the journal bearing(s). Hold the drive shaft thrust bearing (key 28) in the valve body bore against the opening of the drive shaft bearing bore. Push the drive shaft through the bearing bore just enough to hold the thrust bearing.
7. Insert the follower shaft through the bore in the valve body uncovered by removal of the gasket retainer. Hold the follower shaft thrust bearing (key 28) in the valve body bore against the opening of the follower shaft bearing bore. Push the follower shaft through the bearing bore just enough to hold the thrust bearing.
8. Install the valve disk. Place the flat side of the disk on a flat surface. Then, move the valve body from its upright position and suspend the valve body over the disk so the seal ring/T-slot area is facing up. Align the shaft bores through the disk with the drive shaft and follower shaft bores. Lower the valve body over the disk using caution not to dislodge or damage the thrust bearings placed on the ends of the shafts.
9. With the valve disk properly positioned in the valve body, push the drive shaft and follower shaft the rest of the way through the thrust bearings and into the shaft bores in the valve disk.
10. Align the holes in the shafts with the holes in the disk.

CAUTION

To avoid damage to the taper key, tangential pins, disk pins, valve disk, or shaft(s) resulting from the application of excessive force, use appropriate care when driving the key or pins into the disk hub and shaft(s). Use the correct tool, and do not use excessive force.

11. Before installing the taper key, be sure the taper key disk shaft joint is free of oil or grease. If necessary, remove any excess welding material from the taper key.
12. Install the appropriate taper key, tangential pins, and disk pins. Install the taper key by aligning the taper key hole in the shaft with the holes in the shaft boss on the disk. Insert the taper key. Use a pin punch to drive the taper key until solid contact is felt. Measure the depth of the taper key head for a reference during the following steps.
 - a. Drive the taper key in farther as follows:

Valve Size, Inches	Minimum Depth to Drive Taper key After Initial Solid Contact, mm (Inches)
8-inch ANSI Class 300, 10- and 12-inch ANSI Class 150, and 10-inch ANSI Class 300 valves	6 (0.219)

- b. The disk, shaft, and taper key assembly must be inspected to verify that the taper key spans the entire shaft flat width. If so, this procedure is complete. If not, the taper key must be driven in farther until this condition is satisfied. However, do not exceed the following depth limits:

Valve Size, Inches	Maximum Allowable Depth to Drive Taper key After Initial Solid Contact, mm (Inches)
8-inch ANSI Class 300, and 10- and 12-inch ANSI Class 150	10 (0.375)
10-inch ANSI Class 300	11 (0.406)

13. After driving the taper key in place, arc spot weld the head of the taper key to the disk. For valve sizes 8-, 10- and 12-inch, use an arc spot weld bead of 3/16-inch in diameter.
14. Install the packing as described in the Packing Replacement section.

Installing the Gasket Retainer

Valves with a two-piece shaft use a gasket retainer and gasket to cover the follower shaft opening in the valve body.

1. Replace the gasket (key 15) and gasket retainer (key 14) over the end of the follower shaft. Use a new gasket.
2. Replace the four hex head bolts (key 21) and lockwashers (key 20) to hold the gasket retainer in place.
3. Be sure to center the gasket over the follower shaft bore before retightening the bolts. Tighten down the bolts evenly in a crossover or star pattern. Refer to table 5 for proper torque values.

Parts Ordering

When corresponding with your [Emerson sales office](#) about the A31A Cryogenic valve, always provide the valve serial number. For valve/actuator combinations assembled at the factory, the valve serial number is stamped on the nameplate attached to the actuator. For parts information on the 14- through 24-inch sizes, please contact your Emerson sales office.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts List

Note

For part ordering information contact your [Emerson sales office](#).

Key Description

- | | |

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts ordering information for Fisher POSI-SEAL A31D double-flange high-performance butterfly valves (see figure 1). Refer to separate instruction manuals for information covering the actuator and accessories.

Do not install, operate, or maintain an A31D valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

A31D Valve Specifications and Materials of Construction

Table 1. Fisher A31D Valve Specifications

	SPECIFICATION
Valve Body Size	NPS 3, 4, 6, 8, 10, 12
Pressure Rating	Consistent with CL150 and 300 per ASME B16.34
Valve Body Materials	WCC Steel
	CF8M Stainless Steel
Disk Materials	CF8M Stainless Steel
End Connections	Mates with RF flanges per ASME B16.5
Valve Body Style	Double Flange
Shaft Connection	Spline (standard)
	Keyed (optional)
Face-to-Face Dimensions	CL150: ISO 5752 Butterfly Valve Short Series
	CL300: ISO 5752 Butterfly Valve Long Series
Shutoff	Soft Seal: Bidirectional ANSI/FCI 70-2 Class VI
	NOVEX Seal: Unidirectional MSS SP-61 ⁽¹⁾
	Phoenix III Seal: ANSI/FCI 70-2 Class VI
Flow Direction	Reverse (flow direction is into the shaft side of the disk)
Flow Characteristic	Approximately Linear
Disk Rotation	Clockwise (CW) to close

1, 0.1 scfh per unit of NPS at 80 psi.

Description

The valve is available in a double-flanged valve body design, with a variety of seals and internal components. The pressure-assisted seal provides tight shutoff against the full class pressure range for the specific type. The splined shaft combines with a variety of Fisher spring-and-diaphragm or pneumatic double-acting or spring-return piston actuators. Maximum inlet pressure/temperature ratings are consistent with ASME CL150 and CL300.

Educational Services

For information on available courses for the Fisher POSI-SEAL A31D valve, as well as a variety of other products, contact:

Emerson Automation Solutions
 Educational Services - Registration
 Phone: 1-641-754-3771 or 1-800-338-8158
 E-mail: education@emerson.com
emerson.com/fishervalvetraining

Installation

Recommended or "preferred" installation for the A31D valve is with the flow into the shaft side of the disk (retaining ring downstream from the high pressure side of the valve).

The standard soft seal and standard Phoenix III seal offer ANSI/FCI 70-2 Class VI, bidirectional shutoff. The Phoenix III seal for fire-tested applications must be installed in the preferred direction. The Novex seal is unidirectional and should be installed in the preferred direction. See table 3.

For assistance in selecting the appropriate combination of actuator action and open valve position, consult your [Emerson sales office](#) or Local Business Partner.

WARNING

To avoid personal injury or property damage resulting from the sudden release of pressure:

- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Do not install the valve assembly where service conditions could exceed the limits given in this manual or on the nameplates.
- Use pressure-relieving devices as required by government or accepted industry codes and good engineering practices to protect from over-pressurizing the system.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
- If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

When ordered the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials rests solely with the purchaser and end-user. Since some body/trim material combinations are limited in their pressure drop and temperature range capabilities, do not apply any other conditions to the valve without first contacting your Emerson sales office or Local Business Partner.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, shut off all pressure lines to the power actuator, release pressure from the actuator, and disconnect the pressure lines from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you are working on the equipment.

WARNING

See the WARNING at the beginning of the Maintenance section for more information before removing the valve from the pipeline.

2. Install a three-valve bypass around the control valve assembly if continuous operation is necessary during inspection and maintenance of the valve.
3. Inspect the valve to be certain that it is free of foreign material.

CAUTION

Damage to the disk will occur if any pipe flanges or piping connected to the valve interfere with the disk rotation path. If piping flange has a smaller inner diameter than specified for schedule 80 piping, measure carefully to be certain the disk rotates without interference before placing the valve into operation.

Be certain that adjacent pipelines are free of any foreign material, such as pipe scale or welding slag, that could damage the valve sealing surfaces.

Installing Double-Flange Valves

WARNING

The edges of a rotating valve disk have a shearing effect that may result in personal injury. To avoid personal injury, keep clear of the disk edges when rotating the disk.

CAUTION

To avoid damage to the valve disk during installation, the valve must be in the fully closed position. If the A31D valve is equipped with a fail-open actuator, remove the actuator before installing the valve/actuator assembly or cycle the valve into the fully closed position. Then, take appropriate steps to ensure that the actuator does not cause the valve to open during installation.

1. See table 2 for flange bolt specifications.
2. Properly orient the valve according to the specific application. For optimum performance, install the valve so that the shaft will be on the high pressure side of the valve at shutoff.
3. Position the valve between the flanges. Be sure to leave enough room for the flange gaskets. Install the lower flange bolts.
4. Select the appropriate gaskets for the application. Flat sheet, spiral wound, or other gasket types, made to the ASME B16.5 group standard or user's standard, can be used on the valve depending on the service conditions of the application. Install the gaskets and align the valve and the gaskets.
5. Install the remaining bolts.
6. Tighten the flange bolts in an alternating criss-cross fashion to a torque value of one-fourth of the final bolting torque. Repeat this procedure several times increasing the torque value each time by a fourth of the final desired torque. When the final torque value has been applied, tighten each flange bolt again to allow for gasket compression.

WARNING

An A31D valve body is not grounded when installed in a pipeline. To avoid personal injury or property damage, always make sure that the valve body is grounded to the pipeline before putting the valve assembly into operation in a flammable or hazardous atmosphere. To provide shaft and disk-to-body grounding, attach a grounding strap to the shaft with a clamp and connect the other end of the grounding strap assembly to the valve body.

7. If necessary, attach a grounding strap from the valve body or pipeline to the valve shaft. For additional information on grounding procedures, contact your [Emerson sales office](#) or Local Business Partner.

Table 2. Stud Bolt and Cap Screw Chart for Double-Flange Valves

VALVE SIZE, NPS	A31D, CL150, ISO 5752 BUTTERFLY SHORT SERIES

No. of Heavy Hex Nuts	32	32	48	48	64	48

1. Based on 1/8-inch gasket

2. Optional Alternative for Cap Screws

Valve Orientation

The valve can be installed in any orientation, however, it is recommended that the valve drive shaft be horizontal and the actuator vertical.

Before Installing the Valve

⚠ WARNING

The edges of a rotating valve disk (key 2, figure 9 and 10) close with a shearing, cutting motion. To avoid personal injury, keep hands, tools, and other objects away from the disk while stroking the valve.

If the A31D valve is equipped with a fail-open actuator, cycle the valve into the fully closed position. Ensure the valve cannot open during installation by using travel stops, a manual actuator, a constant supply pressure to the pneumatic actuator, or other steps as necessary.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

A31D Valve

June 2017

Instruction Manual

D500248X012

Figure 2. Available Seal Configurations

NOTE:

1 FOR OPTIMUM SEAL PERFORMANCE, THE PREFERRED VALVE ORIENTATION AT SHUTOFF IS WITH THE RETAINING RING DOWNSTREAM FROM THE HIGH PRESSURE SIDE OF THE VALVE.

Table 3. Valve Orientation for Optimal Seal Performance

SEAL TYPE	SHUTOFF DIRECTION	INSTALLED ORIENTATION
Standard soft seal	Bidirectional	Preferred
Novex seal	Unidirectional	Preferred only
Phoenix III seal	Bidirectional	Non Fire-Tested Preferred
	Unidirectional	Fire-Tested Preferred

Recommended or "preferred" installation for the A31D valve is with the flow into the shaft side of the disk (retaining ring downstream from the high pressure side of the valve).

Table 4. Valve Weights

SIZE NPS	CL150		CL300	
	kg	lb	kg	lb
3	15	33	28	63
4	25	56	35	77
6	34	76	65	143
8	54	118	156	343
10	81	178	176	388
12	110	243	294	649

An A31D valve is normally shipped as part of an assembly with an actuator and other accessories such as a valve positioner. If the valve and actuator have been purchased separately or if the actuator has been removed for maintenance, properly mount the actuator and adjust valve/actuator travel and all travel stops before inserting the valve into the line.

CAUTION

Damage to the disk will occur if any pipe flanges or piping connected to the valve interfere with the disk rotation path. Be certain to align the valve accurately to avoid contact between the disk (key 2) and the flanges.

Adjusting the Actuator Travel Stops or Travel

Key number locations are shown in figure 9 and 10, unless otherwise noted.

1. Refer to the actuator instruction manual to locate the actuator travel stop that controls the closed position of the valve disk (key 2). When adjusting the travel stop or travel, make sure that the disk is from 0.25 to 0.76 mm (0.010 to 0.030 inch) away from the internal stop in the valve body (see figure 5). This adjustment is necessary to be certain that the actuator output torque is fully absorbed by the actuator travel stop or by the actuator. The internal travel stop in the valve body should not absorb any of the actuator torque.

CAUTION

When using an actuator, the actuator travel stop (or actuator travel, for actuators without adjustable stops) must be adjusted so the disk stop in the valve does not absorb the output of the actuator. Failure to limit the actuator travel as described in the Adjusting the Actuator Travel Stops or Travel steps can result in damage to the valve, shaft(s), or other valve components.

2. Before installing the valve/actuator assembly in the process line, cycle the valve several times to be sure the valve disk returns to the proper position.

Installing the Valve

The maximum allowable inlet pressures for A31D valves are consistent with the applicable ASME pressure/temperature ratings except where limited by the material capabilities.

Refer to table 2 for the quantity and size of line bolting required to install the valve in the pipeline.

CAUTION

To avoid damage to the valve disk during installation, the valve must be in the fully closed position. If the A31D valve is equipped with a fail-open actuator, remove the actuator before installing the valve/actuator assembly or cycle the valve into the fully closed position. Then, take appropriate steps to be sure that the actuator does not cause the valve to open during installation.

Figure 3. Properly Installed Valve

GE62595-A

1. See figure 3 for recommended valve orientation.
2. Position the valve between the flanges. Be sure to leave enough room for the flange gaskets. Install the lower flange bolts.
3. Select the appropriate gaskets for the application. Flat sheet, spiral wound, or other gasket types, made to the ASME B16.5 standard or user's standard, can be used on A31D valves depending on the service conditions of the application.
4. Install the remaining flange bolts.
5. Tighten the flange bolts in an alternating criss-cross fashion to a torque value of one-fourth of the final bolting torque. Repeat this procedure several times, increasing the torque value each time by a fourth of the final desired torque. After applying the final torque value, tighten each flange bolt again to allow for gasket compression.

Packing Adjustment and Shaft Bonding

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

1. For PTFE or graphite packing: Tighten standard packing follower nuts only enough to prevent shaft leakage. Excessive tightening of packing will accelerate wear and could produce higher rotating friction loads on the valve stem. If necessary, refer to the Packing Maintenance section.

Figure 4. Optional Shaft-to-Valve Body Bonding Strap Assembly

CAUTION

For non-ENVIRO-SEAL packing: Tighten the packing follower nuts only enough to prevent shaft leakage. Excessive tightening will accelerate wear of the packing and could produce higher friction loads on the valve stem.

2. ENVIRO-SEAL Packing Systems: will not require this initial re-adjustment. Refer to the separate instruction manual, Fisher ENVIRO-SEAL Packing System for Rotary Valves ([D101643X012](#)), for repair and adjustment procedures.
3. For hazardous atmosphere or oxygen service valves, read the following **Warning**, and provide the bonding strap assembly mentioned below if the valve is used in an explosive atmosphere.

⚠ WARNING

The valve shaft is not necessarily grounded when installed in a pipeline unless the shaft is electrically bonded to the valve. To avoid personal injury or property damage resulting from the effects of a static electricity discharge from valve components in a hazardous atmosphere or where the process fluid is combustible, electrically bond the drive shaft (key 3) to the valve according to the following step.

Note

Standard PTFE packing is composed of a partially conductive carbon-filled PTFE female adaptor with PTFE V-ring packing. Standard graphite packing is composed of all conductive graphite ribbon packing. Alternate shaft-to-valve body bonding is available for hazardous service areas where the standard packing is not sufficient to electrically bond the shaft to the valve (see the following step).

4. Attach the bonding strap assembly (key 131, figure 4) to the shaft with the clamp (key 130, figure 4).
5. Connect the other end of the bonding strap assembly to the valve flange cap screws.
6. For more information, refer to the Packing Maintenance section below.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

Key numbers in this procedure are shown in figure 9 and 10, unless otherwise indicated.

WARNING

The valve closes with a shearing action. To avoid personal injury, keep hands, tools, and other objects away from the valve while its being stroked.

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
 - Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
 - Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
 - Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
 - Vent the power actuator loading pressure.
 - Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
 - The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
 - Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
-

Removing and Replacing the Actuator

Refer to the appropriate actuator instruction manual for actuator removal and replacement procedures. The actuator stops or travel stops must limit the rotation of the valve shaft. See the CAUTION below.

CAUTION

When using an actuator, the actuator travel stop (or actuator travel stop, for actuators without adjustable stops) must be adjusted so the disk stop in the valve does not absorb the output of the actuator. Failure to limit the actuator travel can result in damage to the valve, shaft(s), or other valve components.

Packing Maintenance

The A31D valve is designed so the packing can be replaced without removing the valve from the process pipeline.

CAUTION

For non-ENVIRO-SEAL packing: Tighten the packing follower nuts only enough to prevent shaft leakage. Excessive tightening will accelerate wear of the packing and could produce higher friction loads on the valve stem.

Usually, packing leakage can be eliminated by merely tightening the hex nuts (key 15) located above the packing follower (key 12) while the valve is in the pipeline. However, if leakage continues, the packing must be replaced.

For PTFE ENVIRO-SEAL packing system, refer to instruction manual, Fisher ENVIRO-SEAL Packing System for Rotary Valves ([D101643X012](#)) (see figure 8).

CAUTION

Never use a wrench or pliers on the drive shaft (key 3). A damaged shaft could cut the packing and allow leakage.

1. Before loosening any parts on the valve, release the pressure from the pipeline. Then, remove the hex nuts (key 15) and lift off the packing follower (key 12).
2. Remove the hex jam nuts (key 17) and the anti-blowout flange (key 10). Remove the packing follower (key 12). Refer to figure 10 for details of the anti-blowout protection parts.

The packing is now accessible.

3. Use a packing extractor to remove packing. Insert the corkscrew-like end of the tool into the first piece of packing and pull firmly to remove the packing. Repeat this process until all packing parts have been removed.

CAUTION

Be careful when cleaning the packing box. Scratches to the drive shaft (key 3) or inside diameter of the packing bore might cause leakage.

4. Before installing new packing, clean the packing box.
5. Install new packing one ring at a time, using the packing follower as a driver. If using split-ring packing, stagger the splits in the rings to avoid creating a leak path.
6. Reinstall the packing parts. Refer to figure 8 for the sequence of packing parts.

Removing the Valve

1. Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open the valve. Vent the power actuator loading pressure.
2. Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from either side of the valve.

CAUTION

Damage to the valve disk can occur if the disk is not closed when the valve is being removed from the pipeline. If necessary, stroke the actuator to place the disk in the closed position while removing the valve from the pipeline.

3. Loosen the flange bolting that holds the valve. Make sure the valve cannot slip or twist while loosening and removing the bolting.
4. Before removing the valve from the pipeline, make sure the valve disk is closed. Removing the valve with the disk open could cause damage to the disk, piping, or pipe flanges.
5. After removing the valve from the pipeline, move the valve to an appropriate work area. Always support the valve properly.
6. When valve maintenance is complete, refer to the Installation procedures in this manual.

Seal Maintenance

Note

For larger valves, it is possible to replace the seal (key 5) while the actuator is mounted to the valve and can be accomplished by cycling the valve to 90 degrees open.

Key numbers in this procedure are shown in figure 9 and 10, unless otherwise indicated.

1. After removing the valve from the pipeline, remove the manual or power actuator. Manually rotate the drive shaft (key 3) counterclockwise until the disk has moved a full 180 degrees away from the closed position.

WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping of a large valve. Support large valves during maintenance.

2. Lay the valve flat on a work bench in a secure position with the retaining ring (key 18) and retaining ring screws (key 19) facing up. Properly secure the valve on a suitable worktable so it cannot slip, twist, or fall during maintenance. Remove all retaining ring screws.
3. Remove the retaining ring by placing a socket head cap screw from the retaining ring into each of the two retaining ring jacking screw holes. Slowly turn the screws until the retaining ring has been lifted from the valve body. Remove the retaining ring to expose the seal in the T-slot area of the valve body.

Note

The A31D is available with different seal designs and components. See figure 2 to identify the specific seal design.

4. Insert a regular screwdriver or other similar tool under the top edge of seal and gently pry the seal out of the T-slot area in the valve body. Take care not to damage the seal or T-slot area of the valve body. After the seal has been removed, clean the T-slot area, retaining ring and, if required, polish the disk (key 2) thoroughly.

To install a new seal, O-ring (key 6), and retaining ring gasket, follow the appropriate instructions given below.

Table 5. Torque Values for Retaining Ring Screws

ASME CLASS AND VALVE SIZE, NPS	RETAINING RING SCREWS		
	Fastener Nominal Size	N • m	Lbf • in
CL150: NPS 3, 4, 8, and 10; NPS 3 and 4	#10	4.6	41
CL150: NPS 6 and 12; CL300: NPS 6, 8, 10, and 12	1/4	11	100

Note: These values are based upon standard materials, S66286/N07718 screws and ASTM A193GRB6 bolts. For other special fastener materials, please contact your Emerson Automation Solutions sales office.

Table 6. Torque Values for Gasket Retainer Bolts

ASME CLASS AND VALVE SIZE, NPS	GASKET RETAINER BOLTS		
	Fastener Nominal Size	N • m	Lbf • in
CL150: NPS 3 and 10; NPS 3	5/16	19	167
CL150: NPS 4, 6, 8, 12; CL300: NPS 4, 6, 8, 10, 12	3/8	33	295

Note: These values are based upon standard materials, S66286/N07718 screws and ASTM A193GRB6 bolts. For other special fastener materials, please contact your Emerson Automation Solutions sales office.

Figure 5. Typical Seal Installation

PTFE Seals

1. Locate the replacement seal ring (key 5) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter as shown in figure 5. Around the outside circumference is one wide groove.

Before installing the seal ring into the valve body, place the O-ring (key 6) into the wide, outer groove of the seal ring. Refer to figure 5.

2. Install the seal ring and O-ring assembly in the valve body. The wider outside diameter of the seal ring, as marked in figure 5, goes into the T-slot area of the body. Start the edge with the wider diameter into the T-slot of the valve body using a blunt-end tool.
3. Carefully tuck the O-ring downward into the body T-slot until the seal ring is completely entrapped in the body T-slot, and it completely covers the backup O-ring.
4. Re-install the retaining ring and the socket head cap screws. Tighten the cap screws just enough to eliminate any movement of the retaining ring. Do not over-tighten the retaining ring screws. Using a blunt-end tool, carefully tuck the lip of the seal ring under the retaining ring.

5. When the seal is under the lip of the retaining ring, continue to tighten the cap screws according to standard procedures. Do not fully torque screws at this time. Final tightening of screws is accomplished in step 7 of this procedure.
6. Manually rotate the drive shaft clockwise 180 degrees to return the disk (key 2) to its closed position.
7. The final seating of the retaining ring cap screws can now be done. For the screw torque values, refer to table 5. The seal is now fully installed. Refer to the Installation procedures in this manual.

NOVEX, Phoenix III and/or Phoenix III Fire-Tested Seals

1. Locate the replacement seal ring (key 5) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter as shown in figure 5. Around the outside circumference is one wide groove.

Install the seal ring (key 5) in the valve body by first placing the wider outside diameter of the seal ring into the T-slot area of the valve body which is shown in figure 2.

The backup O-ring (key 6) for the Phoenix III seal will have to be installed after placement of the seal ring in the valve body using a blunt-end tool. Do not use the seal tool directly on the metal seat. Use tools on the O-ring only.

2. With the seal ring inserted all the way around the body T-slot now lay the O-ring into the opening between the valve body and the seal ring. Use the seal tool to apply pressure to the O-ring and carefully tuck the O-ring down into the T-slot between the valve body and the seal ring.

Note

On larger valves, it may be more efficient to have someone hold down the seal ring while you push the O-ring into the T-slot.

3. Once the seal ring and backup O-ring have been fully installed into the body T-slot, the retaining ring gasket can be installed. This gasket is a thin graphite material. Punch one initial screw hole through the gasket for alignment, being careful not to cause additional damage to the gasket.

CAUTION

The retaining ring gasket is a thin graphite material. When you punch one initial screw hole through the gasket for alignment, be careful not to cause additional damage to the gasket.

4. Install the retaining ring and align the screw holes in the retaining ring with the holes in the valve body. Install the first retaining ring screw through the punched hole in the ring gasket. Install the other ring screws by pushing the screws through the graphite gasket and threading them into the valve body.
5. Tighten the retaining ring socket head cap screws just enough to eliminate any movement of the retaining ring. Do not over-tighten the retaining ring screws.

⚠ WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping of a large valve. Support large valves during maintenance.

6. To complete this step, stand the valve up. Support the valve securely using methods appropriate for the valve size. If a vise or other clamps are being used, be sure to not damage the flange gasket sealing area of the valve body.

7. Manually rotate the drive shaft (key 3) to turn the disk clockwise to meet the seal.
8. Tap the disk with a rubber mallet to drive it against the internal travel stop. When the disk makes contact with the stop, manually rotate the disk counterclockwise back out of the seal to a 90-degree open position. Repeat steps 7 and 8 three times.

Note

When attaching the actuator to the valve, make sure the valve disk is not in contact with the valve internal travel stop (see figure 5). The valve disk should be positioned from 0.25 to 0.76 mm (0.010 to 0.030 inch) away from the internal stop in the valve body (see figure 5).

9. Use an appropriate tool (such as a feeler gauge) to position the disk (key 2) from 0.25 to 0.76 mm (0.010 to 0.030 inch) away from the internal stop in the valve body.

This adjustment is necessary to be certain that the actuator output torque is fully absorbed by the actuator travel stop or by the actuator. The internal travel stop in the valve body should not absorb any of the actuator torque.

CAUTION

When using an actuator, the actuator travel stop (or actuator travel, for actuators without adjustable stops) must be adjusted so the disk stop in the valve does not absorb the output of the actuator. Failure to limit the actuator travel as described in the Adjusting the Actuator Travel Stops or Travel steps can result in damage to the valve, shaft(s), or other valve components.

10. The final seating of the retaining ring screws can now be done. For the screw torque values, refer to table 5.

Figure 6. Blowout Protection (NPS 3 through 12)

Anti-Blowout Protection, Packing, Valve Shaft(s), Disk, and Bearing Maintenance

Removal

Note

NPS 3 through 8 valves (CL150) and NPS 3 through 6 valves (CL300) have a bearing stop pressed into the bearing bore immediately after the packing box.

Do not attempt to remove the bearing stop which is found in the drive shaft bearing bore immediately after the packing box. The bearing stop is pressed into the bearing bore. If the bearing stop needs replacement, contact your [Emerson sales office](#) or Local Business Partner for more information.

Note

The A31D valve has a two-piece shaft. In these procedures, the drive shaft is key 3. The shaft opposite the drive shaft is called the follower shaft (key 4).

CAUTION

When using an actuator, the actuator travel stop (or actuator travel adjustment, for actuators without adjustable stops) must be adjusted so the disk stop in the valve does not absorb the output of the actuator. Failure to limit the actuator travel as described in the next step can result in damage to the valve, shaft(s), or other valve components.

CAUTION

When removing the actuator from the valve, do not use a hammer or similar tool to drive the lever off the valve shaft. Driving the lever or actuator off the valve shaft could damage the valve internal parts.

If necessary, use a wheel puller to remove the lever or actuator from the valve shaft. It is okay to tap the wheel puller screw lightly to loosen the lever or actuator, but hitting the screw with excessive force could also damage internal valve parts.

Key numbers in this procedure are shown in figure 9 and 10, unless otherwise indicated.

1. Remove the valve from the pipeline. Remove the actuator from the valve.

WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping of a large valve. Support large valves during maintenance.

CAUTION

Never use a wrench, pliers, or similar tool to turn the drive shaft. A damaged shaft can cut the packing and allow leakage.

Note

It is not necessary to remove the retaining ring and valve seal when removing the shaft(s) and disk.

2. Properly secure the valve on a suitable worktable so it cannot slip, twist, or fall during maintenance.
3. Removing the Anti-Blowout Design:
 - a. **For PTFE or Graphite Packing:** Remove the hex nuts (key 15) and pull off the packing flange (key 11). Remove the hex jam nuts (key 17) and the anti-blowout flange (key 10). Remove the packing follower (key 12). For NPS 3 through 12, remove the anti-blowout ring (key 16), see figure 6.
 - b. **For ENVIRO-SEAL Packing System:** Remove the hex nuts (key 101), the packing flange (key 102), jam nuts (key 17), anti-blowout flange (key 10), and the spring pack assembly (key 103). For NPS 3 through 12, remove the anti-blowout ring (key 16), see figures 6 and 8.
4. Remove the packing from around the drive shaft.

Note

Different valves require slightly different procedures because different valve sizes/ pressure classes have different methods of connecting the disk and shaft(s). To identify the proper procedures, refer to the list below.

- CL150, NPS 3 through 8: One-piece shaft with 1 taper key, (see figure 9).
 - CL150, NPS 10 and 12: Two-piece shaft. 1 taper key in the drive shaft; 1 tangential pin in the follower shaft, (see figure 10).
 - CL300, NPS 3 through 6: One-piece shaft with 1 taper key, (see figure 9).
 - CL300, NPS 8 and 10: Two-piece shaft. 1 taper key in the drive shaft; 1 tangential pin in the follower shaft, (see figure 10).
 - CL300, NPS 12 : Two-piece shaft with 2 tangential pins in the drive shaft; 1 in the follower shaft, (see figure 10).
-

5. Proceed as appropriate, using the following instructions.

For valves with taper key, locate the taper key (key 9, figure 7) which runs through the drive shaft boss on the back of the valve disk. Using a pin punch on the smaller end of the key, drive it out of the disk and shaft. Driving a taper key in the wrong direction will tighten it.

Note

Certain valve sizes may have a taper key that is arc spot welded in place. To remove the key, use a punch on the smaller end of the taper key and drive it out of the disk and shaft, breaking the weld.

For valves with tangential pins, locate the tangential pins (key 25) in the drive shaft (key 3) and the tangential pin (key 25) in the follower shaft (key 4).

- a. Use a threaded rod with an appropriate spacer and nut as an extractor tool to remove the tangential pins. If using a threaded rod, choose a rod with threads that fit the inside thread of the pins. The rod should extend several inches above the disk when it is screwed into a pin.
- b. After screwing the rod into the pin, slide the spacer over the rod and pin. Thread the nut onto the rod and tighten it. As the nut is tightened, the nut will drive the spacer against the disk. The increasing force will draw the pin from the disk.

1. Valves with a two-piece shaft have a gasket retainer and gasket (keys 20 and 21) on the follower shaft side of the valve. Remove the hex head bolts and lockwashers (keys 23 and 22) from the gasket retainer and remove the gasket retainer and gasket to expose the end of the follower shaft.
2. Support the valve disk properly, and remove the follower shaft. Pull the follower shaft from the valve body. Use a shaft extractor screwed into the puller hole in the end of the follower shaft.
3. Support the valve disk properly, and remove the drive shaft. Pull out the drive shaft (key 3) by hand-pulling or by using a shaft extractor screwed into the end of the shaft.

CAUTION

To avoid damage to the disk, seal ring, and T-slot area, do not force the disk past the seal or T-slot area. Remove the disk from the opposite side of the valve body.

4. After removing the shaft(s), remove the disk and the thrust bearings. Do not force the disk past the seal ring or T-slot area.
5. Remove the journal bearings (key 7). Using a suitable punch or puller, drive or pull the journal bearing(s) into the valve body bore from the drive shaft bearing bore. Do not attempt to remove the bearing stop (key 8). Remove the journal bearing from the follower shaft bearing bore.
6. Inspect the valve body bore, bearings, bearing bores, and packing box for damage.

Installing a One-Piece Shaft

Unless otherwise indicated, key numbers and part names are listed in figure 7.

1. Secure the valve in an upright position. Allow for easy access to the valve body bore. Allow for easy access to the drive shaft bearing bore.
2. Inspect all parts removed from the valve for wear or damage. Replace any worn or damaged parts. Clean the valve body and all parts to be installed with an appropriate solvent or degreaser.

CAUTION

Premature valve failure and loss of process control may result if bearings are improperly installed or are damaged during installation.

3. Using caution to prevent damage to the bearing, insert one journal bearing (key 7) from the valve body bore into the drive shaft bearing bore until it hits the bearing stop (key 8). When properly installed, a portion of the journal bearing will extend into the valve body bore.
4. Insert one journal bearing from the valve body bore into the shaft bearing bore opposite the journal bearing installed in step 3. When correctly installed, this journal bearing will be flush with the valve body bore.
5. Install the valve disk by placing the disk into the valve body bore so the curved side of the disk passes through the end of the valve body that does not contain the T-slot. Align the shaft bore in the disk with the bearing bores.
6. Insert the drive shaft end opposite the splined end into the valve body through the packing box. Push the shaft through the bearing stop. Taking care not to dislodge the journal bearing, push the shaft through the journal bearing and the valve disk and into the bore on the opposite side of the valve body.

CAUTION

To avoid damage to the taper key, tangential pins, valve disk, or shaft(s) resulting from the application of excessive force, use appropriate care when driving the key or pins into the disk hub and shaft(s). Use the right tool. Do not use excessive force.

7. Be sure the taper key disk shaft joint is free of oil or grease. If necessary, remove any excess welding material from the taper key.
8. Align the taper key hole in the shaft with the holes in the shaft boss on the disk. Insert the taper key. Use a flat-end punch to drive the taper key until solid contact is felt. Measure the depth of the taper key head for a reference during the following steps.
 - a. Drive the taper key in farther as follows:

VALVE SIZE, NPS	MINIMUM DEPTH TO DRIVE TAPER KEY AFTER INITIAL SOLID CONTACT
CL150 and 300, NPS 3, 4, 6 valves, & NPS 8 CL150 valves	5 mm (0.188 INCHES)

- b. The disk shaft, and taper key assembly must be inspected to verify that the taper key spans the entire shaft flat width. If so, this procedure is complete. If not, the taper key must be driven in farther until this condition is satisfied. However, do not exceed the following depth limits:

VALVE SIZE, NPS	MAXIMUM ALLOWABLE DEPTH TO DRIVE TAPER KEY AFTER INITIAL SOLID CONTACT
NPS 3 and 4 CL150/300	7 mm (0.281 INCHES)
NPS 6 CL300, and NPS 8 CL150	8 mm (0.312 INCHES)

9. After driving the taper key in place, arc spot weld the head of the taper key to the disk as shown in figure 7. For NPS 3, 4, and 6 valves, use an arc spot weld bead of 1/8-inch diameter. For NPS 8, 10, and 12 valves, use an arc spot weld bead of 3/16-inch diameter.
10. Install the packing as described in the Packing Replacement section or in the ENVIRO-SEAL Rotary Packing Instruction Manual ([D101643X012](#)).

Figure 7. Fisher A31D Taper Key Weld Location

Installing the Two-Piece Shaft

Note

In these instructions, the drive shaft (with splined or keyed end) is key 3. The shaft opposite the drive shaft is called the follower shaft (key 4).

Key numbers in this procedure are shown in figure 9 and 10, unless otherwise indicated.

1. Properly secure the valve on a suitable worktable so it cannot slip, twist, or fall during maintenance. Be prepared to support the valve disk. Allow for easy access to the valve body bore, drive shaft bearing bore and follower shaft bearing bore.

⚠ WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping of a large valve. Support large valves during maintenance.

Note

Replacement disk and shafts are provided as a matched set and both should be replaced at the same time.

2. Inspect all parts removed from the valve for wear or damage. Replace any worn or damaged parts. Clean the valve body and all parts to be installed with an appropriate solvent or degreaser. Note: When installing the bearings, apply lubricant to the outside diameter of the bearing for ease of installation.

CAUTION

Premature valve failure and loss of process control may result if bearings are improperly installed or are damaged during installation.

3. When installing the lower bearings (key 4), insert one or more bearings into the follower shaft bearing bore so it is flush with the body bore.

The number of bearings required changes with valve size and construction. Two bearings are required in the drive shaft and two bearings in the follower shaft.

4. Hold the follower shaft thrust bearing (key 24) in the valve body bore against the counterbore of the follower shaft bearing bore. Push the follower shaft into the bearing bore just enough to hold the thrust bearing.
5. When installing the upper bearing (key 7), insert one or more bearings into the drive shaft from the body bore into the bearing bore below the packing box. Use caution to prevent damage to the bearing.

CAUTION

Use caution to prevent damage to the bearing when installing the upper bearing in the previous step.

6. Hold the drive shaft thrust bearing (key 24) in the valve body bore against the counterbore of the drive shaft bearing bore. Push the drive shaft through the packing box side into the bearing bore just enough to hold the thrust bearing.

CAUTION

To avoid damage to the disk, seal, and T-slot area, do not force the disk past the seal or T-slot area. Install the disk from the opposite side of the valve body.

7. Place the flat side of the disk on a flat surface and insert wooden blocks to raise the disk approximately 50.8 mm (2 inches) from the worktable surface. Then, suspend the valve body over the disk so the seal/T-slot area is facing up. Align the shaft bores through the disk with the drive shaft and follower shaft bores. Lower the valve body over the disk using caution not to dislodge or damage the thrust bearings placed on the ends of the shafts.

8. With the disk (key 2) properly positioned in the valve body (key 1), push the drive shaft and follower shaft the rest of the way through the thrust bearings and into the shaft bores in the valve disk.
9. Align the holes in the shafts with the holes in the disk.

CAUTION

To avoid damage to the taper key, tangential pins, valve disk, or shaft(s) resulting from the application of excessive force, use appropriate care when driving the key or pins into the disk hub and shaft(s). Use the correct tool, and do not use excessive force.

10. Before installing the taper key, be sure the taper key disk shaft joint is free of oil or grease. If necessary, remove any excess welding material from the taper key.
11. Install the appropriate taper key and tangential pins.
12. Install the taper key by aligning the taper key hole in the shaft with the holes in the shaft boss on the disk. Insert the taper key. Use a pin punch to drive the taper key until solid contact is felt. Measure the depth of the taper key head for a reference during the following steps.
 - a. Drive the taper key in farther as follows:

VALVE SIZE, NPS	MINIMUM DEPTH TO DRIVE TAPER KEY AFTER INITIAL SOLID CONTACT
NPS 8 CL300, NPS 10 and 12 CL150, & NPS 10 CL300 valves	6 mm (0.219 INCHES)

- b. The disk shaft, and taper key assembly must be inspected to verify that the taper key spans the entire shaft flat width. If so, this procedure is complete. If not, the taper key must be driven in farther until this condition is satisfied. However, do not exceed the following depth limits:

VALVE SIZE, NPS	MAXIMUM ALLOWABLE DEPTH TO DRIVE TAPER KEY AFTER INITIAL SOLID CONTACT
NPS 8 CL300, and NPS 10 and 12 CL150	10 mm (0.375 INCHES)
NPS 10 CL300	11 mm (0.406 INCHES)

13. After driving the taper key in place, arc spot weld the head of the taper key to the disk as shown in figure 7. For NPS 10 and 12 valves, use an arc spot weld bead of 3/16-inch in diameter.
14. Refer to Packing Maintenance and the Anti-Blowout Design procedures in this manual to re-install the packing and anti-blowout design.

Gasket Retainer

Valves with a two-piece shaft use a gasket retainer and gasket (keys 20 and 21) to cover the follower shaft opening in the valve body. The gasket is held in place by the gasket retainer and four hex head bolts and lockwashers (keys 23 and 22). When reassembling the valve, use a new gasket.

Be sure to center the gasket over the follower shaft bore before retightening bolts. Tighten down bolts evenly in a crossover or star pattern.

Refer to table 6.

Installing the Gasket Retainer

All A31D valves use a gasket retainer and gasket to cover the follower shaft opening in the valve body.

1. Replace the gasket (key 21) and gasket retainer (key 20) over the end of the follower shaft. Use a new gasket.

2. Replace the four hex head bolts (key 23) and lockwashers (key 22) to hold the gasket retainer in place.
3. Be sure to center the gasket over the follower shaft bore before retightening the bolts. Tighten down the bolts evenly in a crossover or star pattern. Refer to table 6 for proper torque values.

Parts Ordering

When replacement parts are required, always use genuine Fisher parts.

Typical parts are shown in figure 9 and 10.

When corresponding with your [Emerson sales office](#) or Local Business Partner about an A31D valve, please identify the valve as an A31D and provide the valve serial number. For valve/actuator combinations assembled at the factory, the valve serial number is stamped on the nameplate attached to the actuator.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Retrofit Kits

Retrofit kits include all parts required for installation of the ENVIRO-SEAL packing system into existing high-performance butterfly valves. Retrofit kits are available for single PTFE packing. See table 7 for retrofit kit included parts.

Note

Key 103, the spring pack assembly, is made up of the packing spring stack held in place by an O-ring on the packing follower.

See table 8 for retrofit kit part numbers.

Table 7. Retrofit Kit Included Parts

Key	Description	Quantity
10	Anti-blowout follower	1
17	Jam nut	1
100	Packing stud	2
101	Packing nut	2
102	Packing flange	1

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and operation information for the Fisher ATST desuperheater.

Do not install, operate, or maintain an ATST desuperheater without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. **To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings.** If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

Water atomization and vaporization are key elements in any steam conditioning application. The ATST design incorporates a manifold of patented nozzles to inject atomizing steam and spraywater into process steam. These specialized nozzles produce an optimized spray pattern over a wide operating range. These nozzles are strategically placed to achieve optimal mixing and quick vaporization at all flowing conditions. Years of experience with other steam atomized desuperheater designs went into the development of this construction. Extensive use of computational analysis, in addition to field performance feedback, was used to validate spray system performance.

Spraywater and Atomizing Steam: ASME CL150 to CL2500⁽⁴⁾

Construction Materials⁽⁵⁾

Desuperheater Body and Liner (if applicable):

■ Carbon Steel, ■ 2-1/4 Cr-1 Mo ■ 9 Cr-1 Mo-V
■ 9 Cr-2 W-V

Spray Nozzles: ■ R31233 Cobalt-Chrome Alloy

Gaskets: ■ N06600/Graphite

Bolting: ■ SA193 Grade B7, ■ SA193 Grade B16, ■ N07718

Maximum Inlet Pressures⁽¹⁾

Consistent with applicable pressure-temperature ratings per ASME B16.34

Maximum Unit Cv (for Spraywater Flow)

Contact your [Emerson sales office](#)

Spraywater Pressure Required⁽²⁾

3.5 to 35 bar (50 to 500 psi) greater than steam line pressure

Atomizing Steam Pressure Required

Atomizing steam source pressure typically should be at least 2 times the pressure of the steam to be desuperheated

1. Do not exceed the pressure or temperature limits in this manual, nor any applicable code or standard limitations.

2. A function of required turndown and equipment selection.

3. Offerings meet ASME standards. Consult your Emerson sales office for additional options.

4. Intermediate rating above CL2500 available upon request. PN ratings also available per pressure requirements of EN1092-1. Consult your Emerson sales office for additional information.

5. EN material options available upon request, consult your Emerson sales office for additional information.

Figure 2. Typical Fisher ATST Installation

X0355A-1

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the ATST desuperheater is installed where service conditions could exceed the limits of the pressure rating noted on the nameplate. To avoid such injury or damage, provide a relief valve for over pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

When ordered, the desuperheater configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and fluid conditions. Do not apply any other conditions to the desuperheater without first contacting your [Emerson sales office](#).

1. Before installation, all piping upstream of the desuperheater must be cleaned so that no loose materials such as welding slag, dirt or other foreign matter are left in the pipe. Use care to keep foreign matter out of the line openings while preparing the desuperheater installation.

⚠ WARNING

Do not lift the desuperheater by its cooler manifold piping. Personal injury or damage to equipment could occur if the desuperheater is improperly lifted into place.

All lifting and rigging must be completed in accordance with federal/national/provincial, state and local regulations and applicable lifting and rigging equipment standards. Only personnel trained in proper lifting and rigging practices shall perform desuperheater assembly lifting, rigging and installation. Because each lift will be unique, the method of lifting the desuperheater assembly, the correct location for attaching and lifting the desuperheater assembly, and what the desuperheater assembly will do when lifted shall be considered for each lift.

Lifting and rigging equipment used to lift, install or remove a desuperheater assembly or component must be properly selected and sized for the weight and configuration of the desuperheater assembly or component being lifted. The weight of the complete desuperheater assembly, including attached accessories, must be taken in consideration for this purpose. The lifting and rigging equipment must be properly maintained and inspected for damage before each use.

Lifting lugs or other lifting equipment attached to the desuperheater must never be used to lift or support the weight of attached piping.

If the ATST is equipped with butt weld ends, the desuperheater body must be supported using a lifting sling or other method that does not place a load or force onto the finished surface of the butt weld ends. The ATST does not have a stable resting condition. The desuperheater inlet and outlet must be fully supported until fully welded (butt weld end connections) or bolted (flanged end connections) into the piping.

2. Arrange lifting slings, or other lifting and rigging equipment appropriate for the desuperheater weight and configuration, around the main steam pipe to safely lift the ATST to the pipe opening.

⚠ WARNING

Do not expose the ATST to undue stresses by installing it in bent pipes or flanges. Personal injury and equipment damage could result from flange sealing failure due to improper installation.

3. Flanged Connections—Lubricate the flange connection bolts with a high temperature thread lubricant. Install flange gaskets and connection bolts per accepted practices and tighten securely.
4. Welded Connections—Welding procedures should be in accordance with the applicable codes and the base materials. For preheat, welding electrodes, and post weld heat treatment, refer to the applicable codes and practices applicable for the specific facility. Materials are specified on the customer specification sheet.

NOTICE

Depending on desuperheater body materials used, post weld heat treating may be required. If so, damage to internal parts is possible. In general, if post weld heat treating is to be performed, all nozzles should be removed. Contact your [Emerson sales office](#) for additional information.

5. Remove the spraywater control valve and flush the cooling water line until all debris is removed from the line prior to connecting it to the ATST desuperheater. Use only clean sources of cooling water to reduce the possibility of nozzle clogging. A strainer should be installed in the water line as close to the ATST desuperheater as possible. To determine appropriate mesh size, refer to desuperheater sizing and specification document, or contact your Emerson sales office. Review strainer manufacturer's pressure drop curves to determine appropriate strainer body size. You may need to use a strainer that is larger than the water line size.
6. Remove the atomizing steam valve and flush the steam line until all debris is removed from the line prior to connecting it to the ATST desuperheater.

⚠ WARNING

Failure to use a strainer could result in nozzle clogging and subsequent property damage or loss. Uncontrolled temperatures resulting from clogged nozzles may result in equipment or process temperature limits being exceeded. Exceeding system temperature limits could result in property damage or personal injury.

7. A length of straight pipe is required downstream of the ATST desuperheater to ensure complete vaporization of cooling water. An example of a typical installation appears in figure 2. Consult the ATST cooler sizing sheet for the required distance of straight pipe. This is unique for each application and is supplied by Emerson.
8. Typically, a temperature sensor will be mounted downstream of the ATST desuperheater. This distance will vary depending on a number of factors including steam velocity and percentage of spraywater. Consult the ATST cooler sizing sheet provided with the unit for this temperature sensor distance. The steam line should not have any branch lines dividing the steam flow between the ATST desuperheater and the temperature sensor. If you have any questions, contact your [Emerson sales office](#).
9. A typical installation is illustrated in figure 2. A temperature sensor (TE) measures changes in temperature and a temperature transmitter (TT) transmits the signal to the temperature control device. The output signal from the controller is sent to the positioner on the cooling water (spraywater) control valve (SWCV). The positioner's output signal strokes the SWCV open, increasing water pressure on the nozzles. Increasing water pressure upstream of the nozzles increases water flow through the nozzles.

The atomizing steam valve operates either as on/off or control depending on application, and the type of operation will be listed in the ATST sizing. In on/off operation, the atomizing steam valve is normally controlled so it fully opens just prior to the spraywater control valve opening. In control operation, the valve signal is modulated based on a downstream pressure target, as noted in the ATST sizing.

Maintenance

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- **Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.**
- **Use bypass valves or completely shut off the process to isolate the desuperheater from process pressure. Relieve process pressure and drain process media from the desuperheater.**
- **Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.**
- **Check with your process or safety engineer for any additional measures that must be taken to protect against process media.**

Servicing

Table 2. Inspection Summary

Key	Part Description	Inspection Tips and Diagnostics	Repair	Replacement
1	Steam Pipe (not replacement part)	Inspect for erosion, thermal fatigue, and other damage	Consult your local Emerson Service Center or Emerson Accredited Service Provider for a recommendation on necessary weld repair or replacement	
2	Nozzle Body (not replacement part)	Inspect for erosion, thermal fatigue, and other damage	Consult your local Emerson Service Center or Emerson Accredited Service Provider for a recommendation on necessary weld repair or replacement	
3	Nozzle Alignment Pin	Refer to Nozzle Maintenance Section		As needed
7	Nozzle Body Flange	Inspect gasket surfaces for damage that could indicate gasket leakage when spray nozzles are replaced	Replacement Only	As needed
10	Nozzle	Refer to Nozzle Maintenance Section		Replacement every 30-42 months for optimal performance
12	Steam Pipe Liner (not replacement part)	Inspect for erosion, thermal fatigue, and other damage	Consult your local Emerson Service Center or Emerson Accredited Service Provider for a recommendation on necessary weld repair or replacement	

Nozzle Maintenance and Replacement

When subjected to normal operating conditions, it is possible that wear, blockage, and/or fatigue will occur to the nozzle assembly. During regularly scheduled maintenance, visually inspect the nozzles for wear and blockage. Your local Emerson Service Center or Emerson Accredited Service Provider can help to determine the extent of fatigue and the correct course of action. Poor performing nozzles or nozzle failure is typically caused by wear, corrosion, erosion, and/or blockage. The following instructions will help to determine if any of these problems are present and provide a recommended course of action for each.

Note

For optimal performance, nozzles should be inspected every 18-24 months and replaced every 30-42 months.

1. Loosen and remove the nozzle body flange stud nuts (key 6) and washers (key 4). Then, remove the nozzle body flange assembly (key 7). Inspect the nozzle body flange gasket surfaces for damage. If damage is present, replacement is necessary.

Figure 3. Fisher ATST Nozzle

X1886

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D104734X012

ATST Desuperheater

July 2022

2. Remove the nozzle (key 10), nozzle gaskets (key 9), and nozzle body flange gasket (key 8).
3. Inspect the water and atomizing steam injection orifices for excessive wear, erosion/corrosion, or blockage due to particulate. Wear is defined as any cuts, gouges, or widening of the openings at the point of water and steam injection. Erosion/corrosion is defined as any form of rust or erosion of the nozzle. Blockages are defined as small particulate becoming trapped within the flow channels of the nozzle, impeding flow. Replacement of the nozzle is recommended if any of the preceding problems are present.
4. Rinse the nozzle (key 10) to remove any loose particulate that may be present.

Figure 4. Spray Nozzle Alignment Pin Location

GH01927

5. Reassemble in the following order: nozzle gasket (key 9), nozzle body flange gasket (key 8), spray nozzle (key 10), second nozzle gasket (key 9), nozzle alignment pin (key 3), nozzle body flange assembly (key 7), washers (key 4), and stud nuts (key 6). Ensure the nozzle is installed such that the flow arrow is aligned with the direction of process steam flow. It is recommended that any used gaskets be discarded and replaced with new ones.
6. Torque nozzle body flange nuts as indicated in table 3.

Table 3. Recommended Nozzle Body Flange Bolting Torque with Nickel Anti-Seize Lubricant⁽¹⁾

BOLT SIZE, INCH	THREADS PER INCH	LUBRICATION	RECOMMENDED BOLT TORQUE ⁽²⁾	
			N•m	Lbf•ft
5/8	11	Nickel Anti-Seize	163	120
3/4	10		258	190
7/8	9		373	275
1	8		522	385
1-1/8			712	525
1-1/4			942	695
1-3/8			1268	935
1-1/2			1654	1220
1. For other lubricants, contact your Emerson sales office for recommended bolt torque. 2. Torques for lubricated studs with heavy hex nuts.				

Parts Ordering

Each ATST desuperheater is assigned a serial number. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts, refer to the serial number and key numbers for each part required. The key numbers in the Parts List and the assembly drawing in figure 5 can be used to help in part identification.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher desuperheater, because they may void your warranty, might adversely affect the performance of the desuperheater, and could cause personal injury and property damage.

Figure 1. Fisher CAV4 Control Valve with 657 Actuator

W2700-1

Introduction

Scope of Manual

This manual includes installation, maintenance, and parts ordering information for the Fisher CAV4 control valve and Cavitrol™ IV trim. Information on the flushing trim is also provided. Refer to separate manuals for information concerning the actuator, positioner, and other accessories used with this control valve.

Do not install, operate, or maintain a CAV4 control valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Table 1. Specifications
Available Configurations and Valve Sizes

Common Characteristics: Four-stage Cavitrol IV trim with soft metal-to-metal seats in CAV4 angle valve. Valve plug action is push-down-to-close

Seal Ring Construction: NPS 2, 3, 4, or 6 angle NPS 6 valve with pressure-balanced valve plug and spring-loaded PTFE seal ring. For use in low-temperature applications

Stem-Balanced Construction: NPS 2 angle or 4 valve body with stem-balanced valve plug (valve stem diameter--for that portion of the stem that passes through the bonnet--is equal to the nominal port diameter). For use in high-temperature applications

Piston Ring Construction: NPS 6 valve with pressure-balanced valve plug and five graphite piston rings. For use in high temperature applications

Unbalanced Construction: NPS 2 globe valve

Maximum Inlet Pressure, Temperature, and Pressure Drops⁽¹⁾

Consistent with ASME B16.34 CL1500 and CL2500 pressure/temperature ratings; but do not exceed the pressure, temperature, and pressure drop conditions specified when the valve was ordered. Also, see the Installation section in this manual

End Connection Style

Butt welding Ends: All butt welding end schedules per ASME B16.25 that are compatible with ASME B16.34 valve body rating.

Raised-Face or Ring-Type Joint Flanged Ends: Inlet connection is CL1500 or CL2500 flange per B16.5. Outlet connection mates with CL2500 flange and has tapped bolt holes

Shutoff Classification

TSO (Tight Shutoff) Trim: Valves with TSO trim are factory tested to a more stringent Emerson

Automation Solutions test requirement of no leakage at time of shipment using ANSI/FCI 70-2 and IEC 60534-4 Class V procedures.

Piston Ring Construction: Class IV per ANSI/FCI 70-2 and IEC 60534-4

Angle Body: Class VI per ANSI/FCI 70-2 and IEC 60534-4

Globe Body: Class V per ANSI/FCI 70-2 and IEC 60534-4

Flow Direction

Angle Bodies: In through the side connection and out the bottom connection

Globe Bodies: Flow down

Flow Characteristic

Linear

Port Diameters and Unbalance Area

See table 2, or table 3 for TSO trim

Minimum Seating Force

First refer to figure 2 to determine minimum seat load in lbf per inch of port circumference, then multiply that value by the port circumference from table 2, or table 3 for TSO trim

Valve Plug Travel

See table 2

Yoke Boss and Valve Stem Diameters

Approximate Weights

See table 4

1. The pressure/temperature limits in this manual and any applicable standard or code limitation for the valve should not be exceeded.

Description

The CAV4 control valve, shown in figure 1, is an angle or globe (NPS 2 only) valve with soft metal-to-metal seats, Cavitrol IV trim, cage guiding, and push-down-to-close valve plug action. Figures 6 and 8 show a typical balanced TSO (tight shutoff) trim construction. Figure 13 shows three additional valve plug constructions that are available: one with a pressure-assisted spring-loaded PTFE seal ring with PEEK (poly ether ether ketone) anti-extrusion rings, another with five graphite piston rings, and a third with stem-balancing.

Cavitrol IV trim is most often used to help eliminate cavitation damage on liquid service where the differential pressure drop is greater than 207 bar, differential (3000 psi). It may also be used in applications with lower pressure drops where its anti-cavitation performance is required. Figure 15 shows the valve with flushing trim. Flushing trim consists of two plates installed prior to system flushing in order to protect Cavitrol IV trim and valve body gasket surfaces.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D100384X012

CAV4 Valve

April 2022

Earlier CAV4 control valves used hard metal-to-metal seats. The soft metal-to-metal seated version can be identified by the letters SMS stamped on the seat ring (key 35, figure 13) or lower cage assembly (key 2, figure 13).

Educational Services

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or system damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in table 1 and on the appropriate nameplates. To avoid such injury or damage, use pressure-relieving devices as required by applicable industry codes to prevent the service conditions from exceeding these limits.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

The valve configuration and construction materials were selected to meet particular pressure, pressure drop, temperature, and controlled fluid conditions indicated when the valve was ordered. Do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

Trim parts, seals, and gaskets may be damaged if post-weld butt-weld heat treatment is applied to valve areas other than the end connections. If heat treatment will be performed over the entire valve body, seals and gaskets must be removed. Valve plug seals may be reused; gaskets that are removed must not be reused. Use new gaskets upon assembly.

If hoisting the valve, be sure the hoist used is capable of handling the weight of the valve and actuator. Also, be sure the sling does not damage the painted surfaces, is positioned securely to prevent swinging or slipping, and is positioned so as to cause no damage to tubing or any accessories.

1. The valve must be installed so that the actuator is positioned vertically above the valve body. This position reduces the possibility of uneven wear on the valve plug. Also, this position facilitates easier maintenance and prevents stem binding due to actuator weight.
2. Be certain the valve body and adjacent pipelines are free of foreign materials that may damage valve seating surfaces.
3. If continuous operation of the system will be required during valve inspection and maintenance, install a conventional three-valve bypass around the point of valve installation.

CAUTION

For long service life and more effective operation, the process liquid must be clean. Impurities or entrained solids in the process liquid may cause irreparable erosion damage to the seating surfaces and may plug cage holes, causing cavitation damage. During valve installation or the plant cleaning cycle, install a strainer upstream from the valve to help free pipelines of foreign material.

4. Flow through the valve must be as indicated by the flow direction arrow on the valve body.
5. Use accepted piping practices when installing the valve in the pipeline. For flanged valves, remove the protective covering from the outlet flange studs, and use a suitable gasket between the valve and the pipeline flanges.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however, the packing might require some readjustment to meet specific service conditions.

Figure 2. Recommended Minimum Seat Load for All Constructions

A2922-1

Flushing the Pipeline

Before flushing the piping system, install the CAV4 flushing trim (figure 15), if available, as described in the Use of Optional Flushing Trim procedure in the Maintenance section.

Principle of Operation

With Cavitrol IV trim, liquid flow enters the valve through the side connection and enters the cage through the top set of holes as shown in figure 3. No significant pressure drop occurs across the set of holes because the flow area is relatively large. As the liquid flows down through the cage, it undergoes four staged pressure drops by flowing through four additional sets of holes. All significant throttling action occurs in the four sets of holes down-stream of the seating surfaces. Flow leaves the valve through the bottom connection.

When the valve is partially open, the valve plug blocks some of the holes above the seating surfaces. A small amount of flow enters the blocked holes and flows out through the clearance between the cage and plug. Because all significant pressure drop is taken downstream of the seating surfaces, the clearance flow does not cavitate or cause erosion of the seating surfaces. Each of the four stages has a successively larger flow area, resulting in higher pressure drops across the first stages where there is no danger of the liquid pressure falling low enough to allow the formation of vapor bubbles that can cause cavitation.

Because more than 90 percent of the total valve pressure drop is across the first three stages, both the inlet pressure to the final stage and the pressure drop across the final stage are relatively low. A low inlet pressure and pressure drop at the final stage result in a pressure at the vena contracta (the lowest pressure reached in the flow stream) that is above the liquid vapor pressure. Maintaining this higher pressure at the vena contracta ensures that the liquid pressure does not fall below the vapor pressure, and thus cavitation does not occur.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing lubrication, packing replacement, trim removal, trim replacement, and use of flushing trim.

Key numbers used in these procedures are shown in figure 13, except where indicated.

Figure 3. Schematic of CAV4 Angle Valve with Cavitrol IV Trim

W3671-3*

⚠ WARNING

Avoid personal injury and property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure, and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Figure 4. Optional Lubricator and Lubricator/Isolating Valve

Packing Lubrication

CAUTION

Do not lubricate graphite packing. Graphite packing is self-lubricated. Additional lubrication may result in slip-stick movement of the valve.

Note

To avoid lubricants breaking down at elevated temperatures, do not lubricate packing used in processes with temperatures over 260°C (500°F).

A lubricator or lubricator/isolating valve (figure 4) is available for use with PTFE-composition packing or other packings that require lubrication. If a lubricator or lubricator/isolating valve is used, it will be installed in place of the pipe plug (key 17) in the bonnet (key 12).

Use a good quality silicon-base lubricant. Packing used in processes with temperatures over 260°C (500°F) should not be lubricated. Be certain the lubricant is compatible with the process liquid. The frequency of lubrication depends upon the severity of the service conditions.

To operate the lubricator, simply turn the cap screw clockwise to force lubricant into the packing box. The lubricator/isolating valve operates the same way except the isolating valve must first be opened and then closed after lubrication is completed.

Table 5. Recommended Torque for Packing Flange Nuts

STEM DIAMETER		MINIMUM		MAXIMUM	
mm	Inch	N•m	Lbf•ft	N•m	Lbf•ft
19.1	3/4	41	30	61	45
25.4	1	61	45	91	67
31.8	1-1/4	81	60	122	90
38.1	1-1/2	61	45	91	67
69.9	2-3/4	81	60	122	90

Packing Maintenance

For spring-loaded single PTFE V-ring packing (figure 5), the spring (key 23) maintains a sealing force on the packing. If leakage is noted around the packing follower (key 22), check to be sure the shoulder on the packing follower is touching the bonnet. If the shoulder is not touching the bonnet, tighten the packing flange nuts (key 15) until the shoulder is against the bonnet. If leakage cannot be stopped in this manner, replace the packing as described in the Packing Replacement procedure.

For PTFE-composition or graphite ribbon/filament packing (figure 5), leakage around the packing follower may be stopped by tightening the packing flange nuts (key 15). If leakage cannot be stopped by tightening the nuts, replace packing as described in the Packing Replacement procedure.

Packing Replacement

WARNING

Refer to the **WARNING** at the beginning of the Maintenance section.

For spring-loaded PTFE V-ring packing (shown in figure 5), tighten the packing flange nuts (key 15) until the shoulder on the packing follower (key 22, figure 5) contacts the bonnet (key 12). If packing leakage still exists, replace the packing according to the numbered steps below.

If packing leakage exists with PTFE-composition or graphite ribbon/filament packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts (key 15) to at least the minimum recommended torque in table 5. However, do not exceed the maximum recommended torque in table 5, or excessive friction may result.

If the packing is relatively new and tight on the stem, and if tightening the packing flange nuts does not stop the leakage, the valve stem may be worn or nicked so that a seal cannot be made. The surface finish of a new valve stem is 0.1 micro-meter (4 micro-inches) rms. If the leakage comes from the outside diameter of the packing, the leakage may be caused by nicks or scratches around the packing box wall. While replacing the packing according to the numbered steps below, inspect the valve stem and packing box wall for nicks or scratches. If the nicks or scratches cannot be removed by refinishing, replace the parts with new parts.

1. Remove the cap screws in the valve/actuator stem connector (not shown), and separate the two halves of the stem connector. Then exhaust all actuator pressure, if any was applied, and disconnect the actuator supply and any leakoff piping.
2. Unscrew the hex nuts (key 26) or the yoke locknut (not shown), and lift the actuator from the bonnet (key 12).
3. Loosen the packing flange nuts (key 15) so that the packing (key 19 or keys 29 and 13, figure 5) is not tight on the valve stem (key 4). Remove any travel indicator disc and stem locknuts from the valve stem threads.

- NOTES:
- ① ONLY 0.102mm (0.004 INCH) THICK; USE ONLY ONE BELOW EACH GRAPHITE RING.
 - ② HAS THE APPEARANCE OF A WOVEN OR BRAIDED RING.
 - ③ HAS THE APPEARANCE OF FLAT WASHERS PRESSED TOGETHER.

**GRAPHITE PACKING FOR 31.8, 38.1, & 69.9 mm
(1-1/4, 1-1/2, & 2-3/4 INCH) STEM DIA**

Table 6. Valve Body-to-Bonnet Bolting Torque

VALVE SIZE, NPS	BODY STYLE	TORQUE	
		N•m	Lbf•ft
2	Angle	974	717
	Globe CL1500	258	190
	Globe CL2500	380	280
3	Angle	1058	780
4		1776	1310
6		2712	2000

CAUTION

When lifting the bonnet (key 12), be sure that the valve plug and stem assembly (key 4) remains on the seat. This will avoid damage to the seating surfaces as a result of the assembly dropping from the bonnet after being lifted part way out. The bonnet is easier to handle separately.

When removing packing, use care to avoid scratching the packing box wall.

4. Unscrew the large hex nuts (key 27) that secure the bonnet (key 12) to the valve body. Carefully lift the bonnet off the valve stem. If the valve plug and stem assembly (key 4) starts to lift with the bonnet, tap the end of the stem down with a brass or similar hammer that will not deform the valve stem threads. Set the bonnet on a cardboard or wooden surface to prevent damage to the bonnet gasket surface.
5. Remove the upper bonnet gasket (key 6).
6. Cover the opening in the valve body to protect the gasket surface and to prevent foreign material from falling into the valve body cavity.
7. Remove the packing flange nuts (key 15), packing flange (key 16), upper wiper (key 21, figures 5 and 13, not used with graphite ribbon/filament packing), and packing follower (key 22). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall.
8. Clean the packing box and these metal packing parts: packing follower (key 22), packing box ring (key 20), spring and special washer (keys 23 and 24, used with PTFE V-ring packing, figure 5) or lantern ring (key 23, used with other packing as shown in the figure 5 arrangements).
9. Inspect the valve stem threads for any sharp edges that might cut the packing. A whetstone or emery cloth may be used to smooth the threads if necessary.
10. Remove the protective covering from the valve body cavity, and install a new upper bonnet gasket (key 6). Then slide the bonnet (key 12) over the stem and onto the stud bolts (key 28).

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) immediately if a discrepancy between actual parts and approved parts is suspected.

11. Lubricate the stud bolt (key 28) threads and the faces of the hex nuts (key 27) with anti-seize lubricant (key 18) (not necessary if new factory prelubricated hex nuts are used). Replace the washers and hex nuts, but do not tighten them. Torque the nuts in a crisscross pattern to no more than 1/4 of the nominal torque value specified in table 6. When all nuts are tightened to that torque value, increase the torque by 1/4 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.
12. Install new packing and the metal packing box parts according to the appropriate arrangement in figure 5. Slip a smooth-edged pipe over the valve stem, and gently tamp each soft packing part into the packing box.

13. Slide the packing follower (key 22), wiper (key 21, not used with graphite ribbon/filament packing), and packing flange (key 16) into position. Lubricate the packing flange studs (key 14) and the faces of the packing flange nuts (key 15). Replace the packing flange nuts.

For spring-loaded PTFE V-ring packing, tighten packing flange nuts (key 15) until the shoulder on the packing follower (key 22) contacts the bonnet (key 12).

For other packing types, tighten the packing flange nuts (key 15) to the maximum recommended torque shown in table 5. Then loosen the packing flange nuts, and retighten them to the recommended minimum torque in the table.

14. Mount the actuator on the valve body assembly, and reconnect the actuator and valve stem according to the procedures in the appropriate actuator instruction manual. After the valve is returned to service, retighten the hex nuts (key 27) to the torques listed in table 6.

Trim Removal

Angle Valves

Note

The NPS 3 CAV4 valve is a clamped-in trim design. No cage retainer is used. See figure 13. Therefore, if you are using these instructions for an NPS 3 valve, disregard references to a cage retainer.

The valve trim consists of the valve plug and stem assembly (key 4), the valve plug rings, if used, (keys 8, 9, 10, 11, and 37), the upper cage (key 3), the cage retainer (key 5), the lower cage assembly (key 2), the separable seat ring (key 35, seal ring construction only), the upper and lower bonnet gaskets (key 6), and the cage gasket (key 7).

Figure 6. TSO (Tight Shutoff) Trim, Detail of Protected Soft Seat

A7088

During trim removal, inspect the seating surface of the plug and lower cage or seat ring. Also inspect the inside diameter of the lower cage. If the seating surfaces need to be refinished, or if the inside diameter of the lower cage has plugged holes, deep scratches, or other signs of wear, the cage retainer and lower cage assembly must be removed. A seat ring or lower cage assembly and cage retainer in good condition may both remain in the valve body.

TOOL INSTALLATION

Recommended Materials	Minimum Rockwell Hardness
S41600	28
S17400	36
S41000	31

Figure 8. Typical Balanced TSO Trim

A cage retainer tool is required to remove the cage retainer and lower cage assembly. If specifically ordered, a tool is supplied with the valve. It can also be ordered individually by referencing the tool part number included in the Parts List of this manual. A tool can also be machined for a specific valve using the dimensions shown in figure 7.

Note

Machine the tool from a material listed in figure 7, or from a material with a yield strength of at least 827 MPa (120,000 psi). Using a tool of lower strength may result in damage to the valve body threads.

CAUTION

Careful handling and installation of trim parts is extremely critical on all CAV4 valves. Any damage to gasket and seal surfaces of the cage or valve body, or valve plug and cage seating surfaces can result in leakage that can cause eventual damage to the cage and valve body due to erosion and cavitation.

1. Remove the actuator (not shown), bonnet (key 12) and packing by following steps 1 through 7 of the Packing Replacement section.

CAUTION

When lifting the valve plug and stem assembly out of the valve body, be certain the upper cage (key 3) remains in the valve (key 1). This will prevent damage that might be caused by the upper cage dropping back into the valve after being lifted

part way out. Use care to avoid damaging gasket sealing surfaces. Lay the valve plug and stem assembly on a protective surface in a safe location.

The NPS 6 CAV4 graphite piston rings (key 11) are brittle and in two halves. Use care to avoid damage to the piston rings caused by dropping or rough handling.

2. Pull the valve plug and stem assembly (key 4) out of the cages. Lay it on a protective surface in a safe location.
3. For stem-balanced valve plugs, proceed to step 4.

For seal ring valve plugs, work the retaining ring (key 10) off the valve plug with a screwdriver. Carefully slide the backup ring (key 9), two-piece anti-extrusion ring (key 37), and seal ring (key 8) off the valve plug (key 4).

For piston-ring valve plugs, the graphite piston rings (key 11) are each in two halves. If the rings are worn and need to be replaced, remove the sections from the grooves in the valve plug (key 4).

For TSO (tight shutoff) trim, perform the following steps (refer to figures 6 and 8):

CAUTION

In the following steps, use care to avoid damaging the outer plug guide surfaces.

- Remove the piston ring, anti-extrusion rings, backup ring, and retainer.
 - Remove the set screws that lock the outer plug to the inner plug.
 - Using a strap wrench or similar tool, unscrew the outer plug from the inner plug. Do not damage the outer plug guide surfaces.
 - Remove the protected soft seat seal.
 - Inspect the parts for damage and replace if needed.
4. The upper cage (key 3) has two tapped holes to aid in removal. Refer to table 7 for the hole diameter and thread type. Install eyebolts or similar devices into those holes, then carefully lift the upper cage out of the valve body.
 5. Remove the lower bonnet gasket (key 6).

If removal of the lower cage assembly is necessary, use a cage retainer tool (figure 7) to remove the cage retainer (key 5) as follows:

- a. Insert the tool into the valve body. Be certain the tool lugs are engaged in the corresponding recesses in the retainer.

CAUTION

Do not use an impact wrench to remove or install the seat ring retainer. Damage to cage retainer, valve body threads, and lower cage could result.

- b. Use a power torque wrench having torque capabilities equal to or greater than those shown in figure 7. Connect the power torque wrench to a standard socket wrench extension or other suitable tool. This extension or tool must fit snugly into the square hole or hex head of the cage retainer tool. Refer to figure 7 for square hole and hex head sizes.

- c. Insert the extension into the cage retainer tool.
- d. Use the stud bolts (key 28) to prevent the power torque wrench from rotating.

Table 7. Hole Diameter and Thread Type for Cage Removal

Valve Size, NPS	Upper Cage	Lower Cage Assembly
2	2 holes, 1/4-20 UNC	---
3	2 holes, 3/8-16 UNC	4 holes, 1/4-20 UNC
4	2 holes, 3/8-16 UNC	4 holes, 1/4-20 UNC
6	2 holes, 1/2-13 UNC	4 holes, 3/8-16 UNC

CAUTION

Hold the power torque wrench and attached socket wrench extension at right angles to the cage retainer when applying torque. Tilting the wrench and extension while applying torque causes the lugs on the cage retainer tool to suddenly disengage from the recesses in the retainer, damaging the retainer and the lower cage assembly (key 2).

- e. Remove the cage retainer (key 5).
- f. Remove the seat ring (key 35) and O-ring (key 36), if used.
6. The NPS 4 and 6 lower cage assemblies (key 2) have tapped holes to aid in removal. Refer to table 7 for hole diameter and thread type. Install eyebolts or similar devices into these holes. Carefully lift the lower cage assembly (key 2) straight out of the valve body.
7. Remove the cage gasket (key 7).

CAUTION

The seat ring (key 35) or integral seat cage assembly (key 2) has a soft metal seat. To avoid damage to the seating surfaces, DO NOT lap this surface. If this area needs repair, contact your [Emerson sales office](#) for assistance.

NPS 2 Globe Valve**CAUTION**

Careful handling and installation of trim parts is extremely critical on all CAV4 valves. Any damage to gasket and seal surfaces of the cage or valve body, bonnet spacer, or valve plug and cage seating surface can result in leakage that can cause eventual damage to the cage and valve body due to erosion and cavitation.

1. Remove the actuator (not shown), bonnet (key 12) and packing by following steps 1 through 7 of the packing replacement section (shown in figure 14).

CAUTION

When lifting the valve plug and stem assembly out of the valve body, be certain the upper cage (key 3), seat ring (key 35) and lower cage assembly (key 2) remain the valve (key 1). This will prevent damage that might be caused by dropping these parts back into the valve after being lifted.

2. Pull the valve plug and stem assembly (key 4) out of the cages. Lay it on a protective surface in a safe location.
3. Remove the upper bonnet gasket (key 6) followed by bonnet spacer (key 40) and lower bonnet gasket (key 6.)
4. Remove the two spiral wound gaskets (key 39).
5. Carefully lift the upper cage (key 3) out of the valve body.
6. Carefully remove the seat ring (key 35) and O-ring (key 36).
7. Carefully lift the lower cage assembly (key 2) straight out of the valve body and remove the cage gasket or O-ring (key 7).

Trim Replacement

Angle Valves

Note

The NPS 3 CAV4 valve is a clamped-in trim design. No cage retainer is used. See figure 13. Therefore, if you are using these instructions for an NPS 3 valve, disregard references to a cage retainer.

After all trim maintenance has been completed, reassemble the trim by following the steps below.

Be certain that all gasketed surfaces are clean. Use new gaskets (keys 6 and 7) during assembly.

1. If the lower cage assembly (key 2) and cage retainer (key 5) remained in the valve body (key 1), proceed to step 4.

If these parts were removed, read the following caution and proceed to step 2:

CAUTION

To avoid galling or improper gasket loading that may result in leakage, thoroughly clean the threads and the gasket surfaces in the valve body (key 1), the valve body bore, and the cage retainer (key 5). Lubricate the surfaces indicated in figure 9 with the appropriate lubricant. Be certain to lubricate all of the following mating surfaces:

- cage retainer and valve body threads,
- bottom of the cage retainer and top of the flange on the lower cage assembly.

Do not lubricate the gasket surfaces.

Position the valve vertically and carefully lower the lower cage assembly into the valve body. When inserting the assembly, use an even motion; do not rock the lower cage assembly while installing it. Use care to avoid damaging the cage gasket (key 7).

2. Install a new cage gasket (key 7), and insert the lower cage assembly (key 2) into the valve body. If installing the separable seat ring (key 35), first install the O-ring (key 36) around the bottom diameter of the seat ring.
3. Thread the cage retainer (key 5) into the valve body. Use the cage retainer tool (figure 7) to tighten the cage retainer as follows:
 - a. Insert the tool into the valve body. Be certain the tool lugs are engaged in the corresponding recesses in the retainer.

Figure 9. Trim Surfaces Requiring Lubrication and Recommended Lubricants

48A6264-A
A2935-1

CAUTION

Do not use an impact wrench to remove or install the seat ring retainer. Damage to cage retainer, valve body threads, and lower cage could result.

- b. Use a power torque wrench having torque capabilities equal to or greater than those shown in figure 7. Connect the power torque wrench to a standard socket wrench extension or other suitable tool. The extension or tool must fit snugly into the square hole or the hex head of the cage retainer tool. Refer to figure 7 for square hole or hex head sizes.
- c. Insert the extension into the cage retainer tool.
- d. Use the stud bolts (key 28) to prevent the power torque wrench from rotating.

CAUTION

Hold the power torque wrench and attached socket wrench extension at right angles to the cage retainer when applying torque. Tilting the wrench and extension while applying torque causes the lugs on the cage retainer tool to suddenly disengage from the recesses in the retainer, damaging the retainer and lower cage assembly.

- e. Tighten the cage retainer (key 5) to the torque shown in figure 7.
4. Install a new lower bonnet gasket (key 6), and insert the upper cage (key 3). Be sure the lugs on the bottom of the cage engage the corresponding slots in the cage retainer (key 5).

Note

Rotate the upper cage (key 3) clockwise by hand as much as possible once the cage lugs engage the slots in the cage retainer (key 5). Failure to do so may result in slight seat leakage.

5. For stem-balanced valve plug, proceed to step 6.

For piston ring valve plug, if installing new graphite piston rings (key 11), each replacement ring will arrive in one piece. Use a vise with smooth jaws to break this replacement ring into halves. Place the new ring in the vise so that the jaws will compress the ring into an oval. Slowly compress the ring until the ring snaps on both sides. If one side snaps first, do not try to tear or cut the other side. Instead, keep compressing the ring until the other side snaps.

With the valve plug and stem assembly (key 4) on a protective surface, place the piston rings in the piston ring grooves with the fractured ends matched. Rotate the rings in the grooves so that all the matched ends are at different points around the plug circumference.

For seal ring valve plug, install the seal ring (key 8) with the open side facing the four flutes on the valve plug. Slide the 2-piece anti-extrusion ring (key 37) and the backup ring (key 9) onto the valve plug. Secure with the retaining ring (key 10).

For TSO (tight shutoff) trim, perform the following steps (refer to figures 6 and 8).

CAUTION

In the following steps, use care to avoid damaging the outer plug guide surfaces.

- Thread the outer plug onto the inner plug until the parts seat metal to metal, using a strap wrench or similar tool that will not damage the outer plug guide surfaces.
 - Mark the top of the inner plug and outer plug with alignment marks in the assembled position.
 - Disassemble the outer plug from the inner plug and install the seal over the inner plug, so that the seal rests below the threaded area.
 - Thread the outer plug onto the inner plug and tighten with a strap wrench or similar tool until the alignment marks line up. This will ensure that the plug parts are metal to metal and the seal is compressed properly. Do not damage the outer plug guide surfaces.
 - Install set screws centering the inner plug in the outer plug and torque to 11 N•m (8 lbf•ft).
 - Assemble the piston ring, anti-extrusion rings, backup ring, and retainer.
6. Slide the valve plug and stem assembly (key 4) into the cages.
7. Place a new upper bonnet gasket (key 6) onto the upper cage (key 3) as shown in figure 13.
8. Install the bonnet (key 12) over the valve stem and onto the valve body (key 1).

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) immediately if a discrepancy between actual parts and approved parts is suspected.

9. Lubricate the threads of the studs (key 28) and the faces of the hex nuts (key 27) with anti-seize lubricant (key 18) (not necessary if new factory prelubricated hex nuts are used). Replace the washers and hex nuts but do not tighten them. Torque the nuts in a crisscross pattern to no more than 1/4 of the nominal torque value specified in table 6. When all nuts are tightened to that torque value, increase the torque by 1/4 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.
10. Install new packing and packing box parts per steps 12 and 13 of the Packing Replacement section.
11. Mount the actuator by following the procedures in the appropriate actuator instruction manual. Check for packing leakage as the valve is being put into service. Retighten packing flange nuts as required. After the valve is returned to service, retighten the hex nuts (key 27) to the torque listed in table 6.

CAUTION

The soft metal seat life can be seriously shortened if the following step is not carefully completed.

12. Isolate the valve from the process and stroke the plug at least three times with maximum actuator force to seat the plug surface against the soft metal seat.

NPS 2 Globe Valve

After all trim maintenance has been completed, reassemble the trim by following the steps below.

Be certain all gasketed surfaces are clean. Use new gaskets (keys 6 and 39) along with new O-rings (keys 36 and 7) during assembly.

1. Install a new cage gasket or O-ring (key 7) in the bottom groove in the lower cage assembly (key 2). Position the valve vertically and carefully lower the lower cage assembly into the valve body (key 1.) When inserting the assembly, use an even motion; do not rock the lower cage assembly while installing it.
2. Install a new gasket or O-ring (key 36) in the bottom groove of the seat ring (key 35). Carefully lower the seat ring onto the lower cage assembly. Acceptable to lubricate O-ring, do not lubricate if gasket.
3. Carefully lower the upper cage (key 3) onto the seat ring.
4. Place two new spiral wound gaskets (key 39) onto the upper cage. Place a new lower bonnet gasket (key 6) on the valve body.
5. Carefully lower the bonnet spacer (key 40) onto the valve body.
6. Slide the valve plug and stem assembly (key 4) into the cages.
7. Place a new upper bonnet gasket (key 6) onto the upper cage.

8. Install the bonnet (key 12) over the valve stem and onto the bonnet spacer.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) immediately if a discrepancy between actual parts and approved parts is suspected.

9. Lubricate the threads of the studs (key 28) and faces of the hex nuts (key 27) with anti-seize lubricant (key 18) (not necessary if new factory prelubricated hex nuts are used). Replace the hex nuts but do not tighten them. Torque the nuts in a crisscross pattern to no more than $\frac{1}{4}$ of the nominal torque value specified in table 6. When all nuts are tightened to that torque value, increase the torque by $\frac{1}{4}$ of the specified nominal torque and repeat the crisscross pattern. Stroke the valve plug a few times as the bonnet studs are tightened to be sure the valve action is smooth. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again, if any nut still turns, tighten every nut again.
10. Install new packing and packing box parts per steps 12 and 13 of the packing replacement section.
11. Mount the actuator by following the procedure in the appropriate actuator instruction manual. Check for packing leakage as the valve is being put into service. Retighten packing flange nuts as required. After the valve is returned to service, retighten the hex nuts (key 27) to the torque listed in table 6.

Use of Optional Flushing Trim for Angle Valve

Install the optional flushing trim (figure 15) prior to system flushing in order to protect the Cavitrol IV trim and the valve body gasket surfaces.

Gaskets (keys 6 and 7) that have not been in service (i.e., original gaskets in a CAV4 valve being installed or new gaskets for a valve already installed) may be used with the flushing trim.

Key numbers referenced in this section are shown in figure 15, unless otherwise indicated.

1. Remove the actuator, and disassemble the valve body by completing steps 1 and 2, and 4 through 7 of the Trim Removal procedure.
2. Install the lower flushing plate (key 31).
3. Thread the cage retainer (key 5) into the valve body hand-tight.
4. Install the lower bonnet gasket (key 6), the upper flushing plate (key 30), and the upper bonnet gasket (key 6).

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) immediately if a discrepancy between actual parts and approved parts is suspected.

5. Place the bonnet (key 12, figure 13) on the valve body. Lubricate the threads of the studs (key 28) and the faces of the hex nuts (key 27) with anti-seize lubricant (key 18) (not necessary if new factory prelubricated hex nuts are used). Replace the washers and hex nuts but do not tighten them. Torque the nuts in a crisscross pattern to no more than 1/4 of the nominal torque value specified in table 6. When all nuts are tightened to that torque value, increase the torque by 1/4 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.
6. After system flushing is completed, remove the bonnet (key 12) and bonnet gaskets (key 6), upper flushing plate (key 30), cage retainer (key 5), lower flushing plate (key 31), and cage gasket (key 7).
7. Assemble the valve as described in the Trim Replacement procedure.

Parts Ordering

Each valve body-bonnet assembly is assigned a serial number, which can be found on the valve body. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Refer to the number when contacting your [Emerson sales office](#) for technical assistance or when ordering replacement parts.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

When ordering replacement parts, also be sure to include the 11-character part number from the following parts kits or parts list information.

Parts Kits

Standard Packing Repair Kits (Non Live-Loaded)

Stem Diameter, mm (Inches) Yoke Boss Diameter, mm (Inches)	19.1 (3/4) 90 (3-9/16)	25.4 (1) 127 (5)	31.8 (1-1/4) 127 (5, 5H)
PTFE (Contains keys 22, 24, 25, 26, 27)	RPACKX00032	RPACKX00342	RPACKX00352
Double PTFE (Contains keys 22, 24, 26, 27)	RPACKX00062	RPACKX00362	RPACKX00372
Single Graphite Ribbon/Filament (Contains keys 23 [ribbon ring], 23 [filament ring], 24, and 26)	RPACKX00122	---	---
Single Graphite Ribbon/Filament (Contains keys 23 [ribbon ring], 23 [filament ring], and 26)	---	RPACKX00532	RPACKX00542
Single Graphite Ribbon/Filament (Contains keys 23 [ribbon ring], 23 [filament ring])	RPACKX00152	---	---

ENVIRO-SEAL™ Packing Retrofit Kits

Retrofit kits include parts to convert valves with existing standard bonnets to the ENVIRO-SEAL packing box construction.

Refer to figure 10 for key numbers for PTFE packing, to figure 11 for key numbers for Graphite ULF packing, and to figure 12 for key numbers for duplex packing.

PTFE kits include keys 200, 201, 211, 212, 214, 215, 217, 218, tag, and cable tie. Graphite ULF kits include keys 200, 201, 207, 208, 209, 210, 211, 212, 214, 216, 217, tag, and cable tie. Duplex kits include keys 200, 201, 207, 209, 211, 212, 214, 215, 216, 217, tag, and cable tie.

Stems and packing box constructions that do not meet Fisher stem finish specifications, dimensional tolerances, and design specifications may adversely alter the performance of this packing kit.

For part numbers of individual components in the ENVIRO-SEAL packing kits, refer to instruction manual ENVIRO-SEAL Packing System for Sliding-Stem Valves, [D101642X012](#).

ENVIRO-SEAL Packing Retrofit Kits

PACKING MATERIAL	STEM DIAMETER AND YOKE BOSS DIAMETER, mm (INCH)		
	19.1 (3/4) 90 (3-9/16)	25.4 (1) 127 (5)	31.8 (1-1/4) 127 (5, 5H)

Graphite ULF	RPACKXRT282	RPACKXRT292	RPACKXRT302
Duplex	RPACKXRT232	RPACKXRT242	RPACKXRT252

ENVIRO-SEAL Packing Repair Kits

Repair kits include parts to replace the “soft” packing materials in valves that already have ENVIRO-SEAL packing arrangements installed or in valves that have been upgraded with ENVIRO-SEAL retrofit kits.

Refer to figure 10 for key numbers for PTFE packing, to figure 11 for key numbers for Graphite ULF packing, and to figure 12 for key numbers for duplex packing.

PTFE repair kits include keys 214, 215, and 218. Graphite ULF repair kits include keys 207, 208, 209, 210, and 214. Duplex repair kits include keys 207, 209, 214, and 215.

Stems and packing box constructions that do not meet Fisher stem finish specifications, dimensional tolerances, and design specifications may adversely alter the performance of this packing kit.

For part numbers of individual components in the ENVIRO-SEAL packing kits, refer to instruction manual ENVIRO-SEAL Packing System for Sliding-Stem Valves, [D101642X012](#).

Figure 1. Fisher CHP NPS 12 Control Valve

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for the Fisher CHP control valve. Refer to separate manuals for instructions covering the actuator, positioner, and accessories.

Do not install, operate, or maintain CHP valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

The CHP globe valve (figure 1) has a metal seat, cage guiding, quick change trim, and push-down-to-close valve plug action. The valve uses a balanced valve plug. To provide a seal between the cage and a balanced valve plug, the balanced valve plug uses a PEEK (Poly Ether Ether Ketone) anti-extrusion ring with a pressure-assisted spring-loaded seal ring.

Specifications

Specifications for the CHP valves are shown in table 1.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

CHP Valve

June 2017

Instruction Manual

D103463X012

Table 1. Specifications

Size/Pressure Class/Body Materials NPS 12 / CL2500 / WCC, WC9 Maximum Inlet Pressure and Temperature⁽¹⁾ Consistent with ASME B16.34 except CHPT PEEK anti-extrusion seal ring construction. Maximum temperature limit is 316°C (600°F). For temperature exceeding 316°C (600°F), please consult Singapore SD&S End Connection Style Buttweld Ends : All butt welding end schedules per ASME B16.25 Bonnet and Body-to-Bonnet Bolting Plain Bonnet: 5 inch H Yoke Boss Studs: Steel A 193-B7 Nuts: Steel A 194-2H	Flow Coefficient Maximum Cv: 1040 Km: 0.65 Fl: 0.81 Modified Equal Percentage Flow Direction Flow down (in through the cage windows and out through the seat ring) except for service with pressure drop exceeding 69 bar (1000psi) when a diverter cone plug is used Stem Diameter 1-1/4 inch with 2-inch VSC (Valve Stem Connection) Shutoff Classification per ANSI/FCI 70-2 and IEC 60534-4 CHPT: Class IV (standard), Class V (optional) CHPD: Class III ⁽²⁾ Weight Estimated 2000 kg Please consult Singapore SD&S for any queries
--	--

1. The pressure/temperature limits in this manual and any applicable standard or code limitation for valve should not be exceeded.

2. For Boiler feedwater application, proper use of a block valve during closing of the control valve is recommended to minimize control valve trim damage.

Installation

WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or property damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

WARNING

A bonnet flange has a tapped hole that was used to handle the bonnet during manufacture. Since this tapped hole was not designed or intended to support the weight of the valve/bonnet assembly, do not use this tapped hole to lift the valve assembly or personal injury may result from the assembly falling.

CAUTION

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Since some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first checking with your [Emerson sales office](#) or Local Business Partner.

1. Before installing the valve, inspect it to ensure that the valve body cavity is free of foreign material.
2. Clean out all pipelines to remove scale, welding slag, and other foreign materials before installing the valve.
3. Flow through the valve must be in the direction indicated by the flow arrow, which is attached to the valve body.
4. Use accepted piping practices when installing the valve in the pipeline.
5. Install a three-valve bypass around the valve if continuous operation is required during maintenance.
6. If the actuator and valve body are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.
7. If the valve body was shipped without packing installed in the packing box, install the packing before putting the valve body into service. Refer to instructions given in the Packing Maintenance procedure.

WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Maintenance

Refer to figure 4.

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing maintenance and trim maintenance. All maintenance operations may be performed with the valve in the line.

WARNING

Avoid personal injury or damage to property from sudden release of pressure or uncontrolled process fluid. Before starting disassembly:

- Do not remove the actuator from the valve while the valve is still pressurized.
 - Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
 - Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
 - Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
 - Vent the power actuator loading pressure and relieve any actuator spring precompression.
 - Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
 - The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
 - Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
-

VALVE RATING	BOLT TORQUES	
	SA193-B7, B16	
	N•m	lbf•ft
CL2500	5760	4260

Table 4. Valve Stem Connection Torque and Hole Size for Pin

VALVE STEM DIAMETER		TORQUE, MINIMUM TO MAXIMUM		HOLE SIZE ⁽¹⁾	
mm	Inches	N•m	Lbf•ft	mm	Inch
31.8	1-1/4	827-908	610-670	9.53 - 9.65	0.375 - 0.380

1. VSC (Valve Stem Connection) size is 2-inch.

CAUTION

The CHP valve uses spiral-wound gaskets which are crushed to provide their seal. A spiral-wound gasket should never be reused. Whenever a gasket seal is disturbed by removing or shifting gasketed parts, a new gasket must be installed upon reassembly. This is necessary to ensure a good gasket seal, since the used gasket will not seal properly.

The spiral-wound gaskets are of special design. Failure to use genuine Fisher replacement parts may result in valve damage and/or failure.

Packing Maintenance

Key numbers refer to figure 2 for PTFE V-ring packing and graphite ribbon/filament, unless otherwise indicated.

⚠ WARNING

To avoid personal injury or equipment damage resulting from packing leakage, inspect the valve plug stem and packing box wall for nicks or scratches while performing the following procedures.

Use care to avoid damaging these surfaces.

For spring-loaded single PTFE V-ring packing, the spring (key 8) maintains a sealing force on the packing. If leakage is noted around the packing follower (key 13), check to be sure the shoulder on the packing follower is touching the bonnet. If the shoulder is not touching the bonnet, tighten the packing flange nuts (key 21, figure 4) until the shoulder is against the bonnet. If leakage cannot be stopped in this manner, proceed to the Replacing Packing procedure.

If there is undesirable packing leakage with other than spring-loaded PTFE V-ring packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts (key 21, figure 4) to at least the minimum recommended torque in table 2. However, do not exceed the maximum recommended torque in table 2 or excessive friction may result. If leakage continues, replace the packing by following the numbered steps presented in the Replacing Packing procedure.

If the packing is relatively new and tight on the valve plug stem, and if tightening the packing flange nuts does not stop the leakage, it is possible that the stem is worn or nicked so that a seal cannot be made. The surface finish of a new

stem is critical for making a good packing seal. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches around the packing box wall. While replacing the packing according to the Replacing Packing procedure, inspect the valve plug stem and packing box wall for nicks or scratches.

Adding Packing Rings

⚠ WARNING

Refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

To avoid personal injury or equipment damage resulting from packing leakage, inspect the valve plug stem and packing box wall for nicks or scratches while performing the following procedures.

Use care to avoid damaging these surfaces.

Key numbers referred to in this procedure are shown in figure 4, unless otherwise indicated.

When using packing with a lantern ring it may be possible to add packing rings above the lantern ring as a temporary measure without removing the actuator from the valve body.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Remove the packing flange nuts (key 21) and lift the packing flange, upper wiper, and packing follower (keys 19, 27, and 28) away from the valve body.
3. It may be possible to dig out the old packing rings on top of the lantern ring, but use care to avoid scratching the valve plug stem or packing box wall. Clean all metal parts to remove particles that would prevent the packing from sealing.
4. Remove the stem connector and slip the packing rings over the end of the valve plug stem.
5. Reassemble the packing follower, upper wiper, packing flange, and packing flange nuts (keys 28, 27, 19, and 21).
6. Reconnect the body-actuator stem connection according to the appropriate actuator instruction manual.
7. Tighten the packing flange nuts only far enough to stop leakage under operating conditions. Check for leakage around the packing follower when the valve is being put into service. Retighten the packing flange nuts as required (see table 2).

Replacing Packing

⚠ WARNING

Refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

To avoid personal injury or equipment damage resulting from packing leakage, inspect the valve plug stem and packing box wall for nicks or scratches while performing the following procedures.

Use care to avoid damaging these surfaces.

Key numbers referred to in this procedure are shown in figure 4, unless otherwise indicated.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power

actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

2. Remove the cap screws in the stem connector, and separate the two halves of the stem connector. Then exhaust all actuator pressure, if any was applied, and disconnect the actuator supply and any leakoff piping.
3. Remove the hex nuts (key 30), and remove the actuator from the bonnet (key 18).
4. Loosen the packing flange nuts (key 21) so that the packing (keys 7, 9, 31, or 32, figure 2) is not tight on the valve plug stem (key 6). Remove the stem locknuts from the valve plug stem threads.

CAUTION

When lifting the bonnet (key 18), be sure that the valve plug and stem assembly (keys 5 and 6) remains on the seat ring (key 4). This avoids damage to the seating surfaces as a result of the assembly dropping from the bonnet after being lifted part way out. The parts are also easier to handle separately.

Use care to avoid damaging gasket sealing surfaces.

⚠ WARNING

To avoid personal injury or property damage caused by uncontrolled movement of the bonnet, loosen the bonnet by following the instructions in the next step. Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet. If the cage sticks to the bonnet, proceed carefully with bonnet removal and support the cage so that it will not fall unexpectedly from the bonnet.

Note

The following step also provides additional assurance that the valve body fluid pressure has been relieved.

5. Hex nuts (key 14) attach the bonnet to the valve body. Loosen these nuts approximately 3 mm (1/8 inch). Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and valve body. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, proceed to the next step. If fluid leaks from the joint, the process pressure was not relieved from the valve as noted in the Warning at the beginning of the Maintenance section in this manual.
6. Unscrew the hex nuts (key 14) and carefully lift the bonnet off the valve stem. If the valve plug and stem assembly starts to lift with the bonnet, use a brass or lead hammer on the end of the stem and tap it back down. Set the bonnet on a cardboard or wooden surface to prevent damage to the bonnet gasket surface.
7. Remove the valve plug (key 5), bonnet gasket (key 11), cage (key 2), seat ring (key 4), and the seat ring gasket (key 12).

CAUTION

Inspect the seat ring, cage, bonnet, and body gasket surfaces. These surfaces must be in good condition, with all foreign material removed. Small burrs less than approximately 0.076 mm (0.003 inch) in height (the thickness of a human hair) can be ignored. Scratches or burrs that run across the serrations are not permitted under any conditions, since they will prevent the gaskets from sealing properly.

8. Clean all gasket surfaces with a good wire brush. Clean in the same direction as the surface serrations, not across them.

9. Cover the opening in the valve body to protect the gasket surface and to prevent foreign material from getting into the valve body cavity.
10. Remove the packing flange nuts (key 21), packing flange (key 19), upper wiper (key 27), and packing follower (key 28). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall.
11. Clean the packing box and the following metal packing parts: packing follower, packing box ring (key 11, figure 2), spring or lantern ring (key 8, figure 2), and, for single arrangements of PTFE V-ring packing only, special washer (key 10, figure 2).
12. Inspect the valve stem threads for any sharp edges that might cut the packing. A whetstone or emery cloth may be used to smooth the threads if necessary.
13. Remove the protective covering from the valve body cavity, and install the seat ring and cage using a new seat ring gasket (key 12), bonnet gasket (key 11). Install the plug, then slide the bonnet over the stem and onto the studs (key 13).

Figure 3. Installing Graphite Ribbon/Filament Packing Rings One at a Time

Note

The prelubricated hex nuts (key 14) referred to in step 14 can be identified by a black film coating on the nut threads.

The proper bolting procedures in step 14 include--but are not limited to--ensuring that the bonnet stud threads are clean, and that the hex nuts are evenly tightened to the specified torque values.

CAUTION

Failure to comply with good bonnet-to-body bolting practices and the torque values shown in table 3 may result in damage to the valve. Cheater bars or slug wrenches should not be used for this procedure.

Hot torquing is not recommended.

14. Lubricate the stud threads and the faces of the hex nuts (key 14) with anti-seize lubricant (not necessary if new factory prelubricated hex nuts are used). Install the hex nuts and tighten them finger-tight. Stroke the valve several times to center the trim. Torque the nuts in a crisscross pattern to no more than 1/4 of the nominal torque value specified in table 3.

When all nuts are tightened to that torque value, increase the torque by 1/4 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.

Note

When installing packing rings, prevent entrapping air between the rings. Add the rings one at a time without forcing them below the chamfer of the packing box entrance chamber. As each successive ring is added, the stack should not be pushed down more than the thickness of the added ring (figure 3).

15. Install new packing and the metal packing box parts according to the appropriate arrangement in figure 2. If desired, packing parts may be pre-lubricated with a silicon base grease for easier installation. Slip a smooth-edged pipe over the valve stem, and gently tap each soft packing part into the packing box, being sure that air is not trapped between adjacent soft parts.
16. Slide the packing follower, wiper, and packing flange into position. Lubricate the packing flange studs (key 20) and the faces of the packing flange nuts (key 21). Install the packing flange nuts.

For the spring-loaded PTFE V-ring packing shown in figure 2, tighten the packing flange nuts until the shoulder on the packing follower (key 28) contacts the bonnet.

For graphite packing, tighten the packing flange nuts to the maximum recommended torque shown in table 2. Then, loosen the packing flange nuts, and retighten them to the recommended minimum torque shown in table 2.

For other packing types, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in table 2. Then, tighten the remaining flange nuts until the packing flange is level and at a 90-degree angle to the valve stem.

17. Mount the actuator on the valve body assembly, and reconnect the actuator and valve plug stems according to the procedures in the appropriate actuator instruction manual.

Trim Removal

Key numbers referenced in this procedure are shown in figure 4, except where indicated.

1. Remove the actuator and bonnet by following steps 1 through 6 of the replacing packing procedure. Observe all warnings and cautions in that procedure.
2. Lift the valve stem and attached valve plug out of the valve body. If the valve plug is to be reused, tape or otherwise protect the valve plug stem and the valve plug seating surface to prevent scratches.
3. Lift out the cage (key 2) and the bonnet gasket (key 11).
4. Remove the seat ring (key 4) and the seat ring gasket (key 12).
5. Inspect the parts for wear or damage and replace if needed.
6. Refer to the Valve Plug Maintenance procedure or to the Lapping Seats procedure.

Valve Plug Maintenance

Key numbers used in this procedure are shown in figure 4, except where indicated.

1. With the valve plug (key 5) removed according to the trim removal procedure, proceed as appropriate:

For the CHPT valve, work the retaining ring (key 10) off the valve plug with a screwdriver. Carefully slide the backup ring, anti-extrusion rings (keys 9, 63, and 8), and seal ring off the valve plug.

2. To replace the valve plug stem (key 6), drive out the pin (key 7), and unscrew the stem from the valve plug.

CAUTION

Never reuse an old stem with a new valve plug. Using an old stem with a new plug requires drilling a new pin hole in the stem. This weakens the stem and may cause the stem to fail in service. If a new valve plug is required, always order a valve plug, stem, and pin as an assembly. Specify the correct part number of each of the three parts, but state that the parts are being ordered as an assembly.

A used valve plug may be reused with a new stem.

3. Thread the new stem into the valve plug and tighten it to the appropriate torque value given in table 4. Using the valve plug pin hole as a guide, drill the pin hole through the stem. Refer to table 4 for drill sizes.
4. Drive in the pin to lock the assembly.
5. If it is necessary to lap the seating surfaces, complete the lapping seats procedure before installing the seal ring. The Trim Replacement procedure provides seal ring installation instructions and valve reassembly instructions.

Lapping Seats

Key numbers referenced in this procedure are shown in figure 4, except where indicated.

With metal-seat constructions, lapping seating surfaces of the valve plug and seat ring (keys 5 and 4) can improve shutoff. (Deep nicks should be machined out rather than ground out.) Use a good quality lapping compound of a mixture of 280 to 600-grit. Apply the compound to the bottom of the valve plug.

Note

The CHP valve uses spiral-wound gaskets. These gaskets provide their seal by being crushed and therefore should never be reused. This includes reusing a gasket after the lapping procedure has been performed.

An “old” gasket can be used to lap the seat, however the gasket must be replaced with a new gasket.

To preserve the effects of lapping, do not change either the position of the seat ring in the valve body cavity or the position of the cage on the seat ring after lapping the seating surfaces. When the parts are removed for cleaning and replacement of the “old” gaskets, return them to the original positions.

Use the following procedure to lap the seating surfaces.

1. Install the following parts according to the instructions presented in the trim replacement procedure: “old” seat ring gasket (key 12), seat ring (key 4), cage (key 2) and “old” bonnet gasket (key 11).
2. Install the valve plug and stem assembly (keys 5 and 6) into the cage.
3. Install the bonnet (key 18) over the valve stem, and secure the bonnet with four of the hex nuts (key 14).
4. Attach a handle, such as a piece of strap iron secured by stem locknuts, to the valve stem. Rotate the handle alternately in each direction to lap the seats.
5. After lapping, disassemble as necessary (you may mark the position of the seat ring and cage with a soft tip marker). Clean the seating surfaces, replace the gaskets, reassemble (taking care to return the seat ring and cage to their original positions), and test for shutoff. Repeat the lapping procedure if necessary.

Trim Replacement

⚠ WARNING

Observe the warning at the start of the Maintenance section.

After all trim maintenance has been completed, reassemble the valve body by following the numbered steps below. Be certain that all gasketed surfaces have been well cleaned. Key numbers referenced in this procedure are shown in figure 4, except where indicated.

CAUTION

Inspect the seat ring, cage, bonnet, and body gasket surfaces. These surfaces must be in good condition, with all foreign material removed. Small burrs less than approximately 0.076 mm (0.003 inches) in height (the thickness of a human hair) can be ignored. Scratches or burrs that run across the serrations are not permitted under any conditions, since they will prevent the gaskets from sealing properly.

1. Install the seat ring gasket (key 12) into the valve body. Install the seat ring (key 4).
2. Install the cage (key 2).
3. Install the seal ring (key 8) onto the valve plug (key 5). Install the anti-extrusion rings (key 63) onto the valve plug (key 5). Install the ring with the open side facing the seat end of the valve plug for flow-down applications (view A of figure 4). Slide the backup ring (key 9) onto the valve plug. Secure with the retaining ring (key 10).
4. Install the valve plug into the cage.
5. Install the bonnet gasket (key 11).
6. Install the bonnet over the valve stem and onto the valve body.

Note

The prelubricated hex nuts (key 14) referred to in step 7 can be identified by a black film coating on the nut threads.

The proper bolting procedures in step 7 include--but are not limited to--ensuring that the bonnet stud threads are clean, and that the hex nuts are evenly tightened to the specified torque values.

CAUTION

Failure to comply with good bonnet-to-body bolting practices and the torque values shown in table 3 may result in damage to the valve. Cheater bars or slug wrenches should not be used for this procedure.

Hot torquing is not recommended.

7. Lubricate the stud threads and the faces of the hex nuts (key 14) with anti-seize lubricant (not necessary if new factory prelubricated hex nuts are used). Install the hex nuts, but do not tighten them. Torque the nuts in a crisscross pattern to no more than 1/4 of the nominal torque value specified in table 3. When all nuts are tightened

to that torque value, increase the torque by 1/4 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.

8. Install new packing and packing box parts per steps 15 and 16 of the Replacing Packing procedure. Be certain to observe the note given prior to step 15 of that procedure.
9. Mount the actuator by following the procedures in the actuator instruction manual. Check for packing leakage as the valve is being put into service. Retorque the packing flange nuts as required. See table 2.

Parts Ordering

Each valve body-bonnet assembly is assigned a serial number which can be found on the valve. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Refer to the serial number when contacting your [Emerson sales office](#) or Local Business Partner for technical assistance. When ordering replacement parts, reference the valve serial number to obtain the correct eleven-character part number for each part; the following Parts Kit and Parts List is for information only.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts Kits

Packing Kits (non live-loaded)

Single PTFE (Contains keys 22, 24, 25, 26, 27)
Single Graphite Ribbon/Filament (Contains keys 23, 23, 24, 26)

Parts List

Numerous available combinations of valve parts make selection of some parts difficult; when ordering valve parts for which a part number is not listed, provide the valve serial number with the order, permitting proper selection of replacement parts to be made at the factory.

Note

For part numbers not shown, contact your [Emerson sales office](#) or Local Business Partner.

Key Description

1	Valve Body If you need a valve body as a replacement part, order by valve size, serial number, and desired material.
2 *	Cage
4 *	Seat Ring

X0955-1

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for the Fisher CL600 Control-Disk valve, NPS 3 through NPS 24 (figure 1). Refer to separate instruction manuals for information covering the power actuator and accessories.

Do not install, operate, or maintain a CL600 Control-Disk valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The Fisher CL600 Control-Disk valve maintains tight shutoff, and can be specified for a wide range of pressure and temperature conditions.

The CL600 Control-Disk valve is available in a lugged or double flanged body design. A splined shaft can combine with a variety of spring-and-diaphragm or pneumatic piston actuators. A keyed shaft option is available for larger sizes and can combine with a variety of pneumatic piston actuators. These combinations help make the CL600 Control-Disk valve a reliable rotary control valve for control applications in the process industries.

Table 1. Fisher CL600 Control-Disk Valve Specifications

Specifications	ASME
Valve Body Size	NPS 3, 4, 6, 8, 10, 12, 14, 16, 18, 20, 24
Pressure Rating	CL600 per ASME B16.34
Valve Body Materials	WCC or CF8M (std)
	LCC, CD3MN, M35-2, and CW2M
Disk Materials	CF8M (std), CD3MN, M35-2, and CW2M
Disk Edge Coating	Chrome Plate (std)
	Chrome Coat
	Chromium Carbide Coating
End Connections	Mates with RF Flanges per ASME B16.5 Optional construction mates with RTJ Flanges per ASME B16.5
Valve Body Style	Lugged (Single Flange), Lugged with drilled through flange holes, or Double Flange
Shaft Connection Style	NPS 3-24: Splined (std) NPS 14-24: Keyed
Face-to-Face Dimensions	Meets MSS SP68, API 609, ASME B16.10, EN 558 standards; Double Flange upon request
Shutoff	Soft Seal: Class VI
	Metal Seal: Class IV, reverse direction only
	Phoenix III Seal: Class VI; reverse direction preferred, forward direction optional
	High Pressure Seal: Class VI, reverse direction only
Flow Direction	Standard (reverse flow) is with the flow into the shaft side of the disk
Flow Characteristic	Linear
Disk Rotation	Clockwise (CW) to close

Figure 2. Available Seal Configurations

E0578

Notes:

1. This unidirectional seal must be installed so that the retaining ring is downstream from the high pressure side of the valve at shutoff, as shown.
2. For this bidirectional seal, the "preferred" valve orientation places the retaining ring downstream from the high pressure side of the valve at shutoff.
3. NPS 3 only.

Table 3. Maximum Allowable Inlet Pressure for CW2M Valves

TEMPERATURE	CW2M ⁽¹⁾
	600 ⁽²⁾
°C	Bar
-29 to 38	103.4
93	103.4
149	100.3
204	96.2
260	91.7
316	83.4
371	78.3
427	70.0
482	62.1
538	50.0
°F	Psig
-20 to 100	1500
200	1500
300	1455
400	1395
500	1330
600	1210
700	1135
800	1015
900	900
1000	725

1. This material is not listed in ASME B16.34. Also see the Installation section.

2. The designation 600 is used only to indicate relative pressure-retaining capabilities and is not an ASME pressure-temperature rating class designation.

	High Pressure Seal		
	S21800 Nitrided	-198 to 538	-325 to 1000
	S20910 Nitrided	-198 to 538	-325 to 1000
Packing	PTFE /Carbon-filled PTFE (standard)	-45 to 232	-50 to 450
	ENVIRO-SEAL™ PTFE	-45 to 232	-50 to 450
	Graphite Die-molded Ribbon	-198 to 538	-325 to 1000
	ENVIRO-SEAL Graphite	-198 to 371	-325 to 700

1. The maximum temperature for a standard of the CL600 Control-Disk valve is 538°C (1000°F). Contact your [Emerson sales office](#) for use in higher temperature applications
2. For use with soft seal only.

Installation

Key numbers in this procedure are shown in figures 13, 14, and 15 unless otherwise indicated.

WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage resulting from the bursting of pressure retaining parts, be certain the service conditions do not exceed either the valve body rating or the flange joint rating, or other limits given in table 4 or on the nameplate. Use pressure-relieving or pressure-limiting devices to prevent the service conditions from exceeding these limits.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section on page 10 in this manual.

CAUTION

The valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions specified in the customer's order. Because some valve body/trim material combinations are limited in their pressure drop and temperature range capabilities, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

The maximum allowable inlet pressures for steel and stainless steel valve bodies are consistent with the pressure-temperature ratings shown in table 1, except where further limited by the trim and packing material temperature capabilities given in table 4. Valves are also available in CW2M valve body materials. The CW2M valve body material is not listed in ASME B16.34. Valve bodies constructed of this material mates with ASME flanges, but must not be installed in systems requiring conformance to ASME standards if not included in ASME pressure/temperature ratings. Maximum allowable inlet pressures for CL600 Control-Disk valve bodies made of CW2M construction materials are shown in table 3.

1. Install a three-valve bypass around the control valve assembly if continuous operation is necessary during inspection and maintenance of the valve body.
2. Inspect the valve body to be certain it is free of foreign material.
3. The valve is normally shipped as part of a control valve assembly, with an actuator mounted on the valve body.

If the valve body and actuator have been purchased separately or if the actuator has been removed for maintenance, mount the actuator, and adjust actuator travel to close the valve before inserting the valve body into the line. This is necessary due to the measurements that must be made during the actuator adjustment process. Refer to the Actuator Mounting section on page 22 of this manual and to the separate actuator instruction manual for mounting and adjusting instructions before proceeding.

4. Inspect adjacent pipelines to be certain they are free of any foreign material, such as pipe scale or welding slag, that could damage the valve body seating surfaces.

CAUTION

Damage to the disk (key 6) will occur if any pipe flanges or piping connected to the valve body interfere with the disk rotation path. However, the disk can be rotated without interference when the valve body is installed between adjacent pipe flanges or piping that has an inside diameter equal to or greater than either schedule 80 pipe or compatible EN pipe sizes. If piping with a smaller inner diameter than specified above is connected to the valve, measure carefully to be certain the disk rotates without interference before putting the valve into operation.

5. Flow is in the standard direction when the seal retainer (key 16) is facing downstream. Standard flow direction is also indicated by the flow direction arrow cast into the valve body. Flow in the forward direction is permissible within allowable pressure drop limits with the proper seal.

CAUTION

CL600 Control-Disk disk rotation is counterclockwise to open (when viewed from the actuator side of the valve body, see figure 12) through 90 degrees of disk rotation.

6. With the disk in the closed position, install line flange gaskets, and insert the valve between the pipeline flanges. Use either flat sheet gaskets or spiral-wound gaskets with compression-controlling centering rings. Spiral-wound gaskets without compression-controlling centering rings are not recommended for this purpose.

Lifting Guidelines

Threaded holes for lifting are standard on the NPS 6 - 24 valve bodies. It is required that swivel hoists rings be used to lift the valve or valve and actuator assembly. An eyebolt cannot accommodate all lifting angles required to install or maintain the valve. The load carrying capability of an eyebolt decreases dramatically if used in any other orientation than axially. Therefore, the use of eyebolts is not permitted.

CAUTION

Care must be taken when lifting the valve/actuator assembly to ensure the accessories and tubing are not damaged in the process. The valve weight is listed in table 2. For the actuator weight, refer to the appropriate instruction manual. Make sure to use appropriate lifting straps/hoists capable of lifting this combined weight.

⚠ WARNING

Avoid personal injury or property damage caused by uncontrolled movement or dropping of the valve assembly.

Ensure the disk is secure from rotating during lifting process. Failure to do so could result in personal injury if the disk rotates uncontrolled during lifting.

Swivel Hoist rings are sized to lift only the valve and actuator. Do not attach piping or other structures to the valve and actuator assembly when lifting with swivel hoists rings.

Take appropriate precautions to avoid unbalanced loading which may result in sudden swinging or movement of the assembled unit, including additional lifting and/or support methods when necessary.

Do not use eyebolts when lifting the valve or valve and actuator assembly due to variable loading angles inherent to valve maintenance and installation.

Failure to utilize safe lifting practices may result in equipment damage and/or personal injury.

Lifting Valve/Actuator Assembly

To lift the assembly, install swivel hoist rings into one or two of the threaded holes on the valve body (see figure 3). Thread sizes are listed in table 5. When lifting the valve and actuator assembly, a strap around the actuator may be required to ensure lifting stability. If straps are used on the actuator, ensure the lifting location is above the center of gravity (CG) for the actuator to prevent load shifting during lifting. Refer to the appropriate assembly drawings for the CG for your assembly.

Lifting Valve Only

To lift the valve, insert two swivel hoist rings into the body. Thread sizes are listed in table 5. Ensure the valve is closed and that the packing is tightened to prevent shaft rotation during lifting. Without an actuator, the valve disk is free to rotate if enough momentum is generated during the lifting process by a sudden stop. The packing and seal friction should prevent the disk from rotating; however take proper precaution when lifting the valve.

7. Insert the valve between the flanges and install two or more line flange studs into the line flanges to help hold the valve in position while centering the valve. Carefully center the valve on the flanges to ensure disk clearance.

Note

Lubricate line flange studs before inserting them into flanges. If necessary, provide additional support for the control valve assembly because of its combined weight.

Figure 5. Stud Bolts for Installation (also see table 7)

Figure 6. Double Flange Stud Bolts for Installation (also see table 8)

⚠ WARNING

For lugged valve bodies with threaded line bolt holes, personal injury and property damage could result from sudden release of process pressure if line bolts are not properly installed. To ensure proper line bolt thread engagement, line studs must be centered in the threaded section of the valve body so that each stud has equal thread engagement in the body. See figure 5.

8. After centering the valve body, first lubricate and then install the remaining line flange bolting to secure the valve in the pipeline. Tighten the nuts to the line flange studs in a crisscross pattern to ensure proper alignment of valve, gaskets, and flanges.

⚠ WARNING

A CL600 Control-Disk valve body is not necessarily grounded when installed in a pipeline. If the valve is used in a flammable or hazardous atmosphere or for oxygen service, an explosion could result due to a discharge of static electricity from the valve components. To avoid personal injury or property damage, always make sure the valve body is grounded to the pipeline before putting the control valve assembly into operation in a flammable or hazardous atmosphere.

Note

Standard packings for the CL600 Control-Disk valve are composed of all conductive packing rings (graphite ribbon packing) or partially conductive packing rings (such as a carbon-filled PTFE female adaptor with PTFE V-ring packing) to electrically bond the

shaft to the valve body for hazardous area service. For oxygen service applications, provide alternate shaft-to-valve body bonding according to the following step.

9. For oxygen service applications, attach the bonding strap assembly (key 34, figure 7) to the shaft with the clamp (key 33, figure 7), and connect the other end of the bonding strap assembly to the valve body with the cap screw (key 31).

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however, the packing might require some readjustment to meet specific service conditions.

Figure 7. Optional Shaft-to-Valve Body Bonding Strap Assembly

Valves with ENVIRO-SEAL packing systems will not require this initial re-adjustment. See ENVIRO-SEAL Packing System for Rotary Valves Instruction Manual ([D101643X012](#)) for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the parts kit sub-section on page 23 of this manual.

Maintenance

Valve body parts are subject to normal wear and must be inspected regularly and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions. Instructions are given in this section for: replacing trim components, changing disk rotation or valve action, and mounting and adjusting the actuator.

As used in these instructions, actuator refers to power actuators (such as pneumatic diaphragm, piston actuators, and rack and pinion actuators).

⚠ WARNING

Avoid personal injury and property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.

- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any spring precompression.
- Use lock-out procedures to be sure the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Figure 8. Packing Arrangement Details

NOTES:

1. WITH CONDUCTIVE PACKING, THE FEMALE ADAPTOR IN PTFE V-RING PACKING IS CARBON-FILLED PTFE.

Packing Maintenance

Refer to figure 8 for available packing configurations. All maintenance operations in this section may be performed with the valve in the line. Packing may be PTFE V-ring or graphite.

An ENVIRO-SEAL packing system is also available with the CL600 Control-Disk valve. To install the ENVIRO-SEAL packing system in an existing valve, follow the instructions in the instruction manual included with the packing system ([D101643X012](#)). To remove packing parts in a valve with the ENVIRO-SEAL packing system, follow the procedures for valves with the ENVIRO-SEAL packing system in this section. Install the replacement packing following the instructions in the packing system instruction manual (D101643X012).

Stopping Leakage

For valves with PTFE or graphite packing:

CAUTION

Tighten the packing flange only enough to prevent shaft leakage. Excessive tightening will only accelerate wear of the packing and could produce higher torques on the valve.

Leakage around the packing followers can be stopped by tightening the packing flange nuts (key 27).

If the packing is relatively new and tight on the shaft, and if tightening the packing flange nuts does not stop leakage, the shaft may be worn or nicked so that a seal cannot be made. If the leakage comes from the outside diameter of the packing, the leakage may be caused by nicks or scratches around the packing box wall. Inspect the shaft and packing box wall for nicks and scratches when performing the packing replacement procedures.

For valves with the ENVIRO-SEAL packing system:

Optimum performance of the ENVIRO-SEAL packing system is obtained when the Belleville springs are tightened to their "target load." The target load is the point where the springs are compressed to 85% of their maximum deflection, or nearly flat. Maximum deflection is when the springs are 100% compressed, or completely flat.

Under normal conditions, the packing nuts should not require re-tightening. However, when servicing, if the springs do not remain at the target load of 85% compression, retighten the packing box nuts according to the following procedure:

1. Tighten the packing flange nuts alternately and evenly, keeping the packing flange parallel with the valve flange (see figure 8), until the Belleville springs are compressed 100% (or completely flat).

- For PTFE packing, loosen each packing flange nut one half turn (180° of rotation).
- For Graphite packing, loosen each packing flange nut one quarter turn (90° of rotation).

The target load of 85% compression has now been reached. If leakage continues, replace the packing components as described in the following procedures.

Replacing the Packing

To replace the packing, the actuator must be removed. Also, the valve should be removed from the pipeline to allow proper readjustment of the disk position.

⚠ WARNING

The edges of a rotating disk have a shearing effect that may result in personal injury. To help prevent such injury, stay clear of the disk edges when rotating the disk (key 6).

CAUTION

Damage to the disk (key 6) may occur if the disk is not closed when the valve is being removed from the pipeline. If necessary, apply operating pressure to the actuator temporarily to retain the disk in the closed position while removing the valve from the pipeline.

For valves with PTFE or graphite packing:

Key numbers in this procedure are shown in figures 13, 14, and 15 unless otherwise indicated.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shutoff all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure the above measures stay in effect while you work on the equipment.

CAUTION

When removing the actuator in the following step, use a wheel puller to separate the actuator parts from the valve shaft. Do not drive the actuator parts off the valve shaft because this could damage valve trim components.

2. Remove the actuator per instructions in separate actuator instruction manuals, then remove the cap screws (key 31). Remove the clamp (key 33, figure 7) if the strap (key 34, figure 7) is used.
3. Remove the packing flange nuts (key 27) and the packing flange (key 25) and pull out the packing follower (key 24).
4. Remove the anti-blowout ring, if used (NPS 3-8) (key 23) from the drive shaft (key 7).
5. Remove the old packing rings (key 22) and the packing box ring (key 21). Carefully avoid scratching the shaft or packing box wall to avoid damage that could cause leakage around the shaft. Clean all accessible metal parts and surfaces to remove particles that would prevent the packing from sealing.

⚠ WARNING

Do not lubricate parts when used in oxygen service, or where the lubrication is incompatible with the process media. Any use of lubricant can lead to the sudden explosion of media due to the oil/oxygen mixture, causing personal injury or property damage.

6. Use the appropriate procedures below for installing packing.
 - Install the packing as shown in figure 8. For NPS 3-8, two packing box rings (key 21) are used on the top and bottom of the packing set (see figures 8, 13, and 14 for details). For NPS 10-24, only one packing box ring (key 21) is used on the bottom of the packing set, at the end closest to the disk (see figure 15 for details).
 - With graphite ribbon packing, stack the packing rings and packing washers together, and slide the stack into the packing box as far as it will go while carefully avoiding trapping air between the rings.
 - Install the anti-blowout ring, if used (NPS 3-8) (key 23) in the groove on the drive shaft (key 7).
 - Install the packing follower and the packing flange.
 - Install the packing flange nuts, and tighten them only far enough to stop leakage under normal operating conditions.
 - For oxygen service applications, attach the bonding strap assembly (key 34, figure 7) to the shaft with the clamp (key 33, figure 7), and connect the other end of the bonding strap assembly to the valve body with a cap screw (key 31).
7. Mount the actuator and adjust the closed position of the valve, per the Actuator Mounting section on page 22 of this manual, before returning the valve to service.
8. When placing the control valve into operation, check around the packing follower for leakage; retighten the packing flange nuts as required according to accepted bolting procedures.

For valves with ENVIRO-SEAL packing systems:

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shutoff all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

CAUTION

When removing the actuator, use a wheel puller to separate the actuator parts from the valve shaft. Do not drive the actuator parts off the valve shaft because this could damage valve trim components.

2. Remove the actuator per instructions in separate actuator instruction manuals, then remove the cap screws (key 31). Remove the clamp (key 33, figure 7) if the strap (key 34, figure 7) is used.
3. Loosen the two packing hex nuts evenly to remove spring tension, then remove the nuts.
4. Remove the packing flange and spring pack assembly. The spring pack assembly consists of the spring stack and packing follower. The spring stack is retained on the packing follower by an O-ring. Remove the anti-blowout ring, if used (NPS 3-8) (key 23) from the drive shaft (key 7). Remove the anti-extrusion washer, the packing set, and the packing ring.

CAUTION

The valve shaft surface condition is critical in making and maintaining a good seal. If the valve shaft surface is scratched, nicked, dented, or worn, replace the valve shaft before replacing the packing system.

5. Inspect the existing valve shaft. If necessary, replace the valve shaft as described in the Replacing the Disk, Shafts, or Bearings section.
6. Install the new packing system components as described in the ENVIRO-SEAL Packing System for Rotary Valves Instruction Manual ([D101643X012](#)). For NPS 3-8, two packing box rings (key 21) are used on the top and bottom of the packing set (see figures 8, 13, and 14 for details). For NPS 10-24, only one packing box ring (key 21) is used on the bottom of the packing set, at the end closest to the disk (see figure 15 for details).
7. Install the anti-blowout ring, if used (NPS 3-8) (key 23) onto the drive shaft (key 7) before installing the packing follower.
8. Mount the actuator and adjust the closed position of the valve, per the Actuator Mounting section on page 22 of this manual, before returning the valve to service.

Replacing the Seal Ring Assembly

Perform this procedure only if the control valve is not shutting off properly (that is, leaking downstream). This procedure does not require removing the actuator from the valve body.

Key numbers in this procedure are shown in figures 13, 14, and 15 unless otherwise indicated.

1. Isolate the control valve from line pressure, and relieve pressure from the valve body. Shut off and disconnect all lines from the power actuator.

⚠ WARNING

The edges of a rotating disk have a shearing effect that may result in personal injury. To help prevent such injury, stay clear of the disk edges when rotating the disk (key 6).

CAUTION

Damage to the disk (key 6) may occur if the disk is not closed when the valve is being removed from the pipeline. If necessary, apply operating pressure to the actuator temporarily to retain the disk in the closed position while removing the valve from the pipeline.

2. Unscrew the flange bolts, and remove the valve from the pipeline.
3. Rotate the disk 180° from the closed position per figure 10.
4. Unscrew the retainer screws (key 17) and remove the seal retainer (key 16).
5. Thread the retainer screws into the jack screw retainer holes to unseat the retainer. These threaded holes may be used to lift the retainer. The thread size is listed in table 9.
6. Remove the retainer gasket and clean the body gasket groove and retainer surface.
7. Remove the seal ring assembly (key 19).

Soft Seal Installation

1. Locate the replacement seal ring (key 19) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter as shown in figure 9. Around the outside circumference is one wide groove.

Before installing the seal ring into the valve body, the backup ring (key 20) must first be placed onto the wide, outer groove of the seal ring.

2. The seal ring and backup ring assembly must be installed in the valve. The wider outside diameter of the seal ring goes into the T-slot area of the valve body, shown in figure 9. Start the wider diameter edge of the seal ring into the T-slot of the valve body using a blunt end screwdriver.

Figure 9. Seal Installation Orientation

3. Carefully tuck the backup ring downward into the valve body T-slot until the seal ring and backup ring are completely entrapped in the valve body T-slot. Install the anti-extrusion ring per figure 2 (for NPS 3 only).
4. Place the retainer gasket (key 18) in the groove in the valve body.

CAUTION

The retainer gasket (key 18) is a thin graphite material. Take care to avoid damaging the gasket during handling.

- When the seal and gasket are seated, re-install the seal retainer (key 16) and screws (key 17). Tighten the retainer screws just enough to eliminate vertical movement of the seal retainer. With the use of the blunt end tool, carefully tuck the lip of the seal ring under the seal retainer.
- When the seal is under the lip of the seal retainer, tighten the screws according to table 9. Manually rotate the valve shaft clockwise 180° to return the disk to its closed position. Ensure these screws are tightened prior to installation.
- Be certain the disk is closed before installing the valve according to the Actuator Mounting section of this manual.

Metal Seal Installation

- With the disk in the closed position, place the seal ring (key 19) onto the disk (key 6). Set the retainer onto the seal, making sure proper alignment between the seal and retainer has been achieved. Install the anti-extrusion ring per figure 2 (for NPS 3 Phoenix III seal only).
- Place the retainer gasket (key 18) in the groove in the valve body.

CAUTION

The retainer gasket (key 18) is a thin graphite material. Take care to avoid damaging the gasket during handling.

- Attach the seal retainer (key 16) to the valve body and tighten the retainer screws (key 17). Tighten just enough to eliminate vertical movement of the retainer.
- Rotate the valve shaft 90° open/closed 3 times.
- With the disk in the closed position, tighten the retainer screws per table 9.
- Be certain the disk is closed before installing the valve according to the Actuator Mounting section of this manual.

Replacing the Disk, Shafts, or Bearings

Key numbers in this procedure are shown in figures 13, 14, and 15 unless otherwise indicated.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shutoff all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

CAUTION

When removing the actuator in the following step, use a wheel puller to separate the actuator parts from the valve shaft. Do not drive the actuator parts off the valve shaft because this could damage valve trim components.

2. Remove the actuator per instructions in separate actuator instruction manuals, then remove the cap screws (key 31). Remove the clamp (key 33, figure 7) if the strap (key 34, figure 7) is used.
3. Remove the packing flange nuts (key 27) and the packing flange (key 25) and pull out the packing follower (key 24 or 29).

Disassembly

1. Remove the seal ring assembly according to steps 3 through 7 of the Replacing Seal Ring Assembly section of this manual.
2. Remove hex nuts, blind flange, gasket, when used (keys 5, 2, and 3).
3. Clean the gasket surfaces on the blind flange (key 2) and on the end of the valve body (key 1).
4. Rotate the disk (key 6) 180 ° from the closed position, as shown in figure 10.
5. Remove shaft pins (key 9) from the disk. Pins can be removed by their internal thread tapping in table 11.

⚠ WARNING

Once the shafts have been removed in the following step, the disk may fall from the valve body. To avoid personal injury and disk damage, support the disk to prevent it from falling as the shafts are being removed.

6. Pull the follower shaft (key 8), when used, out through the outboard end of the valve body. If the follower shaft cannot be pulled free, the end of the follower shaft is internally threaded (see table 10) for screwing in a bolt or stud to aid in pulling the follower shaft.
7. Pull the drive shaft (key 7) out through the actuator end of the valve body and remove the anti-blowout ring, when used (key 23), from the drive shaft. The end of the shaft is internally threaded (shown in table 10) for screwing in a bolt or stud to aid in pulling the drive shaft.
8. Remove the disk (key 6) from the valve body through the side opposite the seal.
9. Remove the packing (key 22, figure 8) and the packing box ring (key 21, figure 8).
10. If any of the bearings (keys 14 and 15) require replacement, remove them.
11. Clean the packing box.

Assembly

⚠ WARNING

Do not lubricate bearings that will be used for oxygen service, or where the lubrication is incompatible with the process media. Any use of lubricant can lead to the sudden explosion of media due to the oil/oxygen mixture, causing personal injury or property damage.

Table 12. Required Blind Flange Bolt Torque

VALVE SIZE	STUD SIZE	STUD MATERIAL ⁽¹⁾			
		SA193 B8M CL2, SA193 B7M/NCF2, SA453 660, & SB164 N05500 Studs		N07718 Studs

24					

1. Stud and nut threads must be lubricated to achieve proper preload.

Figure 10. Disk Orientation for Pin Removal and Soft Seal Installation

CAUTION

To avoid possible product damage, ensure the NPS 3, 4, and 6 thrust bearings are oriented correctly when installing in the following procedure. See figure 11 for proper orientation of the thrust bearings.

Figure 11. Orientation of NPS 3, 4, and 6 Thrust Bearings

1. If new bearings (keys 14 and 15) are required, install them in the valve body. Install the journal bearings (key 14) before installing the thrust bearing (key 15). If installing a thrust bearing into NPS 3-6 valves, ensure the thrust bearing flat is oriented under the seal cavity, as shown in figure 9. If installing a NPS 8-24 thrust bearing, ensure the circular thrust bearing is fully seated in the body thrust bearing counterbore. For NPS 3-6 valves, three journal bearings (key 14 in figure 11) and two thrust bearings (key 15 in figure 11) are required per assembly. For NPS 8-24 valves, four journal bearings (key 14 in figures 12 and 13) and two thrust bearings (key 15 in figures 12 and 13) are required per assembly.
2. Insert the disk (key 6) into the valve body as shown in figure 10, ensuring the “T” stamped on the disk hub is oriented toward the actuator end of the valve body.
3. Install the drive shaft (key 7) and the follower shaft (key 8, when used) through the valve body and into the disk.
4. Align the holes in the shafts with the pin holes in the disk and drive the disk pins (key 9) into the disk. Once the pins are fully seated in the disk, use a punch or small chisel to stake the pins at three points.

CAUTION

To prevent the disk pin from sliding out during operation, ensure the staking operation deforms the disk pin hole diameter sufficiently.

5. Install the blind flange gasket, blind flange, and hex nuts (keys 2, 3, and 5). Ensure the blind flange is oriented so the serrations face the gasket and valve body. Tighten the hex nuts (key 5) per table 12.

CAUTION

Once the final preload torque is applied, do not loosen or remove the blind flange nuts (key 5). If nut removal is necessary, a new gasket is required.

Soft Seal Installation

1. Locate the replacement seal ring (key 19) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter as shown in figure 9. Around the outside circumference is one wide groove, as shown in figure 2.

Before installing the seal ring into the valve body, the backup ring (key 20) must first be placed onto the wide, outer groove of the seal ring. Rotate the disk 180° from closed before installing the seal ring (shown in figure 10).

2. The seal ring and backup ring assembly must be installed in the valve. The wider outside diameter of the seal ring goes into the T-slot area of the valve body, shown in figure 9. Start the wider diameter edge of the seal ring into the T-slot of the valve body using a blunt end screwdriver.
3. Carefully tuck the backup ring downward into the valve body T-slot until the seal ring and backup ring are completely entrapped in the valve body T-slot. If installing for NPS 3, install the anti-extrusion ring per figure 2.
4. Place the retainer gasket (key 18) in the groove in the valve body.
5. When the seal and gasket are seated, install the seal retainer (key 16) and screws (key 17). Tighten the retainer screws just enough to eliminate vertical movement of the seal retainer. With the use of the blunt end tool, carefully tuck the lip of the seal ring under the seal retainer.
6. When the seal is under the lip of the seal retainer, tighten the screws according to table 9. Manually rotate the valve shaft clockwise 180° to return the disk to its closed position.

Figure 12. Sectional of Typical Valve Body

Metal Seal Installation

1. With the disk in the closed position, place the seal ring (key 19) onto the disk (key 6). Set the retainer (key 16) onto the seal, making sure proper alignment between the seal and retainer has been achieved.

2. Place the retainer gasket (key 18) in the groove in the valve body.
3. Attach the seal retainer (key 16) to the valve body and tighten the retainer screws (key 17) just enough to eliminate the vertical movement of the retainer.
4. Rotate the valve shaft 90° open/closed 3 times.
5. Tighten the retainer screws per table 9.
6. Be certain the disk is closed before installing the valve according to the Actuator Installation section of this manual.

General Valve Assembly

7. For **standard packing**, install the packing according to the appropriate instructions presented in step 5 of the Replacing Packing section of this manual.
For **ENVIRO-SEAL packing**, install the new packing system components as described in the ENVIRO-SEAL Packing System for Rotary Valves Instruction Manual ([D101643X012](#)).
8. Install the anti-blowout ring (key 23) when used, in the groove in the drive shaft.

Actuator Mounting

With the valve body out of the line, mount the actuator on the valve body in accordance with the instructions in the actuator instruction manual. Mount the actuator yoke to the valve body, and tighten the actuator-mounting cap screws (key 31) to the appropriate torque from table 13.

Table 13. Required Actuator-Mounting Bolt Torque

VALVE SIZE NPS	SCREW SIZE Inch	SAE J429 GRADE 5/NCF3 ⁽¹⁾	
		N•m	lbf•ft.

16			
18	1-1/4 - 8	1491	1100
20			
24			

1. Screws must be lubricated to achieve proper preload.

CAUTION

CL600 Control-Disk valve disk rotation is counterclockwise to open (when viewed from the actuator side of the valve body, see figure 12). Rotating the disk (key 6) past the fully closed position will damage the seal ring (key 18).

Adjusting the Valve Closed Position

Adjust the actuator to bring the disk to the fully closed position at the end of the actuator stroke. To determine the fully closed disk position, measure the distances between the disk face and the seal retainer face at the top and bottom of the valve (X1 and X2) as shown in figure 12. Adjust the travel stops or turnbuckle to rotate the disk slightly until the two measurements are equal, but are allowed to be within 0.25 mm (0.010 inch) of each other. Refer to the appropriate actuator instruction manual for assistance.

Parts Ordering

When corresponding with your [Emerson sales office](#) about this equipment, always mention the valve serial number. When ordering replacement parts, also specify the key number, part name, desired material, using the Parts List.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts Kits

Retrofit Kits for ENVIRO-SEAL Packing

Retrofit kits are available for replacing the packing in an existing valve with an ENVIRO-SEAL packing system. These kits are available for single PTFE or graphite packing. All parts required for installation of the ENVIRO-SEAL packing system into an existing CL600 Control-Disk valve are included in the kits.

Worn shafts, packing box damage, or other components that do not meet Emerson finish specifications, dimensional tolerances, and design specifications, may adversely alter the performance of the retrofit kit.

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts ordering information for NPS 14 through 36, CL150-300 Control-Disk High-Performance Butterfly Valves (see figure 1). Refer to separate instruction manuals for information covering the actuator and accessories.

Do not install, operate, or maintain A31A valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Unless otherwise noted, all NACE references are to NACE MR0175-2002.

Table 1. Specifications

Valve Size and End Connection Styles ■ NPS 14, ■ 16, ■ 18, ■ 20, ■ 24, ■ 30, or ■ 36 valves, in ■ wafer-style (flangeless) or ■ single-flange (lugged) with raised-face flanges, CL150 or CL300 Maximum Pressure Drop⁽¹⁾ Consistent with CL150 and CL300 pressure/temperature ratings per ASME B16.34. Fire Tested per API 607 Rev. 4. For cryogenic seal applications, consult your Emerson sales office. Available Seal Configurations Standard Constructions See figure 2 and table 2 Standard Construction Materials See table 2 Flow Characteristic Equal percentage Flow Coefficients Contact your Emerson sales office	Flow Coefficient Ratio⁽²⁾ 100 to 1 Noise Levels See Catalog 12 for sound/pressure level prediction Valve In-Line Position Shaft horizontal. See figure 4 Valve/Actuator Action With diaphragm or piston rotary actuator, field-reversible between: ■ push-down-to-close (extending actuator rod closes valve) and ■ push-down-to-open (extending actuator rod opens valve) Valve Body Classification NPS 14 to 24: Face-to-face dimensions are in compliance with MSS SP68 and API 609 standards. Valve bodies are designed for installation between ASME B16.5 CL150 and CL300 raised-face flanges NPS 30 to 36: Valve bodies are designed for installation between ASME B16.47 CL150 and CL300 raised-face flanges Disk Rotation Clockwise to close (when viewing from the drive shaft end) through 90 degrees rotation Shaft Diameter and Approximate Weight See tables 3 and 4 ENVIRO-SEAL™ Packing This optional packing system provides improved sealing, guiding, and transmission of loading force to control liquid and gas emissions. Contact your Emerson sales office for availability of ENVIRO-SEAL packing
--	--

1. The pressure/temperature limits in this manual, and any applicable code or standard limitation should not be exceeded.

2. Ratio of maximum flow coefficient to minimum usable flow coefficient may also be called rangeability.

Description

The valve is available in either a flangeless wafer body or a single-flange (lugged) body design, with a variety of seals and internal components. The pressure-assisted seal provides tight shutoff. The upper (splined) shaft combines with a variety of pneumatic piston or spring-and-diaphragm actuators. Maximum inlet pressure/temperature ratings are consistent with CL150 and CL300.

1. NACE trim constructions are available; consult your [Emerson sales office](#).

2. PEEK stands for poly-ether-ether-ketone.

3. For a complete material description, contact your Emerson sales office.

4. UHMWPE stands for ultra high molecular weight polyethylene.

5. Cast or wrought /plate grades used interchangeably, depending upon availability - unless specified by customer.

6. Seal rated for CL150 pressures. For fully rated CL300 seal rating, use NOVEX S21800 seal ring.

1. NACE trim constructions are available; consult your [Emerson sales office](#).

2. PEEK stands for poly-ether-ether-ketone.

3. For a complete material description, contact your Emerson sales office.

4. UHMWPE stands for ultra high molecular weight polyethylene.

5. Cast or wrought / plate grades used interchangeably, depending upon availability - unless specified by customer.

6. Seal rated for CL150 pressures. For fully rated CL300 seal rating, use NOVEX S21800 seal ring.

Installation

The valve is normally shipped as part of a control valve assembly, with the power actuator mounted on the valve. If the valve or actuator has been purchased separately, or if the actuator has been removed for maintenance, mount the actuator on the valve, and adjust actuator travel before installing the valve into the line. This is necessary due to the measurements that must be made during the actuator calibration adjustment process. Refer to the Actuator Mounting section of this manual and to the separate actuator instruction manual for mounting and adjusting instructions before proceeding.

⚠ WARNING

To avoid personal injury or property damage resulting from the sudden release of pressure:

- Always wear protective gloves, clothing, and eyewear when performing any maintenance operation.
- Do not install the valve assembly where service conditions could exceed the limits given in this manual or on the nameplates.
- Use pressure-relieving devices as required by government or accepted industry codes and good engineering practices to protect from over-pressurizing the system.
- Check with your process or safety engineer for any other hazards that may be present from exposure to process media.
- If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions indicated when the valve was ordered. Because some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, shut off all pressure lines to the power actuator, release pressure from the actuator, and disconnect the pressure lines from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you are working on the equipment.

See the WARNING at the beginning of the Maintenance section for more information before removing the valve from the pipeline.

2. Install a three-valve bypass around the control valve assembly if continuous operation is necessary during inspection and maintenance of the valve.
3. Inspect the valve to be certain that it is free of foreign material.
4. Be certain that adjacent pipelines are free of any foreign material, such as pipe scale or welding slag, that could damage the valve sealing surfaces.

NOTICE

Damage to the disk will occur if any pipe flanges or piping connected to the valve interfere with the disk rotation path. If the piping flange has a smaller inner diameter than specified for schedule 80 piping, measure carefully to be certain the disk rotates without interference before placing the valve into operation. Minimum inside diameters for flanges or pipe mating with valves are shown in tables 3 and 4.

Valve Orientation

The valve can be installed in any orientation, however it is recommended that the valve drive shaft be horizontal and the actuator vertical as shown in figure 4.

Install the valve with the high-pressure shutoff side in the direction noted by the flow arrow for proper installation, and see figure 4 for more information.

Control-Disk NPS 14-36

April 2023

Before Installing the Valve

⚠ WARNING

The edges of a rotating valve disk (key 2, figure 9) close with a shearing, cutting motion. To avoid personal injury, keep hands, tools, and other objects away from the disk while stroking the valve.

If the Control-Disk valve is equipped with a fail-open actuator, cycle the valve into the fully closed position. Ensure the valve cannot open during installation by using a manual actuator, a constant supply pressure to the pneumatic actuator, or other steps as necessary.

Table 3. Valve Body Data, CL150

30	(3)	6.25	28.5	1380	1820
36	(3)	7.00	34.5	2060	2750

1. NPS 14 to 24 face-to-face dimensions are in compliance with MSS SP68 and API 609 specifications.
2. Minimum I.D. is the minimum pipe or flange I.D. required for disk swing clearance.
3. Contact your [Emerson sales office](#) for information.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Control-Disk NPS 14-36

April 2023

Instruction Manual

D103545X012

Table 4. Valve Body Data, CL300

VALVE SIZE, NPS	SHAFT DIAMETER AT ACTUATOR YOKE	FACE-TO-FACE DIMENSION ⁽¹⁾	MINIMUM I.D. ⁽²⁾	APPROXIMATE WEIGHT, KILOGRAMS	
				Wafer	Single-Flange
		mm			
14	44.5	118	304.3	143	249
16	44.5	133	346.2	203	314
18	57.2	149	389.4	253	427
20	76.2	156	442.0	388	568
24	88.9	181	523.2	501	853
30	(3)	241	670.6	1070	1520
36	(3)	273	828.0	1470	2150
VALVE SIZE, NPS	SHAFT DIAMETER AT ACTUATOR YOKE	FACE-TO-FACE DIMENSION ⁽¹⁾	MINIMUM I.D. ⁽²⁾	APPROXIMATE WEIGHT, POUNDS	
				Wafer	Single-Flange
		Inches			
14	1.75	4.63	11.98	315	549
16	1.75	5.25	13.63	447	693
18	2.25	5.88	15.32	558	941
20	3.00	6.13	17.40	855	1250
24	3.50	7.13	20.59	1110	1880
30	(3)	9.50	26.4	2360	3360
36	(3)	10.8	32.6	3240	4730
1. Face-to-face dimensions are in compliance with MSS SP68 and API 609 specifications. 2. Minimum I.D. is the minimum pipe or flange I.D. required for disk swing clearance. 3. Contact your Emerson sales office for information.					

A Control-Disk valve is normally shipped as part of an assembly with an actuator and other accessories such as a valve positioner. If the valve and actuator have been purchased separately or if the actuator has been removed for maintenance, properly mount the actuator and adjust valve/actuator travel before inserting the valve into the line.

NOTICE

Damage to the disk will occur if any pipe flanges or piping connected to the valve interfere with the disk rotation path. Be certain to align the valve accurately to avoid contact between the disk (key 2) and the flanges.

Figure 2. Available Seal Configurations

B2313-3

NOTES:

- 1 THIS UNIDIRECTIONAL SEAL MUST BE INSTALLED SO THAT THE RETAINING RING IS DOWNSTREAM FROM THE HIGH PRESSURE SIDE OF THE VALVE AT SHUTOFF, AS SHOWN.
- 2 FOR THIS BIDIRECTIONAL SEAL, THE "PREFERRED" VALVE ORIENTATION PLACES THE RETAINING RING DOWNSTREAM FROM THE HIGH PRESSURE SIDE OF THE VALVE AT SHUTOFF.

Adjusting the Actuator Travel

Key number locations are shown in figure 9, unless otherwise noted.

1. Adjust the actuator to bring the disk to the fully closed position at the end of the actuator stroke. To determine the fully closed disk position, measure the distances between the disk face and the seal retainer face at the top and bottom of the valve (X1 and X2) as shown in figure 3. Adjust the actuator to rotate the disk slightly until the two measurements are within 0.8 mm (0.032 inch) of each other. Refer to the appropriate actuator instruction manual for assistance.
2. Before installing the valve/actuator assembly in the process line, cycle the valve several times to be sure the valve disk returns to the proper position.

Figure 3. Sectional of Typical Valve Body

GES3027-A

Installing the Valve

The maximum allowable inlet pressures for Control-Disk valves are consistent with the applicable ASME pressure/temperature ratings except where limited by the material capabilities as shown in table 2 or figure 2.

Refer to table 5 for the quantity and size of line bolting required to install the valve in the pipeline.

NOTICE

To avoid damage to the valve disk during installation, the valve must be in the fully closed position. If the Control-Disk valve is equipped with a fail-open actuator, remove the actuator before installing the valve/actuator assembly or cycle the valve into the fully closed position. Then, take appropriate steps to be sure that the actuator does not cause the valve to open during installation.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

30	56	56	---	---	1-1/4-8	1-3/4-8	4.5	5.75	---	---
36	64	64	---	---	1-1/2-8	2-8	5.25	6.5	---	---
1. Thread engagement in accordance with ASME B31.3 "Chemical Plant and Petroleum Refinery Piping". 2. Bolting lengths are based on installation of valve between standard raised face flanges and utilizing flange gaskets with a final compression thickness of 0.125 inch. When gaskets used have a final compression thickness of less than 0.125 inch, reduce bolting lengths shown by 0.25 inch.										

Figure 4. Installation of Wafer-Style Valves

A5557

1. See figure 4 for recommended valve orientation.

- For Wafer-Style Valves: Install the lower flange bolts first to form a cradle for the valve (see figure 5). See table 5 for flange bolt specifications.
 - For Single-Flange Valves: Position the valve between the flanges. Be sure to leave enough room for the flange gaskets. Install the lower flange bolts.
2. For all Valves: Select the appropriate gaskets for the application. Flat sheet, spiral wound, or other gasket types, made to the ASME B16.5 standard or user's standard, can be used on Control-Disk valves depending on the service conditions of the application.

Figure 5. Proper Installation Steps

82263-1

3. For Wafer-Style Valves: Properly orient the valve according to the specific application. Place the valve in the line so the flow properly enters the valve as indicated by the flow tag. Then, install the valve and the gaskets between the flanges into the cradle formed by the flange bolts.
4. Install the remaining flange bolts.
 - For Wafer-Style Valves: Make sure the gaskets are centered on the gasket sealing surfaces of the flange and body.
5. For all Valves: Tighten the flange bolts in an alternating criss-cross fashion to a torque value of one-fourth of the final bolting torque. Repeat this procedure several times, increasing the torque value each time by a fourth of the final desired torque. After applying the final torque value, tighten each flange bolt again to allow for gasket compression.

Packing Adjustment and Shaft Bonding

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any other hazards that may be present from exposure to process media.

Figure 6. Optional Shaft-to-Valve Body Bonding Strap Assembly

NOTICE

For non-ENVIRO-SEAL packing: Tighten the packing follower nuts only enough to prevent shaft leakage. Excessive tightening will accelerate wear of the packing and could produce higher friction loads on the valve stem.

1. For PTFE or graphite packing: Tighten standard packing follower nuts only enough to prevent shaft leakage. Excessive tightening of packing will accelerate wear and could produce higher rotating friction loads on the valve stem. If necessary, refer to the Packing Maintenance section.
2. The ENVIRO-SEAL Packing Systems will not require this initial re-adjustment. Refer to the separate instruction manual ENVIRO-SEAL Packing System for Rotary Valves, [D101643X012](#), for repair and adjustment procedures.
3. For hazardous atmosphere or oxygen service valves, read the following Warning, and provide the bonding strap assembly mentioned below if the valve is used in an explosive atmosphere.

⚠ WARNING

The valve shaft is not necessarily grounded when installed in a pipeline unless the shaft is electrically bonded to the valve.

To avoid personal injury or property damage resulting from the effects of a static electricity discharge from valve components in a hazardous atmosphere or where the process fluid is combustible, electrically bond the drive shaft (key 3) to the valve according to the following step.

Note

Standard PTFE packing is composed of a partially conductive carbon-filled PTFE female adaptor with PTFE V-ring packing. Standard graphite packing is composed of all conductive graphite ribbon packing. Alternate shaft-to-valve body bonding is available for hazardous service areas where the standard packing is not sufficient to bond the shaft to the valve (see the following step).

For oxygen service applications, provide alternate shaft-to-valve body bonding according to the following step.

4. Attach the bonding strap assembly (key 131, figure 6) to the shaft with the clamp (key 130, figure 6).

5. Connect the other end of the bonding strap assembly to the valve flange cap screws.
6. For more information, refer to the Packing Maintenance section below.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

Key numbers in this procedure are shown in figure 9 unless otherwise indicated.

⚠ WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure.
- Use lockout procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any other hazards that may be present from exposure to process media.

Removing and Replacing the Actuator

Refer to the appropriate actuator instruction manual for actuator removal and replacement procedures.

Packing Maintenance

The Control-Disk valve is designed so the packing can be replaced without removing the valve from the process pipeline.

NOTICE

For non-ENVIRO-SEAL packing: Tighten the packing follower nuts only enough to prevent shaft leakage. Excessive tightening will accelerate wear of the packing and could produce higher friction loads on the valve stem.

Usually, packing leakage can be eliminated by merely tightening the hex nuts (key 15) located above the packing follower (key 11) while the valve is in the pipeline. However, if leakage continues, the packing must be replaced.

For PTFE ENVIRO-SEAL packing systems, refer to the separate instruction manual, ENVIRO-SEAL Packing System for Rotary Valves, [D101643X012](#), (see figure 10).

Figure 7. Anti-Blowout Design Details

⚠ WARNING

Never use a wrench or pliers on the splined (upper) shaft (key 3). A damaged shaft could cut the packing and allow leakage.

1. Before loosening any parts on the valve, release the pressure from the pipeline. Then, remove the hex nuts (key 15) and lift off the packing follower (key 11).
2. Remove the hex jam nuts (key 17) and the anti-blowout flange (key 10). Remove the packing follower (key 12). Refer to figure 7 for details of the anti-blowout design parts.

The packing is now accessible.

3. Use a packing extractor to remove packing. Insert the corkscrew-like end of the tool into the first piece of packing and pull firmly to remove the packing. Repeat this process until all packing parts have been removed.

⚠ WARNING

Be careful when cleaning the packing box. Scratches to the upper shaft (key 3) or inside diameter of the packing bore might cause leakage.

4. Before installing new packing, clean the packing box.
5. Install new packing one ring at a time, using the packing follower as a driver. If using split-ring packing, stagger the splits in the rings to avoid creating a leak path.
6. Reinstall packing parts. Refer to figure 9 for sequence of packing parts.

Removing the Valve

1. Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open the valve. Vent the power actuator loading pressure.
2. Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from either side of the valve.

NOTICE

Damage to the valve disk can occur if the disk is not closed when the valve is being removed from the pipeline. If necessary, stroke the actuator to place the disk in the closed position while removing the valve from the pipeline.

3. Loosen the flange bolting that holds the valve. Make sure the valve cannot slip or twist while loosening and removing the bolting.
4. Before removing the valve from the pipeline, make sure the valve disk is closed. Removing the valve with the disk open could cause damage to the disk, piping, or pipe flanges.
5. After removing the valve from the pipeline, move the valve to an appropriate work area. Always support the valve properly.
6. When valve maintenance is complete, refer to the Installation procedures in this manual.

Seal Maintenance

Note

For larger valves, it is possible to replace the seal (key 5) while the actuator is mounted to the valve and can be accomplished by cycling the valve to 90 degrees open.

Key numbers in this procedure are shown in figure 9 unless otherwise indicated.

1. After removing the valve from the pipeline, remove the manual or power actuator. Manually rotate the upper shaft (key 3) counterclockwise until the disk has moved a full 180 degrees away from the closed position.

⚠ WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping of a large valve. Support large valves during maintenance.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D103545X012

Control-Disk NPS 14-36

April 2023

2. Lay the valve flat on a work bench in a secure position with the retaining ring (key 18) and retaining ring screws (key 19) facing up. Properly secure the valve on a suitable worktable so it cannot slip, twist, or fall during maintenance. Remove all retaining ring screws.
3. Remove the retaining ring by placing a socket head cap screw from the retaining ring in each of the two retaining ring jacking screw holes. Slowly turn the screws until the retaining ring has been lifted from the valve body. Remove the retaining ring to expose the seal in the T-slot area of the valve body.

Note

The Control-Disk valve is available with different seal designs and components. See figure 2 to identify the specific seal design.

NOTICE

In the following procedure, take care not to damage the seal or T-slot area of the valve body during removal of the seal.

4. Insert a regular screwdriver or other similar tool under the top edge of the seal and gently pry the seal out of the T-slot area in the valve body. Take care not to damage the seal or T-slot area of the valve body. After the seal has been removed, clean the T-slot area, retaining ring and, if required, polish the disk (key 2) thoroughly with fine steel wool or other appropriate material.

To install a new seal, O-ring (key 6), and retaining ring gasket, follow the appropriate instructions given below.

Table 6. Torque Values for Fasteners

FASTENER NOMINAL SIZE	RETAINING RING SCREWS		GASKET RETAINING BOLTS	
	N•m	lbf•ft	N•m	lbf•ft
#10	4.6	41	4.0	35
1/4	11	100	9.2	81
5/16	25	220	19	167
3/8	45	400	33	295
	N•m	ft•lbf	N•m	ft•lbf
7/16	72	53	53	39
1/2	112	83	80	59
9/16	161	119	117	86
5/8	225	166	161	119
3/4	401	296	286	210
7/8	651	480	447	330
1	976	720	651	480
1-1/8	1356	1000	837	617

Note: These values are based upon standard materials, S66286/N07718 screws and ASTM A193GRB6 bolts. For other special fastener materials, please contact your Emerson sales office.

PTFE Seals

1. Locate the replacement seal ring (key 5) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter. Around the outside circumference is one wide groove.

Before installing the seal ring into the valve body, place the O-ring (key 6) into the wide, outer groove of the seal ring. Refer to figure 8.

2. Install the seal ring and O-ring assembly in the valve body. The wider outside diameter of the seal ring goes into the T-slot area of the body (see figure 5). Start the edge with the wider diameter into the T-slot of the valve body using a blunt-end screwdriver.

Figure 8. Typical Seal Installation

3. Carefully tuck the O-ring downward into the body T-slot until the seal ring is completely entrapped in the body T-slot, and it completely covers the backup O-ring.
4. Re-install the retaining ring and the socket head cap screws. Tighten the cap screws just enough to eliminate any movement of the retaining ring. Do not over-tighten the retaining ring screws. Using a blunt-end tool, carefully tuck the lip of the seal ring under the retaining ring.
5. When the seal is under the lip of the retaining ring, continue to tighten the cap screws according to standard procedures. Do not fully torque the screws at this time. Final tightening of the screws is accomplished in step 7 of this procedure.
6. Manually rotate the upper shaft clockwise 180 degrees to return the disk (key 2) to its closed position.
7. The final seating of the retaining ring cap screws can now be done. For the screw torque values, refer to table 6. The seal is now fully installed. Refer to the Installation procedures in this manual.

NOVEX, Phoenix III and/or Phoenix III Fire-Tested Seals

1. Locate the replacement seal ring (key 5) and note the shape of the ring. The ring is wider across one edge diameter and narrower across the other edge diameter as shown in figure 8. Around the outside circumference is one wide groove.

Install the seal ring (key 5) in the valve body by first placing the wider outside diameter of the seal ring into the T-slot area of the valve body which is shown in figure 2.

The backup O-ring (key 6) for the Phoenix III seal will have to be installed after placement of the seal ring in the valve body using a blunt-end screwdriver. Do not use the screwdriver directly on the metal seat. Use tools on the O-ring only.

2. With the seal ring inserted all the way around the body T-slot now lay the O-ring into the opening between the valve body and the seal ring. Use the screwdriver to apply pressure to the O-ring and carefully tuck the O-ring down into the T-slot between the valve body and the seal ring.

Note

On larger valves, it may be more efficient to have someone hold down the seal ring while you push the O-ring into the T-slot.

3. Once the seal ring and backup O-ring have been fully installed into the body T-slot, the retaining ring gasket can be installed. This gasket is a thin graphite material. Punch one initial screw hole through the gasket for alignment, being careful not to cause additional damage to the gasket.
4. Install the retaining ring and align the screw holes in the retaining ring with the holes in the valve body. Install the first retaining ring screw through the punched hole in the ring gasket. Install the other ring screws by pushing the screws through the graphite gasket and threading them into the valve body.
5. Tighten the retaining ring socket head cap screws just enough to eliminate any movement of the retaining ring. Do not over-tighten the retaining ring screws.

WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping of a large valve. Support large valves during maintenance.

6. To complete this step, stand the valve up. Support the valve securely using methods appropriate for the valve size. If a vise or other clamps are being used, be sure to not damage the flange gasket sealing area of the valve body.
7. Manually rotate the upper shaft (key 3) to turn the disk clockwise to meet the seal.
8. Adjust the actuator to bring the disk to the fully closed position at the end of the actuator stroke. To determine the fully closed disk position, measure the distances between the disk face and the seal retainer face at the top and bottom of the valve (X1 and X2) as shown in figure 3. Adjust the actuator to rotate the disk slightly until the two measurements are within 0.8 mm (0.032 inch) of each other. Refer to the appropriate actuator instruction manual for assistance.
9. The final seating of the retaining ring screws can now be done. For the screw torque values, refer to table 6.

Anti-Blowout Design, Packing, Valve Shaft, Disk, and Bearing Maintenance

Note

The Control-Disk valve has a two-piece shaft. In these procedures, the shaft (with the splined end) is called the upper shaft (key 3). The shaft opposite the upper shaft is called the lower (follower) shaft (key 4).

NOTICE

When removing the actuator from the valve, do not use a hammer or similar tool to drive the lever off the valve shaft. Driving the lever or actuator off the valve shaft could damage the valve internal parts.

If necessary, use a wheel puller to remove the lever or actuator from the valve shaft. It is okay to tap the wheel puller screw lightly to loosen the lever or actuator, but hitting the screw with excessive force could also damage internal valve parts.

Key numbers in this procedure are shown in figure 9 unless otherwise indicated.

1. Remove the valve from the pipeline. Remove the actuator from the valve.

⚠ WARNING

Never use a wrench, pliers, or similar tool to turn the upper shaft. A damaged shaft can cut the packing and allow leakage.

Note

It is not necessary to remove the retaining ring and valve seal when removing the shaft(s) and disk.

⚠ WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping of a large valve. Support large valves during maintenance.

2. Properly secure the valve on a suitable worktable so it cannot slip, twist, or fall during maintenance.
3. Removing the Anti-Blowout Design:
 - a. **For PTFE or Graphite Packing:** Remove the hex nuts (key 15) and pull off the packing follower (key 11). Remove the hex jam nuts (key 17) and the anti-blowout flange (key 10). Remove the anti-blowout gland (key 12). See figure 7.
 - b. **For ENVIRO-SEAL Packing System:** Remove the hex nuts (key 101), the packing follower (key 102), jam nuts (key 17), anti-blowout flange (key 10), and the spring pack assembly (key 103). See figure 10.
4. Remove the packing from around the upper shaft.
5. Remove the tangential pins or disk pins. Locate the pins (key 9) in the upper shaft (key 3) and the pin in the lower shaft (key 4), if the valve has a two-piece shaft.
 - a. If a maintenance kit is available, use the pin extractor to remove the disk pins. Select the correct size pin extractor tip with screws of proper thread size to match the thread size in the disk pins. If you do not have a kit, see steps c and d below.
 - b. Screw the pin extractor tip into the pin as far as possible. With an upward, straight sliding motion, pull out the pin. Repeat the same procedure for the other pins.
 - c. You can use a threaded rod with an appropriate spacer (tube) and nut as an extractor tool. If you use a threaded rod, choose a rod with threads that fit the inside thread of the pins. The rod should extend several inches above the disk when it is screwed into a pin.

- d. After screwing the rod into the pin, slide the spacer over the rod and pin. Thread a nut onto the rod and tighten it. As you tighten the nut, the nut will drive the spacer against the disk. The increasing force will draw the pin from the disk.
6. The gasket retainer (key 20) on the side of the valve opposite the upper shaft must be removed before removing the lower shaft.

Remove the hex head bolts (key 23) and lockwashers (key 22) from the gasket retainer and remove the gasket retainer and gasket (key 21) to expose the end of the lower shaft.

7. Before removing the lower shaft (key 4), be sure the valve disk is properly supported. Pull the lower shaft from the valve body. Use a shaft extractor screwed into the puller hole in the end of the lower shaft.
8. Before removing the upper shaft (key 3), be sure the valve disk is properly supported. Pull out the upper shaft (key 3) by hand-pulling or by using a shaft extractor screwed into the end of the shaft.

NOTICE

To avoid damage to the disk, seal, and T-slot area, do not force the disk past the seal or T-slot area. Remove the disk from the opposite side of the valve body.

Note

Both the upper shaft and the lower shaft have a thrust bearing (key 24) between the disk and the bearings (key 7). The thrust bearing is located outside of the bearing bore which holds the bearings. Use care when removing the valve disk to avoid loss of or damage to the thrust bearings.

9. After removing the shaft(s), remove the disk. Do not force the disk past the seal or T-slot area. Collect the thrust bearings.
10. Remove the bearings (key 7). Using a suitable punch or puller, drive or pull the bearings into the valve body bore from the upper shaft bearing bore. Remove the bearing from the lower shaft bearing bore.
11. Inspect the valve body bore, bearings, bearing bores, and packing box for damage.

Note

In these instructions, the drive shaft (with splined end) is called the upper shaft (key 3). The shaft opposite the upper shaft is called the lower (follower) shaft (key 4).

Installing the Two-Piece Shaft

Key numbers in this procedure are shown in figure 9 unless otherwise indicated.

⚠ WARNING

Avoid personal injury or property damage caused by the impact of a falling or tipping of a large valve. Support large valves during maintenance.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Control-Disk NPS 14-36

April 2023

Instruction Manual

D103545X012

1. Properly secure the valve on a suitable worktable so it cannot slip, twist, or fall during maintenance. Be prepared to support the valve disk.

Note

Replacement disk and shafts are provided as a matched set and both should be replaced at the same time.

2. Inspect all parts removed from the valve for wear or damage. Replace any worn or damaged parts. Clean the valve body and all parts to be installed with an appropriate solvent or degreaser.

Note

When installing the bearings, apply lubricant to the outside diameter of the bearing for ease of installation.

NOTICE

Premature valve failure and loss of process control may result if bearings are improperly installed or are damaged during installation.

3. When installing the lower bearings (key 4), insert one or more bearings into the lower shaft bearing bore so it is flush with the body bore.

The number of bearings required changes with valve size and construction. Two bearings are required in the upper shaft and two bearings in the lower shaft. If using an NPS 14 CL150 valve with metal bearings, four bearings in the upper and four in the lower shaft will be required.

4. Hold the lower shaft thrust bearing (key 24) in the valve body bore against the counterbore of the lower shaft bearing bore. Push the lower shaft into the bearing bore just enough to hold the thrust bearing.
5. When installing the upper bearing (key 7), insert one or more bearings into the upper shaft from the body bore into the bearing bore below the packing box. Use caution to prevent damage to the bearing.
6. Hold the upper shaft thrust bearing (key 24) in the valve body bore against the counterbore of the upper shaft bearing bore. Push the upper shaft through the packing box side into the bearing bore just enough to hold the thrust bearing.
7. When installing the lower bearing (key 4), insert one or more bearings into the lower shaft bearing bore so it is flush with the body bore.
8. Insert the lower shaft through the bore in the valve body uncovered by removal of the gasket retainer. Hold the lower shaft thrust bearing (key 24) in the valve body bore against the counterbore of the lower shaft bearing bore. Push the lower shaft into the bearing bore just enough to hold the thrust bearing.

NOTICE

To avoid damage to the disk, seal, and T-slot area, do not force the disk past the seal or T-slot area. Install the disk from the opposite side of the valve body.

9. Place the flat side of the disk on a flat surface and insert wooden blocks to raise the disk approximately 51 mm (2 inches) from the worktable surface. Then, suspend the valve body over the disk so the seal/T-slot area is facing up. Align the shaft bores through the disk with the upper shaft and lower shaft bores. Lower the valve body over the disk using caution not to dislodge or damage the thrust bearings placed on the ends of the shafts.
10. With the disk (key 2) properly positioned in the valve body (key 1), push the upper shaft and lower shaft the rest of the way through the thrust bearings and into the shaft bores in the valve disk.
11. Align the holes in the shafts with the holes in the disk.

NOTICE

To avoid damage to the tangential pins, disk pins, valve disk, or shaft(s) resulting from the application of excessive force, use appropriate care when driving the pins into the disk hub and shaft(s). Use the right tool. Do not use excessive force.

12. Install the appropriate tangential pins, and disk pins. Use 2 tangential pins that will go through the upper shaft and 1 disk pin that will go through the lower shaft.
13. Refer to the Anti-Blowout Design, Packing, Valve Shaft, Disk and Bearing Maintenance procedures in this manual to re-install the packing and anti-blowout design.

Gasket Retainer

Valves with a two-piece shaft use a gasket retainer and gasket (keys 20 and 21) to cover the lower shaft opening in the valve body. The gasket is held in place by the gasket retainer and four hex head bolts and lockwashers (keys 23 and 22). When re-assembling the valve, use a new gasket.

Be sure to center the gasket over the lower shaft bore before retightening bolts. Tighten down bolts evenly in a crossover or star pattern.

Refer to table 6 for proper torque values.

Parts Ordering

Typical parts are shown in figure 9.

When corresponding with your [Emerson sales office](#) about a Control-Disk valve, identify the valve as a Control-Disk and provide the valve serial number. For valve/actuator combinations assembled at the factory, the valve serial number is stamped on the nameplate attached to the actuator.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Retrofit Kits

Retrofit kits include all parts required for installation of the ENVIRO-SEAL packing system into existing high-performance butterfly valves. Retrofit kits are available for single PTFE packing.

See table 7 for retrofit kit part numbers.

Retrofit Kit Included Parts		
Key	Description	Quantity
10	Anti-blowout follower	1
17	Jam nut	1
100	Packing stud	2
101	Packing nut	2
102	Packing flange	1
103	Spring pack assembly	1
105	Packing Set	1
106	Anti-extrusion washer	2 ⁽¹⁾
107	Packing box ring	2 ⁽²⁾
111	Tag	1
112	Cable	1

1. Not included in graphite packing kit.
2. Only 1 req'd for NPS 18 CL300, NPS 20 CL150 and NPS 24 CL150.

Note: Key 103, the spring pack assembly, is made up of the packing spring stack held in place by an O-ring on the packing follower.

Repair Kits

PTFE Repair kits include a single PTFE packing set and anti-extrusion washers. Graphite packing sets include graphite packing rings and carbon anti-extrusion rings. See table 7 for PTFE repair kit part numbers.

Table 7. Retrofit and Repair Kit Part Numbers

VALVE SIZE, NPS	PRESSURE RATING	SHAFT DIAMETER ⁽¹⁾⁽²⁾ , mm (Inch)	RETROFIT KITS	REPAIR KITS
			PTFE	PTFE
14	CL150	34.9 (1-3/8)	RRTYXRT0592	RRTYX000172
	CL300	50.8 (2)	RRTYXRT0602	RRTYX000182

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for the Fisher Control-Disk valve, DN50 through DN300 or NPS 2 through NPS 12 (figure 1). Refer to separate instruction manuals for information covering the power on-off actuator and accessories. Do not install, operate, or maintain a Control-Disk valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

The Control-Disk rotary valve offers excellent throttling performance. An equal percentage flow characteristic provides an improved throttling range comparable to that of a segmented ball valve. This improved capability allows you to control closer to the target set point, regardless of process disturbances, which results in a reduction in process variability.

Retainer clips provide for versatility to mount and align the same wafer style valve body in different piping configurations (ASME and EN ratings). The valve body is compatible with PN 10 through PN 40, CL150, and CL300 ratings. Face-to-face dimensions meet EN 558, API 609, and MSS-SP68 standards. The Control-Disk rotary valve features an eccentrically-mounted disk with either soft or metal seal, providing capability for enhanced shutoff. The interchangeable sealing technology allows for the same valve body to accept both soft and metal seals.

Table 1. Fisher Control-Disk Valve Specifications

Specifications		EN	ASME
Valve Body Size		DN 50, 80, 100, 150, 200, 250, and 300	NPS 2, 3, 4, 6, 8, 10, and 12
Pressure Rating		PN 10 to 40 per EN 12516-1	CL150 and 300 per ASME B16.34 (CL600 for NPS 2)
Valve Body Materials		EN 1.0619 steel	WCC steel
		EN 1.4409 stainless steel	CF3M (316L) stainless steel
		CW2M ⁽¹⁾	CW2M ⁽¹⁾
		M35-2 ⁽⁴⁾	M35-2
Disk Materials	PTFE or RPTFE Seal ⁽³⁾	EN 1.4409 stainless steel	CF3M stainless steel
		CW2M	CW2M
		M35-2	M35-2
		Metal or UHMWPE ⁽²⁾ Seal	Chrome-plated EN 1.4409 Stainless Steel
End Connections		Mates with raised-face flanges per EN 1092-1	Mates with raised-face flanges per ASME B16.5
Valve Body Style		Lugged with threaded or through holes, Double-Flange with through holes, and Wafer (for select sizes)	
Face-to-Face Dimensions		Meets MSS SP68, API 609, and EN 558 standards	
Shutoff		PTFE, RPTFE, or UHMWPE seal ring - Class VI per ANSI/FCI 70-2 and IEC 60534-4	
		S31600 (316 SST) seal ring - Class IV per ANSI/FCI 70-2 and IEC 60534-4	
Flow Direction		Standard (forward flow) is with the seal retainer facing upstream; reverse flow is permissible within specified pressure drop limitations for soft seal only. Metal seal is unidirectional.	
Flow Characteristic		Equal percentage	
Disk Rotation		Counterclockwise to open (when viewed from actuator side of valve body) through 90 degrees of disk rotation	
1. This material is not listed in EN 12516-1 or ASME B16.34. See table 4 for pressure/temperature ratings. 2. UHMWPE stands for ultra high molecular weight polyethylene. 3. RPTFE is a reinforced PTFE seal. 4. This material is not listed in EN 12516-1. See table 4 for pressure/temperature ratings.			

Table 2. Valve Size, Shaft Diameter, and Approximate Weight

VALVE SIZE		PRESSURE RATING		SHAFT DIAMETER		APPROXIMATE WEIGHT

M35-2	N05500	PEEK / PTFE	PTFE or RPTFE	PTFE	-46 to 232	-50 to 450

1. Minimum allowable temperature for PN series flanges is -10°C (14°F). See requirements of EN 13445-2 Annex B for applications below -10°C (14°F) with PN series flanges.

2. For applications exceeding 427°C (800°F), consult your [Emerson sales office](#) or Local Business Partner for appropriate high temperature disk edge coating selection.

Table 4. Maximum Allowable Inlet Pressure for CW2M and M35-2 Valves

450	185	680	133	212	331	530	130	210	325	525

1. This material is not listed in EN 12516-1 or ASME B16.34. Also see the Installation section.
2. The designations PN or 150 and 300 are used only to indicate relative pressure-retaining capabilities and are not EN or ASME pressure-temperature rating class designations.
3. This material is not listed in EN 12516-1. Also see the Installation section.

Installation

Key numbers in this procedure are shown in figure 11 unless otherwise indicated.

⚠ WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage resulting from the bursting of pressure retaining parts, be certain the service conditions do not exceed either the valve body rating or the flange joint rating, or other limits given in table 1 or on the nameplate. Use pressure-relieving or pressure-limiting devices to prevent the service conditions from exceeding these limits.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section on page 8 in this manual.

CAUTION

The valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions specified in the customer's order. Because some valve body/trim material combinations are limited in their pressure drop and temperature range capabilities, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#) or Local Business Partner.

The maximum allowable inlet pressures for steel and stainless steel valve bodies are consistent with the pressure-temperature ratings shown in table 1, except where further limited by the trim and packing material temperature capabilities given in table 3. Valves are also available in CW2M and M35-2 valve body materials. The CW2M valve body material is not listed in EN 12516-1 or in ASME B16.34. The M35-2 valve body material is listed in ASME B16.34, but is not listed in EN 12516-1. Valve bodies constructed of these materials mate with EN and ASME flanges, but must not be installed in systems requiring conformance to EN or ASME standards if not included in EN or ASME pressure/temperature ratings. Maximum allowable inlet pressures for Control-Disk valve bodies made of CW2M or M35-2 construction materials are shown in table 4.

1. Install a three-valve bypass around the control valve assembly if continuous operation is necessary during inspection and maintenance of the valve.
2. Inspect the valve body to be certain it is free of foreign material.
3. The valve is normally shipped as part of a control valve assembly, with an actuator mounted on the valve body.

If the valve body and actuator have been purchased separately or if the actuator has been removed for maintenance, mount the actuator, and adjust actuator travel before inserting the valve body into the line. This is necessary due to the measurements that must be made during the actuator adjustment process. Refer to the Actuator Mounting section on page 19 of this manual and to the separate actuator instruction manual for mounting and adjusting instructions before proceeding.

4. Inspect adjacent pipelines to be certain they are free of any foreign material, such as pipe scale or welding slag, that could damage the valve body seating surfaces.

CAUTION

Damage to the disk (key 3) will occur if any pipe flanges or piping connected to the valve body interfere with the disk rotation path. However, the disk can be rotated without interference when the valve body is installed between adjacent

pipe flanges or piping that has an inside diameter equal to or greater than either schedule 80 pipe or compatible EN pipe sizes. If piping with a smaller inner diameter than specified above is connected to the valve, measure carefully to be certain the disk rotates without interference before putting the valve into operation.

5. Flow is in the standard direction when the seal retainer (key 2) is facing upstream. Standard flow direction is also indicated by the flow direction arrow cast into the valve body. Flow in the reverse direction is permissible within allowable pressure drop limits for the soft seal. The metal seal is forward flow only.

CAUTION

Control-Disk valve disk rotation is counterclockwise to open (when viewed from the actuator side of the valve body, see figure 8) through 90 degrees of disk rotation. Rotating the disk (key 3) past either the open or closed position could damage the seal and disk sealing surfaces and could cause the disk to jam in the seal retainer.

6. With the disk in the closed position, install line flange gaskets, and insert the valve between the pipeline flanges. Use either flat sheet gaskets or spiral-wound gaskets with compression-controlling centering rings. Spiral-wound gaskets without compression-controlling centering rings are not recommended for this purpose.
7. Depending on valve size and pressure rating, the wafer style valve is centered in the pipeline using either retainer clips or the flange bolt holes. (For valves that have four flange bolt holes in the valve body (key 1), each hole engages one corresponding line flange stud.) Insert the valve between the flanges and use either the retainer clips or install two or more line flange studs into the line flanges to help hold the valve in position while centering the valve. Carefully center the valve on the flanges to ensure disk clearance.
 - Select and install two pipeline gaskets.

Note

Lubricate line flange studs before inserting them into flanges. If necessary, provide additional support for the control valve assembly because of its combined weight.

⚠ WARNING

For lugged valve bodies with threaded line bolt holes, personal injury and property damage could result from sudden release of process pressure if line bolts are not properly installed. To ensure proper line bolt thread engagement, line studs must be centered in the threaded section of the valve body so that each stud has equal thread engagement in the body. See figure 2.

8. After centering the valve body, first lubricate and then install the remaining line flange bolting to secure the valve in the pipeline. Tighten the nuts to the line flange studs in a crisscross pattern to ensure proper alignment of valve, gaskets, and flanges.

⚠ WARNING

A Control-Disk valve body is not necessarily grounded when installed in a pipeline. If the valve is used in a flammable or hazardous atmosphere or for oxygen service, an explosion could result due to a discharge of static electricity from the valve components. To avoid personal injury or property damage, always make sure the valve body is grounded to the pipeline before putting the control valve assembly into operation in a flammable or hazardous atmosphere.

Figure 3. Stud Bolts for Installation (also see table 6)

Note

Standard packings for the Control-Disk valve are composed of all conductive packing rings (graphite ribbon packing) or partially conductive packing rings (such as a carbon-filled PTFE female adaptor with PTFE V-ring packing) to electrically bond the shaft to the valve body for hazardous area service. For oxygen service applications, provide alternate shaft-to-valve body bonding according to the following step.

- For oxygen service applications, attach the bonding strap assembly (key 131, figure 4) to the shaft with the clamp (key 130, figure 4), and connect the other end of the bonding strap assembly to the valve body with the cap screw (key 35). Secure each cap screw with a hex nut (key 36).

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however, the packing might require some re-adjustment to meet specific service conditions.

Valves with ENVIRO-SEAL™ packing systems will not require this initial re-adjustment. See ENVIRO-SEAL Packing System for Rotary Valves Instruction Manual ([D101643X012](#)) for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the parts kit sub-section on page 21 of this manual.

Maintenance

Valve body parts are subject to normal wear and must be inspected regularly and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions. Instructions are given in this section for: replacing trim components, changing disk rotation or valve action, and mounting and adjusting the actuator.

As used in these instructions, actuator refers to power actuators (such as pneumatic diaphragm, piston actuators, and rack and pinion actuators).

⚠ WARNING

Avoid personal injury and property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any spring precompression.
- Use lock-out procedures to be sure the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Figure 4. Optional Shaft-to-Valve Body Bonding Strap Assembly

Packing Maintenance

Refer to figure 5 for available packing configurations. All maintenance operations in this section may be performed with the valve in the line. Packing may be PTFE V-ring or graphite.

An ENVIRO-SEAL packing system is also available with the Control-Disk valve. To install the ENVIRO-SEAL packing system in an existing valve, follow the instructions in the instruction manual included with the packing system ([D101643X012](#)). To remove packing parts in a valve with the ENVIRO-SEAL packing system, follow the procedures for valves with the ENVIRO-SEAL packing system in this section. Install the replacement packing following the instructions in the packing system instruction manual (D101643X012).

Stopping Leakage

For valves with PTFE or graphite packing:

CAUTION

Tighten the packing flange only enough to prevent shaft leakage. Excessive tightening will only accelerate wear of the packing and could produce higher torques on the valve.

Leakage around the packing followers can be stopped by tightening the packing flange nuts (key 28, figure 11).

If the packing is relatively new and tight on the shaft, and if tightening the packing flange nuts does not stop leakage, the shaft may be worn or nicked so that a seal cannot be made. If the leakage comes from the outside diameter of the packing, the leakage may be caused by nicks or scratches around the packing box wall. Inspect the shaft and packing box wall for nicks and scratches when performing the packing replacement procedures.

For valves with the ENVIRO-SEAL packing system:

Optimum performance of the ENVIRO-SEAL packing system is obtained when the Belleville springs are tightened to their “target load.” The target load is the point where the springs are compressed to 85% of their maximum deflection, or nearly flat. Maximum deflection is when the springs are 100% compressed, or completely flat.

Figure 5. Packing Arrangement Details

NOTES:

1. WITH CONDUCTIVE PACKING, THE FEMALE ADAPTOR IN PTFE V-RING PACKING IS CARBON-FILLED PTFE.
2. APPLY LUBRICANT.
3. THESE TWO SURFACES SHOULD REMAIN PARALLEL AS YOU ALTERNATELY AND EVENLY TIGHTEN THE PACKING NUTS (KEY 28).

Under normal conditions, the packing nuts should not require re-tightening. However, when servicing, if the springs do not remain at the target load of 85% compression, retighten the packing box nuts according to the following procedure:

1. Tighten the packing flange nuts alternately and evenly, keeping the packing flange parallel with the valve flange (see figure 5), until the Belleville springs are compressed 100% (or completely flat).
 - For PTFE packing, loosen each packing flange nut one half turn (180° of rotation).
 - For Graphite packing, loosen each packing flange nut one quarter turn (90° of rotation).

The target load of 85% compression has now been reached. If leakage continues, replace the packing components as described in the following procedures.

Replacing the Packing

To replace the packing, the actuator must be removed. Also, the valve should be removed from the pipeline to allow proper readjustment of the disk position.

⚠ WARNING

The edges of a rotating disk have a shearing effect that may result in personal injury. To help prevent such injury, stay clear of the disk edges when rotating the disk (key 3).

CAUTION

Damage to the disk (key 3) may occur if the disk is not closed when the valve is being removed from the pipeline. If necessary, apply operating pressure to the actuator temporarily to retain the disk in the closed position while removing the valve from the pipeline.

For valves with PTFE or graphite packing:

Key numbers in this procedure are shown in figure 11 unless otherwise indicated.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shutoff all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure the above measures stay in effect while you work on the equipment.

CAUTION

When removing the actuator in the following step, use a wheel puller to separate the actuator parts from the valve shaft. Do not drive the actuator parts off the valve shaft because this could damage valve trim components.

2. Remove the actuator per instructions in separate actuator instruction manuals, then remove the cap screws and nuts (keys 35 and 36). Remove the clamp (key 130, figure 4) if the strap (key 131, figure 4) is used.
3. Remove the packing flange nuts and the packing flange (key 26) if used and pull out the packing follower (key 25).
4. Remove the anti-blowout ring (key 40) from the drive shaft (key 10).
5. Remove the old packing rings (key 24) and, if used, the packing washers (key 31). Carefully avoid scratching the shaft or packing box wall to avoid damage that could cause leakage around the shaft. Clean all accessible metal parts and surfaces to remove particles that would prevent the packing from sealing.

⚠ WARNING

Do not lubricate parts when used in oxygen service, or where the lubrication is incompatible with the process media. Any use of lubricant can lead to the sudden explosion of media due to the oil/oxygen mixture, causing personal injury or property damage.

6. Use the appropriate procedures below for installing packing.

- Install the packing as shown in figure 5.
 - With graphite ribbon packing, stack the packing rings and packing washers together, and slide the stack into the packing box as far as it will go while carefully avoiding trapping air between the rings.
 - Install the anti-blowout ring (key 40) in the groove on the drive shaft (key 10).
 - Install the packing follower and, if used, the packing flange.
 - Install the packing flange nuts, and tighten them only far enough to stop leakage under normal operating conditions.
 - For oxygen service applications, attach the bonding strap assembly (key 131, figure 4) to the shaft with the clamp (key 130, figure 4), and connect the other end of the bonding strap assembly to the valve body with a cap screw (key 35). Secure each cap screw with a hex nut (key 36).
7. Mount the actuator and adjust the closed position of the valve, per the Actuator Mounting section on page 19 of this manual, before returning the valve to service.
 8. When placing the control valve into operation, check around the packing follower for leakage; retighten the packing flange nuts as required according to accepted bolting procedures.

For valves with ENVIRO-SEAL packing systems:

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shutoff all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

CAUTION

When removing the actuator, use a wheel puller to separate the actuator parts from the valve shaft. Do not drive the actuator parts off the valve shaft because this could damage valve trim components.

2. Remove the actuator per instructions in separate actuator instruction manuals, then remove the cap screws and nuts (keys 35 and 36). Remove the clamp (key 130, figure 4) if the strap (key 131, figure 4) is used.
3. Loosen the two packing hex nuts evenly to remove spring tension, then remove the nuts.
4. Remove the packing flange and spring pack assembly. The spring pack assembly consists of the spring stack and packing follower. The spring stack is retained on the packing follower by an O-ring. Remove the anti-blowout ring (key 40) from the driveshaft (key 10). Remove the anti-extrusion washer, the packing set, and the packing ring.

CAUTION

The valve shaft surface condition is critical in making and maintaining a good seal. If the valve shaft surface is scratched, nicked, dented, or worn, replace the valve shaft before replacing the packing system.

5. Inspect the existing valve shaft. If necessary, replace the valve shaft as described in the Replacing the Disk, Shafts, or Bearings section.
6. Install the new packing system components as described in the ENVIRO-SEAL Packing System for Rotary Valves Instruction Manual ([D101643X012](#)).

7. Install the anti-blowout ring (key 40) onto the drive shaft (key 10) before installing the packing follower.
8. Mount the actuator and adjust the closed position of the valve, per the Actuator Mounting section on page 19 of this manual, before returning the valve to service.

Replacing the Seal Ring Assembly

Perform this procedure only if the control valve is not shutting off properly (that is, leaking downstream). This procedure does not require removing the actuator from the valve body.

Key numbers in this procedure are shown in figure 11 unless otherwise indicated.

1. Isolate the control valve from line pressure, and relieve pressure from the valve body. Shut off and disconnect all lines from the power actuator.

⚠ WARNING

The edges of a rotating disk have a shearing effect that may result in personal injury. To help prevent such injury, stay clear of the disk edges when rotating the disk (key 3).

CAUTION

Damage to the disk (key 3) may occur if the disk is not closed when the valve is being removed from the pipeline. If necessary, apply operating pressure to the actuator temporarily to retain the disk in the closed position while removing the valve from the pipeline.

2. Unscrew the flange bolts, and remove the valve from the pipeline.
3. Unscrew the machine screws (key 14), remove the retainer clip (key 13), and remove the seal retainer (key 2).
4. Remove the seal ring assembly (key 4).
5. The valve must be closed during seal ring installation to permit accurate centering of the seal. To install the new seal ring assembly:
 - For a soft seal, if the spring (key 5) was disassembled, hook the spring ends together. Work the spring into the recess in the seal ring (key 4). Place the seal ring assembly onto the disk. Set the retainer onto the seal, making sure proper alignment between the seal and retainer has been achieved.
 - For the metal seal ring assembly, place the seal ring assembly onto the disk. Set the retainer onto the seal, making sure proper alignment between the seal and retainer has been achieved.
6. Attach the seal retainer (key 2) and the retainer clips (key 13) to the valve body and secure with the machine screws (key 14).
7. Be certain the disk is closed before installing the valve according to the Installation section on page 4 of this manual.

Replacing the Disk, Shafts, or Bearings

Key numbers in this procedure are shown in figure 11 unless otherwise indicated.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shutoff all pressure lines to the power

actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

CAUTION

When removing the actuator in the following step, use a wheel puller to separate the actuator parts from the valve shaft. Do not drive the actuator parts off the valve shaft because this could damage valve trim components.

2. Remove the actuator per instructions in separate actuator instruction manuals, then remove the cap screws and nuts (keys 35 and 36). Remove the clamp (key 130, figure 4) if the strap (key 131, figure 4) is used.
3. Remove the packing flange nuts and the packing flange (key 26) if used and pull out the packing follower (key 25).

Disassembly

1. Remove the seal ring assembly according to steps 3 and 4 of the Replacing Seal Ring section on page 13 of this manual.
2. Remove hex nuts, blind flange, gasket, spacer (if present), follower spring seats, and follower spring (keys 19, 17, 16, 15, 9, and 12).

Figure 6. Orientation of Bearing Tabs

Table 6. Follower Shaft Internal Threads

VALVE SIZE		THREAD SIZE
DN	NPS	
50	2	M8 X 1.25
80	3	M10 X 1.50
100	4	M12 X 1.75
180	6	M16 X 2.00
200	8	M20 X 2.50 ⁽¹⁾
250	10	M20 X 2.50 ⁽¹⁾
300	12	M24 X 3.00 ⁽¹⁾

1. For valves with a two-piece, split-shaft design only. DN 200 - 300 (NPS 8-12) valves changed to a one-piece, through-shaft design in 2015.

Table 7. Recommended Blind Flange Bolt Torque

VALVE SIZE		TORQUE	
DN	NPS	N•m	lbf•ft
50 to 150	2 to 6	9.5	7.0
200, 250	8, 10	23	17
300	12	45	33

- Clean the gasket surfaces on the blind flange (key 17) and on the end of the valve body (key 1).
- Rotate the disk (key 3) to the fully open position.
- Refer to figure 7 and determine the location of the smaller end of the taper pins (key 8). Drive out the taper pins and expansion pins (key 7) towards the larger end.

WARNING

Once the shafts have been removed in the following step, the disk may fall from the valve body. To avoid personal injury and disk damage, support the disk to prevent it from falling as the shafts are being removed.

- For valves with a two-piece, split-shaft, pull the follower shaft (key 11) out through the outboard end of the valve body. If the follower shaft cannot be pulled free, the end of the follower shaft is internally threaded (see table 6) for screwing in a bolt or stud to aid in pulling the follower shaft.
- Pull the drive shaft (key 10) out through the actuator end of the valve body and remove the anti-blowout ring (key 40) from the drive shaft.
- Remove the disk (key 3) from the valve body.
- Remove the packing (key 24, figure 5) and the packing box ring (key 23, figure 5).
- If either of the bearings (key 6) require replacement, remove them.
- Clean the packing box and [metal packing box parts].

Assembly

WARNING

Do not lubricate bearings that will be used for oxygen service, or where the lubrication is incompatible with the process media. Any use of lubricant can lead to the sudden explosion of media due to the oil/oxygen mixture, causing personal injury or property damage.

CAUTION

To avoid possible product damage, ensure the bearing tabs are oriented correctly when installing in the following procedure. See figure 6 for proper orientation of the bearings.

1. If new bearings (key 6) are required, install and orient them in the valve body, as shown in figure 6. Ensure the bearings are fully seated, contacting the inside diameter of the valve body.
2. Insert the disk into the valve body as shown in figure 7, ensuring the “T” stamped on the disk hub is oriented toward the actuator end of the valve body.
3. Install the drive shaft (key 10) through the valve body into the disk. The disk/shaft connection utilizes taper and expansion pins. The hole for the drive shaft connection is slightly off-center to prevent the drive shaft from being installed in the wrong orientation. Orient the position indication mark on the end of the shaft with the face of the disk as shown in figure 8. For valves using a two-piece, split-shaft, the hole for the follower shaft connection is on-center. Insert the expansion pins into the disk until they are seated, as shown in figure 7. Once in place, insert the taper pins. The taper pins must be driven into the disk/shaft/expansion pin assemblies until “solid contact” is felt. “Solid contact” can be identified by the sound of the hammer blow and the bounce felt in the hammer. NPS 8-12 valves changed to a one-piece, through-shaft design in 2015 and utilize only one pin connection. NPS 8-12 valves shipped prior to 2015 used a two-piece, split-shaft design with two pin connections - same as the NPS 2-6 valves.
4. Reinstall the follower spring/spring seat assembly (keys 9, 12, and 9, figure 9) inside the follower shaft or follower side of the drive shaft for valves with a one-piece, through-shaft design.
5. Install the spacer (key 15) if used, and the gasket, blind flange, and hex nuts (keys 16, 17, and 19). Ensure the blind flange is oriented so the serrations face the gasket and valve body. Tighten the hex nuts (key 19) per table 7.
6. The valve must be closed during seal ring installation to permit accurate centering of the seal. To install the new seal ring assembly or flow ring:
 - For a soft seal, if the spring (key 5) was disassembled, hook the spring ends together. Work the spring into the recess in the seal ring (key 4). Place the seal ring assembly onto the disk. Set the retainer onto the seal, making sure proper alignment between the seal and retainer has been achieved.
 - For the metal seal ring assembly, place the seal ring assembly onto the disk. Set the retainer onto the seal.
 - For the flow ring construction, place the gasket (key 41) onto the valve body. Set the retainer onto the gasket.
7. Attach the seal retainer (key 2) and the retainer clips (key 13) to the valve body and secure with the machine screws (key 14).
8. Insert a packing box ring (key 23) into the packing box.
9. For standard packing, install the packing according to the appropriate instructions presented in step 5 of the Replacing Packing section on page 11 of this manual.

For ENVIRO-SEAL packing, install the new packing system components as described in the ENVIRO-SEAL Packing System for Rotary Valves Instruction Manual ([D101643X012](#)).
10. Install the anti-blowout ring (key 40) in the groove in the drive shaft.
11. Rotate the disk to the approximate closed position.
12. Mount and adjust the actuator per the following Actuator Mounting section on page 19 of this manual.

Figure 7. Taper / Expansion Pin Installation

NOTES:
1 INSTALL THE PINS FROM THIS SIDE OF THE DISK.

Table 8. Recommended Actuator-Mounting Bolt Torque

VALVE SIZE		TORQUE	
DN	NPS	N•m	lbf•ft.
50, 80, 100, and 150	2, 3, 4, and 6	120	88
200, 250, and 300	8, 10, and 12	250	185

Figure 8. Sectional of Typical Valve Body

Figure 9. Follower Spring/Spring Seat Assembly

Actuator Mounting

With the valve body out of the line, mount the actuator on the valve body in accordance with the instructions in the actuator instruction manual. Mount the actuator yoke to the valve body, and tighten the actuator-mounting cap screws and nuts (keys 35 and 36) to the appropriate torque from table 8.

Key numbers in this procedure are shown in figure 11 unless otherwise indicated.

1. Determine the actuator mounting style and position from figure 10.

CAUTION

Control-Disk valve disk rotation is counterclockwise to open (when viewed from the actuator side of the valve body, see figure 8). Rotating the disk (key 3) past the fully closed position will damage the seal ring (key 4). To prevent this damage, use the following procedures:

- For actuators with adjustable travel stops, such as a Fisher 2052, 1051/1052 size 33, 1066 or 1066SR actuator, make certain the actuator travel stop prevents the disk from rotating past the fully closed position.
- For actuators with an adjustable turnbuckle, such as the Fisher 1051/1052 size 40, 60, and 70, or 1061 actuator, the turnbuckle must be adjusted so that the valve is closed when the diaphragm plate or piston is against the actuator travel stop.

2. Adjust the actuator to bring the disk to the fully closed position at the end of the actuator stroke. To determine the fully closed disk position, measure the distances between the disk face and the seal retainer face at the top and bottom of the valve (X1 and X2) as shown in figure 8. Adjust the travel stops or turnbuckle to rotate the disk slightly until the two measurements are within 0.8 mm (0.032 inch) of each other. Refer to the appropriate actuator instruction manual for assistance.

Parts Ordering

When corresponding with your [Emerson sales](#) office or Local Business Partner about this equipment, always mention the valve serial number.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts Kits

Retrofit Kits for ENVIRO-SEAL Packing

Retrofit kits are available for replacing the packing in an existing valve with an ENVIRO-SEAL packing system. These kits are available for single PTFE or graphite packing. All parts required for installation of the ENVIRO-SEAL packing system into an existing Control-Disk valve are included in the kits.

Worn shafts, packing box damage, or other components that do not meet Emerson finish specifications, dimensional tolerances, and design specifications, may adversely alter the performance of the retrofit kit.

ENVIRO-SEAL Packing System Retrofit Kits

SHAFT DIAMETER		SINGLE PTFE PACKING	GRAPHITE PACKING
mm	Inches		
12.7	1/2	RPACKXRT482	RPACKXRT422
15.9	5/8	RPACKXRT492	RPACKXRT432
19.1	3/4	RPACKXRT502	RPACKXRT442
25.4	1	RPACKXRT512	RPACKXRT452
31.8	1-1/4	RPACKXRT522	RPACKXRT462
38.1	1-1/2	RPACKXRT532	RPACKXRT472

Repair Kits for ENVIRO-SEAL Packing

Repair kits for ENVIRO-SEAL PTFE packing include one packing set and two anti-extrusion washers. Repair kits for ENVIRO-SEAL graphite packing include two packing rings and two anti-extrusion rings.

Worn shafts, packing box damage, or other components that do not meet Emerson finish specifications, dimensional tolerances, and design specifications, may adversely alter the performance of the repair kit.

Introduction

Scope of Manual

This instruction manual provides installation, operation, maintenance, and parts ordering information for NPS 3 through 20 Fisher CV500 Cam Vee-Ball™ rotary control valves. Refer to separate manuals for information concerning the actuator and accessories.

Description

The CV500 Cam-Vee-Ball rotary control valve, has a Vee-Ball style segmented ball in a valve body similar to the V500 valve. The CV500 is a flanged valve (figure 1) with a self-centering seat, eccentrically rotating V-notch ball, and splined valve shaft. Suitable for forward or reverse flow use, this valve mates with a variety of actuators to provide throttling or on-off service. The flanged valve mates with ASME flanges or EN flanges.

Do not install, operate, or maintain a CV500 valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Figure 1. Fisher CV500 Valve

emerson.com/mytraining

Installation

WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed either the valve body rating or the mating pipe flange joint rating. To avoid such injury or property damage, provide a relief valve for overpressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions indicated when the valve was ordered. Because some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

16	3	3	710	940	1345
20	3	3	855	1230	1765

1. Spline diameter that connects to actuator versus shaft diameter.

Key numbers are shown in figure 10 for NPS 3 through 8, figure 11 for NPS 10 and 12, and figure 12 for NPS 14 through 20, unless otherwise indicated.

1. If the valve body (key 1) is to be stored before installation, protect the flange mating surfaces and keep the valve body cavity dry and clear of foreign material.
2. Install a three-valve bypass around the control valve assembly if continuous operation will be necessary during inspection and maintenance of the valve.
3. A CV500 valve is normally shipped as part of a control valve assembly, with a power or manual actuator mounted on the valve. If the valve and actuator have been purchased separately or if the actuator has been removed from the valve, mount the actuator according to the actuator instruction manual. Also, adjust the actuator travel using the Adjusting Actuator Travel procedure in this manual before installing the valve; the required measurements cannot be made with the valve installed.
4. Before starting the actual installation of the valve, determine the proper installation orientation of the V-notch ball (key 2) and actuator. Determine the flow direction of the process fluid through the valve. See figure 2.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

CV500 Valve

March 2023

Figure 2. Index Marks for Actuator Lever Orientation

ACTUATOR		VALVE OPEN	ACTUATOR POSITION			
MOUNTING	STYLE		1	2	3	4
RIGHT-HAND	STYLE A (PDTC)					
	STYLE B (PDTO)					
LEFT-HAND	STYLE C (PDTO)					
	STYLE D (PDTC)					

NOTES:
 1. ARROW ON LEVER INDICATES DIRECTION OF ACTUATOR THRUST TO CLOSE VALVE.
 2. PDTC=PUSH DOWN TO CLOSE; PDTO=PUSH DOWN TO OPEN.
 3. F=FORWARD FLOW; R=REVERSE FLOW.

C0741

Note

For control valves used in slurry service, mount the actuator and install the control valve so that the V-notch ball rotates above the valve drive shaft (refer to figure 2), if possible.

5. Before installing the valve, make sure the flow direction arrow (key 32) on the valve (key 1) matches the actual process fluid flow direction through the valve for the application where the valve will be installed.
-

Note

For best shutoff performance, install the valve with the drive shaft horizontal and the Vee-Ball closing in the downward direction for standard right hand mounting.

6. Install the flange gaskets and insert the valve between the mating pipeline flanges. Use flat sheet gaskets compatible with the process media, or spiral wound gaskets with compression-controlling center rings.
7. Install the line bolts and nuts; then, tighten them using accepted bolting procedures. These procedures include, but are not limited to, lubricating the line bolts and hex nuts and tightening the nuts in a crisscross sequence to ensure proper gasket load.
8. If a purge is desired for the purged bearing construction, remove the pipe plugs (keys 29 and 24) and install the purge lines. Purge pressure should be greater than the pressure within the valve and the purge fluid should be as clean as possible.

⚠ WARNING

A CV500 drive shaft is not necessarily grounded when installed in a pipeline unless the shaft is electrically bonded to the valve.

To avoid personal injury or property damage resulting from the effects of a static electricity discharge from valve components in a hazardous atmosphere or where the process fluid is combustible, electrically bond the drive shaft (key 3) to the valve according to the following step.

Note

Standard CV500 packings (key 13) are composed either entirely of conductive packing rings (graphite ribbon packing) or partially of conductive packing rings (a carbon-filled PTFE female adaptor with PTFE V-ring packing or a graphited-composition packing ring with PTFE/composition packing) in order to electrically bond the shaft to the valve body. Alternate shaft-to-valve body bonding is available for hazardous service areas where the standard packing is not sufficient to bond the shaft to the valve (see the following step).

9. For hazardous applications, attach the bonding strap assembly (key 131, figure 3) to the shaft with the clamp (key 130, figure 3) and connect the other end of bonding strap assembly to the valve body with the cap screw (key 25, figure 3).
10. Connect pressure lines to the actuator as indicated in the actuator instruction manual. When a manual actuator (handwheel) is used with a power actuator, install a bypass valve on the power actuator (if not already supplied) for use during manual operation.

Figure 3. Optional Shaft-to-Body Bonding Strap Assembly

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If the valve has ENVIRO-SEAL™ live-loaded packing installed, readjustment will probably not be required. See the instruction manual titled Fisher ENVIRO-SEAL Packing System for Rotary Valves ([D101643X012](#)) for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the parts kit sub-section near the end of this manual.

Maintenance

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations.
- The valve packing area may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

Packing Maintenance

Key numbers refer to figure 10 for NPS 3 through 8, figure 11 for NPS 10 and 12, and figure 12 for NPS 14 through 20, unless otherwise indicated.

Note

For the ENVIRO-SEAL packing system, refer to the Parts List section for retrofit kits, parts kits, and individual parts (see figures 13 and 14). Refer to separate ENVIRO-SEAL instruction manual ([D101643X012](#)) for maintenance instructions.

Standard ENVIRO-SEAL packing systems can be used in vacuum service with packing rings in the standard orientation. It is not necessary to reverse the ENVIRO-SEAL PTFE packing rings.

Stopping Leakage

All maintenance procedures in this section may be performed with the valve body (key 1) in the line.

For packings other than spring-loaded packing, leakage around the packing follower (key 14) may be stopped by tightening the packing flange nuts (key 16). If leakage cannot be stopped in this manner, replace the packing according to the Replacing Packing procedure in this manual.

If the packing is relatively new and tight on the drive shaft (key 3), and if tightening the packing nuts does not stop leakage, it is possible that the shaft is worn or nicked so that a seal cannot be made. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches on the packing box wall. Inspect the shaft and packing box wall for nicks or scratches when performing the following procedures.

Replacing Packing

Note

If the valve has ENVIRO-SEAL live-loaded packing installed, see the manual entitled Fisher ENVIRO-SEAL Packing System for Rotary Valves ([D101643X012](#)).

This procedure may be performed without removing the actuator from the valve if adding PTFE/composition packing rings as a temporary measure. However, the actuator must be removed if replacing any other kind of packing or if the metal packing parts (keys 14, 17, and, if used, 18) need to be replaced.

WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

NOTICE

To avoid increased leakage, increased valve component wear or possible damage to the valve body, ball, shaft, and bearings resulting from a sharp blow to the shaft, use a wheel puller to separate the actuator parts from the drive shaft.

Do not drive the actuator parts off the drive shaft since this could move the valve bearings, shaft, and ball away from proper alignment, causing improper seating of the ball. Such misalignment may result in damage to valve components if the valve is returned to service without disassembly and inspection of the valve ball alignment.

2. If necessary, remove the cap screws (key 25) and hex nuts (key 26). Then remove the actuator while referring to the actuator instruction manual for assistance.
3. Remove the packing nuts (key 16). For NPS 3 through 8, remove the packing follower (key 14). For NPS 10 through 20, remove the packing flange (key 45) and then remove the packing follower (key 14).

⚠ WARNING

In the following step, take care not to scratch the valve shaft or packing box wall, as this may cause leakage.

4. Remove the old packing rings (key 13), packing box ring (key 17), and, if used, the lantern ring (key 18). Do not scratch the valve shaft or packing box wall; scratching these surfaces could cause leakage. Clean all accessible metal parts and surfaces to remove particles that would prevent the packing from sealing.
5. Whenever you are installing new packing, be sure the ball (key 2) is closed while you install and tighten the new packing. Install the new packing rings and packing box ring by stacking the parts as shown in figure 4. Make sure split rings are arranged so that the splits do not line up to form a leak path. Then slide the stack into the packing box as far as they will go while being careful to avoid trapping air among the rings.
6. Install the packing follower (key 14), and, for NPS 10 through 20, also install the packing flange (key 45). Install the nuts (key 16), and tighten them far enough to stop leakage under normal conditions.
7. Mount the actuator while referring to the actuator mounting procedures in the actuator instruction manual. Complete the Adjusting Actuator Travel procedure in this manual before installing the valve in the pipeline. This is necessary due to the measurements that must be made during the actuator adjustment process.
8. When the control valve is being put back into operation, check the packing follower for leakage, and retighten the packing nuts as necessary.

Replacing Retainer, Seat Ring, and Face Seals

This procedure is to be performed if the control valve is not shutting off properly, if installing a different seat ring, or if seat ring inspection is necessary. The actuator and valve must be removed from the pipeline; however, the actuator may remain mounted during this procedure. Key numbers refer to figure 10 for NPS 3 through 8, figure 11 for NPS 10 and 12, and figure 12 for NPS 14 through 20, unless otherwise indicated.

A retainer tool is required to remove the retainer (key 5) on sizes NPS 3 through 12. If specifically ordered, a tool is supplied with the valve; a tool can also be ordered individually by referencing key 33 of the Parts List. If desired, a tool can be machined using the dimensions shown in figure 5.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

CV500 Valve

March 2023

Instruction Manual

D101640X012

NOTICE

During assembly, handle the retainer, seat ring, and face seals carefully. Critical areas that must be protected are the threads and inner surface of the retainer (key 5), the sealing surfaces of the face seals (key 8), the face seal grooves in the seat ring (key 4), the shutoff surface of the seat ring, and the face seal surface in the valve body.

A new retainer gasket (key 11) is required whenever the retainer (key 5) is removed. Other parts that are in good condition can be reused.

Disassembly

⚠ WARNING

Refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

The ball closes with a shearing, cutting motion, which could result in personal injury. To avoid personal injury or damage to tools, valve parts, or other items resulting from the ball closing, prevent against ball travel by using travel stops, manual actuators, constant supply pressure to a pneumatic actuator, or other steps as appropriate. When installing the seat ring, keep hands, tools, and other objects out of the valve.

Table 3. Assembly Clearance

PROCESS TEMPERATURE	SEAT RING AND RETAINER CLEARANCE			
	mm		Inches	
	Minimum	Maximum	Minimum	Maximum
To 260°C (500°F) ⁽¹⁾	0.08	0.30	0.003	0.012
Over 260°C (500°F) ⁽²⁾	0.20	0.43	0.008	0.017
1. Standard Trim 2. Special High Temperature Trim				

Figure 4. Packing Arrangements

NOTES:

- 1 INCLUDES ZINC WASHERS (KEY 28) FOR GRAPHITE RIBBON PACKING ONLY
- 2 INCLUDED IN PTFE/V-RING PACKING SET (KEY 13).
- 3 FOR ONLY PTFE/BOUND-COMPOSITION PACKING, TOP RING IS CONDUCTIVE GRAPHITE FILAMENT RING.

Figure 4. Packing Arrangements (continued)

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Remove line bolting. Then, remove the control valve from the pipeline and place the valve on a flat surface with the retainer (key 5) facing up.

3. Rotate the drive shaft (key 3) to move the ball (key 2) into the open position.

Note

For sizes NPS 3 through 12 the retainer (key 5) was installed at the factory using the torque listed in figure 5.

NOTICE

After performing the following procedures, place the retainer, the seat ring, and both face seals on a protected, flat surface where the threads and sealing surfaces will not be contaminated or damaged.

4. For sizes NPS 3 through 12, remove the retainer (key 5) by engaging the retainer tool, attaching an impact wrench or other suitable tool, and unscrewing the retainer. Inspect the retainer. Place it on a protected, flat surface where the threads and sealing surfaces will not be contaminated or damaged.
5. For sizes NPS 14 through 20, remove the retainer (key 5) by removing each of the four retainer bolts (key 48) and gently lifting it out of the valve body. Inspect the retainer. Place it on a protected, flat surface where the sealing surfaces will not be contaminated or damaged.
6. Remove the retainer gasket (key 11). Inspect the gasket surface in the valve body.
7. Lift out the seat ring (key 4) and both face seals (key 8). Inspect the parts and place them on a flat, protected surface.
8. Inspect the shutoff surface of the V-notch ball. If it is worn, nicked, or scratched, proceed to the Replacing Ball, Shaft, and Bearings procedure in this manual. If the parts are in good condition and do not require replacement, continue to the Assembly procedure in this manual.

Assembly

⚠ WARNING

Seat ring installation requires that the ball (key 2) remain in the open position.

The ball closes with a shearing, cutting motion, which could result in personal injury. To avoid personal injury or damage to tools, valve parts, or other items resulting from the ball closing, prevent against ball travel by using travel stops, manual actuators, constant supply pressure to a pneumatic actuator, or other steps as appropriate. When installing the seat ring, keep hands, tools, and other objects out of the valve.

1. Apply enough supply pressure to the actuator to open the ball, or take other steps to hold the ball open.
2. Clean the valve body, the retainer threads, the retainer gasket surface, and the seat ring sealing surfaces.
3. Using either face seals (key 8) in good condition or new face seals, place one seal in the seat ring cavity of the valve body.

Note

The seat ring (key 4) may have one or two shutoff surfaces. The shutoff surfaces are the narrow, rounded edges of the seat ring bore. Inspect the seat ring and locate the shutoff surfaces before proceeding.

RETAINER TOOL FOR NPS 3 THROUGH 12 VALVES

4. Insert the seat ring into the seat ring cavity with the correct shutoff surface facing the V-notch ball and shaft. The seat ring will cover the face seal installed in step 3.
5. Place the second face seal (key 8) on the seat ring (key 4).
6. Apply anti-seize lubricant to the gasket surface in the valve body. Install the gasket (key 11), while making certain that the concave surface of the gasket is up (hump surface of gasket down).
7. For valve sizes NPS 3 through 12
 - a. Apply anti-seize lubricant to the gasket surface in the valve body. Install the gasket (key 11), while making certain that the concave surface of the gasket is up (hump surface of gasket down).
 - b. Apply anti-seize lubricant to the threads and bottom of the retainer (key 5) only in the area that contacts the gasket. Thread the retainer into the valve body till it begins to compress the face seals.
 - c. Insert a screwdriver, pry bar, or similar tool between the lower ear of the ball and the valve body. Use the pry to move the ball tightly against the thrust washer and bearing stop (key 7) on the actuator side of the valve.
 - d. Rotate the drive shaft to move the ball till it contacts and centers the seat ring. Once the seat ring is centered return ball to the open position.
 - e. Refer to table 5. Find the correct retainer torque for the valve size. With the appropriate tool, tighten the retainer to the torque listed in table 5.
 - f. A gap between the seat ring (key 4) and retainer (key 5) allows the seat ring to self-center. Applying the proper amount of torque during installation should position the retainer and seat ring properly. Use a feeler gage to measure between the parts as shown in figures 9 and 10, making certain the necessary clearance exists. Compare the measured gap to the clearance in table 4.
 - g. If the measured clearance is within the values specified in table 4, proceed to the next step.
 - If the measured gap is larger than the maximum, tighten the retainer--apply more torque than that listed in figure 5, if necessary, until the clearance is within the maximum and minimum values.
 - If the measured clearance is smaller than the minimum, remove the retainer, seat ring, and face seals, clean the parts, and reassemble so as to obtain the necessary minimum clearance.
 - h. Perform the Adjusting Actuator Travel procedure in this manual (pg. 22) and then install the control valve in the pipeline.
8. For valve sizes NPS 14 through 20
 - a. Prior to Actuator Travel Adjustment procedure:

Note

For valve sizes NPS 14, 16, and 20 the retainer gasket (key 11) should not be installed for the Actuator Travel Adjustment procedure.

- Gently lower the retainer (key 5) into the valve body, while making certain that the countersunk bolt holes line up with threaded holes in the body.
- Lubricate and install the retainer bolts (key 48) and torque them to 32 in • lbf (3.6 N • m).
- Perform the Actuator Travel Adjustment procedure in this manual.

b. Post Actuator Travel Adjustment procedure:

- Remove the retainer bolts (key 48) and retainer (key 5) from the valve body.

⚠ WARNING

To avoid personal injury from process fluid leakage, the retainer gasket must be installed prior to installation of the valve in the pipeline.

- Install the retainer gasket (key 11) into the groove in the valve body.
- Gently lower the retainer (key 5) into the valve body, while making certain that the countersunk bolt holes line up with threaded holes in the body.
- Lubricate and install the retainer bolts (key 48) and torque them to 32 in • lbf (3.6 N • m).

Replacing Ball, Shaft, and Bearings

Perform this procedure to replace the ball (key 2), expansion pin (key 9), taper pin (key 10), drive shaft (key 3), follower shaft (key 38), groove pins (key 39), or bearings (keys 6 and 42). These parts are independently replaceable; for example, installing a new ball does not require replacing a reusable valve shaft or expansion pin assembly. For key numbers refer to figure 10 for NPS 3 through 8, figure 11 for NPS 10 and 12, and figure 12 for NPS 14 through 20, unless otherwise indicated.

Disassembly

⚠ WARNING

To avoid personal injury resulting from contact with edges of the V-notch ball (key 2) and seat ring (key 4) during ball rotation, stay clear of its edges when rotating the ball. To avoid damage to tools, valve parts, or other items resulting from V-notch ball rotation, keep tools and other property away from the edges of the ball.

The ball closes with a shearing, cutting motion, which could result in personal injury. When the actuator is removed from the valve, the ball/shaft assembly may suddenly rotate, resulting in personal injury or property damage. To avoid injury or damage, carefully rotate the ball/shaft assembly to a stable position in the valve body after the actuator is disconnected.

NOTICE

To avoid increased leakage, increased valve component wear or possible damage to the valve body (key 1), ball (key 2), drive shaft (key 3), follower shaft (key 38), and bearings (keys 6 and 42) resulting from a sharp blow to the actuator or valve parts, use a wheel puller to separate the actuator parts from the valve drive shaft.

Do not drive the actuator parts off the valve drive shaft since this could move the valve bearings, shafts, and ball away from proper alignment, causing improper seating of the ball. Such misalignment may result in damage to valve components if the valve is returned to service without disassembly and inspection of the ball alignment.

⚠ WARNING

Refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D101640X012

CV500 Valve

March 2023

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Remove the actuator cover. Note the actuator orientation with respect to the valve body and the lever orientation with respect to the valve drive shaft (see figure 2). Remove the lever but do not loosen the actuator turnbuckle adjustment. Remove the actuator mounting screws and nuts, and remove the actuator. If necessary, refer to the actuator instruction manual for assistance.
3. With the valve body (key 1) out of the pipeline, loosen the packing nuts (key 16). If the packing is to be reused, do not remove it. However, Emerson recommends that the packing be replaced whenever the drive shaft is removed.

Table 6. Data for Tapped Holes on Valve Shaft

VALVE SIZE, NPS	SHAFT DIAMETER				THREAD SIZE, UNC
	Through Valve	At Spline End	Through Valve	At Spline End	
	mm		Inches		
3	25.4	25.4	1.00	1.00	3/8-16
	25.4	19.1	1.00	0.75	5/16-18
4	31.8	31.8	1.25	1.25	3/8-16
6	38.1	38.1	1.50	1.50	1/2-13
	38.1	31.8	1.50	1.25	3/8-16
8	38.1	38.1	1.50	1.50	1/2-13
10	44.5	44.5	1.75	1.75	1/2-13
12	53.8	53.8	2.12	2.12	3/4-10
	53.8	50.8	2.12	2.00	
14	53.8	52.3	2.12	2.06	3/4-10
16	76.2	73	3	2.87	3/4-10
20	76.2	73	3	2.87	3/4-10

4. Rotate the V-notch ball (key 2) to the fully open position.
5. Drive out the groove pin (key 39) that secures the ball (key 2) to the follower shaft (key 38). Remove the groove pin from the ball ear in the direction shown in figure 6.
6. For NPS 3 through 8, refer to figure 6. The expansion pin (key 9) and the taper pin (key 10) inside of it are holding the ball in position on the drive shaft. Find the larger hole in the ball ear where these pins enter the ear. On the opposite side of the ear is a smaller hole where the chamfered end of the expansion pin rests on the inner lip of the hole.
7. For NPS 10 through 20, drive out the groove pin from the drive shaft (key 3) in the direction shown in figure 6.
8. For NPS 3 through 8, remove the pipe plug (key 29). Using a punch, drive the follower shaft (key 38) into the center of the ball (key 2). Use care to avoid dropping the follower shaft.
9. For NPS 10 through 20, remove the hex nuts (key 44), and then remove the bottom flange (key 40). Thread a bolt into the end of the follower shaft and pull the follower shaft out of the valve. Refer to table 6 for thread sizes. The bearing (key 6) may come out with the follower shaft. For NPS 14 through 20 the follower shaft can alternatively be pushed out into the center of the ball.

Note

For the NPS 14 through 20 if the valve is mounted with the shaft vertical relative to the ground a spring (key 54), two spring seats (key 53), and a thrust washer (key 55) will also be removed with the follower shaft ones the bottom flange has been unbolted.

⚠ WARNING

To avoid personal injury or damage to tools, valve parts, or other items resulting from the ball (key 2) falling from the valve body, support the ball to prevent it from falling as the drive shaft (key 3) is being removed.

10. Pull the drive shaft (key 3) from the valve body. If the shaft cannot be removed by hand, attach a slide hammer or similar tool to the spline end of the shaft that was attached to the actuator. If the shaft has a tapped hole at the spline end of the shaft, refer to table 6 for thread sizes.
11. Remove the ball (key 2), and thrust washers (key 12) from the valve body. For sizes NPS 3 through 12, if using 17-7PH thrust washers there will be two, if using alloy 6 there will only be one thrust washer.

Figure 6. Taper and Expansion Pin Removal from Ball and Drive Shaft

Note

For NPS 3 through 8, two shaft bearings (key 6) are located inside the valve body on either side of the ball. Only one of these two bearings is identified by key 6. The other bearing is located along the drive shaft on the other side of the V-notch ball.

For NPS 10 through 20, there are two shaft bearings. One is identified as key 6, and the other is identified as key 42.

12. If the shaft bearings are to be replaced, remove the packing (key 13).
13. If the bearing closest to the packing (key 6 on NPS 3 through 8 and key 42 on NPS 10 and 12) requires replacement and cannot be removed by hand, press it out using a ram with dimensions as given in figure 7.

For valve sizes NPS 3 through 12, the ram has a smaller diameter than the bearing stop (key 7) so the bearing stop need not be removed when pressing out the bearing on the drive shaft. Insert the ram through the packing box and press the bearing into the valve body cavity. Take care not to move the bearing stop when pressing out the bearing.

14. For valve sizes NPS 3 through 8, if the second bearing (key 6) requires replacement and cannot be removed by hand, use one of the following methods:
 - a. Knock or pry the bearing out, or

- b. Use the valve drive shaft as a piston to drive the bearing from the valve body. To accomplish this, install the pipe plug (key 29). Fill the bearing bore with a heavy grease and then insert the end of the shaft back through the valve body and into the grease-filled bearing. Protect the splined end of the shaft with, for example, a block of wood; then strike the protected end. When the shaft is struck, it will act as a piston, pushing the grease into the bearing bore. The grease will then force the bearing out of the bore and farther along the shaft. Soon, the bearing will be positioned for easy removal.
15. For NPS 10 through 20, if the bearing (key 6) on the follower shaft requires replacement and cannot be removed by hand, press it out using a ram with dimensions as given in figure 7. Press the bearing into the valve body cavity. Alternatively, for sizes NPS 14 through 20 the follower shaft (key 38) can be used to pull the bearing out by attaching a slide hammer or similar tool to the threaded hole in the bottom. Refer to table 6 for thread size.
16. If used, remove the O-rings (keys 19 and 20) from the bearings.

Table 7. Ram Dimension for Bearing Removal

VALVE SIZE, NPS	A		L	
	mm	Inches	mm	Inches
3	<u>27.8</u> 27.4	<u>1.094</u> 1.078	165	6.50
4	<u>34.1</u> 33.7	<u>1.344</u> 1.328	165	6.50
6	<u>42.1</u> 41.7	<u>1.656</u> 1.641	197	7.75
8	<u>42.1</u> 41.7	<u>1.656</u> 1.641	229	9.00
10	<u>48.4</u> 48.0	<u>1.905</u> 1.890	229	9.00
12	<u>57.8</u> 57.4	<u>2.275</u> 2.260	260	10.25
14	<u>62.5</u> 57.4	<u>2.46</u> 2.26	228.6	9
16	<u>84.5</u> 79.6	<u>3.325</u> 3.135	279.4	11
20	<u>84.5</u> 79.6	<u>3.325</u> 3.135	279.4	11

Figure 7. Ram Dimension for Bearing Removal

A3308

Assembly

Note

Before starting to assemble the valve components, place the valve body (key 1) on a flat surface with the retainer (key 5) facing down as shown in figure 8. This orientation of the valve allows easier installation of the V-notch ball.

1. Thoroughly clean the parts before assembly.
2. If O-rings (keys 19 and 20) are used on the bearings, apply a small amount of lubricant to the O-rings so the bearings will easily slide into the valve body. Insert the smaller O-ring (key 20) inside the bearing and the larger O-ring (key 19) around the outside of the bearing.

NOTICE

To avoid damage to O-rings resulting from contact with sharp edges within the bearing holes, use appropriate care when installing the O-rings.

3. Slide the bearing (key 6) and, if used, O-rings (keys 19 and 20) into the follower shaft bore located on the valve body (key 1) opposite the packing box. For NPS 10 and 12, make certain the groove located on the outside diameter of the bearing is positioned towards the bottom flange side of the valve body.
4. Slide the bearing located on the packing box side (key 6 for NPS 3 through 8 and key 42 for NPS 10 through 20) into the valve body and against the bearing stop.
5. For NPS 3 through 8, inspect the drive shaft (key 3). Insert the shaft end with the expansion or groove pin hole into the packing box and through the bearing that was previously installed in the packing box in step 4. Stop before the drive shaft enters the main valve body cavity. Support the splined or keyed end of the shaft.

For NPS 10 and 12, inspect the drive shaft (key 3). Insert the splined shaft end with the groove pin hole into the packing box and through the bearing that was previously installed in step 4. Stop before the drive shaft enters the main valve body cavity. Support the end of the drive shaft that extends out from the valve body.

6. For NPS 3 and 4, insert the follower shaft through the outside of the ear of the V-notch ball that has the smaller diameter (non-stepped) hole. Push the follower shaft through the ear until the end of the follower shaft with the groove pin hole is between the ears and the other end of the follower shaft is flush with the outside edge of the ear. Place the ball in the valve body cavity with the ear containing the follower shaft adjacent to the follower shaft bore. Slide the follower shaft through the ear of the ball and into the bearing (key 6) which was previously installed in step 3.

For NPS 6 and 8, locate the smaller diameter hole in the V-notch ball ear. Place the ball in the valve body cavity with the ear containing the smaller diameter hole adjacent to the follower shaft bore. Place the follower shaft between the ears of the ball. Slide the follower shaft through the ear of ball and into the bearing (key 6) that was previously installed in step 3.

For NPS 10 and 12, place the ball in the valve body cavity. Slide the follower shaft, splined end first, through the bearing (key 6) that was previously installed in step 3, and into the ear of the ball. Align the groove pin hole in the follower shaft with the hole in the ball ear.

For NPS 14 through 20, place the thrust washer (key 12) in the groove on the drive ear of the V-notch ball using anti seize lubricant to hold in place if needed. Place the ball in the valve body cavity with the splined V-notch ball ear on the packing box side of the body. Slide the follower shaft through the ear of the ball and into the follower bearing (key 6) installed in step 3. Align the groove pin hole in the follower shaft with the hole in the V-notch ball ear.

7. For NPS 3 through 8, position the ball so that the larger of the two expansion pin holes is facing up, away from the seat ring and retainer. Determine the correct orientation of the V-notch ball (key 2) required by the specific installation orientation of the valve and the flow direction of the process fluid. See figure 2.

For NPS 10 through 20, determine the correct orientation of the V-notch ball (key 2) required by the specific installation orientation of the valve and the flow direction of the process fluid. See figure 2. The groove pin hole in both the drive shaft (key 3) and the ear of the ball are offset from center. Make certain the holes will align.

Note

Before proceeding, inspect the V-notch ball position once again to ensure the correct orientation. If the ball is not properly installed, it will not rotate properly and will not shutoff in service.

8. For NPS 3 through 12, Hold the thrust washer (key 12) between the ball (key 2) and the bearing installed next to the packing (key 6 for NPS 3 through 8 and key 42 for NPS 10 and 12).

Note

To obtain the correct thickness, two thrust washers (key 12) are needed when using 17-7PH or a single 17-4PH for the NPS 14 through 20. When using alloy 6, only one thrust washer is needed to get the correct thickness.

For NPS 10 through 20, align the zero mark located on the end of the drive shaft with the zero mark located on the ball ear.

Slide the valve drive shaft (key 3) from the packing box into the valve body through the thrust washer and into the ear of the ball. The expansion or groove pin hole in both the drive shaft (key 3) and the ear of the vee-ball are offset from center. Make certain the holes will align.

9. For NPS 3 through 8, secure the ball in the correct open position. Locate the slash mark on the actuator end of the valve drive shaft. Rotate the drive shaft until the slash mark is vertical and facing out from the center of the shaft in the same direction as the ball seating surface. See figure 8.

Figure 8. Taper and Expansion Pin Insertion into Ball and Drive Shaft

E0576

Note

When the valve drive shaft is correctly positioned for NPS 3 through 8, the slash mark on the splined end will be parallel with the ball shutoff surface. See figure 8. If the ball is not properly aligned with the slash mark, the valve will not function correctly.

Step 9 is not required for NPS 10 through 20 because the drive shaft and the ear of the ball are both splined and were aligned in step 8.

10. Secure the ball to the follower shaft by aligning the groove pin hole in the ball ear and the hole on the opposite side of this ear with the groove pin hole through the follower shaft (key 38).
11. Use pin punches to drive in the groove pin until it is flush with the surface of the ball ear. Stake both ends of the pin hole in the ball ear to retain the pin during this step.
12. Secure the ball to the drive shaft (key 3) as follows:

For NPS 3 through 8:

- c. The holes in both the drive shaft (key 3) and the ear of the ball are offset from center. Make certain the holes in the ear of the ball will align with the hole in the drive shaft.

Note

If the holes in the ball ear do not line up with the hole in the drive shaft, check the slash mark on the splined end of the shaft. Make sure the shaft and ball are properly oriented.

- d. Place the chamfered end of the expansion pin (key 9) into the larger hole in the ball ear (see figure 8).

NOTICE

To avoid damage to the expansion pin, ball, or drive shaft resulting from the application of excessive force on the expansion pin, use appropriate care when driving the expansion pin through the ball and drive shaft. Use the correct tool. Do not use excessive force.

- e. Drive the expansion pin into the larger hole until the chamfered end of the pin reaches the inner lip of the smaller hole on the opposite side of the ball. Closely observe the progress of the pin to avoid striking it after it has reached the lip of the smaller hole.
- f. Place the taper pin (key 10) into the open end of the expansion pin. Drive the taper pin into the expansion pin until the pins, ball, and drive shaft are snug. Do not attempt to drive either pin flush with the ear.

For NPS 10 through 20, the groove pin holes in both the drive shaft (key 3) and the ear of the ball are offset from center and have spline ridges. Make certain the holes in the ear of the ball will align with the hole in the drive shaft. Secure the ball to the drive shaft by using pin punches and driving in the groove pin until it is flush with the surface of the ball ear. Make certain that the groove pin goes completely through the drive shaft and into the opposite side of the ball ear.

13. Rotate the ball by hand to check that it rotates properly. If rotation interferes with the valve body, drive out the taper and expansion pins (keys 9 and 10) for NPS 3 through 8 and the groove pin (key 39) that fastens the drive shaft to the ball for NPS 10 and 12. Remove the drive shaft (key 3), and repeat this procedure starting with step 5.
14. For NPS 3 through 8, install the pipe plug (key 29).
15. For NPS 14 through 20, if the valve has a vertical mounting spring (key 54) then install a spring seat (key 53) into the follower shaft as shown in figure 13 followed by the spring (key 54) and another spring seat (key 53) and finally the thrust washer (key 55) can sit in the bottom flange (key 40) groove.

16. For NPS 10 through 20, lubricate the bottom flange studs (key 43) and hex nuts (key 43) with appropriate anti-seize lubricant. Install the bottom flange studs (key 43), gasket (key 41), bottom flange (key 40), and then install and tighten the hex nuts (key 44) using accepted bolting procedures. See table 8 for torque values. Make sure the pipe plug (key 29) is installed in the bottom flange if applicable.

Table 8. NPS 10 through 20 Torque Levels

VALVE SIZE, NPS	TORQUE		STUD SIZE
	N•m	Lbf•ft	
10	141	104	9/16-12
12	176	130	5/8-11
14	442	325	7/8-9
16			
20			

17. If the seat ring (key 4), face seals (key 8), and retainer (key 5) need to be installed, complete the Assembly portion of the Replacing Retainer, Seat Ring, and Face Seals procedure in this manual. If the seat ring has previously been installed, proceed to Adjusting Actuator Travel in this manual. If the packing has been removed, be sure to refer to the Packing Maintenance procedures in this manual to replace the packing before installing the actuator on the valve.

Cavitrol Hex Replacement

Disassembly

WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

1. Isolate the control valve from line pressure, drain the process media from both sides of the valve, and remove the control valve/actuator assembly from the pipeline as described in the replacing retainer, seat ring, and face seals section.
2. Place the valve on a protected flat surface with the body outlet flange facing up.
3. Refer to figures 15 and 16. Remove the two fasteners (key 48) securing the Cavitrol Hex trim to the valve body.

WARNING

To avoid personal injury or property damage, do not use the two threaded lifting holes provided in the NPS 8 through NPS 12 Cavitrol Hex trim to lift the complete valve assembly. The two threaded holes are sized for lifting the Cavitrol Hex trim only.

All lifting and rigging must be completed in accordance with federal/national/provincial, state and local regulations, and applicable lifting and rigging equipment standards. Lifting and rigging equipment used to lift, install, or remove the Cavitrol Hex trim must be properly selected and sized for the weight of the component. The weights of the Cavitrol Hex trim are provided in table 9.

4. For sizes NPS 8 through NPS 12, install hoist rings or other appropriate lifting equipment into the two 3/8"-16 threaded holes in the Cavitrol Hex flange.
5. Remove the Cavitrol Hex trim (key 49) and place on a protected flat surface.
6. Remove gasket (key 50) from the valve body outlet flange.

Assembly

The Cavitrol Hex anti-cavitation trim (key 49) is available for the NPS 4 through NPS 12 CV500 with raised-face flanged body constructions. To retrofit the Cavitrol Hex to an existing valve assembly, special body machining is required. Two threaded holes must be added to the valve body outlet flange. Contact your [Emerson sales office](#) for retrofit information.

Note

The Cavitrol Hex anti-cavitation trim will add 12.7 mm (1/2-inch) to the face to face dimension of the valve.

1. The Cavitrol Hex anti-cavitation trim (key 49) is to be installed last, after the CV500 valve body assembly is complete. The recommended valve orientation for assembly is with the body outlet flange facing up. Refer to figures 15 and 16.
2. Ensure the ball is in the open position.
3. Place the gasket (key 50) over the body outlet flange serrated surface as illustrated in figure 15.
4. For sizes NPS 8 through NPS 12, install hoist rings or other appropriate lifting equipment into the two 3/8"-16 threaded holes in the Cavitrol Hex flange.

Table 9. Fisher Cavitrol Hex Dimensions and Weight

VALVE SIZE	FLANGE THICKNESS C (ADD TO OVERALL FACE-TO-FACE DIMENSION)		WEIGHT	
NPS	mm	Inch	kg	lbs
4	12.7	0.5	3.3	7.3
6	12.7	0.5	7.8	17.3
8	12.7	0.5	12.8	28.3
10	12.7	0.5	24.0	53.1
12	12.7	0.5	35.7	78.8

5. Insert the Cavitrol Hex anti-cavitation trim into the valve, ensuring the holes in the body outlet flange align with the holes in the trim flange. If applicable, remove the lifting equipment used to install Cavitrol Hex trim.
6. Install two fasteners (key 48) and adequately tighten to secure the trim to the valve assembly.

Adjusting Actuator Travel

Note

For valve sizes NPS 14 through 20 this procedure should be done without the retainer gasket installed.

For valve sizes NPS 14 through 20 ordered without an actuator a temporary zero mark will exist on the shaft (key 3) and packing flange (key 102). The closed position of the valve is achieved when the two marks are aligned, and the actuator travel stops can be adjusted accordingly.

The temporary marks indicating the closed position on sizes NPS 14 through 20 ordered without an actuator are only to be used when setting the travel stops on the actuator for the first time. The marks should be removed after.

Perform this procedure whenever the actuator is removed or disconnected from the valve and whenever the seat ring and retainer (keys 4 and 5) are removed. Too little actuator travel will increase shutoff leakage; too much travel will cause excessive ball and seat ring torque and wear.

Any of the Fisher pneumatic, electric, electrohydraulic, or manual actuators--or any other actuator--must be adjusted for use with a CV500 valve so that the ball is rotated to the fully closed position. For sizes NPS 3 through 12, a gap of approximately 0.0254 mm (0.001 inch) for temperatures to 260°C (500°F) or 0.1524 mm (0.006 inch) for higher temperatures measured between the seat ring (key 5) and retainer (key 4) indicates the fully closed position. For sizes 14 through 20, a gap of approximately 0.0254 mm (0.001 inch) is applicable for the entire temperature range of the product.

Note that this gap is also measured when assembling the seat ring, retainer, and face seals to ensure correct assembly. Measure the gap according to this procedure to ensure proper actuator adjustment. Merely completing the assembly measurement is not sufficient.

Travel adjustments vary with the type of actuator (some use turnbuckle assemblies; some use externally adjusted travel stops; others use internal limit switches). Refer to the actuator instruction manual for adjustment instructions.

Note

When mounting the actuator, be sure the ball (key 2) is closed. Do not use a hammer or other tool to drive the actuator lever onto the valve shaft. Clean the valve shaft and actuator lever splines to be sure the actuator lever will slide on easily.

If the lever does not slide on easily, carefully wedge the ball solidly against the actuator-side thrust washer using a screw driver or similar tool in the same location as the pry bar in the installation. Keep the wedge in place while installing the lever, but again, do not drive on the lever.

Remove the wedge after you have clamped the actuator lever on the valve shaft and connected the lever to the actuator piston rod or diaphragm rod.

1. Mount the actuator following the instructions in the actuator instruction manual. Refer to figure 2 to select actuator mounting style and position and to orient the actuator lever with the valve drive shaft (key 3).
2. For actuators with clamped levers, pull the drive shaft (key 3) by hand toward the packing (key 13) so that the ball (key 2) and thrust washer (key 12) are tight against the bearing closest to the packing (key 6 for NPS 3 through 8 and key 42 for NPS 10 and 12). Clamp the lever to the valve drive shaft.

NOTICE

Do not apply full actuator signal (pressure or power) to the actuator in the next step. A full signal may wedge the ball into the seat ring. Use a regulated signal source and gradually increase the signal to slowly stroke the actuator.

3. Adjust the actuator travel and stroke the actuator so that the ball is close to but not contacting the seat ring at full actuator travel. If available on electric actuators, use the manual handwheel to position the plug.
4. Adjust the travel, using a full actuator signal, until the ball contacts the seat ring around its full circumference. This contact self-centers the seat ring on the V-notch ball.
5. Continue to adjust the travel until a gap of approximately 0.0254 mm (0.001 inch) exists between the seat ring and retainer, as shown in figure 11, at full actuator travel.
6. Refer to the actuator instruction manual to lock the actuator travel adjustment.
7. For valve sizes NPS 14 through 20, refer to the Assembly procedure of the Replacing Retainer, Seat Ring, and Face Seals section in this manual prior to installing the valve in line.
8. After Zeroing the actuator verify that the seat is not visible when looking at the back face of the vee ball. If it is visible remove the retainer cap screws and retainer and repeat the zeroing procedure and ensure that the retainer cap screws are torqued to 32 in • lbf (3.6 N • m). See figure 9 showing a correctly zeroed valve vs an incorrectly zeroed valve with the seat ring visible.

Figure 9. Zeroing the Actuator

Changing Valve Flow Direction

The CV500 valve may be installed in either forward or reverse flow service. Standard flow direction is forward flow enters the seat ring first, then flows past the V-notch ball. If Cavitrol Hex trim is installed, the valve should be used in the forward flow direction for the anti-cavitation trim to be most effective. If changing flow direction is necessary, release all pressure from the valve and actuator. Remove the control valve assembly from the pipeline and rotate the assembly about the valve drive shaft to put the retainer end of the valve where the other end was. Refer to the procedure for changing actuator mounting style if the actuator must be repositioned, and refer to the installation section to install the control valve assembly. Be sure to reposition the flow direction arrow on the valve.

Changing Actuator Mounting Style

Refer to figure 2 of this manual and the actuator instruction manual when changing mounting styles or positions. Right-hand mounting places the actuator on the right side of the valve as viewed from the upstream side of the valve; left-hand mounting places the actuator on the left side of the valve. Remember that the upstream side of the valve inlet is the retainer end of the valve body for forward flow and the other end of the valve body is the upstream side for reverse flow.

Complete the Adjusting Actuator Travel procedure in this manual whenever the actuator is removed.

Parts Ordering

A serial number is assigned to each valve body and stamped on the nameplate. Always refer to this serial number when corresponding with your [Emerson sales office](#) regarding spare parts or technical information.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts Kits

Repair Kits

Repair kits include recommended spares for standard and sealed bearing constructions.

Cavitrol Hex Retrofit Kit

Kit includes the Cavitrol Hex (key 47), gasket (key 48), and fasteners (key 46). Kits are available for the NPS 4 through 12 CV500 flanged, raised-face body constructions. To retrofit the Cavitrol Hex anti-cavitation trim to an existing valve assembly, special body machining is required. Two threaded holes must be added to the valve body outlet flange. Contact your [Emerson sales office](#) for retrofit information.

Introduction

Scope of Manual

This instruction manual includes installation and operation information for the Fisher CVX Blowdown Fixture. Piping blowdown is very important to successful plant startup and trouble free operation. The plan for piping blowdown should be undertaken by professionals familiar with all aspects of blowdown operation. This manual is not intended to cover all details required for successful piping system cleaning.

The CVX Blowdown Fixture is only available for constructions including replaceable diffusers.

Key numbers identified for valve disassembly are shown in the specific valve instruction manual. Refer to separate instruction manuals for instructions covering the exact valve, actuator, and accessories associated with the blowdown fixture.

Do not install, operate, or maintain a CVX Blowdown Fixture without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

The CVX Blowdown Fixture provides a convenient way to clean piping upstream of the valve while taking care not to damage internal valve parts.

Educational Services

For information on available courses for the Fisher CVX Blowdown Fixture, as well as a variety of other products, contact:

Emerson Automation Solutions
Educational Services - Registration
Phone: 1-641-754-3771 or 1-800-338-8158
E-mail: education@emerson.com
emerson.com/fishervalvetraining

Principle of Operation

The Blowdown Fixture replaces the valve plug and cage and allows steam flow from the upstream piping to be directed through the valve body and out the valve outlet and downstream piping.

Maintenance

WARNING

To avoid personal injury or property damage from release of pressurized process media, ensure that the system is completely depressurized and appropriate safety measures have been taken prior to carrying out any of the following maintenance procedures. Only trained competent individuals with the proper equipment should attempt to disassemble and install a Blowdown Fixture, and reassemble a CVX valve.

- Do not remove the actuator from the desuperheater while the valve is still pressurized.
 - Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
 - Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
 - Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
 - Vent the power actuator loading pressure and relieve any actuator spring precompression.
 - Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
 - The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
 - Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
-

Valve Disassembly

The following valve disassembly steps are intended as a quick reference only. Refer to the CVX instruction manual, D103606X012, for key numbers and further detail regarding valve disassembly.

Actuator Removal

The following actuator disassembly steps are intended as a quick reference only. Refer to the appropriate actuator instruction manual for further detail on actuator removal.

1. Release the actuator seat load by either manually stroking the valve or applying the appropriate instrument signal. The stem connector may be removed once the plug is off of the valve seat.
2. If an instrument signal has been used to stroke the plug off the seat, remove the signal only after removing the stem connector.
3. Isolate and disconnect the operating lines from the actuator.
4. Loosen the yoke fasteners and remove the actuator from the valve.

Packing Box

Unbolt the packing stud nuts, (key 68), and remove the packing flange (key 66) and packing follower, (key 65) (reference the appropriate instruction manual for key numbers). Remove as much packing as possible from the packing box.

CAUTION

Extreme care should be taken to avoid scratching the stem or the packing box.

Bonnet and Trim

1. Loosen the bonnet stud nuts, (key 55) using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the bonnet studs, which may cause binding.

Individual nuts should not be completely loosened while the remaining nuts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs.

2. Remove the bonnet (key 6) from the valve with uni-axial pull. If the bonnet seems to bind in the valve body, check the alignment of the hoist or pulling mechanism. Deviation from an axial pull of the parts may result in galling or bending of the stem (key 23). The bonnet may be lightly tapped back into alignment with a soft face mallet. The stem and plug should be pushed back into the valve body while the bonnet is being removed. Once the bonnet is removed, dislodge any remaining packing rings from the packing box.

CAUTION

Do not attempt to overpower any binding, as damage to the guide surfaces may result.

3. Remove the packing ring (key 63) from the bottom of the packing box. Lightly sand the inside of the packing box with 60 or 80 grit paper to remove any adherent packing material. Final cleanup should be made with 160 grit or finer paper.

4. Inspect the bonnet guiding surfaces and gasket mating surfaces. Light damage on the guiding surface may be repaired with an emery cloth or other suitable material. Damage to the gasket mating surface may require bonnet replacement to avoid leakage.
5. Remove the plug assembly (key 22, 23, and 53) as a single unit by grasping the valve stem (key 23) and pulling the assembly from the body cavity. The plug assembly contains sensitive guiding and sealing surfaces on its outside diameter and care must be taken in its handling. The plug should be temporarily stored on a clean wooden or cloth surface.
6. Remove the cage (key 21) from the valve body. Remove and discard the upper and lower cage gaskets (key 43). Reference the CVX valve instruction manual for guidance in performing this disassembly. The cage contains sensitive guiding surfaces on its outside diameter and care must be taken during handling. The cage should be temporarily stored on a clean wooden or cloth surface.
7. Clean and inspect the guiding and sealing surfaces of the plug assembly. For balanced plug designs, inspect the piston ring (key 45) and Bore Seal ring (key 46) for signs of excess wear or damage and replace if necessary. The piston ring is a two piece design with an outer seal ring and an inner expander ring. The outer ring diameter should be expanded beyond the diameter of the plug in its free state. It can be shifted within its groove to inspect for uneven wear around its circumference. The piston ring should require some compression when installing the plug into the cage. Lack of required compression indicates that the piston ring has worn or relaxed and should be replaced. Vertical marks in the axial orientation also indicates wear that requires replacement of the ring. The Bore Seal ring has a C-shaped cross section with the open portion of the C-shape facing the stem side of the plug for flow-up designs and the open portion of the C-shape facing the seating surface of the plug for flow-down designs. Any uneven marks around the circumference of the ring or any flattening of the ring shape at its outside diameter are indications of wear and require replacement. Contact your [Emerson sales office](#) or Local Business Partner for Bore Seal ring replacement.
8. Clean and inspect the inside diameter surfaces of the cage. The entire length of the cage inside diameter is either a sealing and/or guiding surface and any measurable wear requires that the cage be replaced.
9. **Bolted Seat Ring Removable Diffuser Only:** The bolted seat ring and seat diffuser must be removed. Loosen the seat ring bolts, (key 76) using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the seat ring studs, which may cause binding. Individual bolts should not be completely loosened while the remaining bolts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs. Reference the CVX instruction manual for guiding on removing the bolted seat ring and seat diffuser (key 77). Discard lower diffuser gaskets (key 75). The bolted seat ring and seat diffuser contain sensitive guiding and gasket surfaces on its outside diameter and care must be taken in their handling. The seat ring and seat diffuser should be temporarily stored on a clean wooden or cloth surface.
10. Remove all used gaskets and foreign matter from the interior of the valve and from the inlet and outlet openings. Remove any foreign matter that may be in the valve trim. Inspect all valve body guiding and sealing surfaces for any signs of wear.

Visual Inspection

Visually inspect the interior of the valve for abnormal wear, signs of erosion, or scoring if the valve has been in service. All scores and scratches should be removed by grinding or filing to remove any interference of the clearance zones between the internal bores and the mating parts. The affected area should be sanded with 100 grit or finer paper. Do not attempt to completely remove the score, only the interference should be removed and sanded.

The gasket surfaces of the valve body and bonnet should be inspected to verify that they are not damaged and are free of imbedded gasket material.

Installation of the Blowdown Plug

Inspect the valve to ensure that all parts and gaskets have been removed and the valve body is free from foreign debris. Lubricate the lower body bore where the bolted seat and seat diffuser guide are located and the upper valve body bore and counterbore. Install the trim as noted below and illustrated in the Blowdown Fixture drawings, figure 1.

1. Place the lower cage gasket (key 43) into the valve body.
2. Insert the Blowdown Plug (key 3) into the valve body, making sure that the gasket remains properly placed.

Table 1. Recommended Bonnet Stud Torque⁽¹⁾

Bolt Size, Inch	Threads Per Inch	Recommended Bolt Torque, lbf•ft ⁽²⁾
1	8	405
1-1/8	8	550
1-1/4	8	730
1-3/8	8	980
1-1/2	8	1290
1-5/8	8	1650
1-3/4	8	2070
1-7/8	8	2560
2	8	3130
2-1/4	8	4490

1. Torque values for lubricated threads.
2. Torques for studs with heavy hex nuts.

3. Place the upper cage gasket (key 43) on top of the flange of the Blowdown Plug.
4. Lubricate the bonnet studs (key 54) and lower the bonnet (key 6) onto the valve body, making sure that the upper cage gasket remains in the gasket containment groove.
5. Lubricate and tighten the bonnet fasteners as recommended in the TBX valve instruction manual. Torque values are also shown in table 1 of this document.

CAUTION

Failure to comply with good body-to-bonnet bolting practices and the torque values shown in table 1 or in the appropriate valve instruction manual may result in damage to the valve.

Piping Blowdown with the Blowdown Fixture Installed

⚠ WARNING

To avoid personal injury or property damage from blown out debris, take appropriate measures to stay clear of the outlet of the blowdown piping during the following procedure.

Note

The following steps are not intended to be complete instructions for performing a proper system blowdown. They are intended only to address the basic issues required for proper piping blowdown.

1. Perform piping blowdown according to plant startup procedures. Normal blowdown procedures should incorporate piping velocities in excess of those anticipated during maximum system operation. Piping should be blown down until two subsequent checks of a target placed at the outlet of the blowdown piping indicate that all debris has been removed from the piping.
2. At the completion of the blowdown procedure, secure and depressurize the system.

Disassembly of the Blowdown Fixture

1. Loosen the bonnet nuts, (key 55) using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the bonnet flange studs which may cause binding.

Individual nuts should not be completely loosened while the remaining nuts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs.

2. Remove the bonnet (key 6) from the valve with uni-axial pull. If the bonnet seems to bind in the valve body, check the alignment of the hoist or pulling mechanism. Deviation from an axial pull of the parts may result in galling or bending of the stem.

CAUTION

Do not attempt to over-power any binding, as damage to the guide surfaces may result.

3. Remove and discard the upper cage gasket (key 43).
4. Remove the Blowdown Plug (key 3) from the valve body cavity using the integral eyebolt holes in the blowdown plug.
5. Remove and discard the lower cage gasket (key 43).

CAUTION

To avoid compromising the service life of the TBX valve body and/or trim, do not reuse the Blowdown Fixture gaskets for valve reassembly.

Cleaning

After removal of the Blowdown Plug, the interior of the valve body should be rinsed with clean water or repeatedly wiped with clean towels until the surfaces are clean to the touch. All internal parts should be cleaned prior to reassembly.

Reassembly

Refer to the CVX valve instruction manual for guidance in reassembling the valve.

Ordering Information

Information required to order a CVX Blowdown Fixture.

- Valve Serial Number
- Valve Tag Number
- Customer Order Number
- Valve Model Number

Blowdown Fixture Design Conditions

- Flushing Fluid
- Flushing Fluid Pressure
- Flushing Fluid Temperature
- Material (carbon steel unless otherwise specified)

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Introduction

Scope of Manual

This instruction manual includes installation and operation information for the Fisher CVX Blowout Fixture. Piping blowdown is very important to successful plant startup and trouble free operation. The plan for piping blowdown should be undertaken by professionals familiar with all aspects of blowdown operation. This manual is not intended to cover all details required for successful piping system cleaning.

CVX valves are available with either integral welded diffusers or bolted removable diffusers. Some instructions are different between both constructions. See table 1 or consult your Emerson Process Management sales office to determine which blowout fixtures are available for use.

Key numbers identified for valve disassembly are shown in the specific valve instruction manual. Refer to separate instruction manuals for instructions covering the exact valve, actuator, and accessories associated with the blowout fixture.

Do not install, operate, or maintain a CVX Blowout Fixture without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. **To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings.** If you have any questions about these instructions, contact your Emerson Process Management sales office before proceeding.

Description

The CVX Blowout Fixture provides a convenient way to clean piping upstream of the valve while taking care not to damage internal valve parts.

Educational Services

For information on available courses for the Fisher CVX Blowout Fixture, as well as a variety of other products, contact:

Emerson Process Management
Educational Services, Registration

Phone: 641-754-3771
FAX: 641-754-3431
e-mail: education@emerson.com

Table 1. Fisher CVX Blowout Fixture Availability

	Flanged Outlet - Bonnet Blowout	Flange Inlet - Bonnet Blowout	BWE Outlet - Bonnet Blowout	BWE Inlet - Bonnet Blowout
CVX welded seat ring & welded integral diffuser	NA	Available	NA	Available
CVX bolted seat ring & welded integral diffuser	NA	Available	NA	Available
CVX bolted seat ring & bolted removable diffuser	Available	Available	Available	Available

Principle of Operation

The Blowout Fixture replaces the valve cage and plug, as well as the valve bonnet. The fixture allows steam flow from the inlet or outlet piping to be directed through the valve, out the blowout fixture, and through temporary piping.

Maintenance

⚠ WARNING

To avoid personal injury or property damage from the release of pressurized process media, ensure that the system is completely depressurized and appropriate safety measures have been taken prior to carrying out any of the following procedures. Only trained competent individuals with the proper equipment should attempt to disassemble and install a Blowout Fixture, and reassemble a CVX valve.

- Do not remove the actuator from the desuperheater while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Valve Disassembly

The following valve disassembly steps are intended as a quick reference only. Refer to the CVX instruction manual, D103606X012, for key numbers and further detail regarding valve disassembly.

Actuator Removal

The following actuator disassembly steps are intended as a quick reference only. Refer to the appropriate actuator instruction manual for further detail regarding actuator removal.

1. Release the actuator seat load by either manually stroking the valve or applying the appropriate instrument signal. The stem connector may be removed once the plug is off of the valve seat.
2. If an instrument signal has been used to stroke the plug off the seat, remove the signal only after removing the stem connector.
3. Isolate and disconnect the operating lines from the actuator.
4. Loosen the yoke fasteners, as appropriate, and remove the actuator from the valve.

Packing Box

Unbolt the packing stud nuts, (key 68), and remove the packing flange (key 66) and packing follower, (key 65) (reference the appropriate instruction manual for key numbers). Remove as much packing as possible from the packing box.

CAUTION

Extreme care should be taken to avoid scratching the stem or the packing box.

Bonnet and Trim

1. Loosen the bonnet stud nuts, (key 55) using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the bonnet studs which may cause binding.

Individual nuts should not be completely loosened while the remaining nuts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs.

2. Remove the bonnet (key 6) from the valve with uni-axial pull. If the bonnet seems to bind in the valve body, check the alignment of the hoist or pulling mechanism. Deviation from an axial pull of the parts may result in galling or bending of the stem (key 23).

CAUTION

Do not attempt to over-power any binding, as damage to the guide surfaces may result.

The bonnet may be lightly tapped back into alignment with a soft face mallet. The stem and plug should be pushed back into the valve body while the bonnet is being removed. Once the bonnet is removed, dislodge any remaining packing rings from the packing box.

3. Remove the packing ring (key 63) from the bottom of the packing box. Lightly sand the inside of the packing box with 60 or 80 grit paper to remove any adherent packing material. Final cleanup should be made with 160 grit or higher paper.
4. Inspect the bonnet guiding surfaces and gasket mating surfaces. Light damage on the guiding surface may be repaired with an emery cloth or other suitable material. Damage to the gasket mating surface may require bonnet replacement to avoid leakage.
5. Remove the plug assembly (key 22, 23, and 53) as a single unit by grasping the valve stem (key 23) and pulling the assembly from the body cavity. The plug assembly contains sensitive guiding and sealing surfaces on its outside diameter and care must be taken in its handling. The plug should be temporarily stored on a clean wooden or cloth surface.
6. Remove the cage (key 21) from the valve body. Remove and discard the upper and lower cage gaskets (key 43). Reference the CVX valve instruction manual for guidance in performing this disassembly. The cage contains sensitive guiding surfaces on its outside diameter and care must be taken during handling. The cage should be temporarily stored on a clean wooden or cloth surface.
7. Clean and inspect the guiding and sealing surfaces of the plug assembly. For balanced plug designs, inspect the piston ring (key 45) and Bore Seal ring (key 46) for signs of excess wear or damage and replace if necessary. The piston ring is a two piece design with an outer seal ring and an inner expander ring. The outer ring diameter should be expanded beyond the diameter of the plug in its free state. It can be shifted within its groove to inspect for uneven wear around its circumference. The piston ring should require some compression when installing the plug into the cage. Lack of required compression indicates that the piston ring has worn or relaxed and should be replaced. Vertical marks in the axial orientation also indicates wear that requires replacement of the ring. The Bore Seal ring has a C-shaped cross section with the open portion of the C-shape facing the stem side of the plug for flow-up designs and the open portion of the C-shape facing the seating surface of the plug for flow-down designs. Any uneven marks around the circumference of the ring or any flattening of the ring shape at its outside diameter are indications of wear and require replacement. Contact your Emerson Process Management sales office for Bore Seal ring replacement.
8. Clean and inspect the inside diameter surfaces of the cage. The entire length of the cage inside diameter is either a sealing and/or guiding surface and any measurable wear requires that the cage be replaced.
9. **Integral welded diffuser only:** The seat ring remains retained inside the valve body regardless if it is bolted or welded. Clean and inspect the angled seating surface. Any detectable damage around the circumference of the seating surface is an indication of wear and requires reconditioning to ensure seating performance. Contact your Emerson Process Management sales office for specific instructions on reconditioning the seating surface.
10. **Removable bolted diffuser only:** The bolted seat ring and removable diffuser must be removed. Loosen the seat ring bolts, (key 76) using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the seat ring studs, which may cause binding. Individual bolts should not be completely loosened while the remaining bolts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs. Reference the CVX instruction manual for guiding on removing the bolted seat ring and removable diffuser (key 77). Discard lower cage gaskets (key 75). The bolted seat ring and removable diffuser contain sensitive guiding and gasket surfaces on its outside diameter and care must be taken in their handling. The seat ring and removable diffuser should be temporarily stored on a clean wooden or cloth surface.
11. Remove all used gaskets and foreign matter from the interior of the valve and from the inlet and outlet openings. Remove any foreign matter that may be in the valve body or trim. Inspect all valve body guiding and sealing surfaces for any signs of wear.

Visual Inspection

Visually inspect the interior of the valve for abnormal wear, signs of erosion, or scoring if the valve has been in service. All scores and scratches should be removed by grinding or filing to remove any interference of the clearance zones between the internal bores and the mating parts. The affected area should be sanded with 100 grit or finer paper. Do not attempt to completely remove the score, only the interference should be removed and sanded.

The gasket surfaces of the valve body and bonnet should be inspected to verify that they are not damaged and are free of imbedded gasket material.

Installation of the Blowout Fixture

Inspect the valve to ensure that all parts and gaskets have been removed and the valve body is free from foreign debris. For CVX constructions with welded integral diffusers, lubricate the inside and outside of the seat lip and the upper valve body bore and counterbore. For CVX constructions with bolted removable diffusers, lubricate the lower body bore where the bolted seat and removable diffuser guide are located and the upper valve body bore and counterbore. Install the trim as noted below and illustrated in the Blowout Fixture drawings, figures 1-8.

1. Place the lower cage gasket (key 43) in the valve body.
2. **Integral welded diffuser only:** Insert the blowout plug (key 4 or 5) in the valve body making sure that the gasket remains properly placed. Note that the Blowout Plug must extend to and engage with the seat ring. If there is any question regarding the proper seating of the Blowout Plug inside the valve body, the following measurements can be taken for confirmation. Measure the thickness of the Blowout Plug flange at its largest diameter. Measure the depth of the mating counterbore where the Blowout Plug flange engages into the valve body. When assembled with a new cage gasket, the resulting depth from the top of the valve body to the top of the Blowout Plug flange should be the difference in these two measured values, minus an additional 0.045 inch to allow for the uncompressed gasket.
3. **Removable bolted diffuser only:** Insert the Blowout Plug (key 4 or 5) into the valve body, making sure that the gasket remains properly placed.
4. Place the upper cage gasket (key 43) on top of the Blowout Plug flange.
5. Lubricate the bonnet studs (key 54) and lower the blowout bonnet (key 10) onto the valve body, making sure that the upper cage gasket remains located in the gasket containment groove.
6. Lubricate and tighten the bonnet fasteners as recommended in the CVX valve instruction manual. Torque values are also shown in table 2 of this document.

CAUTION

Failure to comply with good body-to-bonnet bolting practices and the torque values shown in table 2 or in the appropriate valve instruction manual may result in damage to the valve.

Piping Blowdown with the Blowout Fixture Installed

⚠ WARNING

To avoid personal injury or property damage from sudden release of process pressure or bursting of parts, do not exceed the pressure class rating of the blowout fixture when performing the piping blowdown.

Note

The following steps are not intended to be complete instructions for performing a proper system blowdown. They are intended only to address the basic issues required for proper piping blowdown.

1. Connect temporary piping to the Blowout Bonnet connection taking care not to impose excessive piping loads on the valve-to-bonnet connection.
2. Perform piping blowdown according to plant startup procedures. Normal blowdown procedures should incorporate piping velocities in excess of those anticipated during maximum system operation. Piping should be blown down until two subsequent checks of a target placed at the outlet of the blowdown piping indicate that all debris has been removed from the piping.
3. At the completion of the blowdown procedure, secure and depressurize the system.

Table 2. Recommended Bonnet Bolt Torque

Bolt Size, Inch	Threads per Inch	Recommended Bolt Torque, lbf•ft ⁽¹⁾
1	8	405
1-1/8	8	550
1-1/4	8	730
1-3/8	8	980
1-1/2	8	1290
1-5/8	8	1650
1-3/4	8	2070
1-7/8	8	2560
2	8	3130
2-1/4	8	4490

1. Torques for studs with heavy hex nuts.

Disassembly of the Blowout Fixture

1. Disconnect the temporary piping connection from the Blowout Bonnet.
2. Loosen the Blowout Bonnet nuts, (key 55) using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the bonnet flange studs which may cause binding.

Individual nuts should not be completely loosened while the remaining nuts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs.

3. Remove the Blowout Bonnet (key 10) from the valve with uni-axial pull. If the Blowout Bonnet seems to bind in the valve body, check the alignment of the hoist or pulling mechanism. Deviation from an axial pull of the parts may result in galling or bending of the stem.

CAUTION

Do not attempt to over-power any binding, as damage to the guide surfaces may result.

4. Remove and discard the upper cage gasket (key 43).
5. Remove the Blowout Plug (key 5) from the valve body cavity using the integral eyebolt holes in the Blowout Plug.
6. Remove and discard the lower cage gasket (key 43).

CAUTION

To avoid compromising the service life of the CVX valve body and/or trim, do not reuse the Blowout Fixture gaskets for valve reassembly.

Cleaning

After removal of the blowout trim, the interior of the valve body should be rinsed with clean water or repeatedly wiped with clean towels until the surfaces are clean to the touch. All internal parts should be thoroughly cleaned prior to reassembly of the valve.

Reassembly

Refer to the CVX valve instruction manual for guidance in reassembling the valve.

Introduction

Scope of Manual

This instruction manual includes installation and operation information for the Fisher CVX Hydro-Plug Fixture. The CVX Hydro-Plug Fixture can be very useful in establishing hydro test boundaries since most CVX valves are split class valves. This manual is not intended to cover all details required for successful hydro testing.

Key numbers identified for valve disassembly are shown in the specific valve instruction manual. Refer to separate instruction manuals for instructions covering the exact valve, actuator, and accessories associated with the Hydro-Plug.

Do not install, operate, or maintain a CVX Hydro-Plug Fixture without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. **To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings.** If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

The CVX Hydro-Plug fixture provides a convenient way to establish hydrotest boundaries associated with using a split class valve typical of the CVX. The Hydro-Plug fixture is intended to be used so that the upstream piping can be tested at the required pressure for body and inlet piping pressure class without overpressurizing the lower pressure class outlet and outlet piping.

Educational Services

For information on available courses for the Fisher CVX Hydro-Plug Fixture, as well as a variety of other products, contact:

Emerson Automation Solutions
Educational Services - Registration
Phone: 1-641-754-3771 or 1-800-338-8158
E-mail: education@emerson.com
emerson.com/fishervalvetraining

Principle of Operation

The Hydro-Plug replaces the valve plug and cage and allows pressurization of the valve inlet, valve body, and inlet piping to the appropriate hydro pressure without overpressurizing the lower pressure class valve outlet and outlet piping.

CAUTION

The Hydro-Plug Fixture employs a rubber O-ring to create a positive seal at the valve seat. The sealing integrity of this O-ring will be compromised if the Hydro-Plug is installed when welding the valve body inline, or during welding preheat or post weld heat treatment.

Maintenance

⚠ WARNING

To avoid personal injury or property damage from pressurized escape of process media, ensure that the system is completely depressurized and appropriate safety measures have been taken prior to carrying out any of the following procedures. Only trained competent individuals with the proper equipment should attempt to disassemble and install a Hydro-Plug Fixture, and reassemble a CVX valve.

- Do not remove the actuator from the desuperheater while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.

-
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
-

Valve Disassembly

The following valve disassembly steps are intended as a quick reference only. Refer to the CVX instruction manual, D103606X012, for further detail regarding valve disassembly.

Actuator Removal

The following actuator disassembly steps are intended as a quick reference only. Refer to the appropriate actuator instruction manual for further detail regarding actuator removal.

1. Release the actuator seat load by either manually stroking the valve or applying the appropriate instrument signal. The stem connector may be removed once the plug is off the valve seat.
2. If an instrument signal has been used to stroke the plug off the seat, remove the signal only after removing the stem connector.
3. Isolate and disconnect the operating lines from the actuator.
4. Loosen the yoke locknut or the fasteners and remove the actuator from the valve.

Packing Box

Unbolt the packing stud nuts, (key 68), and remove the packing flange (key 66) and packing follower, (key 65) (reference appropriate instruction manual for key numbers). Remove as much packing as possible from the packing box.

CAUTION

Extreme care should be taken to avoid scratching the stem or the packing box.

Bonnet and Trim

1. Loosen the bonnet stud nuts (key 55), using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the bonnet studs which may cause binding.

Individual nuts should not be completely loosened while the remaining nuts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs.

2. Remove the bonnet (key 6) from the valve with uni-axial pull. If the bonnet seems to bind in the valve body, check the alignment of the hoist or pulling mechanism. Deviation from an axial pull of the parts may result in galling or bending of the stem (key 23).

CAUTION

Do not attempt to over-power any binding, as damage to the guide surfaces may result.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

CVX Hydro-Plug Fixture

June 2017

Instruction Manual

D103630X012

The bonnet may be lightly tapped back into alignment with a soft face mallet. The stem and plug should be pushed back into the valve body while the bonnet is being removed. Once the bonnet is removed, dislodge any remaining packing rings from the packing box.

3. Remove the packing ring (key 63) from the bottom of the packing box. Lightly sand the inside of the packing box with 60 or 80 grit paper to remove any adherent packing material. Final cleanup should be made with 160 grit or higher paper.
4. Inspect the bonnet guiding surfaces and gasket mating surfaces. Light damage on the guiding surface may be repaired with an emery cloth or other suitable material. Damage to the gasket mating surface may require bonnet replacement to avoid leakage.
5. Remove the plug assembly (key 22, 23, and 53) as a single unit by grasping the valve stem (key 23) and pulling the assembly from the body cavity. The plug assembly contains sensitive guiding and sealing surfaces on its outside diameter and care must be taken in its handling. The plug should be temporarily stored on a clean wooden or cloth surface.
6. Remove the cage (key 21) from the valve body. Remove and discard the upper and lower cage gaskets (key 43). Reference the CVX valve instruction manual for guidance in performing this disassembly. The cage contains sensitive guiding surfaces on its outside diameter and care must be taken during handling. The cage should be temporarily stored on a clean wooden or cloth surface.
7. Clean and inspect the guiding and sealing surfaces of the plug assembly. For balanced plug designs, inspect the piston ring (key 45) and Bore Seal ring (key 46) for signs of excess wear or damage and replace if necessary. The piston ring is a two piece design with an outer seal ring and an inner expander ring. The outer ring diameter should be expanded beyond the diameter of the plug in its free state. It can be shifted within its groove to inspect for uneven wear around its circumference. The piston ring should require some compression when installing the plug into the cage. Lack of required compression indicates that the piston ring has worn or relaxed and should be replaced. Vertical marks in the axial orientation also indicates wear that requires replacement of the ring. The Bore Seal ring has a C-shaped cross section with the open portion of the C-shape facing the seating surface of the plug for flow-up designs and the open portion of the C-shape facing the seating surface of the plug for flow-down designs. Any uneven marks around the circumference of the ring or any flattening of the ring shape at its outside diameter are indications of wear and require replacement. Contact your [Emerson sales office](#) or Local Business Partner for Bore Seal ring replacement.

Table 1. Recommended Bonnet Bolt Torque

Bolt Size, Inch	Threads per Inch	Recommended Bolt Torque, lbf•ft ⁽¹⁾
1	8	405
1-1/8	8	550
1-1/4	8	730
1-3/8	8	980
1-1/2	8	1290
1-5/8	8	1650
1-3/4	8	2070
1-7/8	8	2560
2	8	3130
2-1/4	8	4490

1. Torques for studs with heavy hex nuts.

8. Clean and inspect the inside diameter surfaces of the cage. The entire length of the cage inside diameter is either a sealing and/or guiding surface and any measurable wear requires that the cage be replaced.
9. **Integral Diffuser Constructions Only:** The seat ring remains retained inside the valve body regardless if it is bolted or welded. Clean and inspect the angled seating surface. Any detectable damage around the circumference of the seating surface is an indication of wear and requires reconditioning to ensure seating performance. Contact your Emerson sales office or Local Business Partner for specific instructions on reconditioning the seating surface.
10. **Bolted Seat Ring Removable Diffuser Only:** The bolted seat ring and seat diffuser must be removed. Loosen the seat ring bolts, (key 76) using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the

seat ring studs, which may cause binding. Individual bolts should not be completely loosened while the remaining bolts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs. Reference the CVX instruction manual for guiding on removing the bolted seat ring and seat diffuser (key 77). Discard lower diffuser gaskets (key 75). The bolted seat ring and seat diffuser contain sensitive guiding and gasket surfaces on its outside diameter and care must be taken in their handling. The seat ring and seat diffuser should be temporarily stored on a clean wooden or cloth surface.

11. Remove all used gaskets and foreign matter from the interior of the valve and from the inlet and outlet openings. Remove any foreign matter that may be in the valve trim. Inspect all valve body guiding and sealing surfaces for any signs of wear.

Visual Inspection

Visually inspect the interior of the valve for abnormal wear, signs of erosion, or scoring if the valve has been in service. All scores and scratches should be removed by grinding or filing to remove any interference of the clearance zones between the internal bores and the mating parts. The affected area should be sanded with 100 grit or finer paper. Do not attempt to completely remove the score, only the interference should be removed and sanded.

The gasket surfaces of the valve body and bonnet should be inspected to verify that they are not damaged and are free of imbedded gasket material.

Installation of the Hydro-Plug

Inspect the valve to ensure that all parts and gaskets have been removed and the valve body is free from foreign debris. For CVX constructions containing integral diffusers, lubricate the inside and outside of the seat lip and the upper valve body bore and counterbore. For CVX constructions with removable diffusers, lubricate the lower body bore where the bolted seat and removable diffuser guide and the upper valve body bore and counterbore. Install the trim as noted below and illustrated in the Hydro-Plug Fixture drawings, figures 1 to 3).

1. Place the lower cage gasket (key 43) in the valve body.
2. **Integral Diffuser Constructions only:** Insert the Hydro-Plug (key 2) in the valve body, making sure that the gasket remains properly placed. Note that the Hydro-Plug must extend to and engage with the seat ring. If there is any question regarding the proper seating of the Hydro-Plug inside the valve body, the following measurements can be taken for confirmation. Measure the thickness of the Hydro-Plug flange at its largest diameter. Measure the depth of the mating counterbore where the Hydro-Plug flange engages into the valve body. When assembled with a new cage gasket, the resulting depth from the top of the valve body to the top of the Hydro-Plug flange should be the difference in these two measured values, minus an additional 0.045 inch to allow for the uncompressed gasket.
3. **Bolted Seat Ring Removable Diffuser Only:** Insert the Hydro-Plug (key 2) into the valve body, making sure that the gasket remains properly placed.
4. Place the upper cage gasket (key 43) on the Hydro-Plug.
5. Lubricate the bonnet studs (key 54) and lower the bonnet (key 6) onto the valve body, making sure that the upper cage gasket remains in the gasket containment groove.
6. Lubricate and tighten the bonnet fasteners as recommended in the appropriate valve instruction manual. Torque values are also shown in table 1 of this document.

CAUTION

Failure to comply with good body-to-bonnet bolting practices and the torque values shown in table 1 or in the appropriate valve instruction manual may result in damage to the valve.

Piping Hydro Test with Hydro-Plug Fixture Installed

⚠ WARNING

To avoid personal injury or property damage from pressurized escape of process media, ensure that the system is completely depressurized and appropriate safety measures have been taken prior to carrying out any of the following procedures. Only trained competent individuals with the proper equipment should attempt to perform the following procedure.

- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Note

The following steps are not intended to be complete instructions for performing a safe and complete hydrotest. They are intended only to address the basic issues required for hydrotesting.

1. Establish hydrotest boundaries to ensure that all required components are tested without overpressurizing the lower pressure class piping and components. After following all safety precautions and venting the system of air, raise the system to the required hydrotest pressure.
2. At the completion of the hydrotest procedure, secure and depressurize the system.

Disassembly of the Hydro-Plug Fixture

1. Loosen the bonnet nuts, (key 55) using an even and opposing pattern (for example, if the first nut loosened is at the 1 o'clock position, the next nut to be loosened would be at the 7 o'clock position). This will prevent uneven loading of the bonnet flange studs which may cause binding.

Individual nuts should not be completely loosened while the remaining nuts are tight. It is suggested that at least two stages of loosening be used to avoid overloading the last few remaining studs.

2. Remove the bonnet (key 6) from the valve with uni-axial pull. If the bonnet seems to bind in the valve body, check the alignment of the hoist or pulling mechanism. Deviation from an axial pull of the parts may result in galling or bending of the stem.

CAUTION

Do not attempt to over-power any binding, as damage to the guide surfaces may result.

3. Remove and discard the upper cage gasket (key 43).
4. Remove the Hydro-Plug (key 2) from the valve body cavity using the integral eyebolt holes in the Hydro-Plug.
5. Remove and discard the lower cage gasket (key 43).

CAUTION

To avoid compromising the service life of the CVX valve body and/or trim, do not reuse the blowout gaskets for valve reassembly.

Cleaning

After removal of the hydro-plug, the interior of the valve body should be rinsed with clean water or repeatedly wiped with clean towels until the surfaces are clean to the touch. All internal parts should be cleaned prior to reassembly.

Reassembly

Refer to the appropriate valve instruction manual for guidance in reassembling the valve.

Ordering Information for Hydro-Plug Fixture

Information required for specifying and ordering the CVX Hydro-Plug Fixture.

Valve Information

- Valve Serial Number
- Valve Tag Number
- Customer Order Number
- Valve Model Number
- Material (carbon steel unless otherwise specified)

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual includes installation, maintenance and operation information for the Fisher CVX control valve. Refer to separate instruction manuals for instructions covering the actuator and accessories.

WARNING

Do not install, operate or maintain a CVX valve without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

1.2 Description

The CVX Steam Conditioning Valve (see Figure 1) provides a convenient and efficient way to reduce steam pressure and temperature within a single device. Typical installations include steam backpressure control, turbine bypass, boiler start-up service, auxiliary steam letdown for drying rolls, kettles, equipment drives, plant heating and other loads requiring dependable and accurate control of steam pressure and temperature.

1. Standard end connection sizes. Alternate inlet and outlet sizes available for each valve body size to match piping requirements. 2. Not all valve sizes are available in all valve body ratings. 3. Contact your Emerson sales office for other flow characteristics. 4. Intermediate classes above CL2500 available upon request. PN pressure ratings available per pressure requirements of EN12516-1. Consult your Emerson sales office for additional options.	

The CVX Steam Conditioning Valve (Figure 1) is designed to handle moderate to severe applications in today's cycling power plants as well as provide precise pressure and temperature control for process applications. The CVX incorporates over 30 years of steam conditioning experience and product development. The valve body is designed with the latest finite element analysis (FEA) and computational fluid dynamics (CFD) tools to optimize performance and reliability for demanding steam systems.

The CVX valve design provides an exceptional combination of performance and maintainability. The simplified trim configuration is thermally compensated to handle rapid changes in temperatures, as expected during a turbine trip, without any sticking or binding.

Water atomization and vaporization are key elements in any steam conditioning application. The CVX incorporates a spraywater manifold of variable geometry Type AF nozzles producing a spray pattern suitable for high rangeability applications. These nozzles are strategically placed to achieve complete mixing and quick vaporization at all flowing conditions. Years of research in spray atomization and vaporization were key to optimizing the water injection system. Extensive use of CFD analysis, in addition to field performance feedback, was used to validate spray system enhancements.

1.3 Education Services

Emerson Education Services

Email: education@emerson.com
emerson.com/mytraining

Section 2: Principle of Operation

The positioning of the valve plug within the control cage controls the steam flow (see Figure 1). The control cage has an array of orifices to provide the control characteristic specified. As the plug is lifted from the seat, steam is permitted to pass into the center of the control cage and out through the seat orifice. A signal from the pressure control loop to the valve actuator moves the valve plug within the control cage, which increases or decreases the amount of free flow area. Retracting the plug increases steam flow.

The outlet section of the valve is comprised of a combination acoustical diffuser/cooler section. As the steam exits the seat orifice, it enters a diffuser section designed to further decrease steam pressure. Flow is directed radially, through the multiple orifice diffuser to the outlet pipe. The outlet section is fitted with cooling nozzles connected to a water manifold. This manifold provides cooling water flow to individual cooling nozzles installed in the pipe wall of the outlet section. The result is the creation of a fine spray mist injected into the highly turbulent outlet steam flow.

Figure 2. Typical Fisher CVX Installation

E1463

Section 3: Installation

⚠ WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the CVX valve is installed where service conditions could exceed the limits of the pressure rating noted on the nameplate. To avoid such injury or damage, provide a relief valve for over pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

This valve is intended for a specific range of service conditions (see Table 1). Applying different conditions to the valve could result in parts damage, malfunction of the valve or loss of control of the process. Do not expose this valve to service conditions or variables other than those for which this valve is intended. If you are not sure what these conditions are, you should contact **Emerson** for more complete specifications. Provide the product serial number (shown on the nameplate) and all other pertinent information.

NOTICE

Check that the CVX valve is properly orientated with respect to the flow direction of the valve (flow down). Incorrect installation can result in damage to the valve and poor performance.

NOTICE

To avoid product damage, inspect the valve before installation for any damage or any foreign material that may have collected in the valve body. Also, remove any pipe scale, welding slag or other foreign material from the pipeline.

1. Before installation, all piping upstream of the valve must be blown clean so that no loose materials such as welding slag, dirt or other foreign matter, are left in the pipe. Use care to keep foreign matter out of the line openings while preparing the valve installation.
2. If possible, before fitting in the line, connect the actuator to a temporary air supply and operate to verify positioning. Disconnect the instrument lines (if applicable).

**WARNING**

Do not lift the valve by its actuator yoke or cooler manifold piping. Lifting lugs attached to the actuator must not be used to lift the complete valve assembly unless clearly marked as being rated to support the complete valve assembly weight. Personal injury or damage to equipment could occur if the valve is improperly lifted into place.

All lifting and rigging must be completed in accordance with federal/national/provincial, state and local regulations and applicable lifting and rigging equipment standards. Only personnel trained in proper lifting and rigging practices shall perform valve/actuator assembly lifting, rigging and installation. Because each lift will be unique, the method of lifting the valve assembly, the correct location for attaching and lifting the valve assembly and what the valve assembly will do when lifted shall be considered for each lift.

Lifting and rigging equipment used to lift, install or remove a valve assembly or component must be properly selected and sized for the weight and configuration of the valve assembly or component being lifted. The weight of the complete valve assembly, including attached accessories, must be taken in consideration for this purpose. The lifting and rigging equipment must be properly maintained and inspected for damage before each use.

Lifting lugs or other lifting equipment attached to the valve or actuator must never be used to lift or support the weight of attached piping.

If the CVX is equipped with buttweld ends, the valve body must be supported using a lifting sling or other method that does not place a load or force onto the finished surface of the buttweld ends. The CVX does not have a stable resting position. The valve inlet and outlet must be fully supported until fully welded (buttweld end connections) or bolted (flanged end connections) into the piping.

NOTICE

Care must be taken when lifting the valve/actuator assembly to ensure all accessories and tubing are not damaged in the process. Accessories and tubing may need to be removed prior to lifting to prevent damage and properly reinstalled before use. Protect valve flange faces, buttweld ends and other connection surfaces from damage during lifting.

3. Arrange lifting slings or other lifting and rigging equipment appropriate for the valve weight and configuration around the main valve body to safely lift the valve to the pipe opening.

**WARNING**

Do not expose the valve to undue stresses by installing it in bent pipes or flanges. Personal injury and equipment damage could result from flange sealing failure due to improper installation.

4. Flanged Connections – Lubricate the flange connection bolts with a high temperature thread lubricant. Install flange gaskets and connection bolts per accepted practices and tighten securely.
5. Welded Connections – Welding procedures should be in accordance with the applicable codes and the base materials. For preheat, welding electrodes and postweld heat treatment, refer to the applicable codes and practices applicable for the specific facility. Materials are specified on the customer specification sheet. Emerson recommends the valve be disassembled for welding, however if the valve inlet and outlet connections are to be welded with the valve assembled, the valve plug should be maintained off the valve seat during all associated operations. If the valve is to be welded by SMAW process, the valve must be disassembled for welding to ensure that any weld slag is removed from the valve.

NOTICE

Depending on valve body materials used, post weld heat treating may be required. If so, damage to internal parts is possible. In general, if post weld heat treating is to be performed, all trim parts and nozzles should be removed. Contact your Emerson sales office for additional information.

6. Remove the spraywater control valve and flush the cooling water line until all debris is removed from the line prior to connecting it to the CVX valve. Use only clean sources of cooling water to reduce the possibility of nozzle clogging. A strainer should be installed in the water line as close to the CVX valve as possible. To determine appropriate mesh size, refer to valve sizing and specification document or contact your Emerson sales office. Review strainer manufacturer's pressure drop curves to determine appropriate strainer body size. You may need to use a strainer that is larger than the water line size.

⚠ WARNING

Failure to use a strainer could result in nozzle clogging and subsequent property damage or loss. Uncontrolled temperatures resulting from clogged nozzles may result in equipment or process temperature limits being exceeded. Exceeding system temperature limits could result in property damage or personal injury.

7. A length of straight pipe is required downstream of the CVX valve to ensure complete vaporization of cooling water. An example of a typical installation appears in Figure 2. Consult the CVX cooler sizing sheet for the required distance of straight pipe. This is unique for each application and is supplied by Emerson.
8. Typically, a temperature sensor should be mounted downstream of the CVX valve. This distance will vary depending on a number of factors including steam velocity and percentage of spraywater. Consult the cooler sizing sheet provided with the unit for this temperature sensor distance. The steam line should not have any branch lines dividing the steam flow between the CVX valve and the temperature sensor. If you have any questions, contact your [Emerson sales office](#).
9. A typical installation is illustrated in Figure 2. A pressure transmitter senses the pressure downstream (or upstream in backpressure control applications). The pressure controller sends a signal to the actuator positioner opening or closing the CVX valve as required to maintain pressure. A rising stem opens the CVX valve to allow additional steam flow. A temperature sensor (TE) measures changes in temperature and a temperature transmitter (TT) transmits the signal to the temperature control device. The output signal from the controller is sent to the positioner on the cooling water (spraywater) control valve (SWCV). The positioner's output signal strokes the SWCV open, increasing water pressure on the nozzles. Increasing water pressure upstream of the nozzles increases water flow through the nozzles.

NOTICE

Pneumatic lines (where applicable) should be thoroughly blown clean with dry air before connection. Check to make sure wiring connections are made per the equipment manufacturer's instructions and in accordance with local, regional and national codes.

10. If foreign debris has been introduced into the valve or upstream piping during installation, it must be removed prior to using the valve for the first time. A Blowout or Blow-through tool can be purchased to match the CVX valve and facilitate piping blowdown without removal of the valve from the line. Contact your [Emerson sales office](#) for pricing and availability of fixtures.
11. After cleanliness of the piping system has been assured, connect instrumentation and power supply to the CVX valve actuator and associated equipment.
12. Monitor the CVX valve as the system is brought on line. Some visible vapors may be seen as the lubricants are heated. If you see any steam leaks after startup, follow isolation and disassembly procedures and disassemble the valve and replace the gaskets (key 43). If the packing box leaks, tighten hex nuts (key 68). If leakage continues, replace the packing (key 64). Be sure to properly isolate the CVX valve prior to disassembly of valve or packing.

13. Valves with HIGH-SEAL live-loaded packing will not require this initial re-adjustment. See the Fisher Instruction Manual for HIGH-SEAL Live-Loaded Packing System (as appropriate), for packing instructions.

WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however, the packing might require some re-adjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Section 4: Maintenance

It is recommended that diagnostic tests be performed on the valve 3 to 6 months prior to scheduled maintenance shutdowns. Complete valve disassembly is recommended if tests performed on the valve indicate leakage, sticking or substandard operation. If diagnostics indicate normal valve operation, complete disassembly and inspection of the CVX is recommended during every other regularly scheduled outage or after 24 to 36 months, whichever comes first. Table 2 identifies the recommended inspection tips and diagnostics that can be performed with corresponding repair and replacement information.

WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- **Do not remove the actuator from the valve while the valve is still pressurized.**
- **Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.**
- **Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.**
- **Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.**
- **Vent the power actuator loading pressure and relieve any actuator spring precompression.**
- **Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.**
- **The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings or when loosening the packing box pipe plug.**
- **Check with your process or safety engineer for any additional measures that must be taken to protect against process media.**

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D103606X012

CVX Valve

September 2025

NOTE

For valves with HIGH-SEAL packing, see the Fisher instruction manual, HIGH-SEAL Live-Loaded Packing System, [D101453X012](#), for packing instructions.

Table 2. Inspection Summary

Key	Part Description	Inspection Tips and Diagnostics	Repair	Replacement
1	Valve Body	Inspect for erosion, thermal fatigue and other damage.	Consult your local Emerson Service Center for a recommendation on necessary weld repair or replacement if damage exists.	
6	Bonnet	Inspect gasket surfaces for damage that could indicate gasket leakage. Inspect packing box to ensure no galling, scoring or particulate is present.	If damage exists consult your local Emerson Service Center for a recommendation on necessary weld repair or replacement.	
20	Nozzle Body Flange	Inspect gasket surfaces for damage that could indicate gasket leakage when spray nozzles are replaced.	Replacement Only	As needed
21	Cage	Inspect cage bore for excessive wear, galling damage, particulate damage and flow passage damage or clogging.	Consult your local Emerson Service Center for a recommendation on necessary repair or replacement if damage exists.	As needed for optimal performance
22	Plug	Inspect for seat erosion, excessive wear, galling damage and particulate damage, paying close attention to the seating and guiding surfaces.	Re-cutting/machining of seating surfaces can be performed by your local Emerson Service Center .	As needed for optimal performance
23, 53	Stem and Stem Pin	Inspect stem for dings, scoring and galling. Inspect valve stem connection for tightness.	Valve stem connection can be repaired by your local Emerson Service Center .	As needed
24	Seat	Inspect for seat erosion, particulate damage, galling and proper bolt torque (if applicable, refer to Table 5).	Re-cutting/machining of seating surfaces can be performed by your local Emerson Service Center .	As needed to maintain proper shutoff
25	Plug Retainer	Inspect for excessive wear, galling and other damage.	Repair can be performed by your local Emerson Service Center .	As needed
30	Spray Nozzle	Refer to Nozzle Maintenance Section.		Replacement every 24 to 36 months for optimal performance
37	Nozzle Sleeve	Inspect for particulate or magnetite buildup when spray nozzles are replaced.	Clean if necessary	As needed
43, 47, 48, 75	All Gaskets	Every valve disassembly requires replacement of gaskets.	Replacement Only	Every valve disassembly
45	Piston Ring	Inspect for particulate buildup, scoring and excessive wear. Ensure piston ring is free to expand and contract in the groove.	Replacement Only	As needed

- continued -

Table 2. Inspection Summary (continued)

Key	Part Description	Inspection Tips and Diagnostics	Repair	Replacement
46	Bore Seal Ring	Inspect for excessive wear, galling, signs of leakage and other damage.	Replacement Only	Every 36 months for optimal performance
63	Packing Box Ring	Inspect for scoring, galling and other damage.	Replacement Only	As needed
64	Packing Set	Every valve disassembly requires replacement of the packing set.	Replacement Only	Every valve disassembly
65	Packing Follower	Inspect for scoring, galling and other damage.	Replacement Only	As needed
66	Packing Flange	Inspect for scoring, galling and other damage.	Replacement Only	As needed
77	Bolted Diffuser	Inspect for thermal fatigue, erosion, particulate damage and flow passage damage or clogging.	Clean if necessary	As needed
N/A	Diffuser	Inspect for thermal fatigue, erosion, particulate damage and flow passage damage or clogging.	Clean if necessary	Consult your local Emerson Service Center if replacement is necessary.

4.1 Servicing

Shut off water and steam flow and vent all system pressure before breaking any pressure boundaries.

WARNING

Residual system pressure may be released during the following steps if the system was improperly isolated or vented.

Use extreme care to prevent personal injury while loosening any fasteners in the pressure boundary.

4.2 Removal of Valve Bonnet and Trim

1. If the valve is Class V leakage construction and has a bore seal, use the actuator to unseat the bore seal from the landing.
2. Disconnect all external connections to the positioner and actuator and remove the actuator from the valve. Consult the actuator manufacturer's documentation for assistance in actuator removal.
3. Loosen and remove the hex nuts (key 68) along with the packing follower (key 65). If possible, remove packing set (key 64) from the packing box.
4. Loosen bonnet stud nuts (key 55) using an even pattern to avoid uneven expansion of the gaskets. Remove the entire bonnet assembly (key 6), pulling evenly in line with the valve stem (key 23) centerline. Uneven bonnet removal can result in galling or bending of the valve stem. If difficulty is encountered in removing the bonnet, check the bonnet for alignment and straighten the bonnet before making further attempts to remove it from the valve body.

**WARNING**

The bonnet must be handled with care while being removed from the body. Damage to the bonnet can result in gasket leakage while the valve is in service.

Protect the bonnet by placing it on clean cloth or wood while the valve is disassembled.

5. Dislodge any remaining packing (key 64) from the packing box and discard. Remove the packing box ring (key 63) from the bottom of the packing box. Inspect all parts: packing box, packing box ring (key 63), packing follower (key 65), valve stem (key 23), hex nuts (key 68) and studs (key 69) for signs of wear. Replace parts that are damaged or show excessive wear.
6. Inspect the bonnet guiding surfaces and gasket mating surfaces. Light damage on the guiding surface may be repaired with an emery cloth or other suitable material. Damage to the gasket mating surface may require bonnet replacement to avoid leakage.
7. Remove the plug assembly (keys 22, 23 and 53) as a single unit by lifting the valve stem (key 23) with appropriate rigging and lifting equipment and pulling the assembly from the body cavity. The plug assembly contains sensitive guiding and sealing surfaces on its outside diameter and care must be taken in its handling. Protect the plug by placing it on clean cloth or wood while the valve is disassembled.
8. Remove the cage (key 21) from the valve body. Remove and discard cage gaskets (keys 43 and 44). Reference Figures 13, 15, 16, 17 and 18 for guidance in performing this disassembly. The cage contains sensitive guiding surfaces on its inside and outside diameter and care must be taken during handling. Protect the cage by placing it on clean cloth or wood while the valve is disassembled.
9. ANSI/FCI 70-2 Class V constructions only: Clean and inspect the guiding and sealing surfaces of the plug assembly. Inspect the piston ring (key 45) and Bore Seal ring (key 46) for signs of excess wear or damage and replace if necessary. The piston ring is a two-piece design with an outer seal ring and an inner expander ring. The outer ring diameter should be expanded beyond the diameter of the plug in its free state. It can be shifted within its groove to inspect for uneven wear around its circumference. The piston ring should require some compression when installing the plug into the cage. Lack of required compression indicates that the piston ring has worn or relaxed and should be replaced. Vertical marks in the axial orientation also indicate wear that requires replacement of the ring. The Bore Seal ring has a C-shaped cross section with the open portion of the C-shape facing the seat ring side of the plug. Any uneven marks around the circumference of the ring or any flattening of the ring shape at its outside diameter are indications of wear and require replacement. Contact your [Emerson sales office](#) for Bore Seal ring replacement.

ANSI/FCI 70-2 Class IV constructions only: Clean and inspect the guiding and sealing surfaces of the plug assembly. Inspect the two piston rings (key 45) for signs of excess wear or damage and replace if necessary. The piston ring is a two piece design with an outer seal ring and an inner expander ring. The outer ring diameter should be expanded beyond the diameter of the plug in its free state. It can be shifted within its groove to inspect for uneven wear around its circumference. The piston ring should require some compression when installing the plug into the cage. Lack of required compression indicates that the piston ring has worn or relaxed and should be replaced. Vertical marks in the axial orientation also indicate wear that requires replacement of the ring.

10. Clean and inspect the cage bore for excessive wear. The entire length of the cage bore is either a sealing and/or guiding surface and any measurable wear requires that the cage be replaced.
11. Welded seat rings remain retained inside the valve body. Clean and inspect the seating surface. Any detectable damage around the circumference of the seating surface is an indication of wear and requires reconditioning to ensure seating performance. Contact your [Emerson sales office](#) for specific instructions on reconditioning the seating surface. If the CVX has a bolted seat ring, remove the cap screws (key 76) and discard the gasket (key 75) that sits between the seat ring and diffuser (key 77) or valve body, depending on construction. Inspect cap screws for damage and excessive wear; replace as necessary.
12. Removable (bolted/camped) diffuser constructions only. Remove the diffuser (key 77 or 24) and gasket (key 75) that sits between the diffuser and valve body. Inspect the diffuser for thermal fatigue and flow passage damage or clogging and clean if necessary. Diffuser replacement will be necessary if damage is present. The bolted diffuser contains sensitive guiding surfaces on its outside diameter and care must be taken during handling. Protect the seat diffuser by placing it on a clean cloth or wood while the valve is disassembled.
13. Welded diffuser constructions only. Inspect the diffuser for thermal fatigue and flow passage damage or clogging and clean if necessary. If damage or clogging remains after cleaning, then diffuser replacement will be required; contact your local [Emerson Service Center](#) for this process.
14. Remove all used gaskets and foreign material from the interior of the valve and from the inlet and outlet openings. Remove any foreign material that may be in the valve body or trim. Inspect all valve body guiding and sealing surfaces for any signs of wear.
15. If the valve has been in service, visually inspect the interior of the valve for abnormal wear, erosion or thermal fatigue. The gasket surfaces of the valve body and bonnet should be inspected to verify they are not damaged and are free of imbedded gasket material. All scratches should be removed by grinding or filing to remove any interference of the clearance zones between the internal bores and the mating parts. All signs of thermal fatigue should be carefully evaluated to determine if repair or replacement is necessary. Your local [Emerson Service Center](#) can help determine the severity of damage, if present and recommend a course of action.

Figure 3. Fisher AF Nozzle Cross Section

A7191-2D

4.3 Nozzle Maintenance and Replacement

When subjected to normal operating conditions, it is possible that wear, blockage and/or weld fatigue will occur to the valve body or nozzle assembly. During regularly scheduled maintenance, visually inspect the nozzles for wear and blockage. Your local [Emerson Service Center](#) can help to determine the extent of weld fatigue and the correct course of action. Poor performing nozzles or nozzle failure is typically caused by wear, corrosion, erosion and/or blockage. The following instruction will help to determine if any of these problems are present and provide a recommended course of action for each.

NOTE

For optimal performance, nozzles should be inspected every 18 to 24 months and replaced every 24 to 36 months.

1. OPTIONAL: Figure 3 shows the spray pattern that will need to be present during operation of the AF nozzles. Testing can be performed by attaching the existing or an alternate, similar pressure, water line to the spray water input connection. If this spray pattern is not present, replacement is recommended.
2. Loosen and remove the nozzle body flange stud nuts (key 58) and washers (key 59). Then, remove the nozzle body flange (key 20). Inspect the nozzle body flange gasket surfaces for damage. If damage is present replacement is necessary.

3. Remove the nozzle sleeve (key 37) with attached spray nozzle (key 30), nozzle sleeve gasket (key 47) and nozzle body flange gasket (key 48). Inspect the nozzle sleeve for particulate or magnetite buildup and clean if necessary.
4. Inspect the spray annulus surface, the area between the plug stem and spray head, for excessive wear, erosion/corrosion or blockage due to particulate. Wear is defined as any nicks, cuts or gouges on or immediately around the spray annulus. Erosion/corrosion is defined as any form of rust or erosion of the metal on the plug stem or spray head. Blockages are typically caused by small particulate trapped between the plug stem and spray head or spring casing and spray head. Replacement of the nozzle is recommended if any of the preceding problems are present.
5. Grind off the tack welds holding the nozzle (key 30) in place. Apply a penetrant type thread lubricant and allow to soak prior to unscrewing the nozzle. Using the provided flats on the side of the spray head, unscrew the nozzle from the nozzle sleeve (key 37).
6. Grind excess tack weld material off both the nozzle (key 30) and nozzle sleeve (key 37).
7. In the absence of external forces, the nozzle must be fully closed. If the nozzle is not fully closed, it will need to be replaced.
8. Inspect the water injection holes for reduced or non-circular shape due to erosion. Every hole must be the same size and shape. If any are oversized or non-circular in shape, the nozzle will need to be replaced.
9. Inspect the interior of the water injection holes for buildup of particulate or magnetite. Nozzle replacement will be needed if any buildup is present.

NOTE

Complete disassembly of the nozzle is strongly discouraged, due to individual spare parts not being available.

10. **OPTIONAL:** To further check the nozzle for buildup of particulate or magnetite, the nozzle can be disassembled. If disassembled, take great care not to damage the sharp edges of the spray annulus on the plug stem and the sprayhead, as this will greatly affect the spray pattern. Do not compress a removed spring by hand or with a tool, as compression beyond its normal operating range will damage the spring.
To disassemble the nozzle, first remove the pin using a small punch and unscrew the spring casing from the plug stem. The nozzle can be reassembled by following a reverse order of disassembly, taking care to line the hole in the plug stem up with the hole in the spring casing, then pressing the pin back into place through the two parts.
11. The internal spring may relax over time and not provide the tensile force required to shut off and control flow. If the nozzle spring is suspected of being too relaxed, then the nozzle should be replaced.
12. The travel can be determined by using a feeler gauge to measure the distance between the spray head near the water injection ports to the side of the spring casing, as outlined in Figure 3. This measurement must match the factory set plug stem travel for the corresponding nozzle type as shown in Table 3.

Table 3. AF Nozzle Specifications

Nozzle Type	Plug Travel, In.
AF7	0.014
AF10	0.028
AF14	0.029
AF17	0.034

AF35	0.065
AF40	0.063
AF44	0.069

13. Inspect nozzle threads for damage and clean if needed. If damage is present, nozzle replacement will be necessary.
14. Rinse both the nozzle (key 30) and nozzle sleeve (key 37) to remove particulate.
15. Screw nozzle into the nozzle sleeve (key 37) and tighten just until the spray head is flat and tight against the nozzle sleeve.
16. Tack-weld a small piece of welding wire onto the nozzle sleeve (key 37) next to either of the spray head flats to prevent rotation during service; refer to Figure 4. Maintain low heat to prevent distortion of the nozzle.

Figure 4. Spray Nozzle Tack Weld Location

17. Reassemble in the following order: nozzle sleeve gasket (key 47), nozzle body flange gasket (key 48), spray nozzle/sleeve assembly (keys 30 and 37), nozzle body flange (key 20), washers (key 59) and stud nuts (key 58). It is required to replace the nozzle sleeve gasket (key 47) and nozzle body flange gasket (key 48) with new gaskets each time the nozzle body flange (key 20) is removed.

NOTE

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

**WARNING**

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your Emerson sales office immediately if a discrepancy between actual parts and approved parts is suspected.

18. Lubricate the nozzle body studs (key 57) and all surfaces the studs and nuts come into contact with. Tighten the nozzle body flange nuts (key 58) in a uniform, multistage cross pattern. You may need to torque multiple times at each torque to ensure that the nozzle body flange is torqued evenly. Required nozzle body flange bolting torque can be found in Table 4.

Table 4. Recommended Nozzle Body Flange Bolting Torque with Nickel Anti-Seize Lubricant⁽¹⁾

BOLT SIZE in.	THREADS PER INCH	LUBRICATION	RECOMMENDED BOLT TORQUE ⁽²⁾	
			N•m	Lbf•ft
5/8	11	Nickel Anti-Seize	163	120
3/4	10		258	190
7/8	9		373	275
1	8		522	385
1-1/8	8		712	525
1-1/4	8		942	695
1-3/8	8		1268	935
1-1/2	8		1654	1220

1. For other lubricants, contact your Emerson sales office for recommended bolt torque.

2. Torques for lubricated studs with heavy hex nuts.

4.4 Valve Assembly

1. Cleaning – Make certain that all interior surfaces of the valve body and bonnet (including the packing box) are clean and free of dirt, including the inlet and outlet openings. All surfaces of the valve interior that receive mating parts should be given special attention when cleaning. All sliding fit surfaces should be coated with a copper-based high temperature anti-seize lubricant prior to reassembly. Refer to Figures 16, 17 and 18 for reference.

If the CVX has a removable seat ring, proceed with steps 2 through 4; otherwise proceed directly to step 5.

2. Place one gasket (key 75) into the valve body. If the CVX has a welded-in diffuser: Install the seat ring (key 24) onto this gasket surface. If the CVX has a removable diffuser: install the diffuser (key 77 or 24) onto this gasket surface. If trim is bolted, ensure the bolt holes in the diffuser are positioned with the bolt holes in the valve body. Then place another gasket (key 75) onto the diameter of the diffuser and install the seat ring onto this second gasket surface. Clamped trim constructions will only have one gasket (key 75). Proceed to step 6 if using clamped trim.

NOTE

Horizontal actuator only: CVX valves positioned in the process pipeline with a horizontal actuator/trim may require special attention to ensure that the spiral wound gaskets are maintained in the proper location during the valve assembly procedures without falling out of the gasket groove. A gasket manufacturer recommends spray adhesive 3M #77 Super Spray Adhesive to temporarily hold gaskets in place until they are fully contained by the CVX valve body and trim components. Please note special spiral wound gasket-positioning techniques may be recommended. To use the adhesive, lightly spray the gasket groove that the gasket will be installed in. Also lightly spray one side of the spiral wound gasket that will be contacting the previously coated gasket groove. Let the spray adhesive set for one minute and then lightly press the spiral wound gasket into the gasket groove.

Other Considerations: Ensure the spiral wound gasket is located in the correct location when contact is made. Trying to remove the gasket after contact will damage the gasket by pulling out or removing the soft filler/facing material. If the gasket is incorrectly positioned after applying the spray adhesive, it must be removed and discarded. The gasket groove will then need to be cleaned and a new gasket will need to be installed.

3. Lubricate the seat ring cap screws (key 76) and all surfaces that contact the screws, including the valve body and seat ring.
4. Torque the cap screws in a crisscross pattern, using no more than 1/4 of the specified torque as indicated in Table 5. Repeat the crisscross pattern, working up to the specified torque in 1/4 increments until the final torque is achieved. Wait a minimum of one minute to allow for gasket/screw relaxation and recheck the torque, adjusting as necessary.

Table 5. CVX (Flow Down) Bolted Seat Ring Torque with Nickel Anti-Seize Lubricant⁽¹⁾

CAP SCREW SIZE in.	THREADS PER INCH	LUBRICATION	RECOMMENDED BOLT TORQUE	
			N•m	Lbf•ft
3/8	16	Nickel Anti-Seize	41	30
1/2	13		91	67
5/8	11		163	120

1. For other lubricants, contact your [Emerson sales office](#) for recommended bolt torque.

NOTE

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

**WARNING**

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) immediately if a discrepancy between actual parts and approved parts is suspected.

5. Install one cage gasket (key 43) into the groove in the valve body. If the valve has a horizontal stem orientation, ensure the gasket remains in the groove and does not get pinched during cage installation.

NOTE

Horizontal actuator only: Follow the note in Step 2 above to ensure the gasket are in the proper location during valve assembly.

6. Lubricate the inside of the cage as completely as possible. Insert the lubricated cage (key 21) into the valve body. Ensure the lower cage diameter slides over the outside diameter of the seat ring. If there is any question regarding the proper seating of the cage inside the valve body, the following measurements can be taken for confirmation. For welded or bolted seat rings: Measure the thickness of the cage flange at its largest diameter. Measure the depth of the mating counterbore where the cage flange engages into the valve body. When assembled with a new cage gasket, the resulting depth from the top of the valve body to the top of the cage flange should be the difference in these two measured values, minus an additional 0.045 to allow for the uncompressed gasket. If the CVX is an ANSI/FCI 70-2 Class V construction, proceed with steps 712; otherwise proceed directly to step 13 for Class IV constructions.

7. The plug assembly includes a plug (key 22), stem (key 23), stem pin (key 53), retainer (key 25), piston ring (key 45) and Bore Seal ring (key 46). Lubricate the plug assembly at all raised outside diameter surfaces and lubricate the piston ring and Bore Seal ring.
8. Orient the Bore Seal for correct sealing action according to Figure 5.
9. Place the Bore Seal plug seal over the top of the valve plug. The retainer will help guide the Bore Seal down onto the plug. Do not force the Bore Seal over the plug (Figure 6).

Figure 5. Fisher Bore Seal Construction

-
10. Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the Bore Seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
 11. Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place to secure the Bore Seal retainer.
 12. Install the lubricated plug assembly into the cage. The piston ring should require some radial compression to collapse into the cage diameter. Do not use a metallic tool to create this piston ring compression as this could damage the outer sealing diameter of the ring. The plug should slide into the cage smoothly with little effort until the Bore Seal ring reaches its mating cage diameter. The extra load required to seat the Bore Seal trim seal will be applied during actuator set up.
 13. ANSI/FCI 70-2 Class IV constructions only: The plug assembly includes a plug (key 22), stem (key 23) and two piston rings (key 45). Lubricate the plug assembly at all raised outside diameter surfaces and lubricate the piston rings. Install the lubricated plug assembly into the cage. The piston ring should require some radial compression to collapse into the cage diameter. Do not use a metallic tool to create this piston ring compression, as this could damage the outer sealing diameter of the ring. The plug should slide into the cage smoothly with little effort. Refer to Figure 8.

Figure 6. Retainer Guiding Fisher Bore Seal Onto the Plug

14. Install the second cage gasket (key 43) over the cage boss where it will be self-centering for the mating bonnet groove. For clamped trims, install the bonnet gasket (key 44) in the body groove.

NOTE

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

**WARNING**

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) immediately if a discrepancy between actual parts and approved parts is suspected.

15. Apply appropriate high-temperature anti-seize lubricant to the bonnet studs (key 54) and screw them into the valve body. Back the studs out 1/2 to 1 turns after bottoming the stud in the valve body.
16. Lubricate the bonnet locating surfaces and carefully install the bonnet (key 6). Use care to avoid bending the stem.

17. Install bonnet stud washers (key 52) and nuts (key 55) and hand tighten.
18. Tighten the bonnet nuts (key 55) in a uniform, multistage cross pattern. Monitor the distance between the bonnet and body and keep it even to ensure that the bonnet is being torqued evenly. It is recommended that torquing be performed in a minimum of four torque levels until the final torque level is achieved. You may need to torque multiple times at each torque level to ensure that the bonnet is torqued evenly. Required torque can be found in Table 6. After final torquing, ensure there is an even gap and that the metal-to-metal contact between the valve body and bonnet is achieved around the entire circumference of the body-bonnet joint.
19. After the bonnet has been torqued to the required level, check the plug movement to ensure that the plug still moves freely.
20. Recheck cleanliness of the packing box. Insert the packing box ring (key 63) over the stem and into the packing box. Measure the depth of the packing box before and after ring insertion to be certain that it has traveled to the bottom of the packing box. Insert packing rings (key 64), after lubricating with high temperature grease, into the packing box and staggering the gaps on adjacent rings. The packing follower (key 65) can be used to ensure that each packing ring is pushed down before installing the next packing ring.
21. After all packing rings are installed, thoroughly lubricate the studs (key 69) and insert the packing follower (key 65) and the packing flange (key 66). Tighten the hex nuts (key 68) tight enough to block leakage but not so tight that stem travel is hindered. Consult Table 7, Recommended Packing Nut Torque for recommended torque levels. Evenly tighten the nuts to the maximum level, then loosen and retighten to the minimum torque level. After operating, further tightening may be required to prevent leakage.
22. Install the actuator on the valve in accordance with manufacturer's standard procedure. If this is an ANSI/FCI 70-2 Class V construction, the plug assembly will require an additional load and travel to seat the Bore Seal ring (refer to Figure 9 for details). After calibration of the actuator, the valve should be ready to return to service.

Table 6. Recommended Body/Bonnet Bolting Torque with Nickel Anti-Seize Lubricant⁽¹⁾

NOTE: IF THE TRIM IS BORE SEAL DESIGN, THE PLUG WOULD BE INSERTED FROM THE TOP OF THE CAGE, NOT THE BOTTOM.

1. ROTATE SEAT UNTIL CAGE PIN ALIGNS WITH SEAT SLOT. SEPARATE SEAT FROM CAGE.

2. REMOVE PLUG FROM LOWER END OF CAGE.

Section 5: Parts

5.1 Parts Ordering

Each CVX valve is assigned a serial number that can be found on the bonnet flange. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts, refer to the serial number and key numbers for each part required. The key numbers in the Parts List and the assembly drawing in Figures 16, 17 and 18 can be used to help in part identification.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

5.2 Parts List

NOTE

Contact your [Emerson sales office](#) for Part Ordering information.

Key	Description	Key	Description
1	Body	53*	Stem pin
6	Bonnet	54	Bonnet stud

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual includes installation, maintenance and parts information for Fisher D and DA valves. Refer to separate manuals for instructions covering the actuator, positioner and accessories.

WARNING

Do not install, operate or maintain a D or DA valve without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Unless otherwise noted, all NACE references are to NACE MR0175-2002.

1.2 Description

The Fisher D globe-style (Figure 1) and DA angle-style (Figure 5) valves are single-port, metal-seated valves for high-pressure applications.

Figure 1. Fisher D Valve with 657 Actuator

W0232

Table 1. Specifications

Maximum Inlet Pressures and Temperatures ⁽¹⁾	Maximum Service Temperature
If the valve nameplate shows an ASME pressure-temperature class, maximum inlet pressure and temperature is consistent with applicable ASME class per ASME B16.34. If the nameplate does not show an ASME class, it will show a maximum cold working pressure at 38°C / 100°F (for example, 3600, 6000, 9000 or 10,000 psi)	232°C / 450°F
	Flow Characteristic
	Equal Percentage
Maximum Allowable Pressure Drops ⁽¹⁾	Flow Direction
Flow up: Capable of full rated pressure drops. Flow down: See Table 2 for pressure drop limits for ceramic trim.	Fisher D Valve: Flow up through the seat ring and out past the valve plug Fisher DA Valve: Flow in either direction
Shutoff Classification Per ANSI/FCI 70-2 and IEC 60534-4	Approximate Weight
Standard: Class IV Optional: Class V	Fisher D Valve: 34 kg / 75 lbs Fisher DA Valve: 46 kg / 100 lbs
1. Do not exceed the pressure or temperature limits in this manual and any applicable standard limitations.	

1.3 Specifications

Specifications for these valves are in Table 1. Some of the specifications for a given valve appear on a nameplate, which is attached to the valve actuator or wired to the valve assembly if the valve was purchased without an actuator.

1.4 Education Services

Emerson Education Services
 Phone: 1-800-338-8158
 E-mail: education@emerson.com
emerson.com/mytraining

Table 2. Flow Down Pressure Drop Limits - Ceramic Trim Only

VALVE SIZE, NPS	SEAT RING DIAMETER, mm / in.					
	6.4 / 0.25	9.5 / 0.375	12.7 / 0.5	19.1 / 0.75	25.4 / 1	31.8 / 1.25
	Pressure Drop, bar					
1	414	414	414	193	---	---
2	689	689	689	462	262	165
	Pressure Drop, psi					
	6.4 / 0.25	9.5 / 0.375	12.7 / 0.5	19.1 / 0.75	25.4 / 1	31.8 / 1.25
	Pressure Drop, bar					
1	6000	6000	6000	2800	---	---
2	10,000	10,000	10,000	6700	3800	2400

Section 2: Ceramic Trim

Some types of ceramic trim, including the VTC (very tough ceramic) variety, can create a spark under certain circumstances. When the edge of a ceramic part is struck against a second ceramic part with enough force, a spark can be created.

WARNING

Avoid personal injury and property damage from ignition of process fluid caused by sparks from ceramic trim.

Do not use ceramic trim where the process fluid is unstable or if it is an explosive mixture (such as ether and air).

Section 3: Installation

WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage resulting from the sudden release of process pressure or bursting of parts, do not install the valve assembly where service conditions could exceed the limits given in this manual or on the appropriate nameplates. Use pressure-relieving devices as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some valve body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

NOTICE

To avoid product damage, inspect the valve before installation for any damage or any foreign material that may have collected in the valve body. Also remove any pipe scale, welding slag or other foreign material from the pipeline.

1. Before installing the valve, inspect it to be certain that the valve body cavity is free of foreign material. Clean out all pipelines to remove scale, welding slag and other foreign materials.
2. Install the valve so that flow through the valve is in the direction shown by the arrow cast on the valve body. The control valve assembly may be installed in any position unless limited by seismic considerations. However, the normal method is with the actuator vertical above the valve. With some valves, the actuator may need support when it is not vertical. For more information, consult your [Emerson sales office](#).
3. Use accepted piping and welding practices when installing the valve in the line. For flanged valve bodies, use suitable gaskets between the body flanges and pipeline flanges.

NOTICE

Depending on valve body materials used, post-weld heat treating might be needed. If so, damage to internal elastomeric and plastic parts, as well as internal metal parts is possible. Shrink-fit pieces and threaded connections may also loosen. In general, if post-weld heat treating is needed, remove all trim parts. Contact your [Emerson sales office](#) for additional information.

For screwed end connections, apply pipe compound to pipeline threads.

4. To allow continuous operation during inspection or maintenance, install a three-valve bypass around the control valve assembly.
5. If you received the actuator and valve body shipped separately, refer to the appropriate actuator instruction manual for the actuator mounting procedure.

Figure 2. Lubricator and Lubricator/Isolating Valve (Optional)

LUBRICATOR

LUBRICATOR/ISOLATING VALVE

10A9421-A
AJ5428-D
A0832-2

**WARNING**

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however the packing might require some readjustment to meet specific service conditions.

Section 4: Maintenance

WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shutoff the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Table 3. Bolting Torque for Packing Box Nuts (key 15)

VALVE RATING	STEM DIAMETER		MINIMUM RECOMMENDED TORQUE		MAXIMUM RECOMMENDED TORQUE	
	mm	in.	N•m	lbf•in	N•m	lbf•in

	19.1	3/4	20	180	30	264
10,000 psi	12.7	1/2	6	54	8	72
	19.1	3/4	20	180	30	264

Valve body parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions.

This section includes instructions for packing lubrication, packing maintenance, trim maintenance and lapping seating surfaces. All maintenance operations can be performed with the valve in the line.

NOTE:

Whenever a gasket seal is disturbed by removing or shifting gasketed parts, install a new gasket upon reassembly. This is necessary to ensure a good gasket seal because the used gasket might not seal properly.

4.1 Packing Lubrication

The valve might have an optional lubricator or lubricator/isolating valve (Figure 2) in the tapped bonnet. Use the lubricator or lubricator/isolating valve for PTFE/composition or other packings that need lubrication. Use a silicon-base lubricant. Do not lubricate packing used in oxygen service. To operate the lubricator, turn the cap screw clockwise to force the lubricant into the packing box. The lubricator/isolating valve operates the same way except open the isolating valve before turning the cap screw. Close the isolating valve after lubrication is completed.

4.2 Packing Maintenance

Refer to Figures 3, 4 and 5 for key number locations. For spring-loaded single PTFE V-ring packing, the packing spring (key 9) maintains a sealing force on the packing. If you find leakage around the packing follower (key 10), check to be sure the packing follower is touching the bonnet (key 5). If the packing follower is not touching the bonnet, tighten the packing flange nuts (key 15) until the packing follower touches the bonnet. If you cannot stop leakage in this way, proceed to the Replacing Packing procedure.

If there is unwanted packing leakage with other than spring-loaded packing, first try to limit the leakage and seal the stem. To limit the leakage, tighten the packing flange nuts (key 15) to at least the minimum recommended torque in Table 3. However, do not exceed the maximum recommended torque in Table 3 or excessive friction might result. If the packing (key 8) is relatively new and tight on the stem and tightening the packing flange nuts does not stop the leakage, a worn or nicked valve stem might prevent a seal. If the leakage comes from the outside diameter of the packing, nicks or scratches around the packing box wall might cause the leakage. While replacing the packing per the numbered steps below, inspect the valve stem and packing box wall for nicks and scratches.

4.3 Replacing Packing

Except where indicated, refer to Figures 3, 4 and 5 for key number locations.

WARNING

Refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator and any leak-off piping from the bonnet. Release all pressure from the actuator and relieve spring precompression. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

Disconnect the stem connector and then remove the actuator from the valve body by unscrewing the actuator yoke locknut (key 14).
2. Loosen the packing flange nuts (key 15) so the packing is not tight on the valve stem. Remove any travel indicator parts and stem locknuts from the valve stem threads.
3. Unscrew the bonnet (key 5) from the valve body (key 1). Carefully lift off the bonnet and valve plug/stem assembly (key 4) as a unit. Set the bonnet on a protective surface to prevent damage to the bonnet threads and gasket surface.
4. Remove the valve plug/stem assembly from the bonnet. If you plan to re-use the valve plug, tape or otherwise protect the valve plug seating surface and the stem threads to prevent damage.
5. Remove the bonnet gasket (key 7). Cover the opening in the valve body to protect the gasket surface and prevent foreign material from getting into the body cavity.
6. Remove the packing flange nuts, packing flange, upper wiper and follower (keys 15, 12, 21 and 10). Carefully push out all the remaining packing box parts from the bonnet using a rounded rod or other tool that will not scratch the packing box wall or bottom guide bushing. Clean the packing box and the metal packing box parts.
7. Inspect the valve stem threads and packing box surfaces for any sharp edges that might cut the packing. Scratches or burrs could cause packing box leakage or damage to the new packing. If you cannot improve the surface condition by light sanding, replace the damaged parts.

Figure 3. Packing Arrangements

8. Install a new bonnet gasket (key 7), making sure the gasket seating surfaces are clean and smooth. Carefully install the valve plug/stem assembly into the valve body. Then slide the bonnet over the stem and thread it tightly into the valve body, per the torque values in Table 4.
9. Install new packing and the metal packing box parts according to the correct arrangement in Figure 3. Place a smooth-edged pipe over the valve stem and gently tap each soft packing part into the packing box.

Table 4. Torque for Body-to-Bonnet Joint

VALVE SIZE	RECOMMENDED TORQUE	
	N•m	lbf•ft
NPS 1	1060	780
NPS 2 - Up to 6000 psi valve rating	2030	1500
NPS 2 to 9000 ⁽¹⁾ and 10,000 psi valve rating	2710	2000
1. 9000 psi valve rating is available for Fisher DA only.		

Table 5. Torque for Seat Ring (Key 2)

VALVE SIZE, NPS	RECOMMENDED TORQUE	
	N•m	lbf•ft
1	407	300
2	698	515

10. Slide the packing follower, upper wiper and packing flange (keys 10, 21 and 12) into position. Lubricate the packing flange studs (key 13) and the faces of the packing flange nuts (key 15). Install the packing flange nuts.
11. For spring-loaded PTFE V-ring packing, tighten the packing flange nuts (key 15) until the packing follower (key 10) contacts the bonnet. For other packing arrangements, tighten the packing flange nuts (key 15) alternately in small equal increments. Continue until one of the nuts reaches the minimum recommended torque shown in Table 3. Then tighten the remaining packing flange nut until the packing flange is level and at a 90° angle to the valve stem.
12. Mount the actuator on the bonnet (key 5) and connect the actuator and valve plug stem according to the procedure in the appropriate actuator instruction manual. Check for leakage around the packing follower when you put the control valve assembly into service. Retighten the packing flange nuts as required.

4.4 Trim Maintenance

Refer to Figures 4 and 5 for key number locations.

Disassembly

1. Remove the actuator and the bonnet as described in steps 1 through 3 of the Replacing Packing procedure.

NOTICE

Use care to avoid damaging the gasket sealing surfaces.

The stem surface finish of the valve plug/stem assembly (key 4) is critical for making a good packing seal. The seating surfaces of the seat ring (key 2) and the plug of the valve plug/stem assembly (key 4) are critical for tight shutoff. Protect these parts from damage if you plan to re-use them in the valve.

2. If you wish, remove the valve plug/stem assembly (key 4) and the packing parts from the bonnet. If you plan to re-use the valve plug, tape or otherwise protect the valve plug seating surface and the stem threads to prevent damage. Remove the packing parts as described in the Packing Maintenance procedure.
3. Use a socket wrench to remove the seat ring (key 2).
4. Remove the seat ring (key 2) and seat ring gasket (key 3) from the valve body.
5. Inspect parts for wear or damage that would prevent proper operation of the valve body. Clean the gasket surfaces.
6. Replace trim parts as necessary or use the Lapping Metal Seats procedure.

Lapping Metal Seats

A certain amount of leakage should be expected with metal-to-metal seating in any valve body. If the leakage becomes excessive, however, the condition of the seating surfaces of the valve plug and seat ring (keys 4 and 2, Figures 4 and 5) can be improved by lapping. (Deep nicks should be machined out rather than ground out.) Use a good quality lapping compound of a mixture of 280 to 600-grit. Apply the compound to the bottom of the valve plug.

Partially assemble the valve so the seat ring and valve plug are in place and the bonnet (with bushing installed) is screwed hand-tight into the body. Make a simple handle from a piece of strap iron locked to the valve plug stem with nuts. Rotate the handle alternately in each direction with light downward pressure to lap the seats. If you think there is not enough lubrication (for example, if you hear a squeaking noise or feel vibration), stop the procedure and apply more lapping compound before continuing. After lapping, remove the bonnet and valve plug/stem assembly as a unit and clean the seating surfaces. Completely assemble as described in the Assembly portion of the Trim Maintenance procedure.

Test the valve for shutoff. Repeat the lapping procedure if leakage is still excessive.

Assembly

1. Thoroughly clean the seat ring and bonnet threads in the valve body (key 1). Also clean the valve body seat ring gasket surfaces.
2. Apply anti-seize lubricant to the threads of the seat ring (key 2), bonnet (key 5) and their mating threads in the body.
3. Put the seat ring gasket (key 3) into the body.
4. Screw the seat ring into the body. Use a socket wrench to tighten the seat ring to the torque values shown in Table 4. Remove all excess lubricant after tightening.
5. Clean the bonnet gasket seating surfaces and install a new bonnet gasket (key 7).
6. If you had not removed the valve plug/stem assembly and packing from the bonnet, then install the bonnet (key 5) and valve plug/stem assembly (key 4) as a unit, into the valve body. Keeping the valve plug/stem assembly in an "up" position, thread the bonnet tightly into the valve body, per torque values in Table 4.
7. If you had previously chosen to remove the valve plug/stem assembly and packing from the bonnet, then remove any protective tape or covering from the valve plug/stem assembly (key 4) and carefully install it into the valve body. Slide the bonnet (key 5) over the stem and thread it tightly into the valve body. Install new packing and the metal packing box parts according to the correct arrangement in Figure 3. Place a smooth-edged pipe over the valve stem and gently tap each soft packing part into the packing box.
8. Slide the packing follower, upper wiper and packing flange (keys 10, 21 and 12) into position. Lubricate the packing flange studs (key 13) and the washer surfaces of the packing flange nuts (key 15). Install the packing flange nuts.
9. For spring-loaded PTFE V-ring packing, tighten the packing flange nuts (key 15) until the packing follower (key 10) contacts the bonnet. For other packing arrangements, tighten the packing flange nuts (key 15) alternately in small equal increments. Continue until one of the nuts reaches the minimum recommended torque shown in Table 3. Then tighten the remaining packing flange nut until the packing flange is level and at a 90° angle to the valve stem.
10. Mount the actuator on the bonnet (key 5) and connect the actuator and valve plug stem according to the procedure in the appropriate actuator instruction manual. Check for leakage around the packing follower (key 10) when you put the control valve assembly into service. Retighten the packing flange nuts as required.

Section 5: Parts

5.1 Parts Ordering

Each body-bonnet assembly is assigned a serial number, which is on the body or nameplate. The serial number also appears on the actuator nameplate if you bought a valve and actuator assembly. Refer to this serial number when contacting your [Emerson sales office](#) for technical advice. When ordering replacement parts, mention the serial number. Also specify key number, part description, material and part number from the following lists of Parts Kits and part numbers.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

5.2 Parts Kits

Description	Part Number
Packing box parts for double PTFE V-Ring Packing (Includes keys 3, 7, 8, 11, 18, 19 and 21) 9.5 mm / 3/8 in. Stem 12.7 mm / 1/2 in. Stem	RDX0000CN12 RDX0000CN22

5.3 Parts List

NOTE:

Part numbers are shown for recommended spares only. For part numbers not shown, contact your [Emerson sales office](#).

NOTE:

Abbreviations used in this parts list are: SST (stainless steel), RTJ (ring-type joint), RF (raised face), SCH (schedule), BWE (butt welding end), dia. (diameter), in. (inches), mm (millimeters), psi (pounds per square inch) and zn pl (zinc plated). Sizes shown in inches are valve sizes unless otherwise stated. Select parts titled 3600 psi if your valve has a CL1500 or lower rating and select parts titled 6000 psi if your valve has a CL2500 rating.

Key	Description	Key	Description
001	Valve body	011*	Packing adaptor, male
002*	Seat ring	012	Packing flange

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual provides installation, maintenance and parts information for the Fisher D2T and D2 Angle control valves and actuators.

WARNING

Do not install, operate or maintain a D2T or D2 Angle control valve without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

1.2 Description

The D2T and D2 Angle control valves (Figure 1) are compact, rugged valves designed for on/off control of a variety of fluids at pressures up to 155 bar / 2250 psig. This valve is ideal for use as a dump valve on gas separators and scrubbers. It is also well suited for other high pressure applications in natural gas production, compression and processing. The valve has threaded end connections and is available in an NPS 1 globe style or angle style valve body.

Figure 1. Fisher D2T FloPro Control Valve and D2 Angle Control Valve

Table 1. Specifications

Valve Assembly Pressure Class	Port Diameter
ASME B16.34 CL900	13 mm / 0.5 in.
Maximum Inlet Pressure and Temperature ⁽¹⁾	Maximum Travel
155 bar from -46 to +93°C and 150 bar at 149°C / 2250 psig from -50 to +200°F and 2185 psig at 300°F	13 mm / 0.5 in.
Maximum Allowable Pressure Drop ⁽¹⁾	Approximate Weight
Flow Down⁽²⁾ Maximum Inlet Pressure: 155 bar / 2250 psig Maximum Outlet Pressure: 103 bar / 1500 psig Flow Up Maximum Inlet Pressure: 103 bar / 1500 psig Maximum Outlet Pressure: 103 bar / 1500 psig	7.7 kg / 17 lb
Shutoff Classification	Material Temperature Capabilities
	Valve Body Assembly: -46 to +149°C / -50 to +300°F Actuator Assembly: -46 to +93°C / -50 to +200°F
End Connections	Bonnet/Body Connection
Class IV ANSI/FCI 70-2 and IEC 60534-4	Threaded with leakoff bleed
Construction Materials	Standard Actuator Configuration

1.4 Specifications

Table 1 lists specifications for the D2T and D2 Angle control valves. Some of the specifications for a given control valve as it originally comes from the factory are stamped on a nameplate located on the upper diaphragm casing flange.

Section 2: Installation

WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in Table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for overpressure protection as required by accepted industry or local, state and Federal codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

NOTICE

To avoid product damage, inspect the valve before installation for any damage or any foreign material that may have collected in the valve body. Also, remove any pipe scale, welding slag or other foreign material from the pipeline.

1. Before installing the valve, inspect it to be certain that the valve body cavity is free of foreign material. Clean out all pipelines to remove scale, welding slag and other foreign materials.
2. The control valve assembly may be installed in any orientation unless limited by seismic criteria.
The standard flow direction is indicated by the arrow on the valve body.
3. Use accepted piping practices when installing the valve in the pipeline.
4. If continuous operation is required during inspection or maintenance, install a three-valve bypass around the control valve assembly.

NOTE

The D2T and D2 Angle valves are equipped with Fisher ENVIRO-SEAL™ packing.

The actuator is available from the factory as either air-to-open or air-to-close.

Additionally, the actuator as shipped from the factory, has the FloPro flow adjuster set at a 0.375 in. port flow rate position. If some other flow rate is desired, see the Setting Valve FloPro Flow Adjuster section in this manual.

Figure 2. Flow Rate Adjustments

2.1 Setting Valve FloPro Flow Adjuster

Air-to-Open Actuator Action

1. To change the valve flow rate, loosen the flow adjuster socket head cap screws (key 29) and reposition the flow adjuster halves (keys 14 and 15) to the desired flow rate position. See Figure 2 for flow rate settings.

Air-to-Close Actuator Action

1. Attach a pressure line to the actuator. Supply pressure to the actuator to seat the plug in the seat ring.
2. To change the valve flow rate, loosen the flow adjuster socket head cap screws (key 29) and reposition the flow adjuster halves (keys 14 and 15) to the desired flow rate position. See Figure 2 for flow rate settings.

2.2 Changing Actuator Action from (Air-to-Open) to (Air-to-Close)

Key numbers are referenced in Figures 6 and 7.

WARNING

To prevent possible personal injury or property damage from removing the casing cap screws in the wrong sequence, follow the procedure as outlined below for removing the upper casing.

1. Remove the six short actuator casing cap screws (key 22) first. Once these have been removed from the actuator assembly, remove the two long actuator cap screws (key 30) by alternating between them as you loosen them, to keep the upper casing (key 21) level during this procedure.

NOTE

Be aware as you loosen and remove the actuator cap screws that the actuator springs are under compression.

2. Remove the upper casing (key 21) and the springs (key 27).
3. Do not turn the valve stem (key 4) while removing the diaphragm hex nut (key 26). Keep the stem from turning by using an open end wrench on the machined flats located on the valve stem above the flow adjuster for this procedure. Continue the actuator disassembly by removing the washer (key 24) diaphragm plate (key 25), diaphragm (key 19), washer (key 36) and O-ring (key 37). Inspect the diaphragm for any wear or damage. Replace with a new one if necessary.

4. Unscrew the socket head cap screws (key 29) and remove the flow adjuster halves (keys 14 and 15). Position the stem (key 4) to its most upward position.
5. Place 2 of the springs (key 27) from the actuator into the bottom casing (key 20), equally spaced, 180 degrees apart. Place the washer (key 36) over the valve stem, as shown in view A of Figure 7. Then place the O-ring (key 37) over the valve stem. Next install the diaphragm plate (key 25) and, using the diaphragm plate, correctly position the actuator springs.
6. Place the diaphragm (key 19) over the stem, along with washer (key 24). Position the diaphragm so the holes in the diaphragm align with the holes in the bottom casing.
7. Insert a 1/8 in. diameter drift punch or other suitable device through the 5/32 in. diameter hole in the valve stem located below the bottom of the previously removed flow adjuster. Install hex nut (key 26) and tighten to 10 N•m / 90 lbf•in. Use the 1/8 in. drift punch or other holding device to turn the stem to align the holes of the diaphragm (key 19) to the lower casing (key 20).
8. Position the upper casing and install the two long cap screws (key 30) opposite one another. Install the six shorter cap screws (key 22) and the hex nuts, tightening the actuator casing cap screws evenly using a cross-tightening procedure. Torque to 10 N•m / 8 lbf•ft.
9. Connect a pressure line to the top actuator pressure connection and apply pressure to the actuator. Stroke the actuator until the valve plug is seated on the seat ring. Install the flow adjuster, positioning it to the desired travel. Tighten the flow adjuster socket head cap screws to 3 N•m / 26 lbf•in.
10. Release the actuator pressure and install the vent plug (key 28) into the bottom casing pressure connection.

Section 3: Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing and trim maintenance and replacing actuator parts.

All maintenance operations can be performed with the valve in the line.

NOTE

Whenever a gasket seal or O-ring is disturbed by removing or shifting gasketed parts, a new gasket should be installed upon reassembly. This is necessary to ensure a good gasket seal, since the used gasket or O-ring will not seal properly.

⚠ WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- **Do not remove the actuator from the valve while the valve is still pressurized.**
- **Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.**
- **Disconnect any operating lines providing air pressure or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.**
- **Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.**
- **Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.**
- **The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings.**
- **Check with your process or safety engineer for any additional measures that must be taken to protect against process media.**

3.1 Valve Trim Maintenance

NOTE

The following maintenance procedures apply to both air-to-open and air-to-close actuator configurations, except for steps 2 and 8 as noted.

Key numbers are referenced in Figures 6 and 7.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body and drain the process media from both sides of the valve.
2. For air-to-open actuator action only, apply pressure to the actuator to fully stroke it open. This will raise the plug off its seat so that the valve stem serrations are visible inside the flow adjuster window (see Figure 3). Loosen the socket head screws (key 29) and lower the flow adjuster (key 14 and 15) to its lowest position on the valve stem. Retighten the socket head screws (key 29) to 3 N•m / 26 lbf•in. Relieve pressure to the actuator, shut off all pressure lines to the actuator and disconnect. Use lockout procedures to be sure that the above measures stay in effect while you work on the equipment.

NOTICE

The preceding step is intended to prevent damage to the valve plug (key 3) and seat ring (key 5) during the removal of the bonnet and actuator.

3. Unscrew the bonnet from the valve body.

**WARNING**

Avoid personal injury from sudden release of process pressure. If the process media starts to escape from the safety vent (see Figure 2) located in the bonnet neck of the valve body,

STOP DISASSEMBLY IMMEDIATELY!

The escape of process media indicates that the valve has NOT been isolated from the process media or process pressure is trapped in the valve body.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

4. Once the bonnet has been removed from the valve body, inspect the seat ring (key 5) for wear or damage. If the seating surface has been damaged, remove it from the valve body. Also remove the seat ring gasket (key 6). Clean and inspect the valve body gasket surface for damage. Visually inspect the valve body interior below the seat ring for erosion. Replace the valve body if necessary.

To replace the seat ring, first install a new seat ring gasket. Install the new seat ring and tighten to 230 N•m / 170 lbf•ft.

Cover the opening in the valve body to prevent foreign material from getting into the valve body cavity.
5. Inspect the valve stem for scratches or wear and valve plug for wear or damage. Replace if necessary.
6. If the valve plug requires replacement, use an open end wrench on the machined flats located on the valve stem above the flow adjuster and unscrew the valve plug from the valve stem. Replace it with a new valve plug. Screw the valve plug into the valve stem, being careful not to damage the plug seat or plug contour. Tighten to 18 N•m / 13 lbf•ft.

**WARNING**

Upon reassembly, ensure that no foreign material blocks the safety vent hole as shown in Figure 2. If the safety vent hole is blocked or plugged, possible personal injury from the sudden release of process pressure during maintenance disassembly may occur.

7. Lubricate a new O-ring (key 13) with lithium grease and place it into the valve body as shown in Figure 6 or 7. Ensure that no foreign material blocks the safety vent hole. Screw the bonnet into the valve body and torque to a range of 542 to 678 N•m / 400 to 500 lbf•ft.
8. For air-to-open actuator action only, attach the pressure line to the actuator and supply pressure to the actuator. Loosen the socket head screws (key 29) and remove the flow adjuster (keys 14 and 15). Release the pressure to the actuator. This allows the plug to find its seated position.
9. Set the flow adjuster to the desired travel position (see Figure 2) and tighten the flow adjuster socket head cap screws to 3 N•m / 26 lbf•in.

3.2 Packing, Valve Trim and Actuator Maintenance

NOTE

The following maintenance procedures apply to both air-to-open and air-to-close actuator configurations, except as noted.

Figure 3. Fisher D2T FloPro Construction

Key numbers are referenced in Figures 6 and 7.

Disassembly

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body and drain the process media from both sides of the valve.
2. For air-to-open actuator action only, apply pressure to the actuator to fully stroke it open. This will raise the plug off its seat so that the valve stem serrations are visible inside the flow adjuster window (see Figure 3). Loosen the socket head screws (key 29) and lower the flow adjuster (keys 14 and 15) to its lowest position on the valve stem. Retighten the socket head screws (key 29) to 3 N•m / 26 lbf•in. Relieve pressure to the actuator, shut off all pressure lines to actuator and disconnect. Use lockout procedures to be sure that the above measures stay in effect while you work on the equipment.

NOTICE

The preceding step is intended to prevent damage to the valve plug (key 3) and seat ring (key 5) during the removal of the bonnet and actuator.

3. Unscrew the bonnet from the valve body.

WARNING

Avoid personal injury from sudden release of process pressure. If the process media starts to escape from the safety vent (see Figure 2) located in the bonnet neck of the valve body,

STOP DISASSEMBLY IMMEDIATELY!

The escape of process media indicates that the valve has NOT been isolated from the process media or process pressure is trapped in the valve body.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

4. Once the bonnet has been removed from the valve body, inspect the valve seat (key 5) for wear or damage. If the seating surface has been damaged, remove it from the valve body. Also remove the seat ring gasket (key 6). Clean and inspect the valve body gasket surface for damage. Visually inspect the valve body interior below the seat ring for erosion. Replace the valve body if necessary.

To replace the seat ring, first install a new seat ring gasket. Install the new seat ring and tighten to 230 N•m / 170 lbf•ft.

Cover the opening in the valve body to prevent foreign material from getting into the valve body cavity.

WARNING

To prevent possible personal injury or property damage from removing the casing cap screws in the wrong sequence, follow the procedure as outlined below for removing the upper casing.

5. Remove the six short actuator casing cap screws (key 22) first. Once these have been removed from the actuator assembly, remove the two long actuator cap screws (key 30) by alternating between them as you loosen them, to keep the upper casing (key 21) level during this procedure.

NOTE

Be aware as you loosen and remove the actuator cap screws that the actuator springs are under compression for the air-to-open configuration.

6. Remove the upper casing (key 21) and the springs (key 27).
7. Do not turn the valve stem (key 4) while removing the diaphragm hex nut (key 26). Keep the stem from turning by using an open end wrench on the machined flats located on the valve stem above the flow adjuster for this procedure. Continue the actuator disassembly by removing these parts: washer (key 24) diaphragm plate (key 25), diaphragm (key 19), washer (key 36) and O-ring (key 37). Inspect the diaphragm for any wear or damage. Replace with a new one if necessary.

If you wish to inspect/replace the bonnet to actuator casing O-ring (key 16), mark the orientation of the actuator pressure connection to the bonnet for later reference (see Figure 3). Unscrew the hex nut (key 18) from the bonnet. Remove the bottom casing (key 20).
8. Unscrew the flow adjuster socket head cap screws (key 29) and remove the flow adjuster halves.
9. Unscrew the packing retainer (key 7) from the bonnet (key 2). After the packing retainer has been unscrewed from the bonnet, pull the valve stem and plug out of the bonnet.
10. Remove the five Belleville springs (key 9), packing spacer (key 10), packing (key 11) and two anti-extrusion rings (key 12) from the bonnet. See Figure 4.
11. Clean and inspect the packing box wall to ensure that the packing surfaces are not damaged. If the surface condition is damaged and cannot be improved by light sanding, replace the bonnet by contacting your [Emerson sales office](#).
12. Inspect the valve stem for scratches or wear and valve plug for wear or damage. Replace if necessary.
13. If the valve plug requires replacement, use an appropriate tool on the machined flats located on the valve stem above the flow adjuster and unscrew the valve plug from the valve stem. Replace it with a new valve plug. Screw the valve plug into the valve stem, being careful not to damage the plug seat or plug contour. Tighten to 18 N•m / 13 lbf•ft.
14. Inspect the valve stem bushing (key 8) located in the upper end of the bonnet. If damaged, remove and replace it with new bushing (key 8). Replace the valve stem bushing by inserting the bushing, flange end first, into the bore located at the top of the bonnet flow adjuster window. Insert until the flange snaps into the groove provided for it.
15. Remove the O-ring (key 17) from the upper end of the bonnet. Replace it with a new one and lubricate it with lithium grease.

Assembly

1. Use the packing spacer (key 10) and a tube to push the upper anti-extrusion washer (key 12) into place. Using the packing spacer in this manner will ensure the upper anti-extrusion washer is fully seated and flat when installed in the packing bore.
2. Remove the packing spacer from the packing bore.

NOTE

All D2T and D2 Angle packing kits include a single use packet of high performance fluorinated grease. This is the only acceptable D2T or D2 Angle packing lubricant.

NOTE

In the following procedure, carefully install each packing ring individually over the valve stem and push completely into the packing box with a non-marring tube. A 12-in. length of 1/2 in. PVC pipe works well for this. It is recommended that the lubricated packing rings be installed individually rather than pushed in as a set.

3. Apply a 3 mm / 1/8 in. bead of the supplied high performance fluorinated grease (key 38) around the groove of the female packing adaptor as shown in Figure 5 and install over the valve stem.
4. Apply a 3 mm / 1/8 in. bead of the supplied high performance fluorinated grease (key 38) around the groove of the packing ring as shown in Figure 5 and install over the valve stem.
5. Install the male packing adaptor, lower anti-extrusion washer (key 12) and packing spacer over the valve stem as shown in Figure 4.
6. Firmly press all packing parts into the packing bore with a tube.
7. Install the five Belleville springs (key 9) over the valve stem as shown in Figure 4.
8. Lubricate the threads of the packing retainer with anti-seize and install into the bonnet using a 1-1/8 in. wrench. Make sure the Belleville springs are completely enclosed by the packing retainer as shown in Figure 4.
9. Torque the packing retainer to 81 N•m / 60 lbf•ft. The packing retainer has been installed correctly when a metal-to-metal contact has been made between the packing retainer end and the bonnet (key 2). The packing retainer threads should be flush with the bottom of the bonnet as shown in Figure 4.

Figure 4. Packing and Belleville Spring Stacking Order

13. Position the upper casing and install the two long cap screws (key 30) opposite one another. Install the six shorter cap screws (key 22) and the hex nuts, tightening the actuator casing cap screws evenly using a cross-tightening procedure. Torque to 10 N•m / 8 lbf•ft.

WARNING

Upon reassembly, ensure that no foreign material blocks the safety vent hole as shown in Figure 2. If the safety vent hole is blocked or plugged, possible personal injury from the sudden release of process pressure during maintenance disassembly may occur.

14. Lubricate a new O-ring (key 13) with lithium grease and place it into the valve body as shown in Figure 6 or 7. Ensure that no foreign material blocks the safety vent hole. Screw the bonnet into the valve body and torque to a range of 542 to 678 N•m / 400 to 500 lbf•ft.
15. For air-to-open actuator action only, attach the pressure line to the actuator and supply pressure to the actuator. Loosen the socket head screws (key 29) and remove the flow adjuster (keys 14 and 15). Release the pressure to the actuator. This allows the plug to find its seated position.
16. Set the flow adjuster to the desired travel position (see Figure 2) and tighten the flow adjuster socket head cap screws to 3 N•m / 26 lbf•in.
17. For air-to-close actuator action only, attach a pressure line to the actuator. Supply pressure to the actuator to seat the plug in the seat ring.
18. Set the flow adjuster to the desired travel position (see Figure 2) and tighten the flow adjuster socket head cap screws to 3 N•m / 26 lbf•in.

Section 4: NPT Port Location

WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- **Do not remove the actuator from the valve while the valve is still pressurized.**
- **Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.**
- **Disconnect any operating lines providing air pressure or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.**
- **Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.**
- **Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.**
- **Check with your process or safety engineer for any additional measures that must be taken to protect against process media.**

NOTE

The NPT plug may be located in any port depending on customer installation requirements. The valve is shipped with the NPT plug installed in the bottom port.

1. The NPT plug shall be inserted into the desired port using NPT pipe sealant and/or pipe tape.
2. Tighten the NPT fitting until hand tight, then add 1 to 2-1/2 turns 149 to 163 N•m / 110 to 120 lbf•ft.

Section 5: Parts

5.1 Parts Ordering

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

5.2 Parts Kits

Table 2. Parts Kits

Description	Part Number
Valve Trim Kit*	
R30006 Valve Plug and Seat Includes key numbers 3, 5, 6 and 13	19B8485X012

Introduction

Scope of Manual

This instruction manual provides installation, maintenance, and parts information for the Fisher D3 control valve with easy-Drive electric actuator.

Do not install, operate, or maintain a D3 valve with easy-Drive electric actuator without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Table 1. Specifications

Valve Body Sizes, End Connection Styles, and Port Diameters⁽¹⁾

VALVE SIZE, NPS	PORT DIAMETER, (INCHES)	THREADED	RAISED FACE (RF) FLANGED
		CL900	CL600
1	0.375, 0.75, 1	X	X
2	0.375, 0.75, 1	X	X

X = Available construction.

Maximum Inlet Pressures and Temperatures⁽¹⁾

VALVE BODY SIZE	MAXIMUM INLET PRESSURE	TEMPERATURE RANGE
	bar (psig)	°C (°F)
NPS 1 NPT CL900	155 (2250)	-46 to 93 (-50 to 200)
	150 (2185)	93 to 149 (200 to 300)
NPS 2 NPT CL900	155 (2250)	-46 to 93 (-50 to 200)
	150 (2185)	93 to 149 (200 to 300)
NPS 1 RF CL600	103 (1500)	-46 to 93 (-50 to 200)
	100 (1455)	93 to 149 (200 to 300)
NPS 2 RF CL600	103 (1500)	-46 to 93 (-50 to 200)
	100 (1455)	93 to 149 (200 to 300)

Maximum Shutoff Pressure Drops⁽¹⁾

1. The pressure or temperature limits in the referenced tables and any applicable ASME code limitations should not be exceeded.

2. 10% variation can be expected, based on temperature and pressure of application.

Description

The Fisher D3 with easy-Drive electric actuator technology (figure 1) is a globe valve with electric actuator specifically designed for upstream, low power applications. The easy-Drive operates with 12 or 24VDC in either on/off or Positioning configurations.

The on/off configuration has 2 different states; opened or closed, which are ideal for dump or snap acting applications. The Positioning configuration extends the functionality to intermediate positions for flow and pressure control applications.

Specifications

Table 1 lists specifications for the D3 control valve. Some of the specifications for a given control valve as it originally comes from the factory are stamped on a nameplate located on the lower actuator housing.

Educational Services

For information on available courses for the Fisher D3 control valve with easy-Drive electric actuator, as well as a variety of other products, contact:

Installation

WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage caused by bursting of pressure-retaining parts or by uncontrolled process fluid, be certain the service conditions do not exceed the limits shown on the valve nameplate and in table 1. Use pressure-relieving devices required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

WARNING

For explosion-proof applications, ensure the actuator cover is properly bolted before applying power to the actuator. Personal injury or property damage may result from fire or explosion if power is applied to the actuator with the cover removed in a hazardous area.

For explosion-proof applications, install rigid metal conduit and a conduit seal no more than 457 mm (18 inches) from the actuator. Personal injury or property damage may result from explosion if the seal is not installed.

Select wiring and/or cable glands that are rated for the environment of use (such as hazardous area, ingress protection, and temperature). Failure to use properly rated wiring and/or cable glands can result in personal injury or property damage from fire or explosion.

Wiring connections must be in accordance with local, regional, and national codes for any given hazardous area approval. Failure to follow the local, regional, and national codes could result in personal injury or property damage from fire or explosion.

CAUTION

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#) or Local Business Partner.

To avoid product damage, inspect the valve before installation for any damage or any foreign material that may have collected in the valve body. Also remove any pipe scale, welding slag, or other foreign material from the pipeline.

1. Before installing the control valve assembly, inspect it for any damage and for any foreign material that may have collected in the valve body.
2. Clean out all pipelines to remove scale, welding slag, and other foreign materials.
3. The control valve assembly may be installed in any orientation, but normally the actuator is vertical above the valve. Install the valve so the flow direction arrow on the side of the valve indicates the direction of the process flow.
4. Install the valve following local and national piping codes when they apply to the application. For screwed connections, treat the external pipe threads with a good grade pipe compound. For flanged connections, use suitable gaskets between valve and pipeline flanges.
5. If continuous operation is required during inspection or maintenance, install a three-valve bypass around the control valve assembly.

Special Instructions for “Safe Use” and Installations in Hazardous Locations

ATEX/IECEX

WARNING

To avoid static discharge from the enclosure, do not rub or clean the enclosure with solvents. To do so could result in an explosion. Clean with a mild detergent and water only.

The enclosure is non-conducting and may generate an ignition-capable level of electrostatic charges under certain extreme conditions. The user should ensure that the equipment is not installed in a location where it may be subjected to external conditions (such as high-pressure steam) which might cause a build-up of electrostatic charges on non-conducting surfaces. Additionally, cleaning of the equipment shall only be done with a damp cloth.

To avoid damage to the enclosure, when screws are fully tightened into blind holes in enclosure walls, with no washer fitted, at least one full thread shall remain free at the base of the hole.

Startup Overview

Figure 2. Flowchart

Figure 3. Fisher D3 Valve with easy-Drive Actuator Wiring Diagram

Power Requirements

Ensure a stable DC power source is available, maintaining less than 5% ripple and sufficiently surge protected for the application. A 4 amp (minimum) power supply is required. Use of a 36 volt transient voltage suppressor is highly recommended.

Wiring Instructions

1. Observe local wiring requirements for hazardous location usage.
2. Conduit seals within 450 mm (18 inches) of the enclosure port are required for explosion-proof installation.
3. 22AWG (0.33mm²) to 12AWG (3.31mm²) wire size required.
4. Fuse system to 5A.
5. Connect enclosure and analog signal shields.
6. Ensure power is turned off before connecting the wires.

Power

1. Connect 12 or 24 VDC reference to: –
2. Connect 12 or 24 VDC positive to: +
3. Be sure to tighten terminals sufficiently to ensure solid mechanical connection.

Figure 4. Wiring - Analog Input

NOTE:
1. 40043=0 SETS ANALOG INPUT TO 1-5V AND ASSUMES USE OF RECOMMENDED EXTERNAL 250 OHM RESISTOR.
IF NO EXTERNAL RESISTOR IS USED, SET 40043=1.

Important Technical Notice for easy-Drive Electric Actuator

When using the easy-Drive electric actuator with a 4-20mA control signal, the unit should always have 12/24VDC power present on the power input terminals prior to applying the 4-20mA signal, unless an external 250 ohm resistor is installed per figure 4. Failure to do so could result in damage to the analog input circuitry.

It is strongly recommended to place an external 250 ohm resistor between terminals 3 and 4 when using a 4-20mA signal to control the actuator. When the actuator is configured to 1-5V input with an external 250 ohm resistor in place, a 4-20mA signal may be safely used without danger to input circuitry.

This order of operation must always be maintained when powering the unit on if no external 250 ohm resistor is used:

1. 12/24VDC power on
2. 4-20mA control signal engaged

This order of operation must always be maintained when powering the unit off:

1. 4-20mA control signal disengaged
2. 12/24VDC power off

The result of not following this order of operation could result in permanent damage to the analog input circuitry. This damage can result in the inability of the controller to see the control signal, resulting in the actuator moving the valve plug to the loss of signal position.

Default Input Signals

The D3 with easy-Drive comes from the factory calibrated and ready for use with the following default input signals shown in table 2.

Table 2. D3 easy-Drive Default Input Signals

CONFIGURATION	ON/OFF	POSITIONING
Input Signal	L2e (dual dry contact)	4-20 mA

If the input signal of the application matches table 2, proceed to the Wiring Instructions section. If the input signal of the application does not match table 2, proceed to the Configuration section.

Configuration

Input Configuration

There are 2 functional configurations available for the easy-Drive electric actuator: On/Off and Positioning. It is not possible to change an actuator from On/Off to Positioning after it has been delivered from the factory. Version 4.21 and higher firmware will allow a positioning unit to be changed to on/off.

All available input signals are shown in table 3.

Table 3. All Available Input Signals

CONFIGURATION	ON/OFF			POSITIONING		
Control Source	Modbus	Local		Modbus	Local	
Input Signal	Modbus	L2e Dual Dry Contact (default)	Single Dry Contact	Modbus	4-20 mA (default)	1-5 V

If you are using the default inputs signals, and the valve has not been disassembled or adjusted in any way, there is no need to recalibrate the assembly. You can proceed directly to Startup (page 12).

Changing the Inputs from Default Settings

All configuration within the valve is done by setting values in Modbus registers. This can be done using any Modbus master (flow computer, PLC, PC). Configuration software, providing a visual interface to the registers, is available through your [Emerson sales office](#) or Local Business Partner.

Modbus setup

Use the instructions in the instruction manual for the Modbus master to initiate the connection. The D3 with easy-Drive electric actuator Modbus factory defaults are Address 1, 9600 baud, even parity, 1 stop bit.

When a connection has been achieved, the actuator may be configured to accept the input signal over the Modbus link (ignoring the physical inputs) and the Modbus settings may be changed to accommodate the network to which it is attached. Other changes to functionality are possible, such as:

- Low level cutoff: 40037 (default is 5%)
- Position upon loss of signal: 40035 (default is 0%)

See Appendix A for a full map of Modbus registers and their functions.

Figure 8. Fisher easy-Drive Configuration Software

Connecting using the Fisher easy-Drive configuration software

The Fisher easy-Drive configuration software allows configuration and diagnosing of the Fisher easy-Drive electric actuator with a graphical interface. Connect a PC to the actuator using a USB or serial device to Modbus RTU converter using the wiring instructions above. The USB or serial device will be visible in the drop menu under Serial Port Settings. Baud rate and parity should be set to the Modbus settings of the actuator. Default actuator settings are 9600 baud and Even parity.

Use the Fisher easy-Drive configuration software (figure 8) to make the desired changes, or register values may be changed to allow different functionality. Modbus register 40034 dictates whether the unit will respond to a physical

signal or to the value in Modbus register 40001. A value of 0 in register 40034 will result in the actuator responding to the value in 40001 and a value of 1 will result in the actuator responding to physical control signals.

Note

If an actuator is on/off, a Modbus command of 0-49 in register 40001 will cause the valve to close fully, while a value of 50-100 will cause the valve to open fully.

Local to Modbus Control

Modbus

- Set register 40034 (Control Source)
 - 1 = Local Control
 - 0 = Modbus control

Configuration Software

- Use radio button to select Local Control or Modbus Control.

4-20mA to 1-5V Control

Modbus

- Set register 40043 (Analog I/P mode)
 - 0 = 1-5V
 - 1 = 4-20mA

Configuration Software

- Use radio button to select 4-20mA or 1-5V local analog control when Control Source is set to Local.

L2e (Dual dry contact) to Single Dry Contact Control

Modbus

- Set register 40043 (Analog I/P mode)
 - 0 = L2e (Dual dry contact)
 - 1 = Single dry contact

Configuration Software

- Use radio button to select L2e or Single pole local digital control when Control Source is set to Local.

Calibration Instructions

WARNING

To avoid personal injury or property damage, be aware that the valve will open fully and then close fully during the calibration cycle.

It is not necessary to calibrate your easy-Drive electric actuator prior to use from a factory shipment.

If any of the following are true, recalibration will be required (see next section)

- A change in the Flo-Pro setting
- The actuator has been re-mounted on a different valve since shipment
- Disassembly of the valve for trim or packing changes
- A new version of firmware has been loaded on the controller

The following scenarios do not require recalibrations

- New unit from the box
- Power dips or interruptions
- Changing of control method (i.e. from 4-20mA to Modbus control)
- Extended periods of storage

Calibration with the use of Modbus

1. After the unit has been properly wired and fused per instructions in the Wiring section of this instruction manual, turn power to the unit on.
2. Calibrate using Modbus:
 - a. Send position command of 0% to actuator to prevent unexpected motion. Valve will move to commanded position following the calibration procedure.
 - b. Send a value of 1 to register 40003. Valve plug will move to fully open position and then to fully closed. The valve plug will then return to the commanded position.

If a Modbus connection is not available, and recalibration is desired, use the appropriate calibration method as determined by the control method of your valve.

Calibration without the use of Modbus

1. Turn power to the actuator off.
2. Wait for 10 seconds to ensure all circuits have discharged.
3. Return power to the actuator and use the appropriate calibration method for your control signal. Calibration sequence must be done within 15 seconds of power being switched on.
4. For On/Off operation using L2e dual-input dry contact:
 - a. Close the contact to create a short between pins 1 and 2 – valve plug will not move at this time.
 - b. Close the contact to create a short between pins 1 and 3 – valve plug will move to the upper, open position and then to the lower, closed position.
5. For On/Off operation using single dry contact:
 - a. Close the contact to create a short between pins 1 and 2 – valve plug will not move at this time.
 - b. Open the contact to create an open circuit between pins 1 and 2 – valve plug will move to the upper, open position and then to the lower, closed position.

6. For positioning operation using 4-20mA:
 - a. Apply a 20mA signal between pins 3 and 4 – valve plug will not move at this time.
 - b. Apply a 4mA signal between pins 3 and 4 – valve plug will move to the upper stop, immediately followed by moving to the lower, closed position.
 - c. If calibration of the analog input is desired to improve positional accuracy, an optional operation is listed in the next section titled Analog Input Calibration.
7. For positioning operation using 1-5V:
 - a. Apply a 5V signal between pins 3 and 4 – valve plug will not move at this time.
 - b. Apply a 1V signal between pins 3 and 4 – valve plug will move to the upper stop, immediately followed by moving to the lower, closed position.
 - c. If calibration of the analog input is desired to improve positional accuracy, an optional operation is listed in the next section titled Analog Input Calibration.

8. The unit is now calibrated.

Analog Input Calibration

Improved positional accuracy may be obtained by calibrating the actuator to the analog signal input. The position of the valve plug is linearly proportional to the analog control signal end points, with 4 mA/1V equating to fully closed and 20 mA/5V equating to fully open.

1. Apply a 4 mA or 1V signal between pins 3 and 4 - valve plug will move to the fully open position.
2. Send a value of 1 to register 40004 or click Analog Cal at 0% in the configuration software.
3. Apply a 20 mA or 5V signal between pins 3 and 4 - valve plug will move to the fully closed position.
4. Send a value of 1 to register 40005 or click Analog Cal at 100% in the configuration software.
5. The unit is calibrated to your analog signal.

Start Up

WARNING

To avoid personal injury or property damage, be aware that the valve will move and respond to an input signal during start up.

1. Before turning on power to the unit, be sure that a closed signal is being commanded to the unit.
 - Dry-Contact: contact is open.
 - L2e (Dual Dry Contact): Contact closed across pins 1 & 3.
 - Analog Input: signal < 4mA or 1V.
 - Modbus: position demand = 0.
2. Turn on power to the unit.
3. Apply a change in position demand to ensure unit responds properly.

- Dry-Contact:
 - Closed contact between pins 1 & 2 will open the valve.
 - Dual contact / L2e only (40043=0) : Closed contact between pins 1 & 2 will open the valve. Closed contact between pins 1 & 3 will close the valve.
 - Analog Input: valve will respond to proportional demand.
 - Modbus: valve will respond to positional demand in register 40001. 0 = fully closed and 100 = fully open.
4. If the valve does not respond as expected, proceed to Troubleshooting guide on page 14.
 5. Check conduit ports.
 - Conduit seal must be in place within 450mm (18 inches) of the enclosure.
 - Unused conduit ports must be sealed with an explosion-proof port plug.
 6. Replace the cover and tighten all 8 bolts to 20 N-m (15 ft-lbs).

Troubleshooting

1. Unit does not move.
 - a. Verify that 12VDC to 24VDC is present on the power terminals as shown on the cover.
 - b. Verify that all wires are firmly attached on both ends.
 - c. Verify that wires are connected to the correct terminals - see Wiring in the manual.
 - d. Verify mode of operation (on/off or positioning) matches control signal.
 - e. Verify mode of control (local or Modbus) matches control signal.
2. Unit does not respond to 4-20mA signal
 - a. Verify that 12VDC to 24VDC is present on the power terminals as shown on the cover.
 - b. Verify that the 4-20mA signal is wired correctly and that the terminals are firmly on the wires.
 - c. Verify mode of operation matches control signal (local control: 40033=0, positioning: 40034=1).
 - d. Check the value of the analog input in register 40025 (middle right of configuration software screen) to determine if it is 0 or greater.
 - i. If register 40025 shows 0 and the circuit board is green (not blue), it is possible a 4-20mA signal was applied without power to the power terminals and damage to the input circuitry has occurred. Contact your [Emerson sales office](#) or Local Business Partner for further information.
3. Unit moves to fully open when 1V signal is applied and closed when 5V signal is applied.
 - a. Unit is likely configured as an on/off unit with local control; on/off units can not be controlled as an analog device.
 - i. If on/off control is desired, use a dry contact switch to control in local mode or change to Modbus mode to control the unit.

- ii. If positioning control is desired, contact your [Emerson sales office](#) or Local Business Partner to upgrade your actuator to positioning control.
4. Diagnostics show a Motor Stall Fault.
 - a. The easy-Drive electric actuator is designed to operate in a manner consistent with a pneumatic actuator. This means that if the valve plug can not move to its commanded position, the actuator will stop, without damage, and issue a Motor Stall Fault warning. When the command signal changes outside of the deadband (Modbus register 40036), it will attempt to move again. Recalibrate the actuator span per instructions in the Startup section of this manual.
5. Position on D3 is not accurate (proportional positioning units only).
 - a. If the position of a D3 is too high (i.e. 50% is much higher than 50% on the bonnet), check the valve type. If valve type is D4, change to D3, cycle power, and recalibrate.
 - b. If the local analog input is being used (4-20mA or 1-5V), the analog inputs of the actuator may be calibrated to match the input signal.
 - i. Command 0% (4mA or 1V).
 - ii. Using a Modbus link, send a 1 to register 40004 or use the Fisher easy-Drive configuration software by clicking the button “Analog Cal at 0%”.
 - iii. Command 100% (20mA or 5V).
 - iv. Using a Modbus link, send a 1 to register 40005 or use the Fisher easy-Drive configuration software by clicking the button “Analog Cal at 100%”.

Figure 9. Adjusts to Vary Flow Capacity (Shown with Valve Plug in Seated Position)

Setting the Valve Flow Adjuster

The flow setting may only be adjusted if the 0.375 and 0.75 inch port sizes are installed and only when using the on/off version.

When shipped from the factory, the actuator has the flow adjuster set at the maximum flow rate position for the given port size.

1. Ensure the valve plug is in the seated position.
2. To change the valve flow rate, loosen the flow adjuster socket head cap screws (key 15) with a 5/32 inch Allen key, and reposition the flow adjuster halves (key 13 and 14) to the desired flow rate position. See figure 9 for flow rate settings.
3. Retighten the socket head screws (key 15) to 3 N•m (26 lbf•in).
4. Follow instructions for recalibration on page 10.

Maintenance

Refer to figure 12.

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and maintenance depends on the severity of the service conditions.

WARNING

Avoid personal injury from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

WARNING

For explosion-proof applications, ensure the actuator cover is properly bolted before applying power to the actuator. Personal injury or property damage may result from fire or explosion if power is applied to the actuator with the cover removed in a hazardous area.

Do not remove the actuator cover for 10 minutes after power is disconnected if the UPS option is installed.

For explosion-proof applications, install rigid metal conduit and a conduit seal no more than 457 mm (18 inches) from the transducer. Personal injury or property damage may result from explosion if the seal is not installed.

Select wiring and/or cable glands that are rated for the environment of use (such as hazardous area, ingress protection, and temperature). Failure to use properly rated wiring and/or cable glands can result in personal injury or property damage from fire or explosion.

Wiring connections must be in accordance with local, regional, and national codes for any given hazardous area approval. Failure to follow the local, regional, and national codes could result in personal injury or property damage from fire or explosion.

Figure 10. Packing and Belleville Spring Stacking Order

Figure 11. Packing and Belleville Spring Stacking Order

Valve Plug and Seat Ring Maintenance Trim Disassembly

Key numbers are referenced in figures 10, 12, and 13.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body (key 1), and drain the process media from both sides of the valve.

CAUTION

The following steps are intended to prevent damage to the valve plug (key 3) and seat ring (key 2) during the removal of the bonnet and actuator.

For ON/OFF Actuators

2. Command the valve open.
3. Place an open end wrench or a similar obstruction about 6 mm (1/4 inch) thick under the FloPro.
4. Command the valve closed.

For Positioning Actuators

5. Command the valve to anywhere between 10% and 20% travel.
6. Isolate power and signal.

7. Break the bonnet nut (key 5) loose with a hammer. Continue turning the bonnet nut by using a hammer or a large adjustable wrench, tightened around one ear of the bonnet nut. If the bonnet (key 7) is stuck in the valve, continue to unscrew the bonnet nut. The bonnet nut will contact the spring pins (or pipe plugs) (key 6, figure 12) and jack the bonnet out of the valve. Carefully lift the actuator assembly from the valve body.

⚠ WARNING

The spring pins/pipe plugs (key 6) must always be in place during valve operation. They provide a safeguard against injury when the unit is being disassembled.

8. Completely remove the packing retainer (key 8) using a 1-1/8 inch wrench.
9. Remove the valve plug by driving out the pin (key 43) and unscrewing the valve plug from the stem. Do not remove the Belleville springs (key 9) from the stem, in order to retain the Belleville stacking orientation as shown in figure 10.
10. Use a 1-3/16 inch socket wrench to loosen and remove the seat ring (key 2).

CAUTION

Inspect the seat ring and valve body interior for wear, erosion, or damage in the following steps.

11. Inspect the seat ring for wear or damage. If the seating surface has been damaged, discard the seat ring.
12. Visually inspect the valve body interior below the seat ring for erosion or damage. Replace the valve body if necessary.

⚠ WARNING

Be careful to avoid damaging the seating surface on the valve plug or seat ring as damage in these areas will allow excessive leakage at shutoff. Avoid damaging the highly polished valve stem surface. A damaged valve stem could cut the packing and allow process fluid to leak to the atmosphere.

Cover the opening in the valve body to prevent foreign material from getting into the valve body cavity.

Trim Assembly

1. Ensure the threads of the valve stem (key 16) and valve plug (key 3) are clean and free of debris.
2. Make sure the Belleville springs (key 9) are properly installed on the valve stem, as shown in figure 11.
3. Install the valve plug on the stem and insert a new pin (key 43).
4. Lubricate the threads of the packing retainer with anti-seize and install into the bonnet using a 1-1/8 inch wrench. Make sure the Belleville springs (key 9) are completely enclosed by the packing retainer as shown in figure 11.
5. Torque the packing retainer to 81 N•m (60 lbf•ft). The packing retainer has been installed correctly when a metal-to-metal contact has been made between the packing retainer end and the bonnet (key 7). The packing retainer threads should be completely enclosed by the bonnet (see figure 11).
6. Thoroughly clean the seat ring (key 2) threads and the mating threads in the valve body (key 1).
7. Apply anti-seize lubricant to the threads of the seat ring and its mating threads in the valve body.
8. Screw the seat ring into the valve body. Use a 1-3/16 inch socket wrench to tighten the seat ring to 170 N•m (125 lbf•ft). Remove all excess lubricant after tightening.
9. Lubricate the bonnet O-ring (key 4) with lithium grease and install on the bonnet.

10. Apply anti-seize lubricant to the threads on the valve body and bonnet nut (key 5) and the contact surfaces of the bonnet and bonnet nut flange. Install the bonnet and actuator assembly onto the valve body. Tighten the bonnet nut until the nut stops turning. A few hammer blows will be required to ensure that the assembly is tight.

Packing Maintenance

⚠ WARNING

Observe the warning at the start of the Maintenance section.

Key numbers are referenced in figure 10.

The valve stem packing can only be serviced by removing the bonnet from the valve body.

Packing Disassembly

1. Disassemble the valve per steps 1 - 9 in the Trim Disassembly section of the Valve Plug and Seat Ring Maintenance section of this manual.
2. Remove the five Belleville springs (key 9), lower packing spacer (key 12), packing set (key 11), and two anti-extrusion washers (key 10) from the bonnet (key 7) using a formed wire hook.
3. Clean and inspect the packing box wall to ensure that the packing surfaces are not damaged. If the surface condition is damaged and cannot be improved by light sanding, replace the bonnet.
4. Inspect the valve stem (key 16) and valve plug (key 3) for scratches or wear and replace if necessary.

Packing Assembly

The following steps define the proper procedure for installing the packing in a D3 valve. Improper packing assembly can lead to poor valve performance. The proper packing arrangement is shown in figures 10 and 11.

1. Ensure the upper packing spacer (key 12) is installed.
2. Use the lower packing spacer (key 12) and a tube to push the upper anti-extrusion washer (key 10) into place. Using the lower packing spacer in this manner will ensure the upper anti-extrusion washer is fully seated and flat when installed in the packing bore.
3. Remove the lower packing spacer from the packing bore.

CAUTION

All D3 packing kits include a single use packet of high performance fluorinated grease. This is the only acceptable D3 packing lubricant.

Note

In the following procedure, carefully install each packing ring individually over the valve stem and push completely into the packing box with a non-marring tube. A 12-inch length of 1/2 inch PVC pipe works well for this. It is recommended that the lubricated packing rings be installed individually rather than pushed in as a set.

4. Apply a 3mm (1/8 inch) bead of the supplied high performance fluorinated grease (key 44) around the groove of the female packing adaptor as shown in figure 10 and install over the valve stem (key 16).
5. Apply a 3mm (1/8 inch) bead of the supplied high performance fluorinated grease (key 44) around the groove of the packing ring as shown in figure 10 and install over the valve stem.

6. Install the male packing adaptor, lower anti-extrusion washer (key 10), and lower packing spacer over the valve stem as shown in figure 10.
7. Firmly press all packing parts into the packing bore with a tube.
8. Install the five Belleville springs (key 9) over the valve stem as shown in figure 10.
9. Install the valve plug (key 3) on the stem and insert a new groove pin (key 43).
10. Lubricate the threads of the packing retainer with anti-seize and install into the bonnet using a 1-1/8 inch wrench. Make sure the Belleville springs are completely enclosed by the packing retainer as shown in figure 11.
11. Torque the packing retainer to 81 N•m (60 lbf•ft). The packing retainer has been installed correctly when a metal-to-metal contact has been made between the packing retainer end and the bonnet (key 7). The packing retainer threads should be completely enclosed by the bonnet.
12. Apply anti-seize lubricant to the threads on the valve body and bonnet nut (key 5) and the contact surfaces of the bonnet and bonnet nut flange. Install the bonnet and actuator assembly onto the valve body. Tighten the bonnet nut until the nut stops turning. A few hammer blows will be required to ensure that the assembly is tight.

Stem Replacement

CAUTION

If the valve stem is replaced, the packing will also need to be replaced, since the threads on the valve stem may damage the packing when the valve stem is removed.

1. Follow the Trim Disassembly procedures, steps 1-8 on page 18 of this manual.
2. Ensure power and signal have been isolated from the actuator. Open the explosion-proof enclosure (keys 60 and 61), using a 13mm wrench.
3. Remove the FloPro (keys 13, 14, and 15), using a 5/32 inch hex head wrench.
4. Remove the stem nut (key 27), using an 11/16 inch wrench, noting the position of the FloPro relative to the bonnet markings.
5. Use a rubber mallet to gently drive the stem downward through the bottom of the actuator housing and remove the stem.
6. Ensure the packing has been removed, using procedures in the Packing Disassembly on page 20 of this manual.
7. Replace the stem by gently pushing the stem up through the actuator.
8. Replace the packing and plug, using the procedures in the Packing Assembly on page 20 of this manual.
9. Install the FloPro at the same position it was removed from in step 4. Tighten the hex socket head cap screws to 3 N•m (26 lbf•in).
10. Tighten the stem nut (key 27) to 39 N•m (29 lbf•ft) using an 11/16 inch wrench. Be sure the FloPro is not allowed to rotate when tightening the stem nut.
11. Apply anti-seize lubricant to the threads on the valve body and bonnet nut (key 5) and the contact surfaces of the bonnet and bonnet nut flange. Install the bonnet and actuator assembly onto the valve body. Tighten the bonnet nut until the nut stops turning. A few hammer blows will be required to ensure that the assembly is tight.

Parts Ordering

Each D3 control valve is assigned a serial number, which can be found on the nameplate. Refer to the number when contacting your [Emerson sales office](#) or Local Business Partner for assistance or when ordering replacement parts.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts Kits

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

D3 Valve with easy-Drive Actuator

October 2017

Instruction Manual

D103460X012

Table 4. Register Summary (continued)

DATA	LEGAL FUNCTION CODES	REGISTER (PHYSICAL)	TYPE	R/W	DESCRIPTION
Reserved	03 – Read Holding Reg	40031 (0x001E)	UINT16	R	Read will return power up default of 0
Valve type	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40032 (0x001F)	UINT16	R/W	1 = D3, 2 = D4
Control Type	03 – Read Holding Reg	40033 (0x0020)	UINT16	R	0 = On/Off, 1 = Proportional
Control Source	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40034 (0x0021)	UINT16	R/W	0 = Modbus RTU Register Commands, 1 = Local Control
Loss of control input/comms default position	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40035 (0x0022)	UINT16	R/W	Value 0-100 = 0-100% Position Valve 101 - Last Position
Deadband	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40036 (0x0023)	UINT16	R/W	Value 0-100 = 0-100% Level of hysteretic dead band applied to position control demand
Low travel cutoff	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40037 (0x0024)	UINT16	R/W	Blanking from zero position in percent
Communications Timeout	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40038 (0x0025)	UINT16	R/W	Timeout in seconds before loss of communications state is asserted
Communications Address	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40039 (0x0026)	UINT16	R/W	Modbus address in the range 1-247 (Default = 1)
Communications Baudrate	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40040 (0x0027)	UINT16	R/W	0 = 300 Baud, 1 = 600 Baud, 2 = 1200 Baud, 3 = 2400 Baud, 4 = 4800 Baud, 5 = 9600 Baud, (Default) 6 = 19200 Baud, 7 = 38400 Baud
Parity	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40041 (0x0028)	UINT16 (BOOL)	R/W	0 = Odd, 1 = Even, 2 = None ("None" available in version 4.21 only)
Reset Statistics	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40042 (0x0029)	UINT16 (BOOL)	R/W	0 = Reset Idle, 1 = Reset Active
Local Control Mode	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40043 (0x002A)	UINT16	R/W	On/Off 0 = L2e dual dry contact 1 = Single dry contact Proportional 0 = 1-5V 1 = 4-20 mA

UINT16 – unsigned 16 bit variable, can take value 0-65535.

UINT32 – unsigned 32 bit variable, can take value 0-4294967295.

(Reserved) – registers used for development use only.

† - 32bit register contains data that spans two registers – reads and write of data needs to be performed within the same Modbus command function to ensure coherency of data.

Table 5. Fault Register – Fault Flags Summary Table

Diagnostic Flags – Bit Mask Value	Diagnostic Flags – Binary Mask Value	Description
0x8001	1000 0000 0000 0000	Fault in N.V. Memory – system has restored default settings
0x4000	0100 0000 0000 0000	Motor assembly stall
0x2000	0010 0000 0000 0000	Speed measurement fault
0x1000	0001 0000 0000 0000	System or Watchdog fault
0x0800	0000 1000 0000 0000	Overspeed condition
0x0400	0000 0100 0000 0000	Calibration span not in legal range
0x0200	0000 0010 0000 0000	Fault in N.V. Memory – system has recovered settings
0x0100	0000 0001 0000 0000	Communications Timeout
0x0080	0000 0000 1000 0000	Valve was shutdown while moving
0x0040	0000 0000 0100 0000	Valve span calibrated (informational)
0x0020	0000 0000 0010 0000	Valve position controller active (informational)
0x0010	0000 0000 0001 0000	Analog input – below 3mA/0.75V (informational)
0x0008	0000 0000 0000 1000	Motor Overspeed coast condition
0x0004	0000 0000 0000 0100	Modbus command has been sent (starts a calibrated system)
0x0002	0000 0000 0000 0010	Analog input initialized (system has seen input >3mA/1V)
0x0001	0000 0000 0000 0001	Start delay active (within 10 second calibration window)

A.2 Diagnostic Flags

The diagnostic register holds a 16 bit value that represents 16 individual flags, when set (value '1'), this indicates the following conditions have occurred or are still present, the highest 7 bits are latching and will be present in the register even if the initial cause for the flag being set is removed. If these flags are set, a reset needs to be performed to clear the fault.

A.2.1 Fault in NV Memory

This is a severe fault and is usually seen when the firmware is upgraded with a program that uses a different EEPROM/Non-volatile memory map. If this is not the case then the probable cause is a fault in the memory hardware.

A.2.2 Motor Assembly Stall

The valve plug was unable to move to the commanded position. The drive has attempted to move the motor by applying a non-zero PWM signal, and the speed has not been detected as greater than 0 with a 400ms period. This fault latches and needs to be reset.

A.2.3 Speed Measurement Fault

The controller detected pulses that correspond to the motor going much faster than the speed the speed measurement system is designed for – the integrity of the measurement cannot be relied upon. This fault latches and needs to be reset.

A.2.4 System or Watchdog Fault

The software system has been reset and this flag is set at power up if the case of the reset was the onboard watchdog either timing out OR being forced by program function call. This flag is used as an indication that this type of reset has occurred.

A.2.5 Overspeed Condition

The drive speed was detected as being over the speed 3300RPM. This fault latches and needs to be reset.

A.2.6 Calibration Span Not in Legal Range

Following a calibration the detected mechanical travel was detected as being too short for the valve type. This fault latches and needs to be reset.

A.2.7 Fault in NV Memory – recovered settings

This fault is similar to Fault in NV Memory but is different in that the settings were recovered, however it is possible the fault was due to a setting being changed during a power cycle. The settings need to be validated before valve operation.

A.2.8 Communications Timeout

This flag is set after a timeout or loss of valid communications, it will be cleared if communications is reestablished with the valve controller. If this flag is set and the control demand is set to be taken from the Modbus then the valve will be commanded to the 'Loss of communications position' in setting accessed at Modbus register 40034.

A.2.9 Valve was Shutdown while Moving

The valve was actuating while power was removed, the position information may be unreliable. Command valve to 0% to assure position information is accurate.

A.2.10 Valve Span Calibrated

The valve is calibrated.

A.2.11 Valve Position Controller Active

The valve is being actively controlled to go to a demanded position. The speed and position control loop logic is setting the pwm and direction demands to the ValuDrive motor.

A.2.12 Analog Input Below 3mA/0.75V

The analog input is below a set threshold of 3mA. If since being powered up this level has been met the flag 'Analog input initialized' will be set. If the control source is the analog input and this flag is set then the valve will be commanded to actuate to the 'Loss of control input' position.

A.2.13 Motor Overspeed Coast Condition

The drive speed was detected as being over the speed 2500RPM. The flag is cleared if the speed falls below the coast threshold level. This flag is used purely as a diagnostic.

A.2.14 Modbus Command Initialized

The system has received a command to the Position demand register since being powered up. If Modbus is the selected control mode the valve will be commanded to this position after the startup period.

A.2.15 Analog Input Initialized

The analog input has been detected as having a control signal within the expected range of 3-20mA. If the analog input is the selected control signal then this will activate the valve after the startup period.

A.2.16 Start Delay Active

This is a flag set during the startup phase of operation, if this is set then the valve may be recalibrated by sending the calibration signal sequence (100% demand followed by 0%). It is cleared to indicate normal operation (recalibration will then require a command to Modbus register 40003).

A.3 Register Description

A.3.1 40001 Position Demand – Proportional [Read & Write]

Register: 40001, Address 0x0000 (0).
Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.
Description: This is a value between 0 and 100% to demand a valve position. This register will only be used by the system if the control source (set by register 40035) is set for Modbus RTU control. If the control type (set by register 40034) is On/Off then value will be resolved with a boolean set operation for a Open/Closed position demand variable output (e.g. Values 0-49 = '0' and 50-100 = '100'). This variable needs to be set to 100% then 0% after a power-up to calibrate an un-calibrated system.

A.3.2 40002 Reset Diagnostics [Read & Write]

Register: 40002, Address 0x0001 (1).
Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.
Description: This is a modbus request to reset the system from a fault state (indicated if the Diagnostics flags register has any set faults). Writing a decimal 1 to the register will start a reset process only if the system has a fault, otherwise the write will be ignored. Once the fault reset request has been acknowledged the register will be set to decimal 0. Bit assignments are shown in table 5.

A.3.3 40003 Recalibrate Demand [Read & Write]

Register: 40003, Address 0x0002 (2).
Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.
Description: Writing a value of 1 to this register will force the system to clear any calibration information and go through a cycle of calibration.

A.3.4 40004 Analog Cal at 0% [Read & Write]

Register: 40004, Address 0x0003 (3).
Function code: 0x10 – Write Multiple registers,

Description: 0x06 – Write Single register, or
0x03 – Read Holding registers.
This is a register is used to initiate a calibration of the analog to digital circuit in the system. A write of a '1' will cause the system to store the value at the analog input. This action should be performed with a calibrated 1V or 4mA present at the analog input. If this is not performed the system uses defaults. Values outside the range 0-1 will return an exception code.

A.3.5 40005 Analog Cal at 100% [Read & Write]

Register: 40005, Address 0x0004 (4).
Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.
Description: This is a register is used to initiate a calibration of the analog to digital circuit in the system. A write of a '1' will cause the system to store the value at the analog input. This action should be performed with a calibrated 5V or 20mA present at the analog input. If this is not performed the system uses defaults. Values outside the range 0-1 will return an exception code.

A.3.6 40004-40008 Reserved [Read Only]

Register: 40004-40008 Address 0x0003 (3) - 0x0007 (7).
Function code: 0x03 – Read Holding registers.
Description: Not used – reads will return a value of 0.

A.3.7 40009 Test Register [Read Only]

Register: 40009, Address 0x0008 (8).
Function code: 0x03 – Read Holding registers.
Description: A test register – can be used to confirm communications. Holds a power up default of 45964 (0xB38C Hex).

A.3.8 40010 Actual Position [Read Only]

Register: 40010, Address 0x0009 (9).
Function code: 0x03 – Read Holding registers.
Description: This is a value between 0 and 100% that indicates the physical position of a calibrated valve system. If the valve is un-calibrated (indicated if the Diagnostics flags register has a cleared calibration informational flag), then this register will read 0.

A.3.9 40011 Actual Demand [Read Only]

Register: 40011, Address 0x000A (10).
Function code: 0x03 – Read Holding registers.
Description: This is a value between 0 and 100% that indicates the demand to the position control loop from the active control source.

A.3.10 40012 Diagnostic Flags [Read Only]

Register: 40012, Address 0x000B (11).
Function code: 0x03 – Read Holding registers.
Description: This is a set of 16 bit flags that indicate the state of the system. The lower order byte contains flags that cause the system to go to a fault state – actuation of the valve will not be possible

until the cause of the fault condition has been removed and the fault condition reset by writing a reset request to register 40001. The upper order byte contains flags used to indicate the operational status of the valve actuator. See table 5 - Fault Register for details.

A.3.11 40013-40014 Number of Open/Close Cycles [Read Only]

Register: 40013-40014, Address 0x000C (12) – 0x000D (13).
Function code: 0x03 – Read Holding registers.
Description: This is a pair of registers that hold a 32bit number indicating the number of actuations of the valve. A cycle of moving the valve from closed to open and back closed will count as 2 cycles. The register needs to be read using a single read function command to ensure coherency of the data in the two registers.

A.3.12 40015-40016 Hours/Minutes Running [Read Only]

Register: 40015-40016, Address 0x000E (14) – 0x000F (15).
Function code: 0x03 – Read Holding registers.
Description: This is a pair of registers that hold a 32bit number indicating the number of hours the valve has been powered. The register needs to be read using a single read function command to ensure coherency of the data in the two registers. If version 4.13 firmware is installed, hours are displayed. If version 4.21 firmware is installed, minutes are displayed.

A.3.13 40017-40018 Hours/Minutes Open [Read Only]

Register: 40017-40018, Address 0x0010 (16) – 0x0011 (17).
Function code: 0x03 – Read Holding registers.
Description: This is a pair of registers that hold a 32bit number indicating the number of hours the valve has been in the open (100%) position. The register needs to be read using a single read function command to ensure coherency of the data in the two registers. If version 4.13 firmware is installed, hours are displayed. If version 4.21 firmware is installed, minutes are displayed.

A.3.14 40019-40020 Hours/Minutes Closed [Read Only]

Register: 40019-40020, Address 0x0012 (18) – 0x0013 (19).
Function code: 0x03 – Read Holding registers.
Description: This is a pair of registers that hold a 32bit number indicating the number of hours the valve has been in the closed (0%) position. The register needs to be read using a single read function command to ensure coherency of the data in the two registers. If version 4.13 firmware is installed, hours are displayed. If version 4.21 firmware is installed, minutes are displayed.

A.3.15 40021-40022 Number of Power up cycles [Read Only]

Register: 40021-40022, Address 0x0014 (20) – 0x0015 (21).
Function code: 0x03 – Read Holding registers.
Description: This is a pair of registers that hold a 32bit number of times the system has been successfully powered up. The register needs to be read using a single read function command to ensure coherency of the data in the two registers.

A.3.16 40023-40024 Serial Number [Read Only]

Register: 40023-40024, Address 0x0016-0x0017 (22-23).
Function code: 0x03 – Read Holding registers.

Description: This is a pair of registers that hold a 32 bit number that can be used to hold a unique serial number. The register needs to be read using a single read Modbus function transaction command to ensure coherency of the data in the two registers.

A.3.17 40025 Analog I/P value [Read Only]

Register: 40025, Address 0x0018 (24).
Function code: 0x03 – Read Holding registers.
Description: This is a register that holds a 16 bit scaled representation of the analog input. It is scaled according to input i.e. 0-200 for 0-20.0mA and 0-50 for 1-5 V.

A.3.18 40026 Firmware Project Code [Read Only]

Register: 40026, Address 0x0019 (25).
Function code: 0x03 – Read Holding registers.
Description: This is a register that holds the SRD project code (SRD422) – 422. This is the code used in version control of SRD documents and source code.

A.3.19 40027 Firmware Document Reference [Read Only]

Register: 40027, Address 0x001A (26).
Function code: 0x03 – Read Holding registers.
Description: This is a register that holds the SRD document code (SRD422-5007) – 5007. This code along with the project code is used in version control of SRD documents and source code.

A.3.20 40028 Firmware Version [Read Only]

Register: 40028, Address 0x001B (27).
Function code: 0x03 – Read Holding registers.
Description: This is a register that holds the hex encoded equivalent of a four digit decimal version number of the firmware, the high order 8bits encode the whole number of the version and the low order 8 bits the fraction, e.g. v1.16 would be encoded 0x0110, v2.66 would be 0x0242. Together with the data from registers 40026- 40028 it is possible to determine the unique identity of the code being run in the processor.

A.3.21 40029 Diagnostic Flags [Read Only]

Register: 40029, Address 0x001C (28).
Function code: 0x03 – Read Holding registers.
Description: This is a set of 16 bit flags that show the accumulation of fault flags that have occurred – as faults are self resetting. The register is stored in non-volatile memory. The mapping is the same as the diagnostic register at 40012. See table 5 - Fault Register for guide to values.

A.3.22 40030-40031 Reserved [Read Only]

Register: 40030-40031, Address 0x001D-0x001E (29-30).
Function code: 0x03 – Read Holding registers.
Description: Not used – reads will return a value of 0.

A.3.23 40032 Valve Type [Read & Write]

Register: 40032, Address 0x001F (31).
Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.
Description: This is a register that holds an enumeration of the three types of valve. This is used to set up several internal variables and constants. Writes outside of the legal range 0-2 will be rejected with an exception code.

A.3.24 40033 Control Type [Read Only]

Register: 40033, Address 0x0020 (32).
Function code: 0x03 – Read Holding registers.
Description: This is a register that holds an enumeration of the control type – either 0 for On/Off, or 1 for proportional control.

A.3.25 40034 Control Source [Read & Write]

Register: 40034, Address 0x0021 (33).
Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.
Description: This is a register that holds an enumeration of the control source – either 0 for Modbus RTU control, or 1 for signals local to the system – decided by the contents of register 40032. Note that if the Modbus serial link is not the active mode then the faults associated with serial communications will be disabled, although serial communications for such activities as test and debug monitoring of the analog input will all still function. Writes outside of the legal range 0-1 will be rejected with an exception code.

A.3.26 40035 Loss of Control Default Position [Read & Write]

Register: 40035, Address 0x0022 (34).
Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.
Description: This is a register that holds a position demand 0-100% that will be applied to the position control loop if the active control source is determined to be corrupt or out of normal operating specification, this applies to modbus communications messages being absent or the analog input being un-calibrated or below 3mA/0.75V(open control loop). Writes outside of the legal range 0-100 will be rejected with an exception code.

A.3.27 40036 Deadband [Read & Write]

Register: 40036, Address 0x0023 (35).
Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.
Description: This is a register that holds an integer value of percentage hysteresis used to discriminate against noise entering the control system from the selected control source, this can take a value of 0-100%, e.g. a value of 100 would make the system only respond to 0 or 100% demands. Writes outside of the legal range 0-100 will be rejected with an exception code.

A.3.28 40037 Low travel Cutoff [Read & Write]

Register: 40037, Address 0x0024 (36).
 Function code: 0x10 – Write Multiple registers,
 0x06 – Write Single register, or
 0x03 – Read Holding registers.
 Description: This is a register that holds an integer value of percentage used as a clamp – any position demand less than this value will be clamped to zero before being passed to the position control system.

A.3.29 40038 Communications Timeout [Read & Write]

Register: 40038, Address 0x0025 (37).
 Function code: 0x10 – Write Multiple registers,
 0x06 – Write Single register, or
 0x03 – Read Holding registers.
 Description: This is a register that holds a value 0-65535 that is the number of seconds for a timeout before the modbus serial communications channel is determined to be uncommunicative (0 - ~18Hrs). A valid addressed message must be received by the system within this time limit if the active control source is Modbus RTU communications. If the time without communications is exceeded the system will fault and the valve commanded to the default loss of communications position. A value of 0 can be used to disable this feature. If communications is resumed then the flag will be cleared and the valve will take the refreshed position as a demand. The use of this register is shown in table 5 - Fault Register.

A.3.30 40039 Communications Address [Read & Write]

Register: 40039, Address 0x0026 (38).
 Function code: 0x10 – Write Multiple registers,
 0x06 – Write Single register, or
 0x03 – Read Holding registers.
 Description: This is a register that holds a value 1-247 that is the Modbus address used by the system on power up. Values outside the range 1-247 will return an exception code

A.3.31 40040 Communications Baudrate [Read & Write]

Register: 40040, Address 0x0027 (39).
 Function code: 0x10 – Write Multiple registers,
 0x06 – Write Single register, or
 0x03 – Read Holding registers.
 Description: This is a register that holds a value 4-6 that is an enumeration of the baudrate used by the system on power up.

A.3.32 40041 Parity [Read & Write]

Register: 40041, Address 0x0028 (40).
 Function code: 0x10 – Write Multiple registers,
 0x06 – Write Single register, or
 0x03 – Read Holding registers.
 Description: This is a register that holds an enumeration of the parity type used by the Modbus serial interface – either 0 for Odd, or 1 for Even in version 4.13 firmware (version 4.21 firmware defines 0=Odd, 1=Even, 2=None). Writes outside of the legal range will be rejected with an exception code.

A.3.33 40042 Reset Statistics [Read & Write]

Register: 40042, Address 0x0029 (41).

Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.

Description: This is a register used to reset the non volatile system statistics (such as number of hours run). Writing a value of 1 to these registers will reset the values that accessed in registers 40013-40022 to 0.

A.3.34 40043 Analog Input Mode [Read & Write]

Register: 40043, Address 0x002A (42).

Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.

Description: This is a register that holds an enumeration 0-1 that sets the mode of operation for on/off and proportional control. When in proportional mode (40033 = 1), a value of 0 sets the unit for using a 1-5V voltage input. 1 sets up the unit for using a 4-20 mA current command input. The scaling of the different modes is reflected in the scaling of the value reported in register at 40023 – ‘Analog I/P value’. When in on/off mode (40033 = 0), a value of 0 sets the unit for using both digital inputs, optimized for using the L2e level controller. 1 sets up the unit for using a single digital input. See Operation for further details.

A.4 Example Modbus Protocol Transactions

A.4.1 Write to Position Demand Register (40002/0x0001/1)

Write of a position demand value of 100% to device at address 1 on the Modbus network – 8 characters.

FIELD	SLAVE ADDRESS	FUNCTION CODE	REGISTER ADDRESS HI	REGISTER ADDRESS LO	REGISTER DATA HI	REGISTER DATA LO	CRC LO	CRC HI
Index	0	1	2	3	4	5	6	7
Hex (Dec)	0x01 (1)	0x06 (6)	0x00 (0)	0x01 (1)	0x00 (0)	0x64 (100)	0xD9 (217)	0xE1 (225)

Normal response, 8 characters:

FIELD	SLAVE ADDRESS	FUNCTION CODE	REGISTER ADDRESS HI	REGISTER ADDRESS LO	REGISTER DATA HI	REGISTER DATA LO	CRC LO	CRC HI
Index	0	1	2	3	4	5	6	7
Hex (Dec)	0x01 (1)	0x06 (6)	0x00 (0)	0x01 (1)	0x00 (0)	0x64 (100)	0xD9 (217)	0xE1 (225)

Write of a position demand value of 101% to device at address 1 on the Modbus network, note that this value (101% is outside the legal range of values permitted to be written to this address, so an exception frame is generated – 8 characters.

FIELD	SLAVE ADDRESS	FUNCTION CODE	REGISTER ADDRESS HI	REGISTER ADDRESS LO	REGISTER DATA HI	REGISTER DATA LO	CRC LO	CRC HI
Index	0	1	2	3	4	5	6	7

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual provides installation, maintenance and parts information for the Fisher D3 control valve with Gen 2 easy-Drive electric actuator. For Gen 1 electric actuators, use Fisher D3 with easy-Drive Instruction Manual, (D103460X012). If the actuator has a RPU-100 installed refer to easy-Drive RPU-100 Instruction Manual, (D104551X012).

WARNING

Do not install, operate or maintain a D3 valve with Gen 2 easy-Drive electric actuator without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

1.2 Description

The Fisher D3 with easy-Drive electric actuator technology (Figure 1) is a globe valve with electric actuator specifically designed for upstream, low power applications. The easy-Drive operates with 12 or 24 V DC in either on/off or Positioning configurations.

The on/off configuration has 2 different states; opened or closed, which are ideal for dump or snap-acting applications. The Positioning configuration extends the functionality to intermediate positions for flow and pressure control applications.

1.3 Specifications

Table 1 lists specifications for the D3 control valve. Some of the specifications for a given control valve as it originally comes from the factory are stamped on a nameplate located on the lower actuator housing.

1.4 Education Services

Emerson Education Services

Phone: 800-338-8158

Email: education@emerson.com

emerson.com/en/final-control/services/valve-training

Section 2: Installation

WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage caused by bursting of pressure-retaining parts or by uncontrolled process fluid, be certain the service conditions do not exceed the limits shown on the valve nameplate and in Table 1.

Use pressure-relieving devices required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

For explosion-proof applications, ensure the actuator cover is properly bolted before applying power to the actuator. Personal injury or property damage may result from fire or explosion if power is applied to the actuator with the cover removed in a hazardous area.

For explosion-proof applications, install rigid metal conduit and a conduit seal no more than 457 mm / 18 in. from the actuator. Personal injury or property damage may result from explosion if the seal is not installed.

Select wiring and/or cable glands that are rated for the environment of use (such as hazardous area, ingress protection and temperature). Failure to use properly rated wiring and/or cable glands can result in personal injury or property damage from fire or explosion.

Wiring connections must be in accordance with local, regional and national codes for any given hazardous area approval. Failure to follow the local, regional and national codes could result in personal injury or property damage from fire or explosion.

⚠ WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

NOTICE

To avoid product damage, inspect the valve before installation for any damage or any foreign material that may have collected in the valve body. Also remove any pipe scale, welding slag or other foreign material from the pipeline.

1. Before installing the control valve assembly, inspect it for any damage and for any foreign material that may have collected in the valve body.
2. Clean out all pipelines to remove scale, welding slag and other foreign materials.
3. The control valve assembly may be installed in any orientation, but normally the actuator is vertical above the valve. Install the valve so the flow direction arrow on the side of the valve indicates the direction of the process flow.
4. Install the valve following local and national piping codes when they apply to the application. For screwed connections, treat the external pipe threads with a good grade pipe compound. For flanged connections, use suitable gaskets between valve and pipeline flanges.
5. If continuous operation is required during inspection or maintenance, install a three-valve bypass around the control valve assembly.

2.1 Special Instructions for “Safe Use” and Installations in Hazardous Locations

ATEX/IECEX

WARNING

To avoid static discharge from the enclosure, do not rub or clean the enclosure with solvents. To do so could result in an explosion. Clean with a mild detergent and water only.

The enclosure is non-conducting and may generate an ignition-capable level of electrostatic charges under certain extreme conditions. The user should ensure that the equipment is not installed in a location where it may be subjected to external conditions (such as high-pressure steam) which might cause a buildup of electrostatic charges on non-conducting surfaces. Additionally, cleaning of the equipment shall only be done with a damp cloth.

NOTICE

To avoid damage to the enclosure, when screws are fully tightened into blind holes in enclosure walls, with no washer fitted, at least one full thread shall remain free at the base of the hole.

2.2 Startup Overview

Figure 2. Flowchart

Figure 3. Fisher D3 Valve with Gen 2 easy-Drive Actuator Wiring Diagram

GE47302-7

Power Requirements

Ensure a stable DC power source is available, maintaining less than 5% ripple and sufficiently surge protected for the application. A 4 amp (minimum) power supply is required.

Wiring Instructions

1. Observe local wiring requirements for hazardous location usage.
2. Conduit seals within 450 mm / 18 in. of the enclosure port are required for explosion-proof installation.
3. 18 AWG / 0.52 mm² to 12 AWG / 3.31 mm² wire size required.
4. Fuse system to 5 A.
5. Connect enclosure and analog signal shields.
6. Ensure power is turned off before connecting the wires.

Power

1. Connect 12 or 24 V DC reference to: –
2. Connect 12 or 24 V DC positive to: +
3. Be sure to tighten terminals sufficiently to ensure solid mechanical connection.

Figure 4. Wiring - Analog Input

Figure 5. Wiring - L2e

Figure 6. Wiring - Single Dry Contact

Figure 7. Wiring - Modbus Input

Figure 8. Wiring - Auxiliary Digital I/O Set to Input (40080=0)

Figure 9. Wiring - Auxiliary Digital I/O Set to Output (40080=1)

2.3 Default Input Signals

The D3 with easy-Drive comes from the factory calibrated and ready for use with the following default input signals shown in Table 2.

Table 2. D3 easy-Drive Default Input Signals

CONFIGURATION	ON/OFF	POSITIONING
Input Signal	L2e (dual dry contact)	4 to 20 mA

If the input signal of the application matches Table 2, proceed to the Wiring Instructions section. If the input signal of the application does not match Table 2, proceed to the Configuration section.

2.4 Configuration

Input Configuration

There are two functional configurations available for the easy-Drive electric actuator: On/Off and Positioning. It is possible to change an actuator from On/Off to Positioning after it has been delivered from the factory using a positioning license key. See Licensing section.

All available input signals are shown in Table 3.

Table 3. All Available Input Signals

CONFIGURATION	ON/OFF			POSITIONING	
Control Source	Modbus	Local		Modbus	Local
Input Signal	Modbus	L2e Dual Dry Contact (default)	Single Dry Contact	Modbus	4 to 20 mA (default)

If you are using the default inputs signals and the valve has not been disassembled or adjusted in any way, there is no need to recalibrate the assembly. You can proceed directly to Startup (page 19).

Changing the Inputs from Default Settings

All configuration within the valve is done by setting values in Modbus registers. This can be done using any Modbus master (flow computer, PLC, PC). Configuration software, providing a visual interface to the registers, is available through your [Emerson sales office](#).

2.5 Modbus Setup

Use of a serial or USB to RS-485 device is required to connect to the actuator. Refer to manufacturer's requirements for installation. The D3 with easy-Drive electric actuator Modbus factory defaults are Address 1, 9600 baud, even parity, 1 stop bit, MSB.

When a connection has been achieved, the actuator may be configured to accept the input signal over the Modbus link (ignoring the physical inputs) and the Modbus settings may be changed to accommodate the network to which it is attached. Other changes to functionality are possible, such as:

- Low level cutoff: 40054 (default is 5%)
- Position upon loss of signal: 40053 (default is 0%)

See Appendix A for a full map of Modbus registers and their functions.

Figure 10. Fisher easy-Drive Configuration Software

Connecting Using the Fisher easy-Drive Configuration Software

The Fisher easy-Drive configuration software allows configuration and diagnosing of the Fisher easy-Drive electric actuator with a graphical interface. Connect a PC to the actuator using a USB or serial device to Modbus RTU converter using the wiring instructions. The USB or serial device will be visible in the drop menu under Serial Port Settings. Baud rate and parity should be set to the Modbus settings of the actuator. Default actuator settings are address 1, 9600 baud, even parity, 1 stop bit, MSB. Press the AUTO button in the upper left corner to connect to the valve.

Use the Fisher easy-Drive configuration software (Figure 10) to make the desired changes or register values may be changed to allow different functionality.

NOTE

If an actuator is on/off, a Modbus command of 0 to 499 in register 40001 will cause the valve to close fully, while a value of 500 to 1000 will cause the valve to open fully. The command register has one implied decimal point.

Initial Setup

The control method selection determines what control signal to which the valve will respond. Only the control signal selected will result in movement of the valve; all others will be ignored. The control methods available are dependent upon the licensing tier purchased with the valve. The functions for each tier are shown below.

- On/Off Tier
 - Dual Contact On/Off
 - Single Contact On/Off
 - Modbus On/Off
- Positioning Tier - License required (see Licensing section)
 - Dual Contact On/Off
 - Single Contact On/Off
 - Modbus On/Off
 - Modbus Positioning
 - 4 to 20 mA Positioning
 - 4 to 20 mA Level

When using the easy-Drive Configuration Tool, clicking on the “Control Method” box will create a drop menu as shown. Select the desired control source; the selection will turn yellow. A box with Pending Changes will appear showing all changes. Press “APPLY” and the valve will immediately respond to that signal only.

Figure 11. Fisher easy-Drive Configuration Software

Calibration Instructions

⚠ WARNING

To avoid personal injury or property damage, be aware that the valve will open fully and then close fully during the calibration cycle.

If an easy-Drive valve has been shipped from the Fisher factory, it is not necessary to perform a span calibration. If, however, the valve has a new controller board or maintenance has been performed on the valve, such as trim replacement, it will be necessary to perform a span calibration. A span calibration is accomplished by the following method:

1. Ensure the process and valve are in a safe state – the valve may move during this operation.
2. Press the CALIBRATE SPAN button to initiate the span calibration. The software will show a progress bar during the calibration and display Valve Span Calibrated when complete.

Analog Input Calibration

For valves using 4 to 20 mA as a control source, several options are available to customize control of the actuator. Use a 4 to 20 mA signal generator to provide the desired signal. It is possible to calibrate the 4 to 20 mA signal in reverse acting or split-ranging with the method below with at least 4 mA of signal difference between the close and open values. The example shows a valve being changed from normal to reverse acting during the calibration process.

1. With the Control Method set to 4 to 20 mA Positioning or 4 to 20 mA Level, enter the Calibration screen and the 4 to 20 mA Signal Calibration window will be visible.
2. Click the CALIBRATE CLOSE and OPEN VALUES button. A separate window will open to guide through the process.
3. Set the 4 to 20 mA signal to the desired value for when the valve is to be closed.
4. Enter this value into the Calibrated mA Signal text box and press Next.

Figure 12. Fisher easy-Drive Configuration Software

5. Set the 4 to 20 mA signal to the desired value for when the valve is to be open.
6. Enter this value into the Calibrated mA Signal text box and press Next.

Figure 13. Fisher easy-Drive Configuration Software

7. If the Close and Open values are as expected, press Confirm to accept these values. If not, press Cancel to restart the process.

NOTE

Note 1: The value of the 4 to 20 mA signal must have at least 4 mA difference between the close and open signals. A differential less than that amount will cause the actuator to reject the calibration and use the previous values.

Note 2: Should the entered values vary more than 10% from the expected 4 to 20 mA values; the actuator will accept the calibration and a Notification displaying "Questionable Analog Calibration" will result.

Figure 14. Fisher easy-Drive Configuration Software

Calibration with the Use of Modbus

1. After the unit has been properly wired and fused per instructions in the Wiring section of this instruction manual, turn power to the unit on.
2. Calibrate using Modbus:
 - a. Send position command of 0% to actuator to prevent unexpected motion. Valve will move to commanded position following the calibration procedure.
 - b. Send a value of 1 to register 40043. Valve plug will move to fully open position and then to fully closed. The valve plug will then return to the commanded position.

If a Modbus connection is not available and recalibration is desired, use the appropriate calibration method as determined by the control method of your valve.

Calibration Without the Use of Modbus

1. Turn power to the actuator off.
2. Wait for 10 seconds to ensure all circuits have discharged.
3. Return power to the actuator and use the appropriate calibration method for your control signal. Calibration sequence must be done within 15 seconds of power being switched on.
4. For positioning operation using 4 to 20 mA:
 - a. Apply a 4 mA signal between pins 4 to 20 mA - and 4 to 20 mA +. If Span is currently uncalibrated, valve plug will not move at this time.
 - b. Apply a 20 mA signal between pins 4 to 20 mA - and 4 to 20 mA +. If Span is currently uncalibrated, valve plug will not move at this time.
 - c. Apply a 4 mA signal between pins 4 to 20 mA - and 4 to 20 mA +; valve plug will move to the upper stop, immediately followed by moving to the lower, closed position.
 - d. If calibration of the analog input is desired to improve positional accuracy, an optional operation is listed on page 14 titled Analog Input Calibration.

5. For On/Off operation using dual-input dry contact:
 - a. Close the contact to create a short between pins COMMON and CLOSE. If Span is currently uncalibrated, valve plug will not move at this time.
 - b. Close the contact to create a short between pins COMMON and OPEN. If Span is currently uncalibrated, valve plug will not move at this time.
 - c. Close the contact to create a short between pins COMMON and CLOSE; valve plug will move to the upper, open position and then to the lower, closed position.
6. For On/Off operation using single dry contact:
 - a. Open the contact to create an open circuit between pins COMMON and OPEN. If Span is currently uncalibrated, valve plug will not move at this time.
 - b. Close the contact to create a short between pins COMMON and OPEN. If Span is currently uncalibrated, valve plug will not move at this time.
 - c. Open the contact to create an open circuit between pins COMMON and OPEN; valve plug will move to the upper, open position and then to the lower, closed position.
7. The unit is now calibrated.

Licensing

The Gen 2 easy-Drive actuator has two differing modes of operation: On/Off and Positioning. The On/Off mode is intended for snap-acting applications where the valve is either fully open or fully closed. In this mode, the valve plug cannot remain at any intermediate position; it will move to a fully closed or fully open position only. For applications that require the actuator to control over the full range of motion, it is necessary to have a Positioning license installed. A positioning license will allow access to 4 to 20 mA positioning, 4 to 20 mA level control and Modbus positioning.

Positioning licenses can be purchased with the actuator and installed at the factory or can be installed at a later date by use of a license key on a USB license dongle. Installation of the license can be completed using the configuration software.

1. Insert the USB license dongle into the computer connected to the Gen 2 easy-Drive actuator.

Figure 15. Fisher easy-Drive Configuration Software

- Click the button labelled **MANAGE LICENSES** on the left side of the configuration software screen.

Figure 16. Fisher easy-Drive Configuration Software

- The license control screen will open, showing all licenses installed on the USB and the actuator.

Figure 17. Fisher easy-Drive Configuration Software

4. After verifying the presence of the desired license on the USB license dongle, click the button labelled 'easy-Drive' under Move To and the license will be transferred to the valve as shown below.

Figure 18. Fisher easy-Drive Configuration Software

5. It is also possible to transfer licenses from one USB license dongle to another. Place two dongles into the computer with the configuration software. Type in the number of licenses to move and click USB 2 to move the licenses.

Startup

⚠ WARNING

To avoid personal injury or property damage, be aware that the valve will move and respond to an input signal during startup.

1. Before turning on power to the unit, be sure that a closed signal is being commanded to the unit.
 - Dry Contact: Contact is open.
 - L2e (Dual Dry Contact): Contact closed across pins COMMON and CLOSE.
 - Analog Input: signal = 4 mA.
 - Modbus: position demand = 0.
2. Turn on power to the unit.

3. Apply a change in position demand to ensure unit responds properly.
 - Dry Contact: Closed contact between pins COMMON and OPEN will open the valve.
 - Dual contact/L2e only: Closed contact between pins COMMON and OPEN will open the valve. Closed contact between pins COMMON and CLOSE will close the valve.
 - Analog Input: valve will respond to proportional demand.
 - Modbus: valve will respond to positional demand in register 40001. 0 = fully closed and 1000 = fully open.
4. If the valve does not respond as expected, proceed to Troubleshooting guide on page 20.
5. Check conduit ports.
 - Conduit seal must be in place within 450 mm / 18 in. of the enclosure.
 - Unused conduit ports must be sealed with an explosionproof port plug.
6. Replace the cover and tighten all 8 bolts to 20 N•m / 15 ft•lbs.

Section 3: Troubleshooting

1. Unit does not move.
 - a. Verify that 12 V DC to 24 V DC is present on the power terminals as shown on the cover. Green heartbeat LED will pulse near Modbus terminals when power is present.
 - b. Verify that all wires are firmly attached on both ends.
 - c. Verify that wires are connected to the correct terminals - see Wiring in the manual.
 - d. Verify mode of operation (on/off or positioning) matches control signal.
 - e. Verify mode of control (local or Modbus) matches control signal.
2. Unit does not respond to 4 to 20 mA signal.
 - a. Verify that 12 V DC to 24 V DC is present on the power terminals as shown on the cover.
 - b. Verify that the 4 to 20 mA signal is wired correctly and that the terminals are firmly on the wires.
 - c. Verify mode of operation matches control signal (local control: 40067=0, positioning: 40065=1).
 - d. Check the value of the analog input in register 40026 to determine if it is 0 or greater.
 - i. If register 40026 shows 0, the 4 to 20 mA may be wired backwards. Swap wire and attempt again.

3. Diagnostics show a Motor Stall - Travel Deviation Fault.
 - a. The easy-Drive electric actuator is designed to operate in a manner consistent with a pneumatic actuator. This means that if the valve plug can not move to its commanded position, the actuator will stop, without damage and issue a Motor Stall - Travel Deviation Fault warning. When the command signal changes outside of the deadband (Modbus register 40036), it will attempt to move again. Recalibrate the actuator span per instructions in the Startup section of this manual.
4. Position on D3 is not accurate (proportional positioning units only).
 - a. If the position of a D3 is too high (i.e., 50% is much higher than 50% on the bonnet), check the valve type. If valve type is D4, change to D3, cycle power and recalibrate.
 - b. If the local analog input is being used (4 to 20 mA or 1 to 5 V), the analog inputs of the actuator may be calibrated to match the input signal.
 - i. Command 0% (4 mA or 1 V).
 - ii. Using a Modbus link, send a 1 to register 40004 or use the Fisher easy-Drive configuration software by clicking the button "Analog Cal at 0%".
 - iii. Command 100% (20 mA or 5 V).
 - iv. Using a Modbus link, send a 1 to register 40005 or use the Fisher easy-Drive configuration software by clicking the button "Analog Cal at 100%".

Figure 19. Adjusts to Vary Flow Capacity (Shown with Valve Plug in Seated Position)

Section 4: Setting the Valve Flow Adjuster

The flow setting may only be adjusted if the 0.375 and 0.75 in. port sizes are installed and only when using the on/off version.

When shipped from the factory, the actuator has the flow adjuster set at the maximum flow rate position for the given port size.

1. Ensure the valve plug is in the seated position.
2. To change the valve flow rate, loosen the flow adjuster socket head cap screws (key 15) with a 5/32 in. Allen key and reposition the flow adjuster halves (keys 13 and 14) to the desired flow rate position. See Figure 19 for flow rate settings.
3. Retighten the socket head screws (key 15) to 3 N·m / 26 lbf·in.
4. Follow instructions for recalibration as outlined earlier in this manual.

Section 5: Maintenance

Refer to Figure 22.

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and maintenance depends on the severity of the service conditions.

WARNING

Avoid personal injury from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

WARNING

For explosion-proof applications, ensure the actuator cover is properly bolted before applying power to the actuator. Personal injury or property damage may result from fire or explosion if power is applied to the actuator with the cover removed in a hazardous area.

Do not remove the actuator cover for 10 minutes after power is disconnected if the UPS option is installed.

For explosion-proof applications, install rigid metal conduit and a conduit seal no more than 457 mm / 18 in. from the transducer. Personal injury or property damage may result from explosion if the seal is not installed.

Select wiring and/or cable glands that are rated for the environment of use (such as hazardous area, ingress protection and temperature). Failure to use properly rated wiring and/or cable glands can result in personal injury or property damage from fire or explosion.

Wiring connections must be in accordance with local, regional and national codes for any given hazardous area approval. Failure to follow the local, regional and national codes could result in personal injury or property damage from fire or explosion.

Figure 20. Packing and Belleville Spring Stacking Order

Figure 21. Packing and Belleville Spring Stacking Order

5.1 Valve Plug and Seat Ring Maintenance

Trim Disassembly

Key numbers are referenced in Figures 20, 22 and 23.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body (key 1) and drain the process media from both sides of the valve.

NOTICE

The following steps are intended to prevent damage to the valve plug (key 3) and seat ring (key 2) during the removal of the bonnet and actuator.

For ON/OFF Actuators

2. Command the valve open.
3. Place an open end wrench or a similar obstruction about 6 mm / 1/4 in. thick under the FloPro.
4. Command the valve closed.

For Positioning Actuators

5. Command the valve to anywhere between 10% and 20% travel.
6. Isolate power and signal.

7. Break the bonnet nut (key 5) loose with a hammer. Continue turning the bonnet nut by using a hammer or a large adjustable wrench, tightened around one ear of the bonnet nut. If the bonnet (key 7) is stuck in the valve, continue to unscrew the bonnet nut. The bonnet nut will contact the spring pins (or pipe plugs) (key 6, Figure 22) and jack the bonnet out of the valve. Carefully lift the actuator assembly from the valve body.

WARNING

The spring pins/pipe plugs (key 6) must always be in place during valve operation. They provide a safeguard against injury when the unit is being disassembled.

8. Completely remove the packing retainer (key 8) using a 1-1/8 in. wrench.
9. Remove the valve plug by driving out the pin (key 43) and unscrewing the valve plug from the stem. Do not remove the Belleville springs (key 9) from the stem, in order to retain the Belleville stacking orientation as shown in Figure 20.
10. Use a 1-3/16 in. socket wrench to loosen and remove the seat ring (key 2).

NOTE

Inspect the seat ring and valve body interior for wear, erosion or damage in the following steps.

11. Inspect the seat ring for wear or damage. If the seating surface has been damaged, discard the seat ring.
12. Visually inspect the valve body interior below the seat ring for erosion or damage. Replace the valve body if necessary.

WARNING

Be careful to avoid damaging the seating surface on the valve plug or seat ring as damage in these areas will allow excessive leakage at shutoff. Avoid damaging the highly polished valve stem surface. A damaged valve stem could cut the packing and allow process fluid to leak to the atmosphere.

NOTE

Cover the opening in the valve body to prevent foreign material from getting into the valve body cavity.

Trim Assembly

1. Ensure the threads of the valve stem (key 16) and valve plug (key 3) are clean and free of debris.
2. Make sure the Belleville springs (key 9) are properly installed on the valve stem, as shown in Figure 21.
3. Install the valve plug on the stem and insert a new pin (key 43).
4. Lubricate the threads of the packing retainer with anti-seize and install into the bonnet using a 1-1/8 in. wrench. Make sure the Belleville springs (key 9) are completely enclosed by the packing retainer as shown in Figure 21.
5. Torque the packing retainer to 81 N•m / 60 lbf•ft. The packing retainer has been installed correctly when a metal-to-metal contact has been made between the packing retainer end and the bonnet (key 7). The packing retainer threads should be completely enclosed by the bonnet (see Figure 21).
6. Thoroughly clean the seat ring (key 2) threads and the mating threads in the valve body (key 1).
7. Apply anti-seize lubricant to the threads of the seat ring and its mating threads in the valve body.
8. Screw the seat ring into the valve body. Use a 1-3/16 in. socket wrench to tighten the seat ring to 170 N•m / 125 lbf•ft. Remove all excess lubricant after tightening.
9. Lubricate the bonnet O-ring (key 4) with lithium grease and install on the bonnet.
10. Apply anti-seize lubricant to the threads on the valve body and bonnet nut (key 5) and the contact surfaces of the bonnet and bonnet nut flange. Install the bonnet and actuator assembly onto the valve body. Tighten the bonnet nut until the nut stops turning. A few hammer blows will be required to ensure that the assembly is tight.

5.2 Packing Maintenance

WARNING

Observe the warning at the start of the Maintenance section.

Key numbers are referenced in Figure 20.

The valve stem packing can only be serviced by removing the bonnet from the valve body.

Packing Disassembly

1. Disassemble the valve per steps 1 to 9 in the Trim Disassembly section of the Valve Plug and Seat Ring Maintenance section of this manual.
2. Remove the five Belleville springs (key 9), lower packing spacer (key 12), packing set (key 11) and two anti-extrusion washers (key 10) from the bonnet (key 7) using a formed wire hook.
3. Clean and inspect the packing box wall to ensure that the packing surfaces are not damaged. If the surface condition is damaged and cannot be improved by light sanding, replace the bonnet.
4. Inspect the valve stem (key 16) and valve plug (key 3) for scratches or wear and replace if necessary.

Packing Assembly

The following steps define the proper procedure for installing the packing in a D3 valve. Improper packing assembly can lead to poor valve performance. The proper packing arrangement is shown in Figures 20 and 21.

1. Ensure the upper packing spacer (key 12) is installed.
2. Use the lower packing spacer (key 12) and a tube to push the upper anti-extrusion washer (key 10) into place. Using the lower packing spacer in this manner will ensure the upper anti-extrusion washer is fully seated and flat when installed in the packing bore.
3. Remove the lower packing spacer from the packing bore.

NOTE

All D3 packing kits include a single use packet of high performance fluorinated grease. This is the only acceptable D3 packing lubricant.

NOTE

In the following procedure, carefully install each packing ring individually over the valve stem and push completely into the packing box with a non-marring tube. A 12-in. length of 1/2 in. PVC pipe works well for this. It is recommended that the lubricated packing rings be installed individually rather than pushed in as a set.

4. Apply a 3 mm / 1/8 in. bead of the supplied high performance fluorinated grease (key 44) around the groove of the female packing adaptor as shown in Figure 20 and install over the valve stem (key 16).
5. Apply a 3 mm / 1/8 in. bead of the supplied high performance fluorinated grease (key 44) around the groove of the packing ring as shown in Figure 20 and install over the valve stem.
6. Install the male packing adaptor, lower anti-extrusion washer (key 10) and lower packing spacer over the valve stem as shown in Figure 20.
7. Firmly press all packing parts into the packing bore with a tube.
8. Install the five Belleville springs (key 9) over the valve stem as shown in Figure 20.
9. Install the valve plug (key 3) on the stem and insert a new groove pin (key 43).
10. Lubricate the threads of the packing retainer with anti-seize and install into the bonnet using a 1-1/8 in. wrench. Make sure the Belleville springs are completely enclosed by the packing retainer as shown in Figure 21.
11. Torque the packing retainer to 68 N•m / 50 lbf•ft. The packing retainer has been installed correctly when a metal-to-metal contact has been made between the packing retainer end and the bonnet (key 7). The packing retainer threads should be completely enclosed by the bonnet.
12. Apply anti-seize lubricant to the threads on the valve body and bonnet nut (key 5) and the contact surfaces of the bonnet and bonnet nut flange. Install the bonnet and actuator assembly onto the valve body. Tighten the bonnet nut until the nut stops turning. A few hammer blows will be required to ensure that the assembly is tight.

Stem Replacement

NOTICE

If the valve stem is replaced, the packing will also need to be replaced, since the threads on the valve stem may damage the packing when the valve stem is removed.

1. Follow the Trim Disassembly procedures, steps 1 to 8 on page 25 of this manual.
2. Ensure power and signal have been isolated from the actuator. Open the explosion-proof enclosure (keys 60 and 61), using a 13 mm wrench.
3. Remove the FloPro (keys 13, 14 and 15), using a 5/32 in. hex head wrench.
4. Remove the stem nut (key 27), using an 11/16 in. wrench, noting the position of the FloPro relative to the bonnet markings.
5. Use a rubber mallet to gently drive the stem downward through the bottom of the actuator housing and remove the stem.
6. Ensure the packing has been removed, using procedures in the Packing Disassembly on page 27 of this manual.
7. Replace the stem by gently pushing the stem up through the actuator.
8. Replace the packing and plug, using the procedures in the Packing Assembly on page 28 of this manual.
9. Install the FloPro at the same position it was removed from in step 4. Tighten the hex socket head cap screws to 3 N•m / 26 lbf•in.
10. Tighten the stem nut (key 27) to 39 N•m / 29 lbf•ft using an 11/16 in. wrench. Be sure the FloPro is not allowed to rotate when tightening the stem nut.
11. Apply anti-seize lubricant to the threads on the valve body and bonnet nut (key 5) and the contact surfaces of the bonnet and bonnet nut flange. Install the bonnet and actuator assembly onto the valve body. Tighten the bonnet nut until the nut stops turning. A few hammer blows will be required to ensure that the assembly is tight.

Section 6: Parts

6.1 Parts Ordering

Each D3 control valve is assigned a serial number, which can be found on the nameplate. Refer to the number when contacting your [Emerson sales office](#) for assistance or when ordering replacement parts.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

6.2 Parts Kits

Table 4. Trim Kits

Port Diameter, in.	0.375	0.75	1
Standard trim kit (Contains keys 2, 3, 4 and 43)	RD3STD0012	RD3STD0022	RD3STD0032
Carbide trim kit (Contains keys 2, 3, 4 and 43)	RD3CARB042	RD3CARB052	RD3CARB062

Table 5. Actuator Parts Kits

Kit	Part Number
Packing Kit (Contains keys 4, 10, 11, 43 and 44)	RD3PACK012
Valve Stem (Key 16)	GE48049X012
Board Replacement Kit (On/Off is default)	GE83055X012
Board Replacement Kit + Positioning License Dongle	GE83126X012
Motor/Gearbox Assembly	GK10613X012
Motor/Gearbox/Board Assembly (On/Off is default)	GK16046X012
Motor/Gearbox/Board Assembly + Positioning License Dongle	GK16047X012
Replacement Kit - Belleville Springs	GK15266X012
Replacement Kit - Drivetrain	GK15328X012
Positioning License Dongle (1 License)	GE83574X012
Positioning License Dongle (5 License)	GE83574X022

6.3 Parts List

NOTE

Recommended spare parts are included in the Parts Kits. Contact your [Emerson sales office](#) for Part Ordering information.

Table 6. Parts List

Key	Description	Key	Description
1	Valve body	25*	Stem O-ring
2*	Seat ring	27	Stem nut
3*	Valve plug	34	Valve nameplate
4*	Bonnet O-ring	41	Drive screw (2 req'd)
5	Bonnet nut	43*	Groove pin
6	Spring pin (or alternate pipe plug) (2 req'd)	44*	High performance fluorinated grease packing lubricant
7	Bonnet	58	Enclosure O-ring
8	Packing retainer	59	Motor/gearbox/controller assembly
9	Belleville springs (5 req'd)	60	Upper enclosure
10*	Anti-extrusion washer (2 req'd)	61	Lower enclosure
11*	Packing set	62	Motor cap screws (4 req'd)
12	Packing spacer	63	Motor cap screw washers (4 req'd)

Appendix A: Modbus

A.1 Register Summary

Table A-1. Gen 2 easy-Drive Actuator Modbus Map

Type ⁽¹⁾	Name	MB Register	Default	R/W	Values	Notes
uint16	Modbus position command (100=10.0%)	40001	0	R/W	0 to 1000	Modbus command value with one implied decimal place (1000=100.0%). R/W at all times but only used in Modbus control mode. In on/off mode 0 to 499 will result in a move to 0% and 500 to 1000 will result in a move to 100%.
uint16	Digital output	40002	0	R/W	0, 1	0=no voltage supplied to terminals, 1=voltage supplied to terminals (Only used when output setup is set for Remote controlled)
uint16	Reset error codes	40003	0	R/W	0, 1	Value of 1 will clear faults. Will automatically set back to 0.
uint16	RESERVED	40004	---	---	---	---
uint16	RESERVED	40005	---	---	---	---
uint16	RESERVED	40006	---	---	---	---
uint16	RESERVED	40007	---	---	---	---
uint16	RESERVED	40008	---	---	---	---
uint16	RESERVED	40009	---	---	---	---
uint16	Actual position (100=10.0%)	40010	0	R	0 to 1000	Present position of the actuator relative to span with 1 implied decimal place (1000=100.0%). Valid for all control modes.
uint16	Commanded position (100=10.0%)	40011	0	R	0 to 1000	Present position command of the actuator relative to span (1000=100.0%). Valid for all control modes.
uint16	Diagnostic Flags	40012	0	R	0 to 65535	Bit flags - see chart
uint16	Digital status	40013	0	R	0 to 1	0=no connection between terminals, 1=connection between terminals (Status of digital input or output)
uint32	Total Running Time (min)	40014, 40015	0	R	4294967296	Total number of minutes the actuator has been powered on since time has been reset
uint32	Total Open Time (min)	40016, 40017	0	R	4294967296	Total number of minutes the actuator has been at 100% of travel since time has been reset
uint32	Total Closed Time (min)	40018, 40019	0	R	4294967296	Total number of minutes the actuator has been at 0% of travel since time has been reset
uint32	Number of Closed (Cycle count)	40020, 40021	0	R	4294967296	Total number of close cycles the actuator has performed since reset. One open/close cycle counts as 1.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

D3 Valve with Gen 2 easy-Drive Actuator

Instruction Manual

June 2026

D104161X012

Table A-1. Gen 2 easy-Drive Actuator Modbus Map (continued)

Type ⁽¹⁾	Name	MB Register	Default	R/W	Values	Notes
uint16	Loss of signal position (100=10.0%)	40050	0	R/W	0 to 1001	Position to which valve plug will be driven upon loss of signal. Loss of signal is based upon the active control mode. 0 to 1000=0 to 100.0% with 1 implied decimal point. In on/off mode 0 to 499 will result in movement to 0% while 500 to 1000 will result in movement to 100%. A value of 1001 in any control mode is the setting for "lock-in-last".
uint16	Modbus timeout (s)	40051	60	R/W	0 to 65535	Time without a valid Modbus message is seen (to any address) before "loss of signal" motion is engaged when in Modbus control mode. Only active in Modbus control mode. 0=disabled
uint16	Dual contact timeout (s)	40052	60	R/W	0 to 3600	Time without a digital signal being low (contact made) from either digital input as viewed by voltage level on the digital input terminals. If neither contact has been made (pulled input low) within the timeout period, the valve plug will be moved to the loss-of-signal position. Only active in the local, on-off, dual contact mode. 0=disabled.
uint16	Deadband (10=1.0%)	40053	5	R/W	0 to 250	Minimum percentage signal change to elicit a movement response based upon end position of last movement. For example, if the previous command resulted in the actuator moving to 31.2% of travel and deadband is set to 100 (10.0%), setpoint must command valve to 21.2% or 41.2% before valve will move to new position. Default is set to minimize signal dithering.
uint16	Low travel cutoff position (100=10.0%)	40054	50	R/W	0 to 999	Analog input command, in percent with one implied decimal (50=5.0%), below this value will result in the valve plug moving to the closed position. Active in both local and Modbus control modes.
uint16	Analog on/off close position (100=10.0%)	40055	400	R/W	0 to 999	When the valve is in 4 to 20 mA on/off mode, this value is the point at which the valve will close. It must be set to a smaller value than the analog on/off open position. Percentage position value with one implied decimal (400=40.0%).
uint16	Analog on/off open position (100=10.0%)	40056	500	R/W	1 to 1000	When the valve is in 4 to 20 mA on/off mode, this value is the point at which the valve will open. It must be set to a larger value than the analog on/off close position. Percentage position value with one implied decimal (500=50.0%).
uint16	Analog Close Value	40057	40	R	31 to 220	The analog value, in mA with one implied decimal (40=4.0 mA), that defines the closed position
uint16	Analog Open Value	40058	200	R	31 to 220	The analog value, in mA with one implied decimal (200=20.0 mA), that defines the open position

Table A-2. Diagnostic Fault Flags

Hex Value	Bit Mask	Description	Value	Bit	Definition
0x8000	1000 0000 0000 0000	Fault in N.V. Memory – system has restored default settings	32768	15	A memory fault has occurred and the actuator has been restored to factory defaults. Contact your Emerson sales office .
0x8000	1000 0000 0000 0000	Fault in N.V. Memory – system has restored default settings	32768	15	A memory fault has occurred and the actuator has been restored to factory defaults. Contact your Emerson sales office .
0x4000	0100 0000 0000 0000	Motor Assembly Stall - Travel Deviation	16384	14	The actuator is unable to move to the commanded position and has stopped. Follow troubleshooting guide in Help section to remedy.
0x2000	0010 0000 0000 0000	Discrete Input override mode active	8192	13	The digital input has detected a closed contact and the actuator has moved to its safe position. Check switch input device status.
0x1000	0001 0000 0000 0000	System or Watchdog fault	4096	12	The actuator has experienced a fatal error and shut down. Contact your Emerson sales office .
0x0800	0000 1000 0000 0000	Analog Input calibration value not in expected range	2048	11	The analog values entered do not match the analog signal level. Check analog signal value and value entered.
0x0400	0000 0100 0000 0000	Valve travel distance calibration not in legal range	1024	10	The valve travel distance is outside the acceptable range. Confirm valve type and that no obstructions are present.
0x0200	0000 0010 0000 0000	Analog Input span calibration not in legal range	512	9	The analog values for open and close are less than 4 mA and previous values have been maintained. Calibrate analog input with differential >4 mA.
0x0100	0000 0001 0000 0000		256	8	- - -
0x0080	0000 0000 1000 0000	Valve was shutdown while moving	128	7	Actuator was powered down during a move and actual position may vary from commanded. Recalibrate the valve span.
0x0040	0000 0000 0100 0000	Valve span calibrated (informational)	64	6	Span has been calibrated and actuator is ready.
0x0020	0000 0000 0010 0000	Valve position controller active (informational)	32	5	Actuator is active and ready.
0x0010	0000 0000 0001 0000	Loss of signal active	16	4	Control signal not present. Signal is <3 mA, timeout period exceeded (40051 or 40052).
0x0008	0000 0000 0000 1000		8	3	- - -
0x0004	0000 0000 0000 0100	Modbus command has been sent (starts a calibrated system)	4	2	The actuator is successfully moving the valve.
0x0002	0000 0000 0000 0010	Analog input initialized (system has seen input >3 mA / 1 V)	2	1	4 to 20 mA analog input has a valid signal present.
0x0001	0000 0000 0000 0001	Start delay active (within 15-second calibration window)	1	0	Span calibration using physical inputs allowed during startup

Appendix B: Certificate of Conformance

EU Declaration of Conformity

We, the manufacturer,

Emerson
Fisher Controls International LLC
205 South Center Street
Marshalltown, Iowa 50158 USA

declare under our sole responsibility that the following product(s);

Electric Actuator
easy-Drive

to which this declaration relates, is in conformity with the provisions of the following European Community Directives, including the latest amendments, as shown in the attached schedule.

Assumption of conformity is based on the application of the harmonized standards and, when applicable or required, a European Community Notified Body certification, as shown in the attached schedule.

Introduction

Scope of Manual

This instruction manual provides installation, maintenance, and parts information for the Fisher D3 FloPro control valve and actuator.

Do not install, operate, or maintain D3 FloPro valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The D3 FloPro control valve (figure 1) is a compact, rugged valve designed for on-off control of a variety of fluids at pressures up to 155 bar (2250 psig). This valve is ideal for use as a dump valve on gas separators and scrubbers. It is also well suited for other high pressure applications in natural gas production, compression, and processing. NPS 1 and NPS 2 D3 FloPro control valves are available in CL900 NPT end connections and CL600 raised face flanged end connections.

Standard O-Ring: -40 to 135°C (-40 to 275°F)

Actuator Assembly: -34 to 82°C (-30 to 180°F)

Flow Direction

Flow Up or Flow Down

Available Actuator Configurations

Spring-to-Open

Spring-to-Close

Maximum Actuator Casing Pressure⁽¹⁾

3.4 bar (50 psig)

Actuator Diaphragm Effective Area

329 cm² (51 square inches)

Actuator Pressure Connections

1/4 NPT internal

1. The pressure or temperature limits in the referenced tables and any applicable ASME code limitations should not be exceeded.

Specifications

Table 1 lists specifications for the D3 FloPro control valve. Some of the specifications for a given control valve as it originally comes from the factory are stamped on a nameplate located on the upper diaphragm casing.

Table 2. Fisher D3 Maximum Shutoff Pressure Drops

FLOW DIRECTION	ACTUATOR ACTION	INPUT SIGNAL	NUMBER OF SPRINGS	MAXIMUM ΔP (PSI) PER PORT SIZE (INCH)		
		psi		0.375	0.75	1.00
Up	Spring-to-Close	0-20	3	2250	544	341
		0-35	6	2250	1504	999
	Spring-to-Open	0-20	2	2250	935	608
		0-35	2	2250	2250	2094
Down	Spring-to-Close	0-20	2	1558	1800	950
		0-35	3	2250	2250	2250
	Spring-to-Open	0-20	2	2250	1700	939
		0-35	3	2250	2250	1575

Table 3. Valve Sizes and Connection Styles

VALVE SIZE, NPS	PORT DIAMETER, (INCHES)	THREADED	RAISED FACE (RF) FLANGED
		CL900	CL600
1	0.375, 0.75, 1	X	X
2	0.375, 0.75, 1	X	X

X = Available construction.

Educational Services

emerson.com/fishervalvetraining

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage caused by bursting of pressure-retaining parts or by uncontrolled process fluid, be certain the service conditions do not exceed the limits shown on the valve nameplate and in table 1. Use pressure-relieving devices required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

To avoid product damage, inspect the valve before installation for any damage or any foreign material that may have collected in the valve body. Also remove any pipe scale, welding slag, or other foreign material from the pipeline.

1. Before installing the control valve assembly, inspect it for any damage and for any foreign material that may have collected in the valve body.
2. Clean out all pipelines to remove scale, welding slag, and other foreign materials.
3. The control valve assembly may be installed in any orientation, but normally the actuator is vertical above the valve. Install the valve so the flow direction arrow on the side of the valve indicates the direction of the process flow.

4. Install the valve following local and national piping codes when they apply to the application. For screwed connections, treat the external pipe threads with a good grade pipe compound. For flanged connections, use suitable gaskets between valve and pipeline flanges.
5. If continuous operation is required during inspection or maintenance, install a three-valve bypass around the control valve assembly.
6. Connect loading pressure for the Spring-to-Close configuration to the lower casing assembly (key 21) as shown in figure 7. The Spring-to-Open configuration loading pressure connection is in the upper casing assembly (key 32) as shown in figure 8.

Figure 2. FloPro Adjusts to Vary Flow Capacity (Shown with Valve Plug in Seated Position)

Setting the Valve FloPro Flow Adjuster

The flow setting may only be adjusted if the 0.375 and 0.75 inch port sizes are installed.

When shipped from the factory, the actuator has the FloPro flow adjuster set at the maximum flow rate position for the given port size.

Spring-to-Close Actuator Action

1. Ensure the valve plug is in the seated position.
2. To change the valve flow rate, loosen the flow adjuster socket head cap screws (key 15), and reposition the flow adjuster halves (key 13 and 14) to the desired flow rate position. See figure 2 for flow rate settings.
3. Retighten the socket head screws (key 15) to 3 N•m (26 lbf•in).

Spring-to-Open Actuator Action

1. Attach a pressure line to the actuator. Pressurize the actuator to a maximum of 2.41 bar (35 psi) to seat the plug in the seat ring.
2. To change the valve flow rate, loosen the flow adjuster socket head cap screws (key 15), and reposition the flow adjuster halves (key 13 and 14) to the desired flow rate position. See figure 2 for flow rate settings.
3. Retighten the socket head screws (key 15) to 3 N•m (26 lbf•in).

Maintenance

Refer to figures 7 and 8.

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and maintenance depends on the severity of the service conditions.

⚠ WARNING

Avoid personal injury from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Valve Plug and Seat Ring Maintenance

Trim Disassembly

Spring-to-Close (Air-to-Open)

Key numbers are referenced in figure 7.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body (key 1), and drain the process media from both sides of the valve.

CAUTION

The following steps are intended to prevent damage to the valve plug (key 3) and seat ring (key 2) during the removal of the bonnet and actuator.

2. Pressurize the actuator to a maximum of 2.41 bar (35 psi) to stroke the valve to mid travel. This will raise the valve plug (key 3) off its seat and expose all of the serrations on the valve stem (key 16).
3. Loosen the hex socket head cap screws (key 15) and lower the flow adjuster (keys 13 and 14) to its lowest position on the valve stem.
4. Tighten the hex socket head cap screws to 3 N•m (26 lbf•in).
5. Relieve pressure to the actuator, shut off all pressure lines to the actuator, and disconnect. Use lockout procedures to ensure the above measures stay in effect while you work on the equipment.
6. Break the bonnet nut (key 5) loose with a hammer. Continue turning the bonnet nut by using a hammer or a large adjustable wrench, tightened around one ear of the bonnet nut. If the bonnet (key 7) is stuck in the valve, continue

to unscrew the bonnet nut. The bonnet nut will contact the spring pins (or pipe plugs) (key 6, figures 7 or 8) and jack the bonnet out of the valve. Carefully lift the actuator assembly from the valve body.

⚠ WARNING

The spring pins/pipe plugs (key 6) must always be in place during valve operation. They provide a safeguard against injury when the unit is being disassembled.

7. Completely remove the packing retainer (key 8) using a 1-1/8 inch wrench.
8. Remove the valve plug by driving out the pin (key 43) and unscrewing the valve plug from the stem. Utilize a 1/8 inch drift punch in the holes provided on the stem to keep the stem from turning as the plug is removed. Do not remove the Belleville springs (key 9) from the stem, in order to retain the Belleville stacking orientation as shown in figure 3.
9. Use a 1-3/16 inch socket wrench to loosen and remove the seat ring (key 2).

CAUTION

Inspect the seat ring and valve body interior for wear, erosion, or damage in the following steps.

10. Inspect the seat ring for wear or damage. If the seating surface has been damaged, discard the seat ring.
11. Visually inspect the valve body interior below the seat ring for erosion or damage. Replace the valve body if necessary.

⚠ WARNING

Be careful to avoid damaging the seating surface on the valve plug or seat ring as damage in these areas will allow excessive leakage at shutoff. Avoid damaging the highly polished valve stem surface. A damaged valve stem could cut the packing and allow process fluid to leak to the atmosphere.

Cover the opening in the valve body to prevent foreign material from getting into the valve body cavity.

Spring-to-Open (Air-to-Close)

Key numbers are referenced in figure 8.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body (key 1), and drain the process media from both sides of the valve.

Note

The following steps are intended to ensure the groove pin is fully exposed below the bonnet to allow you to remove the pin before removing the valve plug.

2. Pressurize the actuator to a maximum of 2.41 bar (35 psi) to stroke the valve fully closed. This will seat the valve plug (key 3) and expose the top of the serrations on the valve stem (key 16).
3. Loosen the hex socket head cap screws (key 15) and raise the flow adjustor (keys 13 and 14) to its highest position on the valve stem.
4. Tighten the hex socket head cap screws to 3 N•m (26 lbf•in).
5. Relieve pressure to the actuator and disconnect the air lines. Ensure the flow adjustor is touching the top of the bonnet window. Use lockout procedures to ensure the above measures stay in effect while you work on the equipment.

6. Break the bonnet nut (key 5) loose with a hammer. Continue turning the bonnet nut by using a hammer or a large adjustable wrench, tightened around one ear of the bonnet nut. If the bonnet (key 7) is stuck in the valve, continue to unscrew the bonnet nut. The bonnet nut will contact the spring pins (or pipe plugs) (key 6, figures 7 or 8) and jack the bonnet out of the valve. Carefully lift the actuator assembly from the valve body.

⚠ WARNING

The spring pins/pipe plugs (key 6) must always be in place during valve operation. They provide a safeguard against injury when the unit is being disassembled.

7. Completely remove the packing retainer (key 8) using a 1-1/8 inch wrench.
8. Remove the valve plug by driving out the pin (key 43) and unscrewing the valve plug from the stem. Utilize a 1/8 inch drift punch in the holes provided on the stem to keep the stem from turning as the plug is removed. Do not remove the Belleville springs (key 9) from the stem, in order to retain the Belleville stacking orientation as shown in figure 3.
9. Use a 1-3/16 inch socket wrench to loosen and remove the seat ring (key 2).

CAUTION

Inspect the seat ring and valve body interior for wear, erosion, or damage in the following steps.

10. Inspect the seat ring for wear or damage. If the seating surface has been damaged, discard the seat ring.
11. Visually inspect the valve body interior below the seat ring for erosion or damage. Replace the valve body if necessary.

⚠ WARNING

Be careful to avoid damaging the seating surface on the valve plug or seat ring as damage in these areas will allow excessive leakage at shutoff. Avoid damaging the highly polished valve stem surface. A damaged valve stem could cut the packing and allow process fluid to leak to the atmosphere.

Cover the opening in the valve body to prevent foreign material from getting into the valve body cavity.

Trim Assembly

Spring-to-Close (Air-to-Open)

1. Ensure the threads of the valve stem (key 16) and valve plug (key 3) are clean and free of debris.
2. Make sure the Belleville springs (key 9) are properly installed on the valve stem, as shown in figure 3.
3. Install the valve plug on the stem and insert a new pin (key 43).
4. Lubricate the threads of the packing retainer with anti-seize and install into the bonnet using a 1-1/8 inch wrench. Make sure the Belleville springs (key 9) are completely enclosed by the packing retainer as shown in figure 4.
5. Torque the packing retainer to 81 N•m (60 lbf•ft). The packing retainer has been installed correctly when a metal-to-metal contact has been made between the packing retainer end and the bonnet (key 7). The packing retainer threads should be completely enclosed by the bonnet.

Figure 3. Packing and Belleville Spring Stacking Order

VALVE PLUG INSTALLED WITHOUT PACKING RETAINER

Figure 4. Packing and Belleville Spring Stacking Order

Figure 5. Lubrication Locations on Packing

6. Thoroughly clean the seat ring (key 2) threads and the mating threads in the valve body (key 1).
7. Apply anti-seize lubricant to the threads of the seat ring and its mating threads in the valve body.
8. Screw the seat ring into the valve body. Use a 1-3/16 inch socket wrench to tighten the seat ring to 170 N•m (125 lbf•ft). Remove all excess lubricant after tightening.
9. Lubricate the bonnet O-ring (key 4) with lithium grease and install on the bonnet.
10. Apply anti-seize lubricant to the threads on the valve body and bonnet nut (key 5) and the contact surfaces of the bonnet and bonnet nut flange. Install the bonnet and actuator assembly onto the valve body. Tighten the bonnet nut until the nut stops turning. A few hammer blows will be required to ensure that the assembly is tight.
11. Pressurize the actuator to a maximum of 2.41 bar (35 psi) to stroke the valve to mid travel.
12. Loosen the hex socket head cap screws (key 15) and remove the flow adjuster (keys 13 and 14).
13. Relieve pressure to the actuator to fully close the valve.
14. Make sure the valve is fully seated and install the flow adjuster (keys 13 and 14) and hex socket head cap screws (key 15).
15. Set the desired flow rate position according to figure 2.
16. Tighten the hex socket head cap screws to 3 N•m (26 lbf•in).

Spring-to-Open (Air-to-Close)

1. Ensure the threads of the valve stem (key 16) and valve plug (key 3) are clean and free of debris.
2. Make sure the Belleville springs (key 9) are properly installed on the valve stem, as shown in figure 3.
3. Install the valve plug on the stem and insert a new pin (key 43).
4. Lubricate the threads of the packing retainer with anti-seize and install into the bonnet using a 1-1/8 inch wrench. Make sure the Belleville springs (key 9) are completely enclosed by the packing retainer as shown in figure 4.
5. Torque the packing retainer to 68 N•m (50 lbf•ft). The packing retainer has been installed correctly when a metal to metal contact has been made between the packing retainer end and the bonnet (key 7). The packing retainer threads should be completely enclosed by the bonnet.
6. Thoroughly clean the seat ring (key 2) threads and the mating threads in the valve body (key 1).
7. Apply anti-seize lubricant to the threads of the seat ring and its mating threads in the valve body.
8. Screw the seat ring into the valve body. Use a 1-3/16 inch socket wrench to tighten the seat ring to 170 N•m (125 lbf•ft). Remove all excess lubricant after tightening.

9. Lubricate the bonnet O-ring (key 4) with lithium grease and install on the bonnet.
10. Apply anti-seize lubricant to the threads on the valve body and bonnet nut (key 5) and the contact surfaces of the bonnet and bonnet nut flange. Install the bonnet and actuator assembly onto the valve body. Tighten the bonnet nut until the nut stops turning. A few hammer blows will be required to ensure that the assembly is tight.
11. Pressurize the actuator to a maximum of 2.41 bar (35 psi) to stroke the valve fully closed.
12. Loosen the hex socket head cap screws (key 15) and set the desired flow rate position according to figure 2.
13. Tighten the hex socket head cap screws to 3 N•m (26 lbf•in).
14. Relieve pressure to the actuator.

Packing Maintenance

⚠ WARNING

Observe the warning at the start of the Maintenance section.

Key numbers are referenced in figure 3.

The valve stem packing can only be serviced by removing the bonnet from the valve body.

Packing Disassembly

Spring-to-Close (Air-to-Open)

1. Disassemble the valve per steps 1 - 8 in the Spring-to-Close Trim Disassembly section of the Valve Plug and Seat Ring Maintenance section of this manual.
2. Remove the five Belleville springs (key 9), lower packing spacer (key 12), packing set (key 11), and two anti-extrusion washers (key 10) from the bonnet (key 7) using a formed wire hook.
3. Clean and inspect the packing box wall to ensure that the packing surfaces are not damaged. If the surface condition is damaged and cannot be improved by light sanding, replace the bonnet.
4. Inspect the valve stem (key 16) and valve plug (key 3) for scratches or wear and replace if necessary.

Spring-to-Open (Air-to-Close)

1. Disassemble the valve per steps 1 - 8 in the Spring-to-Open Trim Disassembly section of the Valve Plug and Seat Ring Maintenance section of this manual.
2. Remove the five Belleville springs (key 9), lower packing spacer (key 12), packing set (key 11), and two anti-extrusion washers (key 10) from the bonnet (key 7) using a formed wire hook.
3. Clean and inspect the packing box wall to ensure that the packing surfaces are not damaged. If the surface condition is damaged and cannot be improved by light sanding, replace the bonnet.
4. Inspect the valve stem (key 16) and valve plug (key 3) for scratches or wear and replace if necessary.

Packing Assembly

The following steps define the proper procedure for installing the packing in a D3 FloPro Control Valve. Improper packing assembly can lead to poor valve performance. The proper packing arrangement is shown in figure 3.

Spring-to-Close (Air-to-Open)

1. Ensure the upper packing spacer (key 12) is installed.

2. Use the lower packing spacer (key 12) and a tube to push the upper anti-extrusion washer (key 10) into place. Using the lower packing spacer in this manner will ensure the upper anti-extrusion washer is fully seated and flat when installed in the packing bore.
3. Remove the lower packing spacer from the packing bore.

CAUTION

All D3 FloPro packing kits include a single use packet of high performance fluorinated grease. This is the only acceptable D3 packing lubricant.

Note

In the following procedure, carefully install each packing ring individually over the valve stem and push completely into the packing box with a non-marring tube. A 12-inch length of 1/2 inch PVC pipe works well for this. It is recommended that the lubricated packing rings be installed individually rather than pushed in as a set.

4. Apply a 3mm (1/8 inch) bead of the supplied high performance fluorinated grease (key 44) around the groove of the female packing adaptor as shown in figure 5 and install over the valve stem (key 16).
5. Apply a 3mm (1/8 inch) bead of the supplied high performance fluorinated grease (key 44) around the groove of the packing ring as shown in figure 5 and install over the valve stem.
6. Install the male packing adaptor, lower anti-extrusion washer (key 10), and lower packing spacer over the valve stem as shown in figure 3.
7. Firmly press all packing parts into the packing bore with a tube.
8. Install the five Belleville springs (key 9) over the valve stem as shown in figure 3.
9. Install the valve plug (key 3) on the stem and insert a new groove pin (key 43).
10. Lubricate the threads of the packing retainer with anti-seize and install into the bonnet using a 1-1/8 inch wrench. Make sure the Belleville springs are completely enclosed by the packing retainer as shown in figure 4.
11. Torque the packing retainer to 81 N•m (60 lbf•ft). The packing retainer has been installed correctly when a metal-to-metal contact has been made between the packing retainer end and the bonnet (key 7). The packing retainer threads should be completely enclosed by the bonnet.
12. Assemble the valve per steps 9 - 16 in the Spring-to-Close Trim Assembly section of the Valve Plug and Seat Ring Maintenance section of this manual.

Spring-to-Open (Air-to-Close)

1. Ensure the upper packing spacer (key 12) is installed.
2. Use the lower packing spacer (key 12) and a tube to push the upper anti-extrusion washer (key 10) into place. Using the lower packing spacer in this manner will ensure the upper anti-extrusion washer is fully seated and flat when installed in the packing bore.
3. Remove the lower packing spacer from the packing bore.

CAUTION

All D3 FloPro packing kits include a single use packet of high performance fluorinated grease. This is the only acceptable D3 packing lubricant.

Note

In the following procedure, carefully install each packing ring individually over the valve stem and push completely into the packing box with a non-marring tube. A 12-inch length of 1/2 inch PVC pipe works well for this. It is recommended that the lubricated packing rings be installed individually rather than pushed in as a set.

4. Apply a 3mm (1/8 inch) bead of the supplied high performance fluorinated grease (key 44) around the groove of the female packing adaptor as shown in figure 5 and install over the valve stem (key 16).
5. Apply a 3mm (1/8 inch) bead of the supplied high performance fluorinated grease (key 44) around the groove of the packing ring as shown in figure 5 and install over the valve stem.
6. Install the male packing adaptor, lower anti-extrusion washer (key 10), and lower packing spacer over the valve stem as shown in figure 3.
7. Firmly press all packing parts into the packing bore with a tube.
8. Install the five Belleville springs (key 9) over the valve stem as shown in figure 3.
9. Install the valve plug (key 3) on the stem and insert a new groove pin (key 43).
10. Lubricate the threads of the packing retainer with anti-seize and install into the bonnet using a 1-1/8 inch wrench. Make sure the Belleville springs are completely enclosed by the packing retainer as shown in figure 4.
11. Torque the packing retainer to 81 N•m (60 lbf•ft). The packing retainer has been installed correctly when a metal-to-metal contact has been made between the packing retainer end and the bonnet (key 7). The packing retainer threads should be completely enclosed by the bonnet.
12. Assemble the valve per steps 9 - 14 in the Spring-to-Open Trim Assembly section of the Valve Plug and Seat Ring Maintenance section of this manual.

Servicing the Actuator

The D3 FloPro valve is equipped with a spring and diaphragm actuator. The actuator action may be reversed without the need for additional parts. The number of springs contained in the actuator may have to be adjusted according to actuator action and/or supply pressure. Refer to table 2 for the proper number of springs for your actuator action and valve service conditions.

Actuator Disassembly

Spring-to-Close (Air-to-Open)

Key numbers are referenced in figure 7.

⚠ WARNING

Observe the warning at the start of the Maintenance section.

Inspect all parts for wear or damage during disassembly. Replace any worn or damaged parts with genuine Fisher replacement parts. If the diaphragm is replaced, a new diaphragm O-ring should also be installed.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body (key 1), and drain the process media from both sides of the valve.

⚠ WARNING

To prevent possible personal injury or property damage from removing the casing cap screws in the wrong sequence, follow the procedure as outlined below for removing the upper casing.

Be aware as you loosen and remove the actuator casing cap screws that the actuator springs are under compression.

2. Remove the ten short actuator casing cap screws (key 29).
3. Remove the two long actuator casing cap screws (key 31) by alternating between them as you loosen them. Keep the upper casing (key 32) level during this procedure.
4. Remove the upper casing and the springs (key 28).
5. Remove the stem nut (key 27) taking care not turn the valve stem (key 16). Keep the valve stem from turning by inserting a 1/8 inch drift punch in the holes provided on the valve stem.
6. Remove the actuator spacer (key 26), diaphragm O-ring (key 19), diaphragm plate (key 24), diaphragm (key 23), and the diaphragm washer (key 22).
7. Remove the bonnet locknut (key 20) with a 1-1/2 inch socket wrench and lift off the lower casing (key 21).
8. Remove the casing O-ring (key 17).
9. Break the bonnet nut (key 5) loose with a hammer. Continue turning the bonnet nut by using a hammer or a large adjustable wrench, tightened around one ear of the bonnet nut. If the bonnet (key 7) is stuck in the valve, continue to unscrew the bonnet nut. The bonnet nut will contact the spring pins (or pipe plugs) (key 6, figures 7 or 8) and jack the bonnet out of the valve. Carefully lift the actuator assembly from the valve body.

⚠ WARNING

The spring pins/pipe plugs (key 6) must always be in place during valve operation. They provide a safeguard against injury when the unit is being disassembled.

10. Completely remove the packing retainer (key 8) using a 1-1/8 inch wrench.
11. Remove the valve plug (key 3) by driving out the pin (key 43) and unscrewing the valve plug from the stem. Utilize a 1/8 inch drift punch in the holes provided on the stem to keep the stem from turning as the plug is removed.
12. Remove the five Belleville springs (key 9), lower packing spacer (key 12), packing set (key 11), and two anti-extrusion washers (key 10) from the bonnet using a formed wire hook.
13. Completely remove the flow adjuster (keys 13, 14, and 15) from the valve stem.
14. Remove the valve stem from the top of the bonnet.

CAUTION

The valve stem must be removed to replace the stem O-ring and the bonnet bushing. If the valve stem is removed, the valve packing must be replaced since the threads on the valve stem may damage the packing when the valve stem is removed.

15. Remove the stem O-ring (key 25) and the bonnet bushing (key 18).
16. If the hammer nut needs to be removed from the bonnet, the spring pins (or pipe plugs) (key 6, figures 7 or 8) can be removed with locking pliers.

Spring-to-Open (Air-to-Close)

Key numbers are referenced in figure 8.

⚠ WARNING

Observe the warning at the start of the Maintenance section.

Inspect all parts for wear or damage during disassembly. Replace any worn or damaged parts with genuine Fisher replacement parts. If the diaphragm is replaced, a new diaphragm O-ring should also be installed.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body (key 1), and drain the process media from both sides of the valve.
2. Remove the ten short actuator casing cap screws (key 29) and the two long actuator casing cap screws (key 31).
3. Remove the upper casing (key 32).
4. Lubricate the threads above the stem nut (key 27) with anti-seize lubricant to prevent galling of the threads.

⚠ WARNING

To prevent possible personal injury or property damage, be aware as you loosen and remove the stem nut that the actuator springs are under compression.

5. Relieve spring tension by slowly removing the stem nut. Do not allow the valve stem (key 16) to turn while removing the stem nut. Keep the valve stem from turning by inserting a 1/8 inch drift punch in the holes provided on the valve stem.
6. Remove the diaphragm washer (key 22), diaphragm (key 23), diaphragm plate (key 24), diaphragm O-ring (key 19), and actuator spacer (key 26).
7. Remove the bonnet locknut (key 20) with a 1-1/2 inch socket wrench and lift off the lower casing (key 21).
8. Remove the casing O-ring (key 17).
9. Break the bonnet nut (key 5) loose with a hammer. Continue turning the bonnet nut by using a hammer or a large adjustable wrench, tightened around one ear of the bonnet nut. If the bonnet (key 7) is stuck in the valve, continue to unscrew the bonnet nut. The bonnet nut will contact the spring pins (or pipe plugs) (key 6, figures 7 or 8) and jack the bonnet out of the valve. Carefully lift the actuator assembly from the valve body.

⚠ WARNING

The spring pins/pipe plugs (key 6) must always be in place during valve operation. They provide a safeguard against injury when the unit is being disassembled.

10. Completely remove the packing retainer (key 8) using a 1-1/8 inch wrench.
11. Remove the valve plug (key 3) by driving out the pin (key 43) and unscrewing the valve plug from the stem. Utilize a 1/8 inch drift punch in the holes provided on the stem to keep the stem from turning as the plug is removed.
12. Remove the five Belleville springs (key 9), lower packing spacer (key 12), packing set (key 11), and two anti-extrusion washers (key 10) from the bonnet using a formed wire hook.
13. Completely remove the flow adjuster (keys 13, 14, and 15) from the valve stem.
14. Remove the valve stem from the bottom of the bonnet (key 16).

CAUTION

The valve stem must be removed to replace the stem O-ring and the bonnet bushing. If the valve stem is removed, the valve packing must be replaced since the threads on the valve stem may damage the packing when the valve stem is removed.

Figure 6. Spring Locations As Seen From Above Lower Actuator Casing

15. Remove the stem O-ring (key 25) and the bonnet bushing (key 18).
16. If the hammer nut needs to be removed from the bonnet, the spring pins (or pipe plugs) (key 6, figures 7 or 8) can be removed with locking pliers.

Actuator Assembly

Spring-to-Close (Air-to-Open)

Key numbers are referenced in figure 7. The proper packing arrangement is shown in figure 3.

CAUTION

Avoid possible product damage in the following procedure by ensuring there are no burrs or sharp edges on any threads or surfaces which may damage internal valve components during assembly.

Make sure all parts are clean and in good condition before starting assembly. There should be no burrs or sharp edges on any threads or surfaces that might cut or damage soft parts in the valve assembly.

CAUTION

The threads on factory-produced valve stems have been specially machined to avoid O-ring, bushing, or packing damage during trim maintenance. Use of other than a factory-produced valve stem may result in early stem O-ring, bushing, and packing failure.

⚠ WARNING

The spring pins/pipe plugs (key 6) must always be in place during valve operation. They provide a safeguard against injury when the unit is being disassembled.

1. Install the bonnet nut (key 5) and spring pins (or pipe plugs) (key 6, figures 7 or 8) if previously removed.

2. Lubricate the stem O-ring (key 25) with lithium grease and install in the bonnet (key 7).
3. Press the bonnet bushing (key 18) with the slots upward into the upper hole in the bonnet. The bonnet bushing is installed correctly when it snaps into place.
4. Install the casing O-ring (key 17) in the provided groove at the top of the bonnet.
5. Position the lower casing (key 21) on the bonnet.
6. Install the casing locknut (key 20) on the bonnet and torque to 203 N•m (150 lbf•ft).
7. Install the valve stem (key 16) from the bottom of the bonnet. Inserting the valve stem in this manner will prevent damage to the bonnet bushing and stem O-ring.
8. Ensure the upper packing spacer (key 12) is installed.
9. Use the lower packing spacer (key 12) and a tube to push the upper anti-extrusion washer (key 10) into place. Using the lower packing spacer in this manner will ensure the upper anti-extrusion washer is fully seated and flat when installed in the packing bore.
10. Remove the lower packing spacer from the packing bore.

CAUTION

All D3 FloPro packing kits include a single use packet of high performance fluorinated grease. This is the only acceptable D3 packing lubricant.

Note

In the following procedure, carefully install each packing ring individually over the valve stem and push completely into the packing box with a non-marring tube. A 12-inch length of 1/2 inch PVC pipe works well for this. It is recommended that the lubricated packing rings be installed individually rather than pushed in as a set.

11. Apply a 3mm (1/8 inch) bead of the supplied high performance fluorinated grease (key 44) around the groove of the female packing adaptor as shown in figure 5 and install over the valve stem (key 16).
12. Apply a 3mm (1/8 inch) bead of the supplied high performance fluorinated grease (key 44) around the groove of the packing ring as shown in figure 5 and install over the valve stem.
13. Install the male packing adaptor, lower anti-extrusion washer (key 10), and lower packing spacer over the valve stem as shown in figure 3.
14. Firmly press all packing parts into the packing bore with a tube.
15. Install the five Belleville springs (key 9) over the valve stem as shown in figure 3.
16. Install the valve plug on the stem and insert a new pin (key 43).
17. Lubricate the threads of the packing retainer with anti-seize and install into the bonnet using a 1-1/8 inch wrench. Make sure the Belleville springs (key 9) are completely enclosed by the packing retainer as shown in figure 4.
18. Torque the packing retainer to 81 N•m (60 lbf•ft). The packing retainer has been installed correctly when a metal-to-metal contact has been made between the packing retainer end and the bonnet. The packing retainer threads should be completely enclosed by the bonnet.
19. Lubricate the bonnet O-ring (key 4) with lithium grease and install onto the bonnet.
20. Ensure the seat ring is installed in the valve body.
21. Apply anti-seize lubricant on the threads of the valve body (key 1), the threads of the bonnet nut (key 5), and the contact surfaces of the bonnet and bonnet nut flange.
22. Install the bonnet and actuator assembly into the valve body. Tighten the bonnet nut until the nut stops turning. A few hammer blows will be required to ensure that the assembly is tight.

CAUTION

Avoid possible product damage which may affect proper operation of the diaphragm. Ensure the washer is aligned with the hole in the diaphragm so the washer does not cut the diaphragm.

23. Install the diaphragm washer (key 22) over the valve stem threads with the lip facing upward. If you are unsure of the correct orientation for the diaphragm washer, see figure 7 view A for the correct orientation.
24. Install the diaphragm (key 23), diaphragm plate (key 24), diaphragm O-ring (key 19), and actuator spacer (key 26) on the valve stem. Position the diaphragm so the holes in the diaphragm align with the holes in the lower casing.
25. Lubricate the threads above the stem nut (key 27) with anti-seize lubricant to prevent galling of the threads.
26. Install the stem nut (key 27) and torque to 20 N•m (15 lbf•ft). Use a 1/8 inch drift punch to keep the valve stem from turning as the hex nut is installed.

CAUTION

Non-symmetrical spring arrangement could cause actuator failure, resulting in possible product damage.

27. Install the correct number of springs (key 28) in a symmetrical pattern on the spring locators on the diaphragm plate. See figure 6 for the proper arrangement of the springs. The correct number of springs is dependent on your application and supply pressure. See table 2 for the correct number of springs.
28. Place the upper casing (key 32) on the diaphragm and lower casing. Position the upper casing so the holes in the upper casing align with the holes in the diaphragm and lower casing.

CAUTION

Do not lubricate cap screws (key 29 and 31). The following torque specifications are for unlubricated bolting.

29. Install the two long cap screws (key 31) opposite each other. Install the hex nuts (key 30) onto the long cap screws and tighten, alternating until the upper casing contacts the diaphragm. Keep the upper casing level during this process.
30. Install the ten short cap screws (key 29) into the remaining holes and install hex nuts on the remaining cap screws.
31. Torque the hex nuts in a crossing pattern to 16 N•m (12 lbf•ft).
32. Make sure valve is fully seated and install the flow adjustor (keys 13 and 14) and hex socket head cap screws (key 15).
33. Set the desired flow rate position according to figure 2.
34. Tighten the hex socket head cap screws to 3 N•m (26 lbf•in).

Spring-to-Open (Air-to-Close)

Key numbers are referenced in figure 8. The proper packing arrangement is shown in figure 3.

CAUTION

Avoid possible product damage in the following procedure by ensuring there are no burrs or sharp edges on any threads or surfaces which may damage internal valve components during assembly.

Make sure all parts are clean and in good condition before starting assembly. There should be no burrs or sharp edges on any threads or surfaces that might cut or damage soft parts in the valve assembly.

CAUTION

The threads on factory-produced valve stems have been specially machined to avoid O-ring, bushing, or packing damage during trim maintenance. Use of other than a factory-produced valve stem may result in early stem O-ring, bushing, and packing failure.

⚠ WARNING

The spring pins/pipe plugs (key 6) must always be in place during valve operation. They provide a safeguard against injury when the unit is being disassembled.

1. Install the bonnet nut (key 5) and spring pins (or pipe plugs) (key 6, figures 7 or 8) if previously removed.
2. Lubricate the stem O-ring (key 25) with lithium grease and install in the bonnet (key 7).
3. Press the bonnet bushing (key 18) with the slots upward into the upper hole in the bonnet. The bonnet bushing is installed correctly when it snaps into place.
4. Install the casing O-ring (key 17) in the provided groove at the top of the bonnet.
5. Position the lower casing (key 21) on the bonnet.
6. Install the casing locknut (key 20) on the bonnet and torque to 203 N•m (150 lbf•ft).
7. Install the valve stem (key 16) from the bottom of the bonnet. Inserting the valve stem in this manner will prevent damage to the bonnet bushing and stem O-ring.
8. Ensure the upper packing spacer (key 12) is installed.
9. Use the lower packing spacer (key 12) and a tube to push the upper anti-extrusion washer (key 10) into place. Using the lower packing spacer in this manner will ensure the upper anti-extrusion washer is fully seated and flat when installed in the packing bore.
10. Remove the lower packing spacer from the packing bore.

CAUTION

All D3 FloPro packing kits include a single use packet of high performance fluorinated grease. This is the only acceptable D3 packing lubricant.

Note

In the following procedure, carefully install each packing ring individually over the valve stem and push completely into the packing box with a non-marring tube. A 12-inch length of 1/2 inch PVC pipe works well for this. It is recommended that the lubricated packing rings be installed individually rather than pushed in as a set.

11. Apply a 3mm (1/8 inch) bead of the supplied high performance fluorinated grease (key 44) around the groove of the female packing adaptor as shown in figure 5 and install over the valve stem (key 16).
12. Apply a 3mm (1/8 inch) bead of the supplied high performance fluorinated grease (key 44) around the groove of the packing ring as shown in figure 5 and install over the valve stem.

13. Install the male packing adaptor, lower anti-extrusion washer (key 10), and lower packing spacer over the valve stem as shown in figure 3.
14. Firmly press all packing parts into the packing bore with a tube.
15. Install the five Belleville springs (key 9) over the valve stem as shown in figure 3.
16. Install the valve plug on the stem and insert a new pin (key 43).
17. Lubricate the threads of the packing retainer with anti-seize and install into the bonnet using a 1-1/8 inch wrench. Make sure the Belleville springs (key 9) are completely enclosed by the packing retainer as shown in figure 4.
18. Torque the packing retainer to 81 N•m (60 lbf•ft). The packing retainer has been installed correctly when a metal-to-metal contact has been made between the packing retainer end and the bonnet. The packing retainer threads should be completely enclosed by the bonnet.
19. Lubricate the bonnet O-ring (key 4) with lithium grease and install onto the bonnet.
20. Ensure the seat ring is installed in the valve body.
21. Apply anti-seize lubricant on the threads of the valve body (key 1), the threads of the bonnet nut (key 5), and the contact surfaces of the bonnet and bonnet nut flange.
22. Install the bonnet and actuator assembly into the valve body. Tighten the bonnet nut until the nut stops turning. A few hammer blows will be required to ensure that the assembly is tight.

CAUTION

Non-symmetrical spring arrangement could cause actuator failure, resulting in possible product damage.

23. Install the correct number of springs (key 28) in a symmetrical pattern on the lower casing. See figure 6 for the proper arrangement of the springs. The correct number of springs is dependent on your application and supply pressure. See table 2 for the correct number of springs.
24. Install the actuator spacer (key 26), diaphragm O-ring (key 19), diaphragm plate (key 24), and diaphragm (key 23) on the valve stem. Position the diaphragm so the holes in the diaphragm align with the holes in the bottom casing.

CAUTION

Avoid possible product damage which may affect proper operation of the diaphragm. Ensure the washer is aligned with the hole in the diaphragm so the washer does not cut the diaphragm.

25. Install the diaphragm washer (key 22) over the valve stem threads with the lip facing downward. If you are unsure of the correct orientation for the diaphragm washer, see figure 8 view A for the correct orientation. Make sure the lip fits inside the diaphragm hole.
26. Lubricate the threads above the stem nut (key 27) with anti-seize lubricant to prevent galling of the threads.
27. Install the stem nut and torque to 20 N•m (15 lbf•ft). Use a 1/8 inch drift punch to keep the valve stem from turning as the hex nut is installed. The springs will be compressed when the stem nut is fully tightened.
28. Place the upper casing (key 32) on the diaphragm and lower casing. Position the upper casing so the holes in the upper casing align with the holes in the diaphragm and lower casing.

CAUTION

Do not lubricate cap screws (key 29 and 31). The following torque specifications are for unlubricated bolting.

29. Install the two long cap screws (key 31) opposite each other. Install the ten short cap screws (key 29) into the remaining holes and install hex nuts (key 30) on all cap screws.
30. Torque the hex nuts in a crossing pattern to 16 N•m (12 lbf•ft).
31. Pressurize the actuator to a maximum of 2.41 bar (35 psi) to stroke the valve fully closed.
32. Make sure valve is fully seated and install the flow adjustor (keys 13 and 14) and hex socket head cap screws (key 15).
33. Set the desired flow rate position according to figure 2.
34. Tighten the hex head screws to 3 N•m (26 lbf•in).
35. Relieve pressure to the actuator.

Changing Actuator Action

From Spring-to-Close to Spring-to-Open

1. Follow steps 1 to 6 in the Disassembly instructions for the Spring-to-Close actuator on page 12 of this manual.
2. Follow steps 23 to 34 in the Assembly instructions for the Spring-to-Open actuator on page 17 of this manual.

From Spring-to-Open to Spring-to-Close

1. Follow steps 1 to 6 in the Disassembly instructions for the Spring-to-Open actuator on page 13 of this manual.
2. Follow steps 23 to 34 in the Assembly instructions for the Spring-to-Close actuator on page 17 of this manual.

Parts Ordering

Each D3 FloPro control valve is assigned a serial number, which can be found on the nameplate. Refer to the number when contacting your [Emerson sales office](#) for assistance or when ordering replacement parts.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Introduction

Scope of Manual

This instruction manual provides installation, maintenance, and parts information for the Fisher D4 control valve.

Do not install, operate, or maintain a D4 control valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The D4 control valve is a compact, rugged valve designed primarily for high-pressure throttling applications. This valve is ideal for use on pressure and flow control applications within the oil and gas production industry. The D4 valve also makes an excellent dump valve for high-pressure separators and scrubbers.

The D4 control valve meets the metallurgical requirements of NACE MR0175/ISO 15156 without environmental limits for temperatures below 135°C (275°F). If the temperature is above 135°C (275°F), the N07718 Belleville washers will impose some limits, as shown in table 3.

Table 1. Specifications

Available Configurations Spring-to-Close Spring-to-Open Valve Body Sizes and End Connection Styles⁽¹⁾ See table 2 Maximum Inlet Pressures and Temperatures⁽¹⁾ If the valve nameplate shows an ASME pressure-temperature class, maximum inlet pressure and temperature is consistent with the applicable class per ASME B16.34. If the nameplate does not show an ASME class, it will show a maximum cold working pressure at 38°C (100°F) (for example, 293 bar [4250 psi]) Maximum Pressure Drops⁽¹⁾ See tables 4, 5, 6, and 7 Input Signal to Actuator See tables 4, 5, 6, and 7 Actuator Maximum Casing Pressure⁽¹⁾ 3.4 bar (50 psig) Shutoff Classification per ANSI/FCI 70-2 and IEC 60534-4 Class IV	Material Temperature Capabilities⁽¹⁾ Actuator Assembly: -40 to 93°C (-40 to 200°F) Valve Body Assembly: <i>Standard Bonnet O-Ring:</i> -40 to 135°C (-40 to 275°F) <i>Optional Fluorocarbon Bonnet O-Ring:</i> -23 to 204°C (-10 to 400°F) Flow Characteristic Equal percentage Flow Direction Flow up only Port Diameters See table 2 Valve Plug Travel 19 mm (0.75 inch) Valve Plug Style Micro-Form valve plug Actuator Diaphragm Effective Area 452 cm ² (69 inches ²) Actuator Pressure Connection Size 1/4 NPT internal
---	---

1. The pressure or temperature limits in the referenced tables and any applicable ASME code limitations should not be exceeded.

Specifications

Table 1 lists specifications for the D4 control valve. Some of the specifications for a given control valve as it originally comes from the factory are stamped on a nameplate located on the actuator spring barrel.

25.4	1	43	630	85	1235
31.8	1.25	26	380	52	765
1. The pressure or temperature limits in the referenced tables and any applicable ASME code limitations should not be exceeded. 2. For example, an Electro-Pneumatic Transducer calibrated for 0.4-2.0 bar (6-30 psig) output pressure. 3. For applications with downstream pressure in excess of 202 bar (2925 psig), use 202 bar (2925 psig) for Maximum Shutoff Pressure.					

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage caused by bursting of pressure-retaining parts or by uncontrolled process fluid, be certain the service conditions do not exceed the limits shown on the valve nameplate and in tables 1, 4, 5, 6, and 7. Use pressure-relieving devices required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

⚠ WARNING

Avoid personal injury or property damage caused by possible actuator failure. The use of a rigidly-mounted support on the actuator casing may cause additional stress on the actuator leading to premature wear and/or failure of the actuator components.

NOTICE

To avoid product damage, inspect the valve before installation for any damage or any foreign material that may have collected in the valve body. Also remove any pipe scale, welding slag, or other foreign material from the pipeline.

1. Before installing the control valve assembly, inspect it for any damage and for any foreign material that may have collected in the valve body.
2. Remove any pipe scale, welding slag, and other foreign material from the pipeline.
3. The control valve can be installed in any position, but normally the actuator is vertical above the valve. Install the valve so the flow direction arrow on the side of the valve indicates the direction of the process flow.
4. Install the valve following local and national piping codes when they apply to the application. For screwed connections, treat the external pipe threads with a good grade pipe compound. For flanged valves, use suitable gaskets between valve and pipeline flanges.
5. If continuous operation is required during maintenance and inspection, install a conventional three-valve bypass around the valve.
6. Connect loading pressure for the Spring-to-Open configuration to the 1/4-18 NPT connection in the upper casing assembly (key 23) as shown in figure 5. The Spring-to-Close configuration loading pressure connection is in the lower casing assembly (key 39) as shown in figure 4.

Spring Adjustment

The spring has a fixed pressure span over which loading pressure will stroke the valve. Adjustment of the spring compression shifts the span so that more or less loading pressure is required to start travel. Since the span does not change, there will be a corresponding increase or decrease in the pressure requirements at the end of the valve stroke.

In order to maximize shutoff pressure drop values, the actuator spring must be accurately adjusted for each Input Signal Pressure Range. If the actuator has been disassembled or pressure conditions have changed, the spring may require adjustment. Refer to tables 2 and 4 to determine the Initial Spring Set values based on the Input Signal range that is available to the actuator. These values include packing friction.

Spring-to-Close

Refer to figure 4.

1. Loosen the adjusting screw nut (key 44).
2. Turn the adjusting screw (key 31) clockwise to compress the spring or counterclockwise to decrease spring compression.
3. After adjustment, tighten the adjusting screw nut (key 44).

Spring-to-Open

Refer to figure 5.

1. Unscrew the spring case assembly (key 27).
2. Turn the adjusting stem nut (key 44) clockwise to compress the spring or counterclockwise to decrease spring compression.
3. After adjustment, replace the spring case assembly (key 27).

Maintenance

Refer to figure 4.

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and maintenance depends on the severity of the service conditions.

WARNING

Avoid personal injury from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Valve Plug and Seat Ring

The D4 control valve is designed to allow easy access to the valve plug and seat ring without disturbing the packing. Refer to other sections of this instruction manual if additional maintenance is required.

Disassembly

1. Remove the loading pressure tubing and any accessories that may hamper disassembly.
2. Break the hammer nut (key 6) loose with a hammer. Continue turning the hammer nut by using a hammer or a large adjustable wrench, tightened around one ear of the hammer nut. If the bonnet is stuck on the valve, continue to unscrew the hammer nut. The hammer nut will contact the spring pins (key 7) and will force the bonnet out of the valve. Carefully lift the actuator, bonnet, and valve plug assembly from the valve body.

⚠ WARNING

The spring pins must always be in place during valve operation. They provide a safeguard against injury when the unit is being disassembled.

3. Use a socket wrench to loosen the seat ring (key 3).
4. Remove the seat ring (key 3) and seat ring gasket (key 9) from the valve body.
5. Inspect parts for wear or damage that would prevent proper operation of the valve body. Carefully clean the seat ring gasket surfaces and seat ring threads.

⚠ WARNING

Be careful to avoid damaging the seating surface on the valve plug or seat ring as damage in these areas will allow excessive leakage at shutoff. Avoid damaging the highly polished valve stem surface. A damaged valve stem could cut the packing and allow process fluid to leak to the atmosphere.

Table 8. Torque for Seat Ring (Key 3)

VALVE SIZE	RECOMMENDED TORQUE	
	N•m	Lbf•ft
NPS		
1	407	300
2	698	515

6. For spring-to-close only: To remove the valve plug (key 2), drive out the groove pin (key 4) and unscrew the valve plug from the stem (key 47). If the groove pin (key 4) is not exposed, verify that downward movement of the stem is not restricted by instrument linkages attached to the stem (key 47).

If the valve plug cannot be easily unscrewed from the stem, use a punch to keep the stem from turning as the plug is removed.

7. For spring-to-open only: To remove the valve plug (key 2), first remove the spring case assembly (key 27). Remove the adjustment screw nut (key 44), the upper spring seat (key 29), and the spring (key 30). Push the adjustment stem (key 31) fully downward until the diaphragm plate (key 40) contacts the cap screws (key 38), exposing the groove pin (key 4) in the plug. If the groove pin (key 4) is not exposed, verify that downward movement of the stem is not restricted by instrument linkages attached to the stem (key 47). Drive out the groove pin (key 4) and unscrew the valve plug from the stem (key 47).

If the valve plug cannot be easily unscrewed from the stem, use a punch to keep the stem from turning as the plug is removed.

Assembly

1. Make sure the bonnet O-ring (key 8) is on the bonnet and lubricated with lithium grease (key 49).
2. Install the plug (key 2) on the stem (key 47) and insert a new groove pin (key 4).

3. Thoroughly clean the seat ring and bonnet threads in the valve body (key 1). Also clean the valve body seat ring gasket surfaces.
4. Apply anti-seize lubricant (key 54) to the threads of the seat ring (key 3), and its mating threads in the valve body.
5. Apply anti-seize lubricant (key 54) to the seat ring gasket (key 9) and install into the valve body.
6. Screw the seat ring into the valve body. Use a socket wrench to tighten the seat ring to the torque values shown in table 8. Remove all excess lubricant after tightening.
7. Lubricate (key 54) the threads on the valve body and hammer nut and the contact surfaces of the bonnet and hammer nut flange. Install the bonnet and actuator assembly with pinned valve plug onto the valve body. Tighten the hammer nut using an adjustable wrench until the nut stops turning. A few hammer blows will be required to ensure that the assembly is tight.
8. See the actuator assembly and spring adjustment sections of this manual.

Valve Packing

WARNING

Observe the warning at the start of the Maintenance section.

The valve stem packing can only be accessed from within the valve body. If packing maintenance is required, first disassemble per steps 1, 2, and 6 or 7 in the Valve Plug and Seat Ring Disassembly section of this document.

Note

Packing installation and adjustment is critical to the long-term packing performance. Absolutely no deviations from this procedure are allowed.

To minimize friction and maximize sealing performance, a small amount of fluorinated grease (key 56) is placed between the packing rings.

Single Packing Arrangement

The packing components are to be installed as shown in the assembly drawing per the following procedure:

1. Install packing spacer (key 48) in the packing box.
2. Using a non-marring installation tool, such as a 12 inch length of 1/2 inch PVC pipe, push the first anti-extrusion washer (key 12) fully into the packing box by hand. Then, use the packing spacer (key 14) to fully seat the anti-extrusion washer by firmly tapping the packing spacer against the anti-extrusion washer with a hammer and the PVC pipe.
3. Using a needle point syringe filled with fluorinated grease, apply a continuous bead of approximately 3/16 inch diameter inside the V-groove of the female adaptor ring. See figure 2. Take care to keep the lubricant confined to only the V-groove. Do not lubricate the other surfaces of the packing ring, the stem, or the packing box.

Note

All D4 packing kits include a single use packet of high performance fluorinated grease. This is the only acceptable D4 packing lubricant.

4. Install the female adaptor ring using the packing spacer and PVC pipe to push the ring against the anti-extrusion washer. Apply only enough force to cause the female adaptor to make contact.
5. Using a needle point syringe filled with fluorinated grease, apply a continuous bead of approximately 3/16 inch diameter inside the V-groove of the white V-ring. See figure 2. Take care to keep the lubricant confined to only the V-groove. Do not lubricate the other surfaces of the packing ring, the stem, or the packing box.
6. Install the V-ring using the packing spacer and PVC pipe to push the V-ring against the female adaptor. Apply only enough force to cause the female adaptor to make contact.
7. Install the male adaptor.
8. Using the PVC pipe, push the second anti-extrusion washer (key 12) fully into the packing box by hand. Then, use the packing spacer (key 14) to fully seat the anti-extrusion washer by firmly tapping the packing spacer against the anti-extrusion washer with a hammer and the PVC pipe.
9. Install the packing spacer (key 14) and five Belleville springs (key 11). The Belleville springs (key 11) should be single stacked with the ID of the inner spring contacting the packing spacer (key 14) and the OD of the outer spring contacting the packing retainer (key 10). The final Belleville spring should be within the 1.26 inch-diameter bore of the bonnet.
10. Adjust the packing retainer by hand until it contacts the Belleville springs. Do not tighten by hand, simply install the packing retainer until it contacts the Belleville springs. Torque the packing retainer to 68 N•m (50 lbf•ft).

Figure 2. Fisher D4 Packing Installation

Figure 3. Lubrication Locations on Packing

Double Packing Arrangement

The packing components are to be installed as shown in the assembly drawing per the following procedure:

1. Using a non-marring installation tool, such as a 12 inch length of 1/2 inch PVC pipe, push the first anti-extrusion washer (key 12) fully into the packing box by hand. Then, use the packing spacer (key 14) to fully seat the anti-extrusion washer by firmly tapping the packing spacer against the anti-extrusion washer with a hammer and the PVC pipe.
2. Using a needle point syringe filled with fluorinated grease, apply a continuous bead of approximately 3/16 inch diameter inside the V-groove of the female adaptor ring. See figure 2. Take care to keep the lubricant confined to only the V-groove. Do not lubricate the other surfaces of the packing ring, the stem, or the packing box.

Note

All D4 packing kits include a single use packet of high performance fluorinated grease. This is the only acceptable D4 packing lubricant.

3. Install the female adaptor ring using the packing spacer and PVC pipe to push the ring against the anti-extrusion washer. Apply only enough force to cause the female adaptor to make contact.
4. Using a needle point syringe filled with fluorinated grease, apply a continuous bead of approximately 3/16 inch diameter inside the V-groove of the white V-ring. See figure 2. Take care to keep the lubricant confined to only the V-groove. Do not lubricate the other surfaces of the packing ring, the stem, or the packing box.
5. Install the V-ring using the packing spacer and PVC pipe to push the V-ring against the female adaptor. Apply only enough force to cause the female adaptor to make contact.
6. Install the male adaptor.
7. Install the packing spacer (key 14).
8. Using a needle point syringe filled with fluorinated grease, apply a continuous bead of approximately 3/16 inch diameter inside the V-groove of the female adaptor ring. See figure 2. Take care to keep the lubricant confined to only the V-groove. Do not lubricate the other surfaces of the packing ring, the stem, or the packing box.
9. Install the female adaptor ring using the packing spacer and PVC pipe to push the ring against the anti-extrusion washer. Apply only enough force to cause the female adaptor to make contact.

10. Using a needle point syringe filled with fluorinated grease, apply a continuous bead of approximately 3/16 inch diameter inside the V-groove of the white V-ring. See figure 2. Take care to keep the lubricant confined to only the V-groove. Do not lubricate the other surfaces of the packing ring, the stem, or the packing box.
11. Install the V-ring using the packing spacer and PVC pipe to push the V-ring against the female adaptor. Apply only enough force to cause the female adaptor to make contact.
12. Install the male adaptor.
13. Using the PVC pipe, push the second anti-extrusion washer (key 12) fully into the packing box by hand. Then, use the packing spacer (key 14) to fully seat the anti-extrusion washer by firmly tapping the packing spacer against the anti-extrusion washer with a hammer and the PVC pipe.
14. Install the packing spacer (key 14) and six Belleville springs (key 11). The Belleville springs (key 11) should be double stacked with the ID of the inner spring contacting the packing spacer (key 14) and the OD of the outer spring contacting the packing retainer (key 10). The final Belleville spring should be within the 1.26 inch-diameter bore of the bonnet.
15. Adjust the packing retainer by hand until it contacts the Belleville springs. Torque the packing retainer to 54 N•m (40 lbf•ft).

Actuator (Spring-to-Close)

⚠ WARNING

Observe the warning at the start of the Maintenance section.

Refer to figure 4.

Before disassembling the actuator, disassemble the valve plug, seat ring, and packing according to instructions in this manual.

Disassembly

1. Loosen the adjusting screw nut (key 44) and turn the adjusting screw (key 31) counterclockwise to remove all spring compression.
2. Unscrew the casing cap screws and hex nuts (keys 45 and 46), and remove the upper casing assembly (key 23) from the lower casing (key 39).
3. Remove the spring seat (key 29) and actuator spring (key 30).
4. Lift out the diaphragm, diaphragm plate, and stem assembly. Remove the travel indicator (key 32) when the bottom of the stem enters the yoke window.
5. To replace the diaphragm (key 15), separate the diaphragm assembly by using a wrench on the hex nuts (key 42) to unscrew the assembly.
6. Separate the parts--diaphragm washer, actuator O-ring (keys 41 and 25), diaphragm, and diaphragm plate, (keys 15 and 40).
7. Inspect the diaphragm and the actuator O-ring for damage or deterioration, and replace if necessary. If the diaphragm is replaced, a new O-ring should also be installed.
8. Inspect the stem O-ring (key 19) and bonnet bushing (key 20); replace if necessary. To inspect the casing O-ring (key 18), remove the cap screws (key 38) and lift off the lower casing (key 39). Replace the O-ring if necessary.
9. If the hammer nut needs to be removed from the bonnet, the spring pins (key 7) can be removed with locking pliers.

Assembly

1. Before starting assembly, make sure all parts are clean and in good condition. There should be no burrs or sharp edges on any threads or surfaces that might cut or damage an O-ring, bushing, the packing, or the diaphragm.

When replacing O-rings and bushings, be sure the O-ring or bushing groove is clean and undamaged. Using a general purpose lubricant (key 49), lubricate all bushings and O-rings and the threads of parts that have to pass through the bushings and O-rings.

NOTICE

The threads on factory-produced valve stems have been specially machined to avoid O-ring, bushing, or packing damage during trim maintenance. Use of other than a factory-produced valve stem may result in early stem O-ring, bushing, and packing failure.

Note

Do not lubricate cap screws (key 38) before inserting them in the following procedure.

2. Place the hammer nut and spring pins on the bonnet, if removed. Install the casing O-ring (key 18), the stem O-ring (key 19), and the bonnet bushing (key 20). Position the lower casing (key 39) on the bonnet. Insert the nonlubricated cap screws (key 38), and torque to 49 N•m (36 lbf•ft).

⚠ WARNING

The spring pins must always be in place during valve operation. They provide a safeguard against injury when the unit is being disassembled.

3. Assemble the diaphragm plate assembly. Place the patterned side of the diaphragm (key 15) against the diaphragm plate (key 40). Be sure to turn the diaphragm washer (key 41) so that the side that is beveled on the inside diameter is against the O-ring (key 25). Also, make sure that it is assembled for installation with the diaphragm on the loading pressure side and the lockwasher (key 43) and lower spring seat (key 28) are on the spring side.
4. Fasten the diaphragm and diaphragm plate assembly on the stem with hex nuts (key 42). Place the diaphragm and diaphragm plate, and stem assembly into the lower casing and bonnet. Install the travel indicator (key 32) on the stem as the bottom of the stem enters the yoke window.

NOTICE

Over-tightening the diaphragm casing cap screws and nuts (keys 45 and 46) can damage the diaphragm. Do not exceed 27 N•m (20 lbf•ft) torque.

5. Replace the spring (key 30) on the diaphragm plate (key 40). Replace the upper spring seat (key 29). Position the upper casing (key 23) on the lower casing (key 39). Insert the cap screws (key 45) and tighten the hex nuts (key 46). Torque the casing cap screws evenly to 27 N•m (20 lbf•ft) using a crisscross pattern.
6. Adjust the initial spring set per the Spring Adjustment section in this manual.

Actuator (Spring-to-Open)

⚠ WARNING

Observe the warning at the start of the Maintenance section.

Refer to figure 5.

Before disassembling the actuator, disassemble the valve plug, seat ring, and packing according to instructions in this manual.

Disassembly

1. Unscrew the spring case assembly (key 27). Turn the adjusting screw nut (key 44) counterclockwise to remove all spring compression. Remove the adjusting screw nut, upper spring seat, and spring (keys 44, 29, and 30)
2. Unscrew the casing cap screws and hex nuts (keys 45 and 46), and remove the upper casing assembly (key 23) from the lower casing (key 39). Remove the cotter pin (key 36) and unscrew the adjusting stem (key 31).
3. Lift out the diaphragm (key 15), diaphragm plate (key 40), and stem assembly. Remove the travel indicator (key 32) when the bottom of the stem enters the yoke window.
4. To replace the diaphragm (key 15), separate the diaphragm assembly by using a wrench on the hex nuts (key 42) to unscrew the assembly.
5. Separate the parts--diaphragm washer, actuator O-ring (keys 41 and 25), diaphragm, and diaphragm plate, (keys 15 and 40).
6. Inspect the diaphragm and the actuator O-ring for damage or deterioration, and replace if necessary. If the diaphragm is replaced, a new O-ring should also be installed.
7. Inspect the stem O-ring (key 19) and bonnet bushing (key 20); replace if necessary. To inspect the casing O-ring (key 18), remove the cap screws (key 38) and lift off the lower casing (key 39). Replace the O-ring if necessary. Inspect the adjusting stem bushing (key 26) and actuator stem O-ring (key 53). Replace if necessary.
8. If the hammer nut needs to be removed from the bonnet, the spring pins (key 7) can be removed with locking pliers.

Assembly

1. Before starting assembly, make sure all parts are clean and in good condition. There should be no burrs or sharp edges on any threads or surfaces that might cut or damage an O-ring, bushing, the packing, or the diaphragm. When replacing O-rings and bushings, be sure the O-ring or bushing groove is clean and undamaged. Using a general purpose lubricant (key 49), lubricate all bushings and O-rings and the threads of parts that have to pass through the bushings and O-rings.

NOTICE

The threads on factory-produced valve stems have been specially machined to avoid O-ring, bushing, or packing damage during trim maintenance. Use of other than a factory-produced valve stem may result in early stem O-ring, bushing, and packing failure.

Note

Do not lubricate cap screws (key 38) before inserting them in the following procedure.

2. Place the hammer nut and spring pins on the bonnet, if removed. Install the casing O-ring (key 18), the stem O-ring (key 19), and the bonnet bushing (key 20). Position the lower casing (key 39) on the bonnet. Insert the nonlubricated cap screws (key 38), and torque to 49 N•m (36 lbf•ft).
3. Assemble the diaphragm plate assembly. Place the patterned side of the diaphragm (key 15) against the diaphragm plate (key 40). Be sure to turn the diaphragm washer (key 41) so that the side that is beveled on the inside diameter is against the O-ring (key 25). Also, make sure that it is assembled for installation with the diaphragm on the loading pressure side and the lockwasher (key 43) and diaphragm washer (key 41) are on the upper side.

⚠ WARNING

The spring pins must always be in place during valve operation. They provide a safeguard against injury when the unit is being disassembled.

4. Fasten the diaphragm and diaphragm plate assembly on the stem with hex nuts (key 42). Place the diaphragm and diaphragm plate, and stem assembly into the lower casing and bonnet. Install the travel indicator (key 32) on the stem as the bottom of the stem enters the yoke window.
5. Screw the adjusting stem (key 31) onto the stem (key 47) and secure the cotter pin (key 36). Make sure the bushing and O-ring are in place in the upper casing.

NOTICE

Over-tightening the diaphragm casing cap screws and nuts (keys 45 and 46) can damage the diaphragm. Do not exceed 27 N•m (20 lbf•ft) torque.

6. Position the upper casing (key 23) on the lower casing (key 39). Insert the cap screws (key 45) and tighten the hex nuts (key 46). Torque the casing cap screws evenly to 27 N•m (20 lbf•ft) using a crisscross pattern.
7. Replace the spring (key 30), spring seat (key 29), and adjusting stem nut (key 44) over the adjusting stem. Replace the spring case assembly (key 27).
8. Adjust the initial spring set per the Spring Adjustment section in this manual.

Parts Ordering

Each D4 control valve is assigned a serial number, which can be found on the nameplate. Refer to the number when contacting your [Emerson sales office](#) for assistance or when ordering replacement parts.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Repair Kits

Note

All repair kits are supplied with hydrogenated nitrile bonnet O-ring. FKM (fluorocarbon) bonnet O-ring must be ordered separately when required.

	Description	Part Number
*	Packing Repair Kit Includes key numbers 4, 8, 12 (2 req'd), 13, and high performance fluorinated grease	RD4X0000012
*	Actuator Repair Kit Includes key numbers 4, 8, 12 (2 req'd), 13, 15, 18, 19, 20, 25, 26, 36, 53, and high performance fluorinated grease	RD4X0000022

Introduction

Scope of Manual

This instruction manual provides installation, maintenance, and parts information for the Fisher D4 control valve with easy-Drive electric actuator.

Do not install, operate, or maintain a D4 control valve with easy-Drive electric actuator without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Table 1. Specifications

Valve Body Sizes and End Connection Styles⁽¹⁾ See table 2 Maximum Inlet Pressures and Temperatures⁽¹⁾ If the valve nameplate shows an ASME pressure-temperature class, maximum inlet pressure and temperature is consistent with the applicable class per ASME B16.34. If the nameplate does not show an ASME class, it will show a maximum cold working pressure at 38°C (100°F) (for example, 293 bar [4250 psi]) Maximum Pressure Drops⁽¹⁾ See table 4 Shutoff Classification per ANSI/FCI 70-2 and IEC 60534-4 Class IV Material Temperature Capabilities⁽¹⁾ Valve Body Assembly: <i>Standard Bonnet O-Ring:</i> -40 to 135°C (-40 to 275°F) <i>Optional Fluorocarbon Bonnet O-Ring:</i> -23 to 204°C (-10 to 400°F) Flow Characteristic Equal percentage Flow Direction Flow up only Port Diameters See table 2 Valve Plug Travel 19 mm (0.75 inch) Valve Plug Style Micro-Form valve plug Available Actuator Configurations On/off (snap acting) Positioning (flow or pressure control)	Power Requirements 12 or 24VDC, minimum 4 amp power supply required (fuse to 5 amps) Maximum Current Draw 4 amps Idle Current Draw 38 mA Conduit Connections Two 3/4 NPT connections Stroke Length 19mm (0.75 inch) Nominal Stroke Speed⁽²⁾ 3.9 mm/s (0.15 inch/s) at 24 VDC 2.2 mm/s (0.09 inch/s) at 12 VDC Hazardous Area Approvals CSA (C/US): Explosion-Proof Class I, Division 1, Groups C and D, T6, Ex d IIA T6, Class I, Zone 1, AEx d IIA T6 ATEX Flameproof - Gas: Ex II 2 G ,Ex d IIA T6 IECEx Flameproof - Gas: Ex d IIA T6 Enclosure Rating Type 4X and IP66 Duty Cycle 50% maximum Enclosure Material Cast aluminum alloy with powder coat paint Approximate Weight: 22 - 51 kg (49 - 113 lbs), depending upon construction
--	---

1. The pressure or temperature limits in the referenced tables and any applicable ASME code limitations should not be exceeded.

2. 10% variation can be expected, based on temperature and pressure of application.

Description

The D4 control valve with easy-Drive electric actuator is a compact, rugged valve designed primarily for high-pressure throttling applications. This valve is ideal for use on pressure and flow control applications within the oil and gas production industry. The D4 valve also makes an excellent dump valve for high-pressure separators and scrubbers.

The D4 control valve meets the metallurgical requirements of NACE MR0175/ISO 15156 without environmental limits for temperatures below 135°C (275°F). If the temperature is above 135°C (275°F), the N07718 Belleville washers will impose some limits, as shown in table 3.

Specifications

Table 1 lists specifications for the D4 control valve with easy-Drive electric actuator. Some of the specifications for a given control valve as it originally comes from the factory are stamped on a nameplate located on the lower actuator enclosure.

Educational Services

25.4	1	56	814
31.8	1.25	34	495

1. Downstream pressure, P2, is limited to 2250 psig.

Installation

WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage caused by bursting of pressure-retaining parts or by uncontrolled process fluid, be certain the service conditions do not exceed the limits shown on the valve nameplate and in table 1. Use pressure-relieving devices required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

WARNING

For explosion-proof applications, ensure the actuator cover is properly bolted before applying power to the actuator. Personal injury or property damage may result from fire or explosion if power is applied to the actuator with the cover removed in a hazardous area.

For explosion-proof applications, install rigid metal conduit and a conduit seal no more than 457 mm (18 inches) from the actuator. Personal injury or property damage may result from explosion if the seal is not installed.

Select wiring and/or cable glands that are rated for the environment of use (such as hazardous area, ingress protection, and temperature). Failure to use properly rated wiring and/or cable glands can result in personal injury or property damage from fire or explosion.

Wiring connections must be in accordance with local, regional, and national codes for any given hazardous area approval. Failure to follow the local, regional, and national codes could result in personal injury or property damage from fire or explosion.

CAUTION

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#) or Local Business Partner.

To avoid product damage, inspect the valve before installation for any damage or any foreign material that may have collected in the valve body. Also remove any pipe scale, welding slag, or other foreign material from the pipeline.

WARNING

Avoid personal injury or property damage caused by possible actuator failure. The use of a rigidly-mounted support on the actuator casing may cause additional stress on the actuator leading to premature wear and/or failure of the actuator components.

CAUTION

To avoid product damage, inspect the valve before installation for any damage or any foreign material that may have collected in the valve body. Also remove any pipe scale, welding slag, or other foreign material from the pipeline.

1. Before installing the control valve assembly, inspect it for any damage and for any foreign material that may have collected in the valve body.
2. Remove any pipe scale, welding slag, and other foreign material from the pipeline.
3. The control valve can be installed in any position, but normally the actuator is vertical above the valve. Install the valve so the flow direction arrow on the side of the valve indicates the direction of the process flow.
4. Install the valve following local and national piping codes when they apply to the application. For screwed connections, treat the external pipe threads with a good grade pipe compound. For flanged valves, use suitable gaskets between valve and pipeline flanges.
5. If continuous operation is required during maintenance and inspection, install a conventional three-valve bypass around the valve.

Special Instructions for “Safe Use” and Installations in Hazardous Locations

ATEX/IECEX

⚠ WARNING

To avoid static discharge from the enclosure, do not rub or clean the enclosure with solvents. To do so could result in an explosion. Clean with a mild detergent and water only.

The enclosure is non-conducting and may generate an ignition-capable level of electrostatic charges under certain extreme conditions. The user should ensure that the equipment is not installed in a location where it may be subjected to external conditions (such as high-pressure steam) which might cause a build-up of electrostatic charges on non-conducting surfaces. Additionally, cleaning of the equipment shall only be done with a damp cloth.

To avoid damage to the enclosure, when screws are fully tightened into blind holes in enclosure walls, with no washer fitted, at least one full thread shall remain free at the base of the hole.

Startup Overview

Figure 2. Flowchart

Figure 3. Fisher D4 Valve with easy-Drive Actuator Wiring Diagram

Power Requirements

Ensure a stable DC power source is available, maintaining less than 5% ripple and sufficiently surge protected for the application. A 4 amp (minimum) power supply is required. Use of a 36 volt transient voltage suppressor is highly recommended.

Wiring Instructions

1. Observe local wiring requirements for hazardous location usage.
2. Conduit seals within 457 mm (18 inches) of the enclosure port are required for explosion-proof installation.
3. 22AWG (0.33mm²) to 12AWG (3.31mm²) wire size required.
4. Fuse system to 5A.
5. Connect enclosure and analog signal shields.
6. Ensure power is turned off before connecting the wires.

Power

1. Connect 12 or 24 VDC reference to: –
2. Connect 12 or 24 VDC positive to: +
3. Be sure to tighten terminals sufficiently to ensure solid mechanical connection.

Figure 4. Wiring - Analog Input

NOTE:
1. 40043=0 SETS ANALOG INPUT TO 1-5V AND ASSUMES USE OF RECOMMENDED EXTERNAL 250 OHM RESISTOR.
IF NO EXTERNAL RESISTOR IS USED, SET 40043=1.

Figure 5. Wiring - L2e

Figure 6. Wiring - Single Dry Contact

Dry Contact (single dry contact:
40033=0, 40034=0, 40043=1)

1. Connect one side of contact switch to terminal 1 (COMM)
2. Connect other side of contact switch to terminal 2 (N.O.)

1 Stop Bit

Important Technical Notice for easy-Drive Electric Actuator

When using the easy-Drive electric actuator with a 4-20mA control signal, the unit should always have 12/24VDC power present on the power input terminals prior to applying the 4-20mA signal, unless an external 250 ohm resistor is installed per figure 4. Failure to do so could result in damage to the analog input circuitry.

It is strongly recommended to place an external 250 ohm resistor between terminals 3 and 4 when using a 4-20mA signal to control the actuator. When the actuator is configured to 1-5V input with an external 250 ohm resistor in place, a 4-20mA signal may be safely used without danger to input circuitry.

This order of operation must always be maintained when powering the unit on if no external 250 ohm resistor is used:

1. 12/24VDC power on
2. 4-20mA control signal engaged

This order of operation must always be maintained when powering the unit off:

1. 4-20mA control signal disengaged
2. 12/24VDC power off

The result of not following this order of operation could result in permanent damage to the analog input circuitry. This damage can result in the inability of the controller to see the control signal, resulting in the actuator moving the valve plug to the loss of signal position.

Default Input Signals

The D4 with easy-Drive comes from the factory calibrated and ready for use with the following default input signals shown in table 5.

Table 5. D4 easy-Drive Default Input Signals

CONFIGURATION	ON/OFF	POSITIONING
Input Signal	L2e (dual dry contact)	4-20 mA

If the input signal of the application matches table 5, proceed to the Wiring Instructions section. If the input signal of the application does not match table 5, proceed to the Configuration section.

Configuration

Input Configuration

There are 2 functional configurations available for the easy-Drive electric actuator: On/Off and Positioning. It is not possible to change an actuator from On/Off to Positioning after it has been delivered from the factory. Version 4.21 and higher firmware will allow a positioning unit to be changed to on/off.

All available input signals are shown in table 6.

Table 6. All Available Input Signals

CONFIGURATION	ON/OFF			POSITIONING		
Control Source	Modbus	Local		Modbus	Local	
Input Signal	Modbus	L2e Dual Dry Contact (default)	Single Dry Contact	Modbus	4-20 mA (default)	1-5 V

If you are using the default inputs signals, and the valve has not been disassembled or adjusted in any way, there is no need to recalibrate the assembly. You can proceed directly to Startup (page 12).

Changing the Inputs from Default Settings

All configuration within the valve is done by setting values in Modbus registers. This can be done using any Modbus master (flow computer, PLC, PC). Configuration software, providing a visual interface to the registers, is available through your Emerson local business partner or the Fisher website.

Modbus setup

Use the instructions in the instruction manual for the Modbus master to initiate the connection. The D4 with easy-Drive electric actuator Modbus factory defaults are Address 1, 9600 baud, even parity, 1 stop bit.

When a connection has been achieved, the actuator may be configured to accept the input signal over the Modbus link (ignoring the physical inputs) and the Modbus settings may be changed to accommodate the network to which it is attached. Other changes to functionality are possible, such as:

- Low level cutoff: 40037 (default is 5%)
- Position upon loss of signal: 40035 (default is 0%)

See Appendix A for a full map of Modbus registers and their functions.

Figure 8. Fisher easy-Drive Configuration Software

Connecting using the Fisher easy-Drive configuration software

The Fisher easy-Drive configuration software allows configuration and diagnosing of the Fisher easy-Drive electric actuator with a graphical interface. Connect a PC to the actuator using a USB or serial to Modbus RTU converter using the wiring instructions above. The USB or serial device will be visible in the drop menu under Serial Port Settings. Baud rate and parity should be set to the Modbus settings of the actuator. Default actuator settings are 9600 baud and Even parity.

Use the Fisher easy-Drive configuration software (figure 8) to make the desired changes, or register values may be changed to allow different functionality. Modbus register 40034 dictates whether the unit will respond to a physical signal or to the value in Modbus register 40001. A value of 0 in register 40034 will result in the actuator responding to the value in 40001 and a value of 1 will result in the actuator responding to physical control signals.

Note

If an actuator is on/off, a Modbus command of 0-49 in register 40001 will cause the valve to close fully, while a value of 50-100 will cause the valve to open fully.

Local to Modbus Control

Modbus

- Set register 40034 (Control Source)
 - 1 = Local Control
 - 0 = Modbus control

Configuration Software

- Use radio button to select Local Control or Modbus Control.

4-20mA to 1-5V Control

Modbus

- Set register 40043 (Analog I/P mode)
 - 0 = 1-5V
 - 1 = 4-20mA

Configuration Software

- Use radio button to select 4-20mA or 1-5V local analog control when Control Source is set to Local.

L2e (Dual dry contact) to Single Dry Contact Control

Modbus

- Set register 40043 (Analog I/P mode)

- 0 = L2e (Dual dry contact)
- 1 = Single dry contact

Configuration Software

- Use radio button to select L2e or Single pole local digital control when Control Source is set to Local.

Calibration Instructions

WARNING

To avoid personal injury or property damage, be aware that the valve will open fully and then close fully during the calibration cycle.

It is not necessary to calibrate your easy-Drive electric actuator prior to use from a factory shipment.

If any of the following are true, recalibration will be required (see next section)

- The actuator has been re-mounted on a different valve since shipment
- Disassembly of the valve for trim or packing changes
- A new version of firmware has been loaded on the controller

The following scenarios do not require recalibrations

- New unit from the box
- Power dips or interruptions
- Changing of control method (i.e. from 4-20mA to Modbus control)
- Extended periods of storage

Calibration with the use of Modbus

1. After the unit has been properly wired and fused per instructions in the Wiring section of this instruction manual, turn power to the unit on.
2. Calibrate using Modbus:
 - a. Send position command of 0% to actuator to prevent unexpected motion. Valve will move to commanded position following the calibration procedure.
 - b. Send a value of 1 to register 40003. Valve plug will move to fully closed. The valve plug will then return to the commanded position.

If a Modbus connection is not available, and recalibration is desired, use the appropriate calibration method as determined by the control method of your valve.

Calibration without the use of Modbus

1. Turn power to the actuator off

2. Wait for 10 seconds to ensure all circuits have discharged.
3. Return power to the actuator and use the appropriate calibration method for your control signal. Calibration sequence must be done within 15 seconds of power being switched on.
4. For On/Off operation using L2e dual-input dry contact:
 - a. Close the contact to create a short between pins 1 and 2 – valve plug will not move at this time.
 - b. Close the contact to create a short between pins 1 and 3 – valve plug will move to the lower, closed position.
5. For On/Off operation using single dry contact:
 - a. Close the contact to create a short between pins 1 and 2 – valve plug will not move at this time.
 - b. Open the contact to create an open circuit between pins 1 and 2 – valve plug will move to the lower, closed position.
6. For positioning operation using 4-20mA:
 - a. Apply a 20mA signal between pins 3 and 4 – valve plug will not move at this time.
 - b. Apply a 4mA signal between pins 3 and 4 – valve plug will move to the lower, closed position.
 - c. If calibration of the analog input is desired to improve positional accuracy, an optional operation is listed in the next section titled Analog Input Calibration.
7. For positioning operation using 1-5V:
 - a. Apply a 5V signal between pins 3 and 4 – valve plug will not move at this time.
 - b. Apply a 1V signal between pins 3 and 4 – valve plug will move to the lower, closed position.
 - c. If calibration of the analog input is desired to improve positional accuracy, an optional operation is listed in the next section titled Analog Input Calibration.
8. The unit is now calibrated.

Analog Input Calibration

Improved positional accuracy may be obtained by calibrating the actuator to the analog signal input. The position of the valve plug is linearly proportional to the analog control signal end points, with 4 mA/1V equating to fully closed and 20 mA/5V equating to fully open.

1. Apply a 4 mA or 1V signal between pins 3 and 4 - valve plug will move to the fully open position.
2. Send a value of 1 to register 40004 or click Analog Cal at 0% in the configuration software.
3. Apply a 20 mA or 5V signal between pins 3 and 4 - valve plug will move to the fully closed position.
4. Send a value of 1 to register 40005 or click Analog Cal at 100% in the configuration software.
5. The unit is calibrated to your analog signal.

Start Up

WARNING

To avoid personal injury or property damage, be aware that the valve will move and respond to an input signal during start up.

1. Before turning on power to the unit, be sure that a closed signal is being commanded to the unit
 - Dry-Contact: contact is open
 - L2e (Dual Dry Contact): Contact closed across pins 1 & 3
 - Analog Input: signal < 4mA or 1V
 - Modbus: position demand = 0
2. Turn on power to the unit
3. Apply a change in position demand to ensure unit responds properly
 - Dry-Contact:
 - Closed contact between pins 1 & 2 will open the valve
 - Dual contact / L2e only (40043=0) : Closed contact between pins 1 & 2 will open the valve. Closed contact between pins 1 & 3 will close the valve
 - Analog Input: valve will respond to proportional demand
 - Modbus: valve will respond to positional demand in register 40001. 0 = fully closed and 100 = fully open.
4. If the valve does not respond as expected, proceed to Troubleshooting guide on page 15.
5. Check conduit ports
 - Conduit seal must be in place within 450mm (18 inches) of the enclosure
 - Unused conduit ports must be sealed with an explosion-proof port plug
6. Replace the cover and tighten all 8 bolts to 20 N-m (15 ft-lbs)

Troubleshooting

1. Unit does not move
 - a. Verify that 12VDC to 24VDC is present on the power terminals as shown on the cover
 - b. Verify that all wires are firmly attached on both ends
 - c. Verify that wires are connected to the correct terminals - see Wiring in the manual
 - d. Verify mode of operation (on/off or positioning) matches control signal
 - e. Verify mode of control (local or Modbus) matches control signal
2. Unit does not respond to 4-20mA signal
 - a. Verify that 12VDC to 24VDC is present on the power terminals as shown on the cover.
 - b. Verify that the 4-20mA signal is wired correctly and that the terminals are firmly on the wires.
 - c. Verify mode of operation matches control signal (local control: 40033=0, positioning: 40034=1).

- d. Check the value of the analog input in register 40025 (middle right of configuration software screen) to determine if it is 0 or greater.
 - i. If register 40025 shows 0 and the circuit board is green (not blue), it is possible a 4-20mA signal was applied without power to the power terminals and damage to the input circuitry has occurred. Contact your [Emerson sales office](#) or Local Business Partner for further information.
3. Unit moves to fully open when 1V signal is applied and closed when 5V signal is applied
 - a. Unit is likely configured as an on/off unit with local control; on/off units can not be controlled as an analog device.
 - i. If on/off control is desired, use a dry contact switch to control in local mode or change to Modbus mode to control the unit
 - ii. If positioning control is desired, contact your Emerson sales office or Local Business Partner to upgrade your actuator to positioning control.
4. Diagnostics show a Motor Stall Fault
 - a. The easy-Drive electric actuator is designed to operate in a manner consistent with a pneumatic actuator. This means that if the valve plug can not move to its commanded position, the actuator will stop, without damage, and issue a Motor Stall Fault warning. When the command signal changes outside of the deadband (Modbus register 40036), it will attempt to move again. Recalibrate the actuator span per instructions in the Startup section of this manual.
5. Position on D4 is not accurate (proportional positioning units only)
 - a. If the valve plug opened during calibration, it is set to a D3. Change valve type to D4 and recalibrate.
 - b. If the local analog input is being used (4-20mA or 1-5V), the analog inputs of the actuator may be calibrated to match the input signal. Follow instructions in Analog Input Calibration, found in the Calibration section of this instruction manual.

Maintenance

Refer to figure 12.

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and maintenance depends on the severity of the service conditions.

WARNING

Avoid personal injury from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings.

- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

⚠ WARNING

For explosion-proof applications, ensure the actuator cover is properly bolted before applying power to the actuator. Personal injury or property damage may result from fire or explosion if power is applied to the actuator with the cover removed in a hazardous area.

Do not remove the actuator cover for 10 minutes after power is disconnected if the UPS option is installed.

For explosion-proof applications, install rigid metal conduit and a conduit seal no more than 457 mm (18 inches) from the actuator. Personal injury or property damage may result from explosion if the seal is not installed.

Select wiring and/or cable glands that are rated for the environment of use (such as hazardous area, ingress protection, and temperature). Failure to use properly rated wiring and/or cable glands can result in personal injury or property damage from fire or explosion.

Wiring connections must be in accordance with local, regional, and national codes for any given hazardous area approval. Failure to follow the local, regional, and national codes could result in personal injury or property damage from fire or explosion.

Valve Plug and Seat Ring

Disassembly

Key Numbers are referenced in figures 11 and 12.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body (key 1), and drain the process media from both sides of the valve.

CAUTION

The following steps are intended to prevent damage to the valve plug (key 3) and seat ring (key 2) during the removal of the bonnet and actuator.

2. For Positioning Actuators

- Command the valve to anywhere between 10% and 20% travel.
- Isolate power and signal.
- Proceed to step 3.

For ON/OFF Actuators

- Command the valve to open or close, and cut the power when the valve is at mid-stroke.
- Isolate power and signal.
- Proceed to step 3.

3. Break the hammer nut (key 6) loose with a hammer. Continue turning the hammer nut by using a hammer or a large adjustable wrench, tightened around one ear of the hammer nut. If the bonnet is stuck on the valve, continue to unscrew the hammer nut. The hammer nut will contact the spring pins (key 7) and will force the bonnet out of the valve. Carefully lift the actuator, bonnet, and valve plug assembly from the valve body.

⚠ WARNING

The spring pins must always be in place during valve operation. They provide a safeguard against injury when the unit is being disassembled.

4. Use a socket wrench to loosen the seat ring (key 3).
5. Remove the seat ring (key 3) and seat ring gasket (key 9) from the valve body.
6. To replace the plug, the stem nut (key 42) must be removed to expose the groove pin (key 4). Open the explosion-proof enclosure (key 60), using a 13mm wrench.
7. Remove the stem nut (key 42) using a 11/16 inch wrench; insert a punch in the hole in the stem to restrict rotation of the stem while removing the stem nut. The travel indicator (key 32) may need to be moved to expose the hole.
8. Push the stem downward just far enough to expose the groove pin (key 4) on the plug.
9. Remove the plug by driving out the groove pin and unscrewing the valve plug from the stem.

⚠ WARNING

Be careful to avoid damaging the seating surface on the valve plug or seat ring as damage in these areas will allow excessive leakage at shutoff. Avoid damaging the highly polished valve stem surface. A damaged valve stem could cut the packing and allow process fluid to leak to the atmosphere.

Table 7. Torque for Seat Ring (Key 3)

VALVE SIZE	RECOMMENDED TORQUE	
	N•m	Lbf•ft
NPS 1	407	300
NPS 2	698	515

Assembly

1. Make sure the bonnet O-ring (key 8) is on the bonnet and lubricated with lithium grease (key 49).
2. Install the plug (key 2) on the stem (key 47) and insert a new groove pin (key 4).
3. Push the plug and stem upward to ensure the threads on the top of the stem are exposed. Thread the stem nut (key 42) onto the top of the stem and tighten the stem nut (key 42) to 39 N•m (29lbf•ft). Insert a punch in the hole in the stem to restrict rotation while tightening the stem nut.
4. Replace the top of the explosion proof enclosure (key 60) and tighten cap screws (key 64) to 20 N•m (15 lbf•ft).
5. Thoroughly clean the seat ring and bonnet threads in the valve body (key 1). Also clean the valve body seat ring gasket surfaces.
6. Apply anti-seize lubricant (key 54) to the threads of the seat ring (key 3), and its mating threads in the valve body.
7. Apply anti-seize lubricant (key 54) to the seat ring gasket (key 9) and install into the valve body.
8. Screw the seat ring into the valve body. Use a socket wrench to tighten the seat ring to the torque values shown in table 7. Remove all excess lubricant after tightening.
9. Lubricate (key 54) the threads on the valve body and hammer nut and the contact surfaces of the bonnet and hammer nut flange. Install the bonnet and actuator assembly with pinned valve plug onto the valve body. Tighten the hammer nut using an adjustable wrench until the nut stops turning. A few hammer blows will be required to ensure that the assembly is tight.

Valve Packing

⚠ WARNING

Observe the warning at the start of the Maintenance section.

The valve stem packing can only be accessed from within the valve body.

Disassembly

1. Disassemble the valve per steps 1 through 12 of the Valve Plug and Seat Ring Disassembly section in this instruction manual.
2. Unscrew the packing retainer (key 10) from the bonnet (key 5).
3. Remove the five Belleville springs (key 11), packing spacer (key 14), packing (key 13), and two anti-extrusion rings (key 12) from the bonnet, using a formed wire hook. To aid in packing removal, the stem may be removed.
4. Clean and inspect the packing box wall to ensure that the packing surfaces are not damaged. If the surface condition is damaged, and cannot be improved by light sanding, replace the bonnet by contacting your [Emerson sales office](#) or Local Business Partner.
5. Inspect the valve stem for scratches or wear, and valve plug for wear or damage. Replace if necessary.

Figure 9. Fisher D4 Packing Installation

Figure 10. Lubrication Locations on Packing

Assembly

Refer to figures 9, 10, 11, and 12.

1. If the stem was removed during packing disassembly, insert the stem back into the valve/actuator assembly.
2. Ensure the upper packing spacer (key 48) is installed, as shown in figure 9.
3. Using a non-marring installation tool, such as a 12-inch length of 1/2 inch PVC pipe, push the first anti-extrusion washer (key 12) fully into the packing box by hand. Then, use the packing spacer (key 14) to fully seat the anti-extrusion washer by firmly tapping the packing spacer against the anti-extrusion washer with a hammer and the PVC pipe.
4. Remove the packing spacer from the packing bore.

CAUTION

All D4 packing kits include a single use packet of high performance fluorinated grease. This is the only acceptable D4 packing lubricant.

Note

In the following procedure, carefully install each packing ring individually over the valve stem and push completely into the packing box with a non-marring tube. A 12-inch length of 1/2 inch PVC pipe works well for this. It is recommended that the lubricated packing rings be installed individually rather than pushed in as a set.

5. Apply a 3mm (1/8 inch) bead of the supplied high performance fluorinated grease (key 44) around the groove of the female packing adaptor as shown in figure 10 and install over the valve stem (key 16).
6. Apply a 3mm (1/8 inch) bead of the supplied high performance fluorinated grease (key 44) around the groove of the packing ring as shown in figure 10 and install over the valve stem.
7. Install the male packing adaptor, lower anti-extrusion washer (key 10), and lower packing spacer over the valve stem as shown in figure 9.

8. Firmly press all packing parts into the packing bore with a tube.
9. Install the five Belleville springs (key 11) over the valve stem. The Belleville springs should be single-stacked with the inside diameter of the inner spring contacting the packing spacer (key 14), and the outside diameter of the outer spring contacting the packing retainer (key 10).
10. Lubricate the threads of the packing retainer with anti-seize and install into the bonnet using a 1-5/8 inch wrench. Make sure the Belleville springs are completely enclosed by the packing retainer as shown in figure 9.
11. Torque the packing retainer to 136 N•m (100 lbf•ft). The packing retainer has been installed correctly when a metal-to-metal contact has been made between the packing retainer end and the bonnet (key 5). The packing retainer threads should be completely enclosed by the bonnet.
12. Follow steps 1 through 9 of the Valve Plug and Seat Ring Assembly section in this instruction manual.

Parts Ordering

Each D4 control valve is assigned a serial number, which can be found on the nameplate. Refer to the number when contacting your [Emerson sales office](#) or Local Business Partner for assistance or when ordering replacement parts.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Repair Kits

Note

All repair kits are supplied with hydrogenated nitrile bonnet O-ring. FKM (fluorocarbon) bonnet O-ring must be ordered separately when required.

Description	Part Number
* Packing Repair Kit Includes key numbers 4, 8, 12 (2 req'd), 13, and high performance fluorinated grease	RD4X0000012

A.1 Register Summary

Table 8. Register Summary

DATA	LEGAL FUNCTION CODES	REGISTER (PHYSICAL)	TYPE	R/W	DESCRIPTION
Position Demand – Proportional	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40001 (0x0000)	UINT16	R/W	Value 0-100 = 0-100% Position
Reset Diagnostics	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40002 (0x0001)	UINT16 (BOOL)	R/W	0 = Reset Idle, 1 = Reset Active
Recalibrate Demand	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40003 (0x0002)	UINT16	R/W	0 = Idle, 1 = Reset calibration request – unit will reset to non calibrated state and await calibration sequence
Analog Cal at 0%	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40004 (0x0003)	UINT16	R/W	0 = Idle, 1 = Calibrate at 0%
Analog Cal at 100%	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40005 (0x0004)	UINT16	R/W	0 = Idle, 1 = Calibrate at 100%
Reserved	03 – Read Holding Reg	40006 (0x0005)	UINT16	R	Read will return power up default of 0
Reserved	03 – Read Holding Reg	40007 (0x0006)	UINT16	R	Read will return power up default of 0
Reserved	03 – Read Holding Reg	40008 (0x0007)	UINT16	R	Read will return power up default of 0
Test Register	03 – Read Holding Reg	40009 (0x0008)	UINT16	R	Read will return power up default of 45964 decimal (Binary/Hex -0b10110001110001100 / 0xB38C)
Actual Position	03 – Read Holding Reg	40010 (0x0009)	UINT16	R	Value 0-100 = 0-100% Position
Actual Demand	03 – Read Holding Reg	40011 (0x000A)	UINT16	R	Value 0-100 = 0-100% is demand to position loop from active control source
Diagnostic Flags	03 – Read Holding Reg	40012 (0x000B)	UINT16	R	Bit Flags – see Description in section 5.2 and table 9
Number of cycles	03 – Read Holding Reg	40013 (LSW) (0x000C) 40014 (MSW) (0x000D)	UINT32†	R	Number of movements
Hours Running	03 – Read Holding Reg	40015 (LSW) (0x000E) 40016 (MSW) (0x000F)	UINT32†	R	Total hours powered - version 4.13 Total minutes powered - version 4.21
Hours Open	03 – Read Holding Reg	40017 (LSW) (0x0010) 40018 (MSW) (0x0011)	UINT32†	R	Total hours in open position (at 100%) - version 4.13 Total minutes in open position (at 100%) - version 4.21
Hours Closed	03 – Read Holding Reg	40019 (LSW) (0x0012) 40020 (MSW) (0x0013)	UINT32†	R	Total hours in closed position (at 0%) - version 4.13 Total minutes in closed position (at 0%) - version 4.21
Number of power up cycles	03 – Read Holding Reg	40021 (LSW) (0x0014) 40022 (MSW) (0x0015)	UINT32†	R	Number of times power is cycled successfully
Serial Number	03 – Read Holding Reg	40023 (LSW) (0x0016) 40024 (MSW) (0x0017)	UINT32†	R	Product Unique Identifier 0-4294967295
Analog I/P Value	03 – Read Holding Reg	40025 (0x0018)	UINT16	R	0-50 = 0-5V (Voltage mode I/P) 0-200 = 0-20mA (Current Loop I/P)
Firmware Project Code	03 – Read Holding Reg	40026 (0x0019)	UINT16	R	Project code
Firmware Document Reference	03 – Read Holding Reg	40027 (0x001A)	UINT16	R	Document reference
Firmware Version	03 – Read Holding Reg	40028 (0x001B)	UINT16	R	Version, MSB 8bits = major, LSB 8bits = minor
Diagnostic Flags History	03 – Read Holding Reg	40029 (0x001C)	UINT16	R	Bit Flags – see Description in section 5.2. – This is a history of any faults that have occurred and is stored in memory
Reserved	03 – Read Holding Reg	40030 (0x001D)	UINT16	R	Read will return power up default of 0

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

D4 Valve with easy-Drive Actuator

October 2017

Instruction Manual

D103597X012

Table 8. Register Summary (continued)

DATA	LEGAL FUNCTION CODES	REGISTER (PHYSICAL)	TYPE	R/W	DESCRIPTION
Reserved	03 – Read Holding Reg	40031 (0x001E)	UINT16	R	Read will return power up default of 0
Valve type	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40032 (0x001F)	UINT16	R/W	1 = D3, 2 = D4
Control Type	03 – Read Holding Reg	40033 (0x0020)	UINT16	R	0 = On/Off, 1 = Proportional
Control Source	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40034 (0x0021)	UINT16	R/W	0 = Modbus RTU Register Commands, 1 = Local Control
Loss of control input/comms default position	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40035 (0x0022)	UINT16	R/W	Value 0-100 = 0-100% Position Valve 101 - Last Position
Deadband	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40036 (0x0023)	UINT16	R/W	Value 0-100 = 0-100% Level of hysteretic dead band applied to position control demand
Low travel cutoff	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40037 (0x0024)	UINT16	R/W	Blanking from zero position in percent
Communications Timeout	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40038 (0x0025)	UINT16	R/W	Timeout in seconds before loss of communications state is asserted
Communications Address	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40039 (0x0026)	UINT16	R/W	Modbus address in the range 1-247 (Default = 1)
Communications Baudrate	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40040 (0x0027)	UINT16	R/W	0 = 300 Baud, 1 = 600 Baud, 2 = 1200 Baud, 3 = 2400 Baud, 4 = 4800 Baud, 5 = 9600 Baud, (Default) 6 = 19200 Baud, 7 = 38400 Baud
Parity	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40041 (0x0028)	UINT16 (BOOL)	R/W	0 = Odd, 1 = Even, 2 = None ("None" available in version 4.21 only)
Reset Statistics	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40042 (0x0029)	UINT16 (BOOL)	R/W	0 = Reset Idle, 1 = Reset Active
Local Control Mode	03 – Read Holding Reg 06 – Write Single Reg 16 – Write Multiple Reg	40043 (0x002A)	UINT16	R/W	On/Off 0 = L2e dual dry contact 1 = Single dry contact Proportional 0 = 1-5V 1 = 4-20 mA

UINT16 – unsigned 16 bit variable, can take value 0-65535.

UINT32 – unsigned 32 bit variable, can take value 0-4294967295.

(Reserved) – registers used for development use only.

† - 32bit register contains data that spans two registers – reads and write of data needs to be performed within the same Modbus command function to ensure coherency of data.

Table 9. Fault Register – Fault Flags Summary Table

Diagnostic Flags – Bit Mask Value	Diagnostic Flags – Binary Mask Value	Description
0x8001	1000 0000 0000 0000	Fault in N.V. Memory – system has restored default settings
0x4000	0100 0000 0000 0000	Motor assembly stall
0x2000	0010 0000 0000 0000	Speed measurement fault
0x1000	0001 0000 0000 0000	System or Watchdog fault
0x0800	0000 1000 0000 0000	Overspeed condition
0x0400	0000 0100 0000 0000	Calibration span not in legal range
0x0200	0000 0010 0000 0000	Fault in N.V. Memory – system has recovered settings
0x0100	0000 0001 0000 0000	Communications Timeout
0x0080	0000 0000 1000 0000	Valve was shutdown while moving
0x0040	0000 0000 0100 0000	Valve span calibrated (informational)
0x0020	0000 0000 0010 0000	Valve position controller active (informational)
0x0010	0000 0000 0001 0000	Analog input – below 3mA/0.75V (informational)
0x0008	0000 0000 0000 1000	Motor Overspeed coast condition
0x0004	0000 0000 0000 0100	Modbus command has been sent (starts a calibrated system)
0x0002	0000 0000 0000 0010	Analog input initialized (system has seen input >3mA/1V)
0x0001	0000 0000 0000 0001	Start delay active (within 10 second calibration window)

A.2 Diagnostic Flags

The diagnostic register holds a 16 bit value that represents 16 individual flags, when set (value '1'), this indicates the following conditions have occurred or are still present, the highest 7 bits are latching and will be present in the register even if the initial cause for the flag being set is removed. If these flags are set, a reset needs to be performed to clear the fault.

A.2.1 Fault in NV Memory

This is a severe fault and is usually seen when the firmware is upgraded with a program that uses a different EEPROM/Non-volatile memory map. If this is not the case then the probable cause is a fault in the memory hardware.

A.2.2 Motor Assembly Stall

The valve plug was unable to move to the commanded position. The drive has attempted to move the motor by applying a non-zero PWM signal, and the speed has not been detected as greater than 0 with a 400ms period. This fault latches and needs to be reset.

A.2.3 Speed Measurement Fault

The controller detected pulses that correspond to the motor going much faster than the speed the speed measurement system is designed for – the integrity of the measurement cannot be relied upon. This fault latches and needs to be reset.

A.2.4 System or Watchdog Fault

The software system has been reset and this flag is set at power up if the case of the reset was the onboard watchdog either timing out OR being forced by program function call. This flag is used as an indication that this type of reset has occurred.

A.2.5 Overspeed Condition

The drive speed was detected as being over the speed 3300RPM. This fault latches and needs to be reset.

A.2.6 Calibration Span Not in Legal Range

Following a calibration the detected mechanical travel was detected as being too short for the valve type. This fault latches and needs to be reset.

A.2.7 Fault in NV Memory – recovered settings

This fault is similar to Fault in NV Memory but is different in that the settings were recovered, however it is possible the fault was due to a setting being changed during a power cycle. The settings need to be validated before valve operation.

A.2.8 Communications Timeout

This flag is set after a timeout or loss of valid communications, it will be cleared if communications is reestablished with the valve controller. If this flag is set and the control demand is set to be taken from the Modbus then the valve will be commanded to the 'Loss of communications position' in setting accessed at Modbus register 40034.

A.2.9 Valve was Shutdown while Moving

The valve was actuating while power was removed, the position information may be unreliable. Command valve to 0% to assure position information is accurate.

A.2.10 Valve Span Calibrated

The valve is calibrated.

A.2.11 Valve Position Controller Active

The valve is being actively controlled to go to a demanded position. The speed and position control loop logic is setting the pwm and direction demands to the ValuDrive motor.

A.2.12 Analog Input Below 3mA/0.75V

The analog input is below a set threshold of 3mA. If since being powered up this level has been met the flag 'Analog input initialized' will be set. If the control source is the analog input and this flag is set then the valve will be commanded to actuate to the 'Loss of control input' position.

A.2.13 Motor Overspeed Coast Condition

The drive speed was detected as being over the speed 2500RPM. The flag is cleared if the speed falls below the coast threshold level. This flag is used purely as a diagnostic.

A.2.14 Modbus Command Initialized

The system has received a command to the Position demand register since being powered up. If Modbus is the selected control mode the valve will be commanded to this position after the startup period.

A.2.15 Analog Input Initialized

The analog input has been detected as having a control signal within the expected range of 3-20mA. If the analog input is the selected control signal then this will activate the valve after the startup period.

A.2.16 Start Delay Active

This is a flag set during the startup phase of operation, if this is set then the valve may be recalibrated by sending the calibration signal sequence (100% demand followed by 0%). It is cleared to indicate normal operation (recalibration will then require a command to Modbus register 40003).

A.3 Register Description

A.3.1 40001 Position Demand – Proportional [Read & Write]

Register: 40001, Address 0x0000 (0).
Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.
Description: This is a value between 0 and 100% to demand a valve position. This register will only be used by the system if the control source (set by register 40035) is set for Modbus RTU control. If the control type (set by register 40034) is On/Off then value will be resolved with a boolean set operation for a Open/Closed position demand variable output (e.g. Values 0-49 = '0' and 50-100 = '100'). This variable needs to be set to 100% then 0% after a power-up to calibrate an un-calibrated system.

A.3.2 40002 Reset Diagnostics [Read & Write]

Register: 40002, Address 0x0001 (1).
Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.
Description: This is a modbus request to reset the system from a fault state (indicated if the Diagnostics flags register has any set faults). Writing a decimal 1 to the register will start a reset process only if the system has a fault, otherwise the write will be ignored. Once the fault reset request has been acknowledged the register will be set to decimal 0. Bit assignments are shown in table 9.

A.3.3 40003 Recalibrate Demand [Read & Write]

Register: 40003, Address 0x0002 (2).
Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.
Description: Writing a value of 1 to this register will force the system to clear any calibration information and go through a cycle of calibration.

A.3.4 40004 Analog Cal at 0% [Read & Write]

Register: 40004, Address 0x0003 (3).
Function code: 0x10 – Write Multiple registers,

Description: 0x06 – Write Single register, or
0x03 – Read Holding registers.
This is a register is used to initiate a calibration of the analog to digital circuit in the system. A write of a '1' will cause the system to store the value at the analog input. This action should be performed with a calibrated 1V or 4mA present at the analog input. If this is not performed the system uses defaults. Values outside the range 0-1 will return an exception code.

A.3.5 40005 Analog Cal at 100% [Read & Write]

Register: 40005, Address 0x0004 (4).
Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.
Description: This is a register is used to initiate a calibration of the analog to digital circuit in the system. A write of a '1' will cause the system to store the value at the analog input. This action should be performed with a calibrated 5V or 20mA present at the analog input. If this is not performed the system uses defaults. Values outside the range 0-1 will return an exception code.

A.3.6 40004-40008 Reserved [Read Only]

Register: 40004-40008 Address 0x0003 (3) - 0x0007 (7).
Function code: 0x03 – Read Holding registers.
Description: Not used – reads will return a value of 0.

A.3.7 40009 Test Register [Read Only]

Register: 40009, Address 0x0008 (8).
Function code: 0x03 – Read Holding registers.
Description: A test register – can be used to confirm communications. Holds a power up default of 45964 (0xB38C Hex).

A.3.8 40010 Actual Position [Read Only]

Register: 40010, Address 0x0009 (9).
Function code: 0x03 – Read Holding registers.
Description: This is a value between 0 and 100% that indicates the physical position of a calibrated valve system. If the valve is un-calibrated (indicated if the Diagnostics flags register has a cleared calibration informational flag), then this register will read 0.

A.3.9 40011 Actual Demand [Read Only]

Register: 40011, Address 0x000A (10).
Function code: 0x03 – Read Holding registers.
Description: This is a value between 0 and 100% that indicates the demand to the position control loop from the active control source.

A.3.10 40012 Diagnostic Flags [Read Only]

Register: 40012, Address 0x000B (11).
Function code: 0x03 – Read Holding registers.
Description: This is a set of 16 bit flags that indicate the state of the system. The lower order byte contains flags that cause the system to go to a fault state – actuation of the valve will not be possible

until the cause of the fault condition has been removed and the fault condition reset by writing a reset request to register 40001. The upper order byte contains flags used to indicate the operational status of the valve actuator. See table 9 - Fault Register for details.

A.3.11 40013-40014 Number of Open/Close Cycles [Read Only]

Register: 40013-40014, Address 0x000C (12) – 0x000D (13).
Function code: 0x03 – Read Holding registers.
Description: This is a pair of registers that hold a 32bit number indicating the number of actuations of the valve. A cycle of moving the valve from closed to open and back closed will count as 2 cycles. The register needs to be read using a single read function command to ensure coherency of the data in the two registers.

A.3.12 40015-40016 Hours/Minutes Running [Read Only]

Register: 40015-40016, Address 0x000E (14) – 0x000F (15).
Function code: 0x03 – Read Holding registers.
Description: This is a pair of registers that hold a 32bit number indicating the number of hours the valve has been powered. The register needs to be read using a single read function command to ensure coherency of the data in the two registers. If version 4.13 firmware is installed, hours are displayed. If version 4.21 firmware is installed, minutes are displayed.

A.3.13 40017-40018 Hours/Minutes Open [Read Only]

Register: 40017-40018, Address 0x0010 (16) – 0x0011 (17).
Function code: 0x03 – Read Holding registers.
Description: This is a pair of registers that hold a 32bit number indicating the number of hours the valve has been in the open (100%) position. The register needs to be read using a single read function command to ensure coherency of the data in the two registers. If version 4.13 firmware is installed, hours are displayed. If version 4.21 firmware is installed, minutes are displayed.

A.3.14 40019-40020 Hours/Minutes Closed [Read Only]

Register: 40019-40020, Address 0x0012 (18) – 0x0013 (19).
Function code: 0x03 – Read Holding registers.
Description: This is a pair of registers that hold a 32bit number indicating the number of hours the valve has been in the closed (0%) position. The register needs to be read using a single read function command to ensure coherency of the data in the two registers. If version 4.13 firmware is installed, hours are displayed. If version 4.21 firmware is installed, minutes are displayed.

A.3.15 40021-40022 Number of Power up cycles [Read Only]

Register: 40021-40022, Address 0x0014 (20) – 0x0015 (21).
Function code: 0x03 – Read Holding registers.
Description: This is a pair of registers that hold a 32bit number of times the system has been successfully powered up. The register needs to be read using a single read function command to ensure coherency of the data in the two registers.

A.3.16 40023-40024 Serial Number [Read Only]

Register: 40023-40024, Address 0x0016-0x0017 (22-23).
Function code: 0x03 – Read Holding registers.

Description: This is a pair of registers that hold a 32 bit number that can be used to hold a unique serial number. The register needs to be read using a single read Modbus function transaction command to ensure coherency of the data in the two registers.

A.3.17 40025 Analog I/P value [Read Only]

Register: 40025, Address 0x0018 (24).
Function code: 0x03 – Read Holding registers.
Description: This is a register that holds a 16 bit scaled representation of the analog input. It is scaled according to input i.e. 0-200 for 0-20.0mA and 0-50 for 1-5 V.

A.3.18 40026 Firmware Project Code [Read Only]

Register: 40026, Address 0x0019 (25).
Function code: 0x03 – Read Holding registers.
Description: This is a register that holds the SRD project code (SRD422) – 422. This is the code used in version control of SRD documents and source code.

A.3.19 40027 Firmware Document Reference [Read Only]

Register: 40027, Address 0x001A (26).
Function code: 0x03 – Read Holding registers.
Description: This is a register that holds the SRD document code (SRD422-5007) – 5007. This code along with the project code is used in version control of SRD documents and source code.

A.3.20 40028 Firmware Version [Read Only]

Register: 40028, Address 0x001B (27).
Function code: 0x03 – Read Holding registers.
Description: This is a register that holds the hex encoded equivalent of a four digit decimal version number of the firmware, the high order 8bits encode the whole number of the version and the low order 8 bits the fraction, e.g. v1.16 would be encoded 0x0110, v2.66 would be 0x0242. Together with the data from registers 40026- 40028 it is possible to determine the unique identity of the code being run in the processor.

A.3.21 40029 Diagnostic Flags [Read Only]

Register: 40029, Address 0x001C (28).
Function code: 0x03 – Read Holding registers.
Description: This is a set of 16 bit flags that show the accumulation of fault flags that have occurred – as faults are self resetting. The register is stored in non-volatile memory. The mapping is the same as the diagnostic register at 40012. See table 9 - Fault Register for guide to values.

A.3.22 40030-40031 Reserved [Read Only]

Register: 40030-40031, Address 0x001D-0x001E (29-30).
Function code: 0x03 – Read Holding registers.
Description: Not used – reads will return a value of 0.

A.3.23 40032 Valve Type [Read & Write]

Register: 40032, Address 0x001F (31).
Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.
Description: This is a register that holds an enumeration of the three types of valve. This is used to set up several internal variables and constants. Writes outside of the legal range 0-2 will be rejected with an exception code.

A.3.24 40033 Control Type [Read Only]

Register: 40033, Address 0x0020 (32).
Function code: 0x03 – Read Holding registers.
Description: This is a register that holds an enumeration of the control type – either 0 for On/Off, or 1 for proportional control.

A.3.25 40034 Control Source [Read & Write]

Register: 40034, Address 0x0021 (33).
Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.
Description: This is a register that holds an enumeration of the control source – either 0 for Modbus RTU control, or 1 for signals local to the system – decided by the contents of register 40032. Note that if the Modbus serial link is not the active mode then the faults associated with serial communications will be disabled, although serial communications for such activities as test and debug monitoring of the analog input will all still function. Writes outside of the legal range 0-1 will be rejected with an exception code.

A.3.26 40035 Loss of Control Default Position [Read & Write]

Register: 40035, Address 0x0022 (34).
Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.
Description: This is a register that holds a position demand 0-100% that will be applied to the position control loop if the active control source is determined to be corrupt or out of normal operating specification, this applies to modbus communications messages being absent or the analog input being un-calibrated or below 3mA/0.75V(open control loop). Writes outside of the legal range 0-100 will be rejected with an exception code.

A.3.27 40036 Deadband [Read & Write]

Register: 40036, Address 0x0023 (35).
Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.
Description: This is a register that holds an integer value of percentage hysteresis used to discriminate against noise entering the control system from the selected control source, this can take a value of 0-100%, e.g. a value of 100 would make the system only respond to 0 or 100% demands. Writes outside of the legal range 0-100 will be rejected with an exception code.

A.3.28 40037 Low travel Cutoff [Read & Write]

Register: 40037, Address 0x0024 (36).
 Function code: 0x10 – Write Multiple registers, 0x06 – Write Single register, or 0x03 – Read Holding registers.
 Description: This is a register that holds an integer value of percentage used as a clamp – any position demand less than this value will be clamped to zero before being passed to the position control system.

A.3.29 40038 Communications Timeout [Read & Write]

Register: 40038, Address 0x0025 (37).
 Function code: 0x10 – Write Multiple registers, 0x06 – Write Single register, or 0x03 – Read Holding registers.
 Description: This is a register that holds a value 0-65535 that is the number of seconds for a timeout before the modbus serial communications channel is determined to be uncommunicative (0 - ~18Hrs). A valid addressed message must be received by the system within this time limit if the active control source is Modbus RTU communications. If the time without communications is exceeded the system will fault and the valve commanded to the default loss of communications position. A value of 0 can be used to disable this feature. If communications is resumed then the flag will be cleared and the valve will take the refreshed position as a demand. The use of this register is shown in table 9 - Fault Register.

A.3.30 40039 Communications Address [Read & Write]

Register: 40039, Address 0x0026 (38).
 Function code: 0x10 – Write Multiple registers, 0x06 – Write Single register, or 0x03 – Read Holding registers.
 Description: This is a register that holds a value 1-247 that is the Modbus address used by the system on power up. Values outside the range 1-247 will return an exception code

A.3.31 40040 Communications Baudrate [Read & Write]

Register: 40040, Address 0x0027 (39).
 Function code: 0x10 – Write Multiple registers, 0x06 – Write Single register, or 0x03 – Read Holding registers.
 Description: This is a register that holds a value 4-6 that is an enumeration of the baudrate used by the system on power up.

A.3.32 40041 Parity [Read & Write]

Register: 40041, Address 0x0028 (40).
 Function code: 0x10 – Write Multiple registers, 0x06 – Write Single register, or 0x03 – Read Holding registers.
 Description: This is a register that holds an enumeration of the parity type used by the Modbus serial interface – either 0 for Odd, or 1 for Even in version 4.13 firmware (version 4.21 firmware defines 0=Odd, 1=Even, 2=None). Writes outside of the legal range will be rejected with an exception code.

A.3.33 40042 Reset Statistics [Read & Write]

Register: 40042, Address 0x0029 (41).

Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.

Description: This is a register used to reset the non volatile system statistics (such as number of hours run). Writing a value of 1 to these registers will reset the values that accessed in registers 40013-40022 to 0.

A.3.34 40043 Analog Input Mode [Read & Write]

Register: 40043, Address 0x002A (42).

Function code: 0x10 – Write Multiple registers,
0x06 – Write Single register, or
0x03 – Read Holding registers.

Description: This is a register that holds an enumeration 0-1 that sets the mode of operation for on/off and proportional control. When in proportional mode (40033 = 1), a value of 0 sets the unit for using a 1-5V voltage input. 1 sets up the unit for using a 4-20 mA current command input. The scaling of the different modes is reflected in the scaling of the value reported in register at 40023 – ‘Analog I/P value’. When in on/off mode (40033 = 0), a value of 0 sets the unit for using both digital inputs, optimized for using the L2e level controller. 1 sets up the unit for using a single digital input. See Operation for further details.

A.4 Example Modbus Protocol Transactions

A.4.1 Write to Position Demand Register (40002/0x0001/1)

Write of a position demand value of 100% to device at address 1 on the Modbus network – 8 characters.

FIELD	SLAVE ADDRESS	FUNCTION CODE	REGISTER ADDRESS HI	REGISTER ADDRESS LO	REGISTER DATA HI	REGISTER DATA LO	CRC LO	CRC HI
Index	0	1	2	3	4	5	6	7
Hex (Dec)	0x01 (1)	0x06 (6)	0x00 (0)	0x01 (1)	0x00 (0)	0x64 (100)	0xD9 (217)	0xE1 (225)

Normal response, 8 characters:

FIELD	SLAVE ADDRESS	FUNCTION CODE	REGISTER ADDRESS HI	REGISTER ADDRESS LO	REGISTER DATA HI	REGISTER DATA LO	CRC LO	CRC HI
Index	0	1	2	3	4	5	6	7
Hex (Dec)	0x01 (1)	0x06 (6)	0x00 (0)	0x01 (1)	0x00 (0)	0x64 (100)	0xD9 (217)	0xE1 (225)

Write of a position demand value of 101% to device at address 1 on the Modbus network, note that this value (101% is outside the legal range of values permitted to be written to this address, so an exception frame is generated – 8 characters.

FIELD	SLAVE ADDRESS	FUNCTION CODE	REGISTER ADDRESS HI	REGISTER ADDRESS LO	REGISTER DATA HI	REGISTER DATA LO	CRC LO	CRC HI
Index	0	1	2	3	4	5	6	7
Hex (Dec)	0x01 (1)	0x06 (6)	0x00 (0)	0x01 (1)	0x00 (0)	0x65 (101)	0x18 (24)	0x21 (33)

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual provides installation, maintenance and parts information for the Fisher D4 control valve with Gen 2 easy-Drive electric actuator. For Gen 1 electric actuators, use Fisher D4 with easy-Drive Instruction Manual, (D103597X012). If the actuator has a RPU-100 installed, refer to easy-Drive RPU-100 Instruction Manual, (D104551X012).

WARNING

Do not install, operate, or maintain a D4 control valve with Gen 2 easy-Drive electric actuator without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Port Diameters	Enclosure Rating
See Table 2.	Type 4X and IP66
Valve Plug Travel	Duty Cycle
19 mm / 0.75 in.	50% maximum
Valve Plug Style	Enclosure Material
Micro-Form valve plug	Cast aluminum alloy with powder coat paint
Available Actuator Configurations	Approximate Weight:
On/off (snap acting) Positioning (flow or pressure control)	22 to 51 kg / 49 to 113 lbs, depending upon construction
1. The pressure or temperature limits in the referenced tables and any applicable ASME code limitations should not be exceeded. 2. 10% variation can be expected, based on temperature and pressure of application.	

1.2 Description

The D4 control valve with easy-Drive electric actuator is a compact, rugged valve designed primarily for high-pressure throttling applications. This valve is ideal for use on pressure and flow control applications within the oil and gas production industry. The D4 valve also makes an excellent dump valve for high-pressure separators and scrubbers.

The D4 control valve meets the metallurgical requirements of NACE MR0175/ISO 15156 without environmental limits for temperatures below 135°C / 275°F. If the temperature is above 135°C / 275°F, the N07718 Belleville washers will impose some limits, as shown in Table 3.

1.3 Specifications

Table 1 lists specifications for the D4 control valve with easy-Drive electric actuator. Some of the specifications for a given control valve as it originally comes from the factory are stamped on a nameplate located on the lower actuator enclosure.

1.4 Education Services

For information on available courses for the Fisher D4 control valve with easy-Drive electric actuator, as well as a variety of other products, contact:

Emerson Educational Services

Phone: 800-338-8158

31.8	1.25	34	495

1. Downstream pressure, P₂, is limited to 2250 psig.

Section 2: Installation

WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage caused by bursting of pressure-retaining parts or by uncontrolled process fluid, be certain the service conditions do not exceed the limits shown on the valve nameplate and in Table 1. Use pressure-relieving devices required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

For explosion-proof applications, ensure the actuator cover is properly bolted before applying power to the actuator. Personal injury or property damage may result from fire or explosion if power is applied to the actuator with the cover removed in a hazardous area.

For explosion-proof applications, install rigid metal conduit and a conduit seal no more than 457 mm / 18 in. from the actuator. Personal injury or property damage may result from explosion if the seal is not installed.

Select wiring and/or cable glands that are rated for the environment of use (such as hazardous area, ingress protection and temperature). Failure to use properly rated wiring and/or cable glands can result in personal injury or property damage from fire or explosion.

Wiring connections must be in accordance with local, regional and national codes for any given hazardous area approval. Failure to follow the local, regional and national codes could result in personal injury or property damage from fire or explosion.

⚠ WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

NOTICE

To avoid product damage, inspect the valve before installation for any damage or any foreign material that may have collected in the valve body. Also remove any pipe scale, welding slag or other foreign material from the pipeline.

⚠ WARNING

Avoid personal injury or property damage caused by possible actuator failure. The use of a rigidly-mounted support on the actuator casing may cause additional stress on the actuator leading to premature wear and/or failure of the actuator components.

1. Before installing the control valve assembly, inspect it for any damage and for any foreign material that may have collected in the valve body.
2. Remove any pipe scale, welding slag and other foreign material from the pipeline.
3. The control valve can be installed in any position, but normally the actuator is vertical above the valve. Install the valve so the flow direction arrow on the side of the valve indicates the direction of the process flow.
4. Install the valve following local and national piping codes when they apply to the application. For screwed connections, treat the external pipe threads with a good grade pipe compound. For flanged valves, use suitable gaskets between valve and pipeline flanges.
5. If continuous operation is required during maintenance and inspection, install a conventional three-valve bypass around the valve.

2.1 Special Instructions for “Safe Use” and Installations in Hazardous Locations

ATEX/IECEx

WARNING

To avoid static discharge from the enclosure, do not rub or clean the enclosure with solvents. To do so could result in an explosion. Clean with a mild detergent and water only.

The enclosure is non-conducting and may generate an ignition-capable level of electrostatic charges under certain extreme conditions. The user should ensure that the equipment is not installed in a location where it may be subjected to external conditions (such as highpressure steam) which might cause a build-up of electrostatic charges on non-conducting surfaces. Additionally, cleaning of the equipment shall only be done with a damp cloth.

NOTICE

To avoid damage to the enclosure, when screws are fully tightened into blind holes in enclosure walls, with no washer fitted, at least one full thread shall remain free at the base of the hole.

2.2 Startup Overview

Figure 2. Flowchart

Figure 3. Fisher D4 Valve with Gen 2 easy-Drive Actuator Wiring Diagram

GE47302-7

Power Requirements

Ensure a stable DC power source is available, maintaining less than 5% ripple and sufficiently surge protected for the application. A 4 amp (minimum) power supply is required.

Wiring Instructions

1. Observe local wiring requirements for hazardous location usage.
2. Conduit seals within 450 mm / 18 in. of the enclosure port are required for explosion-proof installation.
3. 18 AWG / 0.52 mm² to 12 AWG / 3.31 mm² wire size required.
4. Fuse system to 5 A.
5. Connect enclosure and analog signal shields.
6. Ensure power is turned off before connecting the wires.

Power

1. Connect 12 or 24 V DC reference to: –
2. Connect 12 or 24 V DC positive to: +
3. Be sure to tighten terminals sufficiently to ensure solid mechanical connection.

Figure 4. Wiring - Analog Input

Figure 5. Wiring - L2e

Figure 6. Wiring - Single Dry Contact

Figure 7. Wiring - Modbus Input

Figure 8. Wiring - Auxiliary Digital I/O Set to Input (40080=0)

Figure 9. Wiring - Auxiliary Digital I/O Set to Output (40080=1)

2.3 Default Input Signals

The D4 with easy-Drive comes from the factory calibrated and ready for use with the following default input signals shown in Table 5.

Table 5. D4 easy-Drive Default Input Signals

CONFIGURATION	ON/OFF	POSITIONING
Input Signal	L2e (dual dry contact)	4 to 20 mA

If the input signal of the application matches Table 5, proceed to the Wiring Instructions section. If the input signal of the application does not match Table 5, proceed to the Configuration section.

2.4 Configuration

Input Configuration

There are two functional configurations available for the easy-Drive electric actuator: On/Off and Positioning. It is possible to change an actuator from On/Off to Positioning after it has been delivered from the factory using a positioning license key. See Licensing section.

All available input signals are shown in Table 6.

Table 6. All Available Input Signals

CONFIGURATION	ON/OFF			POSITIONING	
Control Source	Modbus	Local		Modbus	Local
Input Signal	Modbus	L2e Dual Dry Contact (default)	Single Dry Contact	Modbus	4 to 20 mA (default)

If you are using the default inputs signals and the valve has not been disassembled or adjusted in any way, there is no need to recalibrate the assembly. You can proceed directly to Startup (page 21).

Changing the Inputs from Default Settings

All configuration within the valve is done by setting values in Modbus registers. This can be done using any Modbus master (flow computer, PLC, PC). Configuration software, providing a visual interface to the registers, is available through your [Emerson sales office](#) or the Fisher website, at www.emerson.com/en-us/catalog/fisher-easy-drive.

2.5 Modbus setup

Use of a serial or USB to RS-485 device is required to connect to the actuator. Refer to manufacturer's requirements for installation. The D4 with easy-Drive electric actuator Modbus factory defaults are Address 1, 9600 baud, even parity, 1 stop bit, MSB.

When a connection has been achieved, the actuator may be configured to accept the input signal over the Modbus link (ignoring the physical inputs) and the Modbus settings may be changed to accommodate the network to which it is attached. Other changes to functionality are possible, such as:

- Low level cutoff: 40054 (default is 5%)
- Position upon loss of signal: 40053 (default is 0%)

See Appendix A for a full map of Modbus registers and their functions.

Figure 10. Fisher easy-Drive Configuration Software

Connecting Using the Fisher easy-Drive Configuration Software

The Fisher easy-Drive configuration software allows configuration and diagnosing of the Fisher easy-Drive electric actuator with a graphical interface. Connect a PC to the actuator using a USB or serial device to Modbus RTU converter using the wiring instructions. The USB or serial device will be visible in the drop menu under Serial Port Settings. Baud rate and parity should be set to the Modbus settings of the actuator. Default actuator settings are address 1, 9600 baud, even parity, 1 stop bit, MSB. Press the AUTO button in the upper left corner to connect to the valve.

Use the Fisher easy-Drive configuration software (Figure 10) to make the desired changes or register values may be changed to allow different functionality.

NOTE

If an actuator is on/off, a Modbus command of 0 to 499 in register 40001 will cause the valve to close fully, while a value of 500 to 1000 will cause the valve to open fully. The command register has one implied decimal point.

Initial Setup

The control method selection determines what control signal to which the valve will respond. Only the control signal selected will result in movement of the valve; all others will be ignored. The control methods available are dependent upon the licensing tier purchased with the valve. The functions for each tier are shown below.

- On/Off Tier
 - Dual Contact On/Off
 - Single Contact On/Off
 - Modbus On/Off
- Positioning Tier - License required (see Licensing section)
 - Dual Contact On/Off
 - Single Contact On/Off
 - Modbus On/Off
 - Modbus Positioning
 - 4 to 20 mA Positioning
 - 4 to 20 mA Level

When using the easy-Drive Configuration Tool, clicking on the "Control Method" box will create a drop menu as shown. Select the desired control source; the selection will turn yellow. A box with Pending Changes will appear showing all changers. Press "APPLY" and the valve will immediately respond to that signal only.

Figure 11. Initial Setup

Calibration Instructions

WARNING

To avoid personal injury or property damage, be aware that the valve will open fully and then close fully during the calibration cycle.

If an easy-Drive valve has been shipped from the Fisher factory, it is not necessary to perform a span calibration. If, however, the valve has a new controller board or maintenance has been performed on the valve, such as trim replacement, it will be necessary to perform a span calibration. A span calibration is accomplished by the following method:

1. Ensure the process and valve are in a safe state – the valve may move during this operation.
2. Press the CALIBRATE SPAN button to initiate the span calibration. The software will show a progress bar during the calibration and display Valve Span Calibrated when complete.

Analog Input Calibration

For valves using 4 to 20 mA as a control source, several options are available to customize control of the actuator. Use a 4 to 20 mA signal generator to provide the desired signal. It is possible to calibrate the 4 to 20 mA signal in reverse acting or split-ranging with the method below with at least 4 mA of signal difference between the close and open values. The example shows a valve being changed from normal to reverse acting during the calibration process.

1. With the Control Method set to 4 to 20mA Positioning or 4 to 20mA Level, enter the Calibration screen and the 4 to 20mA Signal Calibration window will be visible.
2. Click the CALIBRATE CLOSE & OPEN VALUES button. A separate window will open to guide through the process.
3. Set the 4 to 20 mA signal to the desired value for when the valve is to be closed.
4. Enter this value into the Calibrated mA Signal text box and press Next.

Figure 12. Analog Input Calibration

5. Set the 4 to 20 mA signal to the desired value for when the valve is to be open.
6. Enter this value into the Calibrated mA Signal text box and press Next.

Figure 13. Analog Input Calibration

The screenshot displays the 'CALIBRATION' tab with a 'PREFERENCES' button. The main area is titled '4-20mA Signal Calibration' and contains a 'CALIBRATE CLOSE & OPEN VALUES' button. Below this, 'Present mA Settings' are shown: 'Close Value' at 4.0mA and 'Open Value' at 20.0mA. A modal window titled 'Step 2: 4-20mA Open Value' is open, prompting the user to 'Enter the opened mA value:'. It shows 'Valve mA Signal' as 3.99 mA and 'Commanded mA Signal' as 4 mA. The modal has 'Cancel' and 'NEXT' buttons.

7. If the Close and Open values are as expected, press Confirm to accept these values. If not, press Cancel to restart the process.

NOTE

The value of the 4 to 20 mA signal must have at least 4 mA difference between the close and open signals. A differential less than that amount will cause the actuator to reject the calibration and use the previous values.

Should the entered values vary more than 10% from the expected 4 to 20 mA values; the actuator will accept the calibration and a Notification displaying "Questionable Analog Calibration" will result.

Figure 14. Analog Input Calibration

The screenshot shows the 'Notifications' tab with a 'Statistics' button. Under the 'Alerts' section, there is a notification titled 'Questionable Analog Calibration' with a yellow warning icon. Below the notification is a 'CLEAR ...' button.

Calibration with the use of Modbus

1. After the unit has been properly wired and fused per instructions in the Wiring section of this instruction manual, turn power to the unit on.
2. Calibrate using Modbus:
 - a. Send position command of 0% to actuator to prevent unexpected motion. Valve will move to commanded position following the calibration procedure.
 - b. Send a value of 1 to register 40043. Valve plug will move to fully open position and then to fully closed. The valve plug will then return to the commanded position.

If a Modbus connection is not available and recalibration is desired, use the appropriate calibration method as determined by the control method of your valve.

Calibration without the use of Modbus

3. Turn power to the actuator off.
4. Wait for 10 seconds to ensure all circuits have discharged.
5. Return power to the actuator and use the appropriate calibration method for your control signal. Calibration sequence must be done within 15 seconds of power being switched on.
6. For positioning operation using 4 to 20 mA:
 - a. Apply a 4 mA signal between pins 4 to 20 mA - and 4 to 20 mA +. If Span is currently uncalibrated, valve plug will not move at this time.
 - b. Apply a 20 mA signal between pins 4 to 20 mA - and 4 to 20 mA +. If Span is currently uncalibrated, valve plug will not move at this time.
 - c. Apply a 4 mA signal between pins 4 to 20 mA - and 4 to 20 mA +; valve plug will move to the upper stop, immediately followed by moving to the lower, closed position.
 - d. If calibration of the analog input is desired to improve positional accuracy, an optional operation is listed on page 16 titled Analog Input Calibration.
7. For On/Off operation using dual-input dry contact:
 - a. Close the contact to create a short between pins COMMON and CLOSE. If Span is currently uncalibrated, valve plug will not move at this time.
 - b. Close the contact to create a short between pins COMMON and OPEN. If Span is currently uncalibrated, valve plug will not move at this time.
 - c. Close the contact to create a short between pins COMMON and CLOSE; valve plug will move to the upper, open position and then to the lower, closed position.
6. For On/Off operation using single dry contact:
 - a. Open the contact to create an open circuit between pins COMMON and OPEN. If Span is currently uncalibrated, valve plug will not move at this time.
 - b. Close the contact to create a short between pins COMMON and OPEN. If Span is currently uncalibrated, valve plug will not move at this time.

- c. Open the contact to create an open circuit between pins COMMON and OPEN; valve plug will move to the upper, open position and then to the lower, closed position.
7. The unit is now calibrated.

Licensing

The Gen 2 easy-Drive actuator has two differing modes of operation: On/Off and Positioning. The On/Off mode is intended for snap-acting applications where the valve is either fully open or fully closed. In this mode, the valve plug cannot remain at any intermediate position; it will move to a fully closed or fully open position only. For applications that require the actuator to control over the full range of motion, it is necessary to have a Positioning license installed. A positioning license will allow access to 4 to 20 mA positioning, 4 to 20 mA level control and Modbus positioning.

Positioning licenses can be purchased with the actuator and installed at the factory or can be installed at a later date by use of a license key on a USB license dongle. Installation of the license can be completed using the configuration software.

1. Insert the USB license dongle into the computer connected to the Gen 2 easy-Drive actuator.

Figure 15. USB License Dongle

2. Click the button labelled MANAGE LICENSES on the left side of the configuration software screen.

Figure 16. Configuration Software Screen

- The license control screen will open, showing all licenses installed on the USB and the actuator.

Figure 17. License Control Screen

- After verifying the presence of the desired license on the USB license dongle, click the button labelled 'easy-Drive' under Move To and the license will be transferred to the valve as shown below.

Figure 18. Licensing

- It is also possible to transfer licenses from one USB license dongle to another. Place two dongles into the computer with the configuration software. Type in the number of licenses to move and click USB 2 to move the licenses.

Startup

WARNING

To avoid personal injury or property damage, be aware that the valve will move and respond to an input signal during startup.

1. Before turning on power to the unit, be sure that a closed signal is being commanded to the unit.
 - DryContact: contact is open.
 - L2e (Dual Dry Contact): Contact closed across pins COMMON and CLOSE.
 - Analog Input: signal = 4 mA.
 - Modbus: position demand = 0.
2. Turn on power to the unit.
3. Apply a change in position demand to ensure unit responds properly.
 - DryContact:
 - Closed contact between pins COMMON and OPEN will open the valve.
 - Dual contact / L2e only: Closed contact between pins COMMON and OPEN will open the valve. Closed contact between pins COMMON and CLOSE will close the valve.
 - Analog Input: valve will respond to proportional demand.
 - Modbus: valve will respond to positional demand in register 40001. 0 = fully closed and 1000 = fully open.
4. If the valve does not respond as expected, proceed to Troubleshooting guide on page 22.
5. Check conduit ports.
 - Conduit seal must be in place within 450 mm / 18 in. of the enclosure.
 - Unused conduit ports must be sealed with an explosion-proof port plug.
6. Replace the cover and tighten all 8 bolts to 20 N•m / 15 ft•lbs.

Section 3: Troubleshooting

1. Unit does not move.
 - a. Verify that 12 V DC to 24 V DC is present on the power terminals as shown on the cover. Green heartbeat LED will pulse near Modbus terminals when power is present.
 - b. Verify that all wires are firmly attached on both ends.
 - c. Verify that wires are connected to the correct terminals - see Wiring in the manual.
 - d. Verify mode of operation (on/off or positioning) matches control signal.
 - e. Verify mode of control (local or Modbus) matches control signal.
2. Unit does not respond to 4 to 20 mA signal
 - a. Verify that 12 V DC to 24 V DC is present on the power terminals as shown on the cover.
 - b. Verify that the 4 to 20 mA signal is wired correctly and that the terminals are firmly on the wires.
 - c. Verify mode of operation matches control signal (local control: 40067=0, positioning: 40065=1).
 - d. Check the value of the analog input in register 40026 to determine if it is 0 or greater.
 - i. If register 40026 shows 0, the 4 to 20 mA may be wired backwards. Swap wire and attempt again.
3. Diagnostics show a Motor Stall - Travel Deviation Fault.
 - a. The easy-Drive electric actuator is designed to operate in a manner consistent with a pneumatic actuator. This means that if the valve plug cannot move to its commanded position, the actuator will stop, without damage and issue a Motor Stall - Travel Deviation Fault warning. When the command signal changes outside of the deadband (Modbus register 40036), it will attempt to move again. Recalibrate the actuator span per instructions in the Startup section of this manual.

Section 4: Maintenance

Refer to Figure 22.

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and maintenance depends on the severity of the service conditions.

WARNING

Avoid personal injury from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

WARNING

For explosion-proof applications, ensure the actuator cover is properly bolted before applying power to the actuator. Personal injury or property damage may result from fire or explosion if power is applied to the actuator with the cover removed in a hazardous area.

Do not remove the actuator cover for 10 minutes after power is disconnected if the UPS option is installed.

For explosion-proof applications, install rigid metal conduit and a conduit seal no more than 457 mm / 18 in. from the actuator. Personal injury or property damage may result from explosion if the seal is not installed.

Select wiring and/or cable glands that are rated for the environment of use (such as hazardous area, ingress protection and temperature). Failure to use properly rated wiring and/or cable glands can result in personal injury or property damage from fire or explosion.

Wiring connections must be in accordance with local, regional and national codes for any given hazardous area approval. Failure to follow the local, regional and national codes could result in personal injury or property damage from fire or explosion.

4.1 Valve Plug and Seat Ring

Disassembly

Key Numbers are referenced in Figures 21 and 22.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body (key 1) and drain the process media from both sides of the valve.

NOTICE

The following steps are intended to prevent damage to the valve plug (key 3) and seat ring (key 2) during the removal of the bonnet and actuator.

2. For Positioning Actuators

- Command the valve to anywhere between 10% and 20% travel.
- Isolate power and signal.
- Proceed to step 3.

For ON/OFF Actuators

- Command the valve to open or close and cut the power when the valve is at mid-stroke.
- Isolate power and signal.
- Proceed to step 3.

3. Break the hammer nut (key 6) loose with a hammer. Continue turning the hammer nut by using a hammer or a large adjustable wrench, tightened around one ear of the hammer nut. If the bonnet is stuck on the valve, continue to unscrew the hammer nut. The hammer nut will contact the spring pins (key 7) and will force the bonnet out of the valve. Carefully lift the actuator, bonnet and valve plug assembly from the valve body.

WARNING

The spring pins must always be in place during valve operation. They provide a safeguard against injury when the unit is being disassembled.

4. Use a socket wrench to loosen the seat ring (key 3).
5. Remove the seat ring (key 3) and seat ring gasket (key 9) from the valve body.
6. To replace the plug, the stem nut (key 42) must be removed to expose the groove pin (key 4). Open the explosion-proof enclosure (key 60), using a 13 mm wrench.
7. Remove the stem nut (key 42) using a 11/16 in. wrench; insert a punch in the hole in the stem to restrict rotation of the stem while removing the stem nut. The travel indicator (key 32) may need to be moved to expose the hole.

8. Push the stem downward just far enough to expose the groove pin (key 4) on the plug.
9. Remove the plug by driving out the groove pin and unscrewing the valve plug from the stem.

**WARNING**

Be careful to avoid damaging the seating surface on the valve plug or seat ring as damage in these areas will allow excessive leakage at shutoff. Avoid damaging the highly polished valve stem surface. A damaged valve stem could cut the packing and allow process fluid to leak to the atmosphere.

Table 7. Torque for Seat Ring (Key 3)

VALVE SIZE, NPS	RECOMMENDED TORQUE	
	N•m	Lbf•ft
1	407	300
2	698	515

Assembly

1. Make sure the bonnet O-ring (key 8) is on the bonnet and lubricated with lithium grease (key 49).
2. Install the plug (key 2) on the stem (key 47) and insert a new groove pin (key 4).
3. Push the plug and stem upward to ensure the threads on the top of the stem are exposed. Thread the stem nut (key 42) onto the top of the stem and tighten the stem nut (key 42) to 39 N•m / 29lbf•ft. Insert a punch in the hole in the stem to restrict rotation while tightening the stem nut.
4. Replace the top of the explosion-proof enclosure (key 60) and tighten cap screws (key 64) to 20 N•m / 15 lbf•ft.
5. Thoroughly clean the seat ring and bonnet threads in the valve body (key 1). Also clean the valve body seat ring gasket surfaces.
6. Apply anti-seize lubricant (key 54) to the threads of the seat ring (key 3) and its mating threads in the valve body.
7. Apply anti-seize lubricant (key 54) to the seat ring gasket (key 9) and install into the valve body.
8. Screw the seat ring into the valve body. Use a socket wrench to tighten the seat ring to the torque values shown in Table 7. Remove all excess lubricant after tightening.
9. Lubricate (key 54) the threads on the valve body and hammer nut and the contact surfaces of the bonnet and hammer nut flange. Install the bonnet and actuator assembly with pinned valve plug onto the valve body. Tighten the hammer nut using an adjustable wrench until the nut stops turning. A few hammer blows will be required to ensure the assembly is tight.

4.2 Valve Packing

WARNING

Observe the warning at the start of the Maintenance section.

The valve stem packing can only be accessed from within the valve body. If packing maintenance is required, first disassemble per steps 1, 2 and 6 or 7 in the Valve Plug and Seat Ring Disassembly section of this document.

NOTE

Packing installation and adjustment is critical to the long-term packing performance. Absolutely no deviations from this procedure are allowed.

To minimize friction and maximize sealing performance, a small amount of fluorinated grease (key 56) is placed between the packing rings.

Single Packing Arrangement

The packing components are to be installed as shown in the assembly drawing per the following procedure:

1. Install packing spacer (key 48) in the packing box.
2. Using a non-marring installation tool, such as a 12 in. length of 1/2 in. PVC pipe, push the first anti-extrusion washer (key 12) fully into the packing box by hand. Then, use the packing spacer (key 14) to fully seat the anti-extrusion washer by firmly tapping the packing spacer against the anti-extrusion washer with a hammer and the PVC pipe.
3. Using a needle point syringe filled with fluorinated grease, apply a continuous bead of approximately 3/16 in. diameter inside the V-groove of the female adaptor ring. See Figure 2. Take care to keep the lubricant confined to only the V-groove. Do not lubricate the other surfaces of the packing ring, the stem or the packing box.

NOTE

All D4 packing kits include a single use packet of high performance fluorinated grease. This is the only acceptable D4 packing lubricant.

4. Install the female adaptor ring using the packing spacer and PVC pipe to push the ring against the anti-extrusion washer. Apply only enough force to cause the female adaptor to make contact.
5. Using a needle point syringe filled with fluorinated grease, apply a continuous bead of approximately 3/16 in. diameter inside the V-groove of the white V-ring. See Figure 2. Take care to keep the lubricant confined to only the V-groove. Do not lubricate the other surfaces of the packing ring, the stem or the packing box.
6. Install the V-ring using the packing spacer and PVC pipe to push the V-ring against the female adaptor. Apply only enough force to cause the female adaptor to make contact.
7. Install the male adaptor.
8. Using the PVC pipe, push the second anti-extrusion washer (key 12) fully into the packing box by hand. Then, use the packing spacer (key 14) to fully seat the anti-extrusion washer by firmly tapping the packing spacer against the anti-extrusion washer with a hammer and the PVC pipe.
9. Install the packing spacer (key 14) and five Belleville springs (key 11). The Belleville springs (key 11) should be single stacked with the ID of the inner spring contacting the packing spacer (key 14) and the OD of the outer spring contacting the packing retainer (key 10). The final Belleville spring should be within the 1.26 in.-diameter bore of the bonnet.
10. Adjust the packing retainer by hand until it contacts the Belleville springs. Do not tighten by hand, simply install the packing retainer until it contacts the Belleville springs. Torque the packing retainer to 68 N•m / 50 lbf•ft.

Figure 19. Fisher D4 Packing Installation

Figure 20. Lubrication Locations on Packing

Double Packing Arrangement

The packing components are to be installed as shown in the assembly drawing per the following procedure:

1. Using a non-marring installation tool, such as a 12 in. length of 1/2 in. PVC pipe, push the first anti-extrusion washer (key 12) fully into the packing box by hand. Then, use the packing spacer (key 14) to fully seat the anti-extrusion washer by firmly tapping the packing spacer against the anti-extrusion washer with a hammer and the PVC pipe.
2. Using a needle point syringe filled with fluorinated grease, apply a continuous bead of approximately 3/16 in. diameter inside the V-groove of the female adaptor ring. See Figure 2. Take care to keep the lubricant confined to only the V-groove. Do not lubricate the other surfaces of the packing ring, the stem or the packing box.

NOTE

All D4 packing kits include a single use packet of high performance fluorinated grease. This is the only acceptable D4 packing lubricant.

3. Install the female adaptor ring using the packing spacer and PVC pipe to push the ring against the anti-extrusion washer. Apply only enough force to cause the female adaptor to make contact.

4. Using a needle point syringe filled with fluorinated grease, apply a continuous bead of approximately 3/16 in. diameter inside the V-groove of the white V-ring. See Figure 2. Take care to keep the lubricant confined to only the V-groove. Do not lubricate the other surfaces of the packing ring, the stem or the packing box.
5. Install the V-ring using the packing spacer and PVC pipe to push the V-ring against the female adaptor. Apply only enough force to cause the female adaptor to make contact.
6. Install the male adaptor.
7. Install the packing spacer (key 14).
8. Using a needle point syringe filled with fluorinated grease, apply a continuous bead of approximately 3/16 in. diameter inside the V-groove of the female adaptor ring. See Figure 2. Take care to keep the lubricant confined to only the V-groove. Do not lubricate the other surfaces of the packing ring, the stem or the packing box.
9. Install the female adaptor ring using the packing spacer and PVC pipe to push the ring against the anti-extrusion washer. Apply only enough force to cause the female adaptor to make contact.
10. Using a needle point syringe filled with fluorinated grease, apply a continuous bead of approximately 3/16 in. diameter inside the V-groove of the white V-ring. See Figure 2. Take care to keep the lubricant confined to only the V-groove. Do not lubricate the other surfaces of the packing ring, the stem or the packing box.
11. Install the V-ring using the packing spacer and PVC pipe to push the V-ring against the female adaptor. Apply only enough force to cause the female adaptor to make contact.
12. Install the male adaptor.
13. Using the PVC pipe, push the second anti-extrusion washer (key 12) fully into the packing box by hand. Then, use the packing spacer (key 14) to fully seat the anti-extrusion washer by firmly tapping the packing spacer against the anti-extrusion washer with a hammer and the PVC pipe.
14. Install the packing spacer (key 14) and six Belleville springs (key 11). The Belleville springs (key 11) should be double stacked with the ID of the inner spring contacting the packing spacer (key 14) and the OD of the outer spring contacting the packing retainer (key 10). The final Belleville spring should be within the 1.26 in.-diameter bore of the bonnet.
15. Adjust the packing retainer by hand until it contacts the Belleville springs. Torque the packing retainer to 54 N•m / 40 lbf•ft.

Section 5: Parts

5.1 Parts Ordering

Each D4 control valve is assigned a serial number, which can be found on the nameplate. Refer to the number when contacting your [Emerson sales office](#) for assistance or when ordering replacement parts.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

5.2 Parts Kits

Table 8. Actuator Parts Kits

Kit	Part Number
Board Replacement Kit (On/Off is default)	GE83055X012
Board Replacement Kit + Positioning License Dongle	GE83126X012
Motor/Gearbox Assembly	GK10613X012
Motor/Gearbox/Board Assembly (On/Off is default)	GK16046X012
Motor/Gearbox/Board Assembly + Positioning License Dongle	GK16047X012
Replacement Kit - Belleville Springs	GK15266X012
Replacement Kit - Drivetrain	GK15328X012
Positioning License Dongle (1 License)	GE83574X012
Positioning License Dongle (5 License)	GE83574X022

5.3 Repair Kits

NOTE

All repair kits are supplied with hydrogenated nitrile bonnet O-ring. FKM (fluorocarbon) bonnet O-ring must be ordered separately when required.

Table 9. Repair Kits

Description	Part Number
Packing Repair Kit Includes key numbers 4, 8, 12 (qty. 2), 13 and high performance fluorinated grease	RD4X0000012

5.4 Parts List

Appendix A: Modbus

A.1 Register Summary

Table A-1. Gen 2 easy-Drive Actuator Modbus Map

Type ⁽¹⁾	Name	MB Register	Default	R/W	Values	Notes
uint16	Modbus position command (100=10.0%)	40001	0	R/W	0 to 1000	Modbus command value with one implied decimal place (1000=100.0%). R/W at all times but only used in Modbus control mode. In on/off mode 0 to 499 will result in a move to 0% and 500 to 1000 will result in a move to 100%.
uint16	Digital output	40002	0	R/W	0, 1	0=no voltage supplied to terminals, 1=voltage supplied to terminals (Only used when output setup is set for Remote controlled)
uint16	Reset error codes	40003	0	R/W	0, 1	Value of 1 will clear faults. Will automatically set back to 0.
uint16	RESERVED	40004	---	---	---	---
uint16	RESERVED	40005	---	---	---	---
uint16	RESERVED	40006	---	---	---	---
uint16	RESERVED	40007	---	---	---	---
uint16	RESERVED	40008	---	---	---	---
uint16	RESERVED	40009	---	---	---	---
uint16	Actual position (100=10.0%)	40010	0	R	0 to 1000	Present position of the actuator relative to span with 1 implied decimal place (1000=100.0%). Valid for all control modes.
uint16	Commanded position (100=10.0%)	40011	0	R	0 to 1000	Present position command of the actuator relative to span (1000=100.0%). Valid for all control modes.
uint16	Diagnostic Flags	40012	0	R	0 to 65535	Bit flags - see chart
uint16	Digital status	40013	0	R	0 to 1	0=no connection between terminals, 1=connection between terminals (Status of digital input or output)
uint32	Total Running Time (min)	40014, 40015	0	R	4294967296	Total number of minutes the actuator has been powered on since time has been reset
uint32	Total Open Time (min)	40016, 40017	0	R	4294967296	Total number of minutes the actuator has been at 100% of travel since time has been reset
uint32	Total Closed Time (min)	40018, 40019	0	R	4294967296	Total number of minutes the actuator has been at 0% of travel since time has been reset

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

D4 Valve with Gen 2 easy-Drive Actuator

June 2026

Instruction Manual

D104188X012

Table A-1. Gen 2 easy-Drive Actuator Modbus Map (continued)

Type ⁽¹⁾	Name	MB Register	Default	R/W	Values	Notes
uint32	Number of Closed (Cycle count)	40020, 40021	0	R	4294967296	Total number of close cycles the actuator has performed since reset. One open/close cycle counts as 1.
uint32	Number of Power Cycles	40022, 40023	0	R	4294967296	Total number of times the actuator has been powered on.
uint32	Number of Movements	40024, 40025	0	R	4294967296	Total number of movements the actuator has performed. Move must be at least 5% of rated travel for cycle to increment.
uint16	Analog input control value	40026	0	R	0 to 2400	Value of the analog signal in mA with 2 implied decimals. In analog control mode, this is the command value and is subject to the analog settings in registers 40046 to 40059. Always active but a slower refresh rate when unit is not in analog control mode.
uint16	Incoming voltage	40027	0	R	0 to 350	Diagnostic register - value of incoming voltage with 1 implied decimal.
uint16	Latch Open State	40028	0	R	0 to 1	Normally open latch state
uint16	Latch Close State	40029	0	R	0 to 1	Normally closed latch state

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D104188X012

D4 Valve with Gen 2 easy-Drive Actuator

June 2026

Table A-1. Gen 2 easy-Drive Actuator Modbus Map (continued)

Type ⁽¹⁾	Name	MB Register	Default	R/W	Values	Notes
uint16	RESERVED	40046	---	---	---	---
uint16	RESERVED	40047	---	---	---	---
uint16	RESERVED	40048	---	---	---	---
uint16	RESERVED	40049	---	---	---	---
uint16	Loss of signal position (100=10.0%)	40050	0	R/W	0 to 1001	Position to which valve plug will be driven upon loss of signal. Loss of signal is based upon the active control mode. 0 to 1000=0-100.0% with 1 implied decimal point. In on/off mode 0 to 499 will result in movement to 0% while 500 to 1000 will result in movement to 100%. A value of 1001 in any control mode is the setting for "lock-in-last".
uint16	Modbus timeout (s)	40051	60	R/W	0 to 65535	Time without a valid Modbus message is seen (to any address) before "loss of signal" motion is engaged when in Modbus control mode. Only active in Modbus control mode. 0=disabled
uint16	Dual contact timeout (s)	40052	60	R/W	0 to 3600	Time without a digital signal being low (contact made) from either digital input as viewed by voltage level on the digital input terminals. If neither contact has been made (pulled input low) within the timeout period, the valve plug will be moved to the loss-of-signal position. Only active in the local, on-off, dual contact mode. 0=disabled.
uint16	Deadband (10=1.0%)	40053	5	R/W	0 to 250	Minimum percentage signal change to elicit a movement response based upon end position of last movement. For example, if the previous command resulted in the actuator moving to 31.2% of travel and deadband is set to 100 (10.0%), setpoint must command valve to 21.2% or 41.2% before valve will move to new position. Default is set to minimize signal dithering.
uint16	Low travel cutoff position (100=10.0%)	40054	50	R/W	0 to 999	Analog input command, in percent with one implied decimal (50=5.0%), below this value will result in the valve plug moving to the closed position. Active in both local and Modbus control modes.

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual includes installation, maintenance and operation information for the DFA variable orifice desuperheater. Refer to separate instruction manuals for information on the actuator and accessories.

WARNING

Do not install, operate or maintain a DFA desuperheater without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your Emerson sales office before proceeding.

1.2 Description

The Fisher DFA desuperheater flexible architecture (Figure 1) incorporates both a water control element and a variable geometry mechanically atomized, self-contained desuperheater for moderate to high flow variation. It is installed through a flanged connection on the side of an NPS 8 or larger pipeline.

The desuperheater design incorporates an integral thermal liner inside the desuperheater body pipe. This minimizes the potential for thermal shock when cool water is introduced to the unit which has been heated to the operating steam temperature.

The nozzle mount for the DFA is engineered to minimize the potential for excitation due to vortex shedding and flow induced vibration. The DFA desuperheater is installed through a flanged connection on a DN 200 / NPS 8 or larger pipeline. Maximum nozzle C_V is 15.0.

Figure 1. Fisher DFA Variable Geometry Desuperheater

X0838

Table 1. Specifications

Available Configurations ⁽¹⁾ and Valve Sizes	Shutoff Classifications per ANSI/FCI 70-2 and IEC 60534-4
■ DFA valve body style: Angle Common Characteristics: Designed according to ASME B16.34 Valve-Flanges, Threaded and Welding End	Class V only
End Connections Styles ⁽¹⁾	Material Temperature Capabilities ⁽¹⁾
See Tables 2 and 3	Up to 593°C / 1100°F depending on construction
Maximum Inlet Pressure and Temperature ^(1,2)	Flow Characteristics ⁽⁴⁾
Flanged, Socketwelding or Buttwelding: Consistent with CL150, 300, 600, 900, 1500 and 2500 according to ASME B16.34, unless limited by maximum pressure drop or material temperature capabilities.	Standard Cages: ■ Linear, ■ equal percentage, ■ modified equal percentage ⁽⁵⁾ Cavitrol III: Linear Micro-Flat (with or without liner): Linear
Maximum Pressure Drop ⁽¹⁾	Flow Direction
Valve with Cavitrol™ III Cage: 149 bar / 2160 psi for two-stage and 207 bar / 3000 psi for three-stage cage. Consult Fisher Bulletin 80.2:030, Cavitrol III One-, Two- and Three-Stage trims, for more information. Anti-cavitation MicroFlat: <51.7 bard / <750 psid	All: Flow down
Up to 50:1. The ratio of maximum to minimum controllable C_V is dependent upon the available water pressure differential.	Bonnet Style and Mounting ⁽¹⁾
	Standard Bonnet Yoke Temperature Limit: Standard bonnet with cast iron yoke is limited to 537°C / 1000°F
Inherent Rangeability	Packing Arrangements
Up to 50:1. The ratio of maximum to minimum controllable C_V is dependent upon the available water pressure differential.	■ Single, ■ Double and ■ Leakoff standard graphite packing or optional ENVIRO-SEAL™ and ■ HIGH-SEAL packing systems. See Bulletin 59.1:061, ENVIRO-SEAL and HIGH-SEAL Packing System for Sliding-Stem Valves
Spray Water Pressure Required ⁽³⁾	Approximate Weight
6.9 bar / 100 psi above steam pressure	See Table 12
1. Do not exceed the pressure or temperature limits in this bulletin, nor any applicable code or standard limitations. 2. EN (or other valve body material) ratings and end connections can usually be supplied; consult your Emerson sales office . 3. A function of required turndown and equipment selection. 4. Special characterized cages are available. Contact your Emerson sales office . 5. Modified equal percentage characteristic is equal percentage for the first 75% of travel, then opens quickly for additional capacity.	

The DFA Features

1. Fine atomization over a wide range of operating conditions helping to assure rapid and complete vaporization of injected water.
2. Available with a wide range of standard and anti-cavitation trim styles.
3. Design minimizes affects of thermal cycling.
4. High turndown capability.
5. Flexible architecture with multiple valve trim combinations and face-to-face dimensions available.

1.3 Education Services

Emerson Education Services

E-mail: education@emerson.com
emerson.com/mytraining

Section 2: Principle of Operation

The DFA desuperheater reduces steam temperatures through the introduction of cooling water directly into the hot steam flow stream. By regulating the quantity of water that is injected, accurate downstream steam temperature can be both controlled and maintained.

The rate of vaporization and/or cooling, is a function of droplet size, distribution, mass flow and temperature. Steam velocity is critical and should be maintained at 6.1 to 9.1 meters per second / 20 to 30 feet per second as the minimum. Actual minimum steam velocity requirements will vary by application. As steam velocity increases, a longer distance is required to achieve homogeneous mixing and to complete vaporization.

In DFA desuperheater nozzle styles, the spraywater quantity is controlled by internal control valve which responds to signals received from the temperature control system. The water enters the main tube of the desuperheater, passes through the spray nozzle and discharges into the steam line as a fine, atomized spray (see Figure 4).

Each particular nozzle or set of nozzles, in the sprayhead is tailored to meet a specific set of operating conditions. The nozzle design optimizes the spraywater droplet size promoting rapid atomization and complete vaporization of water in the steam flow stream to obtain precise temperature control. The DFA desuperheater uses a variable geometry AF nozzle. In the AF nozzle design (see Figure 4), water enters the swirl chamber via compound angled orifices, thus creating a rotational flow stream. This flow stream is further accelerated as it is forced up and out through the spray annulus. The cone-shaped plug varies the geometry of the spray annulus using a force balance principle between water pressure and the preload exerted by a helical spring. This variable geometry design sprays a thin hollow cone over a wide range of flow rates, resulting in excellent temperature control over a wide range of operating conditions.

Figure 2. AF Nozzle Cross Section

A7191

Section 3: Installation

WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the desuperheater is installed where service conditions could exceed the limits of the pressure class noted on the nameplate. To avoid such injury or damage, provide a relief valve for over pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

Table 2. Available Spray Inlet Connections

Inlet Size, NPS	ASME Pressure Rating ^(2,4)	Spraywater Connection Styles ^(1,2,3)
1, 1-1/2 and 2	CL150 to 2500	RF, RTJ, BW and SW
1. End connection style abbreviations: RF-Raised Face, RTJ-Ring Type Joint, BW-Butt weld, SW-Socket Weld. 2. EN (or other valve body material) ratings and end connections can usually be supplied; consult your Emerson sales office. 3. Socket weld available on NPS 1, 1-1/2 and 2 only. 4. Inlet and outlet of DFA must have the same pressure class rating.		

Table 3. Available Desuperheater Body Connections

DESIGN	STEAM LINE SIZE, NPS	STEAM LINE CONNECTION		
		Size, NPS	ASME Pressure Rating ^(1,2)	CONNECTION STYLES
DFA	8 to 60	3 or 4	CL150 to 2500	RF and RTJ
1. Steam line connection pressure rating must match the valve inlet connection pressure rating. 2. Inlet and outlet of DFA must have the same pressure class rating.

4	DFA- A through H	101.6	4

⚠ WARNING

When ordered, the desuperheater configuration and construction materials were selected to meet particular pressure, temperature, pressure drop and fluid conditions. Do not apply any other conditions to the desuperheater without first contacting your Emerson sales office.

1. Mount the DFA desuperheater in a "Tee" piece at the desired location in the pipe, in accordance with standard piping practice. The nozzle should be positioned in the top quadrant of the pipe (see Figure 3 for the proper "T" length dimension).
2. Clean and flush out the cooling water line before connecting to the desuperheater. Use only clean sources of cooling water. Use of clean water decreases wear and prevents clogging of the nozzle by solid particles.

⚠ WARNING

Personal injury or property damage could result from clogging of the desuperheater. Installation of a strainer and an isolating valve on the water line between the desuperheater and the water control valve is recommended. Failure to do so may result in clogging of the desuperheater by solid particles, thus hampering temperature control of the steam.

3. A minimum straight run of pipe is required downstream of the desuperheater before any elbows or reducer to ensure complete vaporization of cooling water. Consult the desuperheater certified drawing for the required distance of straight pipe.
4. The temperature sensor should be mounted according to the manufacturer's instructions. Typical distance to the sensor is at least 9.1 meters / 30 feet downstream of the desuperheater. This distance changes with higher velocity steam flow before any elbows or reducer and the percentage of spraywater required. Consult the desuperheater certified drawing for this distance.
5. There should be no branching out from or into the steam line to divide the steam flow between the temperature sensor and the desuperheater.
6. A typical installation is illustrated in Figure 6. A temperature sensor element (TE) measures changes in temperature and transmits a signal to a remote temperature-indicating controller (TC) or distributed control system (DCS). The output signal from the controller is sent to the positioner on the spraywater control valve. The positioner output signal is piped to the actuator. The actuator strokes the stem/plug of the spraywater control valve, as required, to supply the required cooling water to the desuperheater to maintain temperature setpoint.

Figure 3. Fisher DFA Dimensions (Also See Tables 4 and 5)

Section 4: Nozzle Maintenance and Replacement

If it is necessary to remove the DFA desuperheater from service, take note of the following warning.

⚠ WARNING

Avoid personal injury or damage to property from sudden release of pressure or uncontrolled process fluid. Before starting disassembly:

- Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.
- Isolate the desuperheater from process pressure. Relieve process pressure on both sides of the desuperheater. Drain the process media from both sides of the desuperheater.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

When subjected to normal operating conditions, it is possible that wear, blockage and/or weld fatigue will occur to the desuperheater body or nozzle assembly. During regularly scheduled maintenance, visually inspect the desuperheater welds for cracks and inspect nozzles for wear and blockage. Your local [Emerson sales office](#) can help to determine the extent of weld fatigue and the correct course of action. Poor performing nozzles or nozzle failure is typically caused by wear, corrosion, erosion and/or blockage. The following instruction will help to determine if any of these problems are present and provide a recommended course of action for each.

NOTE

For optimal performance, nozzles should be inspected every 18 to 24 months and replaced every 24 to 36 months.

Figure 4. Fisher AF Nozzle (DFA)

4.1 DFA Desuperheater Variable Geometry Nozzles

1. Inspect the spray annulus surface, the area between the plug stem and spray head, for excessive wear, erosion/corrosion and/or blockage due to particulate. Wear is defined as any nicks, cuts or gouges on or immediately around the spray annulus. Erosion/corrosion is defined as any form of rust or erosion of the metal on the plug stem or spray head. Blockages are defined when small particulate becomes trapped between the plug stem and spray head or spring casing and spray head. Replacement of the nozzle is recommended if any of the preceding problems are present.
2. **OPTIONAL:** Figure 4 shows the spray pattern that will need to be present during operation of the AF nozzles. Testing can be performed by attaching the existing or an alternate, similar pressure, water line to the unit. If this spray pattern is not present, replacement is recommended.

3. Grind off the tack welds holding the nozzle in place. Apply a penetrant type thread lubricant and allow to soak prior to unscrewing the nozzle. Using the provided flats on the side of the spray head, unscrew the nozzle.
4. Grind excess tack weld material off of both the nozzle and desuperheater body.
5. In the absence of external forces, the nozzle must be fully closed. If the nozzle is not fully closed, it will need to be replaced.
6. Inspect the water injection holes for reduced or non-circular shape due to erosion. Every hole must be the same size and shape. If any are oversized or non-circular in shape, the nozzle will need to be replaced.
7. Inspect the interior of the water injection holes for buildup of particulate and/or magnetite. Nozzle replacement will be needed if any buildup is present.

NOTE

Complete disassembly of the nozzle is strongly discouraged, due to individual spare parts not being available.

8. OPTIONAL: To further check the nozzle for buildup of particulate or magnetite, the nozzle can be disassembled. If disassembled, take great care not to damage the sharp edges of the spray annulus on the plug stem and the sprayhead, as this will greatly affect the spray pattern. Do not compress a removed spring by hand or with a tool, as compression beyond its normal operating range will damage the spring.

To disassemble the nozzle, first remove the pin using a small drill bit as a punch and unscrew the spring casing from the plug stem. The nozzle can be reassembled by following a reverse order of disassembly, taking care to line the hole in the plug stem up with the hole in the spring casing, then pressing the pin back into place through the two parts.

Table 7. AF Nozzle Specifications

NOZZLE TYPE	PLUG TRAVEL	
	mm	in.
AF7	0.356	0.014
AF10	0.711	0.028
AF14	0.737	0.029
AF17	0.864	0.034
AF20	0.914	0.036
AF24	1.067	0.042
AF28	1.122	0.048
AF32	1.422	0.056
AF35	1.651	0.065
AF40	1.600	0.063
AF44	1.753	0.069

Figure 5. Spray Nozzle Tack Weld Locations

9. The travel can be determined by using a feeler gauge to measure the distance between the nozzle body near the water injection ports to the side of the spring casing as outlined in Figure 4. This measurement must match the factory set plug travel for the corresponding nozzle type as shown in Table 7.
10. Inspect nozzle threads for damage and clean if needed; if damage is present, nozzle replacement will be necessary.
11. Rinse both the desuperheater body and nozzle to remove particulate.
12. Screw nozzle into the desuperheater body and tighten just until the spray head is flat and tight against the desuperheater body.
13. Tackweld a small piece of welding wire onto the nozzle mount next to either of the spray head flats to prevent rotation during service (refer to Figure 5). Maintain low heat to prevent distortion of the nozzle.
14. Reinstall the desuperheater into the line, using a reverse order of assembly; refer to the installation instructions to complete this step. Make sure the mounting flange gasket (customer supplied) is replaced with a new one.

4.2 DFA Installation

NOTE

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) immediately if a discrepancy between actual parts and approved parts is suspected.

1. Place the desuperheater portion of the DFA into the line and align with the pin. Nozzles should face downstream.
2. Insert the gasket into the lower portion of the DFA.
3. Slowly lower the valve body onto the desuperheater portion and ensure that the alignment pin from the lower portion slides into the corresponding hole in the valve body.
4. Completely lower the valve body onto the lower portion and bolt into place using the recommended line gasket bolting torques.

4.3 Troubleshooting

Table 8 is intended as a basic first line troubleshooting guide. Contact your local [Emerson sales office](#) for assistance if you are unable to resolve your field operation problem.

Table 8. Troubleshooting Guide

Problem	Corrective Action
Temperature setpoint is not reached	Check water source availability and pressure
Temperature setpoint is not reached	Check nozzle(s) for plugging
Temperature setpoint is not reached	Make sure that steam saturation pressure is not above setpoint
Temperature setpoint is not reached	Check to ensure full actuator stroke is reached on the spraywater control valve
Temperature setpoint is not reached	Check for proper orientation of nozzle in steam flow
Temperature is below setpoint	Check temperature control loop - reset
Temperature is below setpoint	Check nozzle for fouling/poor spray pattern - clean/replace
Temperature is below setpoint	Check temperature sensor location - relocate per guidelines
Temperature is below setpoint	Check for proper orientation of nozzle in steam flow
Water in steam line	Check that steam traps are functioning properly
Water in steam line when steam line isolated	Check for proper spraywater control valve actuator installation
Water in steam line when steam line isolated	Replace spraywater control valve seat and plug assembly

Figure 6. Typical DFA Installation

Section 5: Parts

5.1 Parts Ordering

Each desuperheater assembly is assigned a serial number which can be found on the mounting flange of the desuperheater. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering numbers for each part required, the key numbers on Figure 7 can be used to help in part identification.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

Figure 1. Fisher DMA, DMA/AF, and DMA/AF-HTC Desuperheaters

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and operation information for the Fisher DMA, DMA/AF, and DMA/AF-HTC mechanically atomized desuperheaters.

Do not install, operate, or maintain these desuperheaters without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your local [Emerson sales office](#) or Local Business Partner before proceeding.

Description

DMA, DMA/AF, and DMA/AF-HTC desuperheaters (figure 1) can be used in many applications to effectively reduce the temperature of superheated steam to the desired set point. Available variations are mechanically atomized (both fixed geometry and variable geometry styles). Desuperheaters are available for installation in steam lines from DN 150 through DN 1500 (NPS 6 through 60) in diameter and are capable of maintaining steam temperatures to within 6°C (10°F) of saturation temperatures.

- **DMA**—A simple mechanically atomized desuperheater with single or multiple, fixed-geometry spray nozzles is intended for applications with nearly constant load. The DMA is installed through a flanged connection on the side of a DN 150 (NPS 6) or larger pipeline. Maximum unit C_v is 3.8.
- **DMA/AF**—A variable-geometry, mechanically atomized, back-pressure-activated desuperheater with one, two, or three spray nozzles is designed for applications requiring control over moderate load fluctuations. The DMA/AF desuperheater (figure 2) is installed through a flanged connection on the side of a DN 200 (NPS 8) or larger pipeline. Maximum unit C_v is 15.0.
- **DMA/AF-HTC**—The DMA/AF-HTC is functionally equivalent to the DMA/AF, however it is structurally suited for more severe applications. The most common applications include boiler interstage attemperation, where the desuperheater is exposed to high thermal cycling and stress, high steam velocities and flow induced vibration. In addition to this specific application, the DMA/AF-HTC is suitable for other severe desuperheating application environments. The DMA/AF-HTC uses a construction optimized to move weld joints away from high stress regions.

The desuperheater design incorporates an integral thermal liner inside the desuperheater body pipe. This minimizes the potential for thermal shock when cool water is introduced to the unit which has been heated to the operating steam temperature.

The nozzle mount for the DMA/AF-HTC is engineered to minimize the potential for excitation due to vortex shedding and flow induced vibration. The DMA/AF-HTC desuperheater (figure 3) is installed through a flanged connection on a DN 200 (NPS 8) or larger pipeline. Maximum unit C_v is 15.0.

Specifications

Specifications for the DMA, DMA/AF, and DMA/AF-HTC desuperheaters are shown in table 1 and table 2.

1. Other standard flanges and connections are also available.⁷

2. Consult your local [Emerson sales office](#) or Local Business Partner for acceptability of NPS 3 mounting connection for size and pressure class specified.

3. NPS 1-1/2 spraywater connection is only available for CL150 - 900.

Principle of Operation

The DMA, DMA/AF, and DMA/AF-HTC desuperheaters reduce steam temperatures through the introduction of cooling water directly into the hot steam flow stream. By regulating the quantity of water that is injected, accurate downstream steam temperature can be both controlled and maintained.

The rate of vaporization, and/or cooling, is a function of droplet size, distribution, mass flow, and temperature. Steam velocity is critical and should be maintained at 6.1 to 9.1 meters per second (20 to 30 feet per second) as the minimum. Actual minimum steam velocity requirements will vary by application. As steam velocity increases, a longer distance is required to achieve homogeneous mixing and to complete vaporization.

In both DMA desuperheater nozzle styles, the spraywater quantity is controlled by an external control valve which responds to signals received from the temperature control system. The water enters the main tube of the desuperheater, passes through the spray nozzle, and discharges into the steam line as a fine, atomized spray (see figure 2).

Each particular nozzle, or set of nozzles, in the sprayhead is tailored to meet a specific set of operating conditions. The nozzle design optimizes the spraywater droplet size promoting rapid atomization and complete vaporization of water in the steam flow stream to obtain precise temperature control. The DMA desuperheater uses a fixed geometry nozzle, while the DMA/AF desuperheater uses a variable geometry AF nozzle. In the AF nozzle design (see figure 5), water enters the swirl chamber via compound angled orifices, thus creating a rotational flow stream. This flow stream is further accelerated as it is forced up and out through the spray annulus. The cone-shaped plug varies the geometry of the spray annulus using a force balance principle between water pressure and the preload exerted by a helical spring. This variable geometry design sprays a thin hollow cone over a wide range of flow rates, resulting in excellent temperature control over a wide range of operating conditions.

2. TE - Temperature Sensor Element

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the desuperheater is installed where service conditions could exceed the limits given in table 1 or on the nameplate. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

When ordered, the desuperheater configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and fluid conditions. Do not apply any other conditions to the desuperheater without first contacting your local Emerson Automation Solutions sales office representative.

1. Mount the DMA, DMA/AF, or DMA/AF-HTC desuperheater in a "Tee" piece at the desired location in the pipe, in accordance with standard piping practice. The nozzle should be positioned in the top quadrant of the pipe (see figure 6 or 7 for the proper "T" length dimension).

2. Clean and flush out the cooling water line before connecting to the desuperheater. Use only clean sources of cooling water. Use of clean water decreases wear and prevents clogging of the nozzle by solid particles.

⚠ WARNING

Personal injury or property damage could result from clogging of the desuperheater. Installation of a strainer and an isolating valve on the water line between the desuperheater and the water control valve is recommended. Failure to do so may result in clogging of the desuperheater by solid particles, thus hampering temperature control of the steam.

3. A minimum straight run of pipe is required downstream of the desuperheater to ensure complete vaporization of cooling water. Consult the desuperheater certified drawing for the required distance of straight pipe.
4. The temperature sensor should be mounted according to the manufacturer's instructions. Typical distance to the sensor is at least 9.1 meters (30 feet) downstream of the desuperheater. This distance changes with higher velocity steam flow and the percentage of spraywater required. Consult the desuperheater certified drawing for this distance.
5. There should be no branching out from or into the steam line to divide the steam flow between the temperature sensor and the desuperheater.
6. A typical installation is illustrated in figure 4. A temperature sensor element (TE) measures changes in temperature and transmits a signal to a remote temperature-indicating controller (TC) or distributed control system (DCS). The output signal from the controller is sent to the positioner on the spraywater control valve. The positioner output signal is piped to the actuator. The actuator strokes the stem/plug of the spraywater control valve, as required, to supply the required cooling water to the desuperheater to maintain temperature setpoint.

Nozzle Maintenance and Replacement

If it is necessary to remove the DMA, DMA/AF, or DMA/AF-HTC desuperheater from service, take note of the following warning.

⚠ WARNING

Avoid personal injury or damage to property from sudden release of pressure or uncontrolled process fluid. Before starting disassembly:

- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Isolate the desuperheater from process pressure. Relieve process pressure on both sides of the desuperheater. Drain the process media from both sides of the desuperheater.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

When subjected to normal operating conditions, it is possible that wear, blockage, and/or weld fatigue will occur to the desuperheater body or nozzle assembly. During regularly scheduled maintenance, visually inspect the desuperheater welds for cracks and inspect nozzles for wear and blockage. Your local [Emerson sales office](#) or Local Business Partner can help to determine the extent of weld fatigue and the correct course of action. Poor performing nozzles or nozzle failure is typically caused by wear, corrosion, erosion, and/or blockage. The following instruction will help to determine if any of these problems are present and provide a recommended course of action for each.

Note

For optimal performance, nozzles should be inspected every 18-24 months and replaced every 24-36 months.

Figure 5. Fisher AF Nozzle (DMA/AF and DMA/AF-HTC)

A7191-2D

DMA/AF and DMA/AF-HTC Desuperheater Variable Geometry Nozzles

1. Inspect the spray annulus surface, the area between the plug stem and spray head, for excessive wear, erosion/corrosion, and/or blockage due to particulate. Wear is defined as any nicks, cuts, or gouges on or immediately around the spray annulus. Erosion/corrosion is defined as any form of rust or erosion of the metal on the plug stem or spray head. Blockages are defined when small particulate becomes trapped between the plug stem and spray head or spring casing and spray head. Replacement of the nozzle is recommended if any of the preceding problems are present.
2. **OPTIONAL:** Figure 5 shows the spray pattern that will need to be present during operation of the AF nozzles. Testing can be performed by attaching the existing or an alternate, similar pressure, water line to the unit. If this spray pattern is not present, replacement is recommended.
3. Grind off the tack welds holding the nozzle in place. Apply a penetrant type thread lubricant and allow to soak prior to unscrewing the nozzle. Using the provided flats on the side of the spray head, unscrew the nozzle.
4. Grind excess tack weld material off of both the nozzle and desuperheater body.
5. In the absence of external forces, the nozzle must be fully closed. If the nozzle is not fully closed, it will need to be replaced.
6. Inspect the water injection holes for reduced or non-circular shape due to erosion. Every hole must be the same size and shape. If any are over-sized or non-circular in shape, the nozzle will need to be replaced.
7. Inspect the interior of the water injection holes for buildup of particulate and/or magnetite. Nozzle replacement will be needed if any buildup is present.

Note

Complete disassembly of the nozzle is strongly discouraged, due to individual spare parts not being available.

8. **OPTIONAL:** The internal spring may relax over time and not provide the tensile force required to shut off and control flow. If the nozzle spring is suspected of being too relaxed, then the nozzle should be replaced.

Table 3. AF Nozzle Specifications

NOZZLE TYPE	PLUG TRAVEL, INCHES
AF7	0.014
AF10	0.028
AF14	0.029
AF17	0.034
AF20	0.036
AF24	0.042
AF28	0.048
AF32	0.056
AF35	0.065
AF40	0.063
AF44	0.069

To further check the spring, the spring can be removed by first removing the pin, using a small drill bit as a punch and unscrewing the spring casing from the plug stem. The nozzle can be reassembled by following a reverse order of disassembly, taking care to line the hole in the plug stem up with the hole in the spring casing, then pressing the pin back into place through the two parts.

9. The travel can be determined by using a feeler gauge to measure the distance between the nozzle body near the water injection ports to the side of the spring casing as outlined in figure 5. This measurement must match the factory set plug travel for the corresponding nozzle type as shown in table 3.
10. Inspect nozzle threads for damage and clean if needed; if damage is present, nozzle replacement will be necessary.
11. Rinse both the desuperheater body and nozzle to remove particulate.
12. Screw nozzle into the desuperheater body and tighten just until the spray head is flat and tight against the desuperheater body.
13. Tack-weld a small piece of welding wire onto the nozzle mount next to either of the spray head flats to prevent rotation during service (refer to figure 8). Maintain low heat to prevent distortion of the nozzle.
14. Reinstall the desuperheater into the line, using a reverse order of assembly; refer to the installation instructions to complete this step. Make sure the mounting flange gasket (customer supplied) is replaced with a new one.

DMA Desuperheater Fixed Geometry Nozzles

1. Inspect the nozzle orifice for excessive wear, erosion/corrosion, and/or blockage due to particulate. Wear is defined as any nicks, cuts, or gouges on or immediately around the orifice. Erosion/corrosion is defined as any form of rust or erosion of the metal on the nozzle. Blockages are defined when small particulate becomes trapped between the plug stem and spray head. Replacement of the nozzle is recommended if any of the preceding problems are present.

Proceed to steps 2-5 only if nozzle replacement is required.

2. Grind off the tack welds holding the nozzle in place. Apply a penetrant type thread lubricant and allow to soak prior to unscrewing the nozzle. Using the provided flats on the side of the spray head, unscrew the nozzle.
3. Rinse both the desuperheater body and new nozzle to remove particulate.
4. Screw the new nozzle into place just until it is tight in the nozzle mount.
5. Tack-weld the nozzle in place to prevent rotation during service (refer to figure 8). Maintain low heat to prevent distortion of the nozzle.
6. Reinstall the desuperheater into the line, using a reverse order of assembly; refer to the installation instructions to complete this step. Make sure the mounting flange gasket (customer supplied) is replaced with a new one.

Troubleshooting

Table 4 is intended as a basic first line troubleshooting guide. Contact your [Emerson sales office](#) or Local Business Partner for assistance if you are unable to resolve your field operation problem.

Table 4. Troubleshooting Guide

Problem	Corrective Action
Temperature setpoint is not reached	Check water source availability and pressure
Temperature setpoint is not reached	Check nozzle(s) for plugging
Temperature setpoint is not reached	Make sure that steam saturation pressure is not above setpoint
Temperature setpoint is not reached	Check to ensure full actuator stroke is reached on the spraywater control valve
Temperature setpoint is not reached	Check for proper orientation of nozzle in steam flow
Temperature is below setpoint	Check temperature control loop - reset
Temperature is below setpoint	Check nozzle for fouling/poor spray pattern - clean/replace
Temperature is below setpoint	Check temperature sensor location - relocate per guidelines
Temperature is below setpoint	Check for proper orientation of nozzle in steam flow
Water in steam line	Check that steam traps are functioning properly
Water in steam line when steam line isolated	Check for proper spraywater control valve actuator installation
Water in steam line when steam line isolated	Replace spraywater control valve seat and plug assembly

Parts Ordering

When corresponding with your [Emerson sales office](#) or Local Business Partner about this equipment, mention the serial number of the desuperheater. Each DMA, DMA/AF, and DMA/AF-HTC desuperheater assembly is assigned a serial number which can be found on the mounting flange. The only available replacement part for this desuperheater is the complete nozzle assembly. Whenever ordering replacement nozzles, state the complete eleven-digit part number of each nozzle required as found in the following parts list.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher equipment, because they may void your warranty, might adversely affect the performance of the equipment, and could cause personal injury and property damage.

Parts List

Note

Part numbers are shown for recommended spares only. For part numbers not shown, contact your [Emerson sales office](#) or Local Business Partner.

W5366-1

Introduction

Scope of Manual

This instruction manual includes installation and operation information for the Fisher DSA steam-atomized desuperheater.

Do not install, operate, or maintain a DSA desuperheater without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. **To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings.** If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

The DSA steam-atomized desuperheater (figure 1) serves a wide range of desuperheating applications. It is best suited for those installations requiring high rangeability in low steam velocity pipelines. With adequate controls, this unit provides an efficient means of atomizing spraywater over wide fluctuations in flow rate while maintaining downstream steam temperature to within 6 to 8°C (10 to 15°F) of saturation. The DSA desuperheater is easily installed directly into the steam line. The standard mounting is with the desuperheater perpendicular to the steam line. However, the DSA desuperheater can be made to fit angle or elbow installations.

Table 1. Specifications

Steam Line Sizes ■ NPS 6 to 60	Inherent Rangeability⁽²⁾ Up to 50:1
Steam Line Connection Sizes NPS ■ 3, ■ 4, and ■ 6 ■ CL150, ■ CL300, ■ CL600, ■ CL900, ■ CL1500, and ■ CL2500 raised-face flange	Spraywater Pressure Required 3.5 to 35 bar (50 to 500 psi) greater than steam line pressure
Spraywater and Atomizing Steam Connection Sizes NPS ■ 1, ■ 1-1/2, and ■ 2 ■ CL150, ■ CL300, ■ CL600, ■ CL900, ■ CL1500, and ■ CL2500 raised-face flange	Minimum Steam Velocity 1.5 m/s (5 feet per second) depending on actual operating conditions
Maximum Inlet Pressures⁽¹⁾ Consistent with applicable CL150, 300, 600, 900, 1500, or 2500 pressure-temperature ratings per ASME B16.34	Atomizing Steam Atomizing steam should be at least 2.0 times the pressure of the steam to be desuperheated. Total atomizing steam flow (lb/hr) will be 10 to 15 percent of the maximum spraywater flow (lb/hr).

1. Do not exceed the pressure or temperature limits in this instruction manual, nor any applicable code or standard limitations.

2. Ratio of maximum to minimum controllable Cv.

Principle of Operation

The DSA desuperheater utilizes the energy of atomizing steam to produce a fine spray of cooling water for injection into the steam line. An external spraywater control valve controls the quantity of cooling water. The water flows into the desuperheater and fills the main body of the unit just ahead of the atomizing head. Here the water is directed into a number of flow channels where it is mixed and atomized by the high velocity atomizing steam (see figure 3).

The atomizing steam is controlled via an automatic or manual shutoff valve. The steam flows down the center of the desuperheater body toward the atomizing head. Here too, the steam is directed into a number of flow channels. These channels are sized to produce a critical pressure drop. This assures very high steam velocities and maximum kinetic energy for spraywater atomization.

The atomizing steam mixes with the cooling water and produces a spraywater cloud with almost infinite surface area. This spray cloud is almost instantaneously vaporized when injected into the main steam line, resulting in steam at a reduced temperature.

The atomizing steam tube inside the desuperheater is only secured at the atomizing head. The packing box on top allows for the free movement of the unit due to thermal expansion from steam/water temperature differentials.

Installation

WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the desuperheater is installed where service conditions could exceed the limits given in table 1 or on the nameplate. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

When ordered, the desuperheater configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and fluid conditions. Do not apply any other conditions to the desuperheater without first contacting your Emerson Automation Solutions sales office.

1. Insert the DSA desuperheater into the flanged pipe stud on the steam line (see figure 2 for the proper “T” length dimension). Bolt the unit to the pipe in accordance with standard piping practice.
2. Clean and flush out the cooling water line before connecting to the desuperheater. Use only clean sources of cooling water. Use of clean water decreases wear to the valve trim and prevents clogging of the desuperheater by solid particles.

⚠ WARNING

Personal injury or property damage could result from clogging of the desuperheater. Emerson Automation Solutions recommends installation of a strainer and isolating valve on the water line leading to the desuperheater. Failure to do so may result in clogging of the desuperheater by solid particles, thus hampering temperature control of the steam.

3. A straight run of pipe is required downstream of the desuperheater to assure complete vaporization of cooling water. Consult the desuperheater certified drawing for the required distance of straight pipe.
4. The temperature sensor should be mounted according to manufacturer's instructions. Minimum distance to the sensor is approximately 9.1 m (30 feet) downstream of the desuperheater. This distance changes with higher velocity steam flow and percentage of spraywater required. Consult the desuperheater certified drawing for the exact distance.
5. Allow no branching out from the steam line, to divide the steam flow, between the temperature sensor and the desuperheater.

A typical control loop is illustrated in figure 4. A temperature sensor generates a pneumatic instrument air signal through a transmitter. This signal is transmitted to a remote mounted temperature indicating control station. The output signal from the control station is sent to the positioner on the spraywater control valve. The positioner output signal is piped to the actuator, which strokes the valve and controls the flow of cooling water to the desuperheater. The atomizing steam valve is normally controlled so that it fully opens as soon as the spraywater control valve starts to open.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however some readjustment will be required to meet specific service conditions.

Operating Instructions

Verification of Control Instrumentation

Note

The following steps assume that a local controller is used. If all controls are through a DCS, adjust verification steps accordingly.

1. Connect the instrument air supply lines to the temperature transmitter, indicating control station, and valve positioner in accordance with instrumentation manufacturer's instructions.
2. Switch the controller to manual control.

Note

If 0.4 to 2.0 bar (6 to 30 psig) or another range is used, adjust the instrument air signal referenced in the following steps accordingly.

3. This instruction manual assumes an instrument air signal of 0.2 to 1.0 bar (3 to 15 psig). Adjust the instrument air signal to 0.2 bar (3 psig). Check that the water valve is completely closed. Adjust the positioner, if necessary.
4. Now adjust the instrument air signal to 1.0 bar (15 psig). Check that the water valve opens to its full travel. Adjust the positioner to correct the range and re-zero if needed, by referring to step 3. Check to ensure the atomizing steam valve opens as soon as the spraywater control valve begins to open.
5. Thereafter, check that the controller is responding so that rising steam temperature gives an increasing instrument air signal.
6. Adjust the instrument air signal to 0.6 bar (9 psig).
7. Verify that the atomizing steam valve has opened.
8. Open the water supply.
9. Observe the downstream steam temperature.
10. Increase the instrument air signal to 0.8 bar (11 psig). Check that the steam temperature decreases.
11. Adjust the instrument air signal to 0.5 bar (7 psig) and check that the steam temperature rises.

Note

If the temperature does not fall when the instrument air signal is increased, the cause may be that either the water isolation valve has not been opened or that the steam temperature is close to saturation. If the latter is the case, set the instrument air signal to 0.3 bar (4 psig) [spraywater valve slightly open] and increase to 0.4 bar (6 psig). Check if the temperature decreases.

12. When satisfactory coordination between the instrument air signal and steam temperature is reached, adjust the controller according to directions of the manufacturer.
13. Switch the controller to "automatic" for automatic positioning.

Note

For more detailed calibration information, refer to the instrument manufacturer's operating instructions.

Maintenance Instructions

⚠ WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the desuperheater while the valve is still pressurized.

- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuators. Be sure the actuators cannot suddenly open or close the atomizing steam or spraywater control valves.
- Completely shut off the process to isolate the DSA desuperheater from process pressure. Relieve process pressure and drain the process media before servicing the unit.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The desuperheater packing box may contain process fluids that are pressurized, *even when the desuperheater has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Servicing

Although the DSA desuperheater is a simple design requiring almost no maintenance, it may be necessary to repack the unit if a steam packing leak should develop.

⚠ WARNING

Residual system pressure may be released during the following steps if the system was improperly isolated or vented. Use extreme care to prevent personal injury while loosening any fasteners in the pressure boundary.

1. Slowly and evenly loosen the gland nuts (key 13, figure 5) and remove them from the gland studs (key 12, figure 5).
2. Pull back the gland flange (key 10, figure 5) and gland follower (key 9, figure 5) from the stuffing box.
3. Using a suitable packing pick, remove the packing (key 11, figure 5) from the stuffing box.
4. Reinstall packing (key 11, figure 5), making sure to push down each ring as far as possible with the gland follower (key 9, figure 5) prior to installing the next ring. This process can be made somewhat easier by lubricating each ring with grease similar to copper-based anti-seize or heavy duty anti-seize.
5. After installation of the new packing set, gland follower and gland flange, tighten the gland nuts (key 13, figure 5) to seal the packing on the steam pipe from leakage.
6. After ensuring that the DSA desuperheater is properly reinstalled in the pipeline, the unit may be returned to service. The DSA desuperheater should be monitored as the unit is brought on line to ensure that there are no leaks in the connections.

Table 1. Troubleshooting Guide

Problem	Possible Solution
Temperature setpoint is not reached	Check water source availability and pressure
Temperature setpoint is not reached	Check nozzle(s) for plugging
Temperature setpoint is not reached	Make sure that steam saturation pressure is not above setpoint
Temperature setpoint is not reached	Check to ensure full actuator stroke is reached
Temperature is below setpoint	Check temperature control loop - reset
Temperature is below setpoint	Check nozzle for fouling/poor spray pattern - clean/replace
Temperature is below setpoint	Check temperature sensor location - relocate per guidelines
Temperature oscillates around setpoint	Tune control system parameters
Temperature oscillates around setpoint	Temperature setpoint may be too close to saturation
Water in steam line	Check atomizing steam supply pressure and valve opening
Water in steam line	Check that steam traps are functioning properly
Water in steam line when steam line isolated	Check for leakage of spraywater control valve
Water in steam line	Review piping configuration for downstream tees and elbows

Troubleshooting

Table 1 is a basic first line troubleshooting guide. Contact your [Emerson sales office](#) or Local Business Partner for assistance if you are unable to resolve your field operation problem.

Parts Ordering

Each DSA desuperheater is assigned a serial number that can be found on the DSA desuperheater body or on a tag attached to the mounting flange. Refer to the serial number when contacting your Emerson sales office or Local Business Partner for technical assistance. When ordering a replacement part, refer to the serial number and key number. The key numbers in figure 5 can be used to help in part identification.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

X1492

Introduction

Scope of Manual

This instruction manual provides installation, operation, maintenance, and parts information for the Fisher DSV1000 Full-Bore Ball valve (see figure 1). Refer to separate manuals for information concerning the actuator, positioner, and accessories.

Do not install, operate, or maintain a DSV1000 valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The Fisher DSV1000 is a three piece, trunnion mounted, full-bore ball valve designed with features for isolation shutoff. The DSV1000 comes standard with dual seal construction allowing unidirectional or bidirectional flow and double block-and-bleed operation. The full-bore ball design presents little or no restriction to flow at full travel. The DSV1000 construction meets ANSI / NACE MR0175 / ISO 15156 as standard.

Installation

⚠ WARNING

- To avoid personal injury, always wear protective gloves, clothing, and eyewear when performing any installation operations.
- To avoid personal injury or property damage resulting from the bursting of pressure retaining parts, be certain the service conditions do not exceed the limits given in this manual.
- To avoid personal injury or property damage that can result from the sudden release of process pressure if valve or mating pipe flange pressure ratings are exceeded, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.
- Personal injury could result from packing leakage. See the Packing Maintenance section for adjustment information.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
- If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.
- Use proper lifting and rigging practices while moving the valve or valve/actuator assembly.

Key number locations are shown in figures 4, 5, and 6, unless otherwise noted. Throughout this manual, the component key number will be identified for clarity.

1. Install a three-valve bypass around the valve assembly if continuous operation will be necessary during inspection and maintenance of the valve.
2. The valve is normally shipped as part of a valve assembly, with a factory adjusted actuator mounted on the valve. If the valve or actuator has been purchased separately, or if the actuator has been removed, refer to the Actuator Mounting section and the appropriate actuator instruction manual for installation and adjustment procedures.
3. The standard valve construction allows uni-directional or bi-directional flow. If possible, install the valve in a horizontal pipeline with the drive shaft vertical, however, the orientation of the valve does not affect the performance.

NOTICE

Be certain the valve and adjacent pipelines are free of any foreign material that could damage the valve sealing surfaces.

4. Provide appropriate flange gaskets, and place the valve in the pipeline. Tighten flange bolting in a star pattern to ensure the flange gaskets are compressed evenly.

Note

Standard Fisher DSV1000 live-loaded PTFE packing is composed of partially conductive packing rings (carbon-filled PTFE male and female adaptors) to electrically bond the drive shaft to the valve body. For hazardous area service, an alternate shaft-to-body bonding strap is also available by using the following step (see figure 2).

5. For hazardous area applications where redundant shaft-to-body grounding is preferred, attach the optional bonding strap assembly (key 45) to the valve drive shaft (key 4) with the clamp (key 44) and connect the other end of the bonding strap assembly to the valve body with the mounting cap screw as shown in figure 2.

Figure 2. Optional Shaft-to-Body Bonding Strap Assembly

A3143-2

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. The frequency of inspection and replacement depends upon the severity of service conditions.

⚠ WARNING

Avoid personal injury or equipment damage from sudden release of process pressure or uncontrolled movement of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Do not loosen any pressure retaining bolting while the valve is still pressurized. This includes the body to tailpiece nuts (key 21), packing box housing screws (key 10), packing nuts (key 36) or pipe plugs (keys 23 and 28).
- Avoid injury by keeping hands, tools, and other objects away from the ball while stroking the valve.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Check the actuator cannot suddenly open or close the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure, relieve any process pressure from both sides of the valve body, and drain the process media from both sides of the valve.
- Dual-seal constructions can retain pressure and process fluid even after process pressure has been removed from both sides of the valve. The ball should be partially opened to relieve this pressure before disassembling or removing the valve from the line. Take additional care if the process fluid is hot, flammable, caustic, or hazardous.
- A tip over hazard exists for the valve/actuator assembly. Ensure the valve/actuator assembly is properly secured and always supported to prevent falling or rolling which may cause injury or property damage.
- Use lock-out/tag-out best practices and procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box housing may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Packing Maintenance

Refer to figure 3 for details of the standard live-loaded PTFE packing. All maintenance operations in this section may be performed on an unpressurized valve that is still installed inline.

Note

For additional information on the live-loaded packing system refer to the ENVIRO-SEAL Packing System Instruction Manual ([D101643X012](#)).

Stopping Leakage

Optimum performance of the PTFE live-loaded packing system is obtained when the Belleville springs are compressed to the required “target load”. The target load is the point where the springs are compressed to 85% of their maximum deflection.

Under normal conditions, the packing nuts should not require re-tightening. However, when servicing, if the springs do not remain at the target load of 85% compression, retighten the packing box nuts per the following:

1. Tighten the packing flange nuts alternately and evenly, keeping the packing flange parallel with the valve flange (see figure 3), until the Belleville springs are compressed 100% (or completely flat).
 - a. For PTFE packing, loosen each packing flange nut one half turn (180° of rotation).
2. The target load of 85% compression has now been reached. If leakage continues, replace the packing components and inspect the packing box housing bore and valve drive shaft for damage as described in the following procedures.

Replacing Packing

Replacing the packing requires bleeding off the system and removing the actuator from the valve. Valve/actuator adjustments cannot be made correctly without observing the fully open or closed position of the ball (key 3). It is not necessary to remove the valve from the pipeline to make adjustments, if care is taken to note the position and alignment of the shaft and coupler.

Refer to figure 3 which identifies the DSV1000 packing components by key number.

Packing Disassembly

1. Isolate the valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, shut off all pressure lines (or other power source) to the power actuator, release pressure from the actuator, and disconnect the pressure lines from the actuator. Use lockout/tagout procedures to be sure that the above measures stay in effect while disassembling the equipment.

WARNING

- See the **WARNING** at the beginning of the Maintenance section for more information before removing the valve from the pipeline.
 - Use proper lifting and rigging practices while moving the valve or valve/actuator assembly.
-

Figure 3. Packing Arrangement Details

2. To assist with future reassembly, note and mark the orientation of the actuator with respect to the valve body and the coupler orientation with respect to the valve drive shaft.
3. Refer to the appropriate actuator instruction manual for information on removal.
4. Remove the actuator mounting screws, bolts, or nuts while properly supporting the actuator then separate the actuator and mounting bracket from the valve.
5. If necessary, remove the bonding strap assembly, shown in figure 2, from the valve before removing the packing parts.
6. Remove the packing follower nuts, packing flange, and spring pack and packing follower (keys 36, 37, and 38).
7. Remove the packing parts:
 - a. If the packing box housing (key 6) is mounted on the valve: Use a formed wire hook with a sharp end to pierce the packing rings, and pull the rings out of the packing box housing. Do not scratch the drive shaft or packing gland bore. Scratching these surfaces could cause leakage. Clean, inspect, and obtain replacement parts as necessary for reassembly. Examine the drive shaft and packing gland bore for any signs of damage that may prevent proper sealing.
 - b. If the packing box housing is separated from the valve (refer to Seal Ring Maintenance section of this manual for disassembly instructions): Remove the drive shaft (key 4) from the packing box housing. With the drive shaft removed, remove all internal packing parts. Clean, inspect, and obtain replacement parts as necessary for reassembly. Examine the drive shaft and packing gland bore for any signs of damage that may prevent proper sealing.

Packing Assembly

For additional information on the live-loaded packing system refer to the ENVIRO-SEAL Packing System Instruction Manual ([D101643X012](#)).

1. If the packing housing box (key 6) is removed from the valve, use the valve assembly steps to reinstall the drive shaft (key 4) and packing box housing assembly on the valve. (Refer to Seal Ring Maintenance section of this manual for additional assembly instructions).
2. Place the new packing components over the drive shaft and slide each into the packing box housing until properly seated at the bottom of the packing gland. Use the parts sequence shown in figure 3 and verify the Belleville springs are in the correct configuration.
3. Secure the spring pack and packing follower assembly and packing flange with the packing nuts (keys 38, 37, and 36).
4. Tighten the packing flange nuts alternately and evenly, keeping the packing flange parallel with the valve flange (see figure 3), until the Belleville springs are compressed 100% (or completely flat).
 - a. For PTFE packing, loosen each packing flange nut one half turn (180° of rotation).
5. If necessary, install the bonding strap assembly shown in figure 2.
6. Use the steps provided in the Actuator Mounting section to install the actuator on the valve. For actuator travel adjustments, refer to the appropriate actuator instruction manual.
7. When the valve is in operation, carefully examine the packing follower region for any signs of leakage.

Seal Ring Maintenance

⚠ WARNING

- See the **WARNING** at the beginning of the Maintenance section for more information before removing the valve from the pipeline.
- Use proper lifting and rigging practices while moving the valve or valve/actuator assembly.

Valve Disassembly

Refer to figures 4, 5, and 6 to identify the DSV1000 valve components by key number.

Disassemble the valve only to the extent necessary to accomplish the needed inspection and repairs. For some repairs complete disassembly of the valve is not necessary. Follow the disassembly procedures to the point necessary to accomplish the repair, then skip to the appropriate assembly steps to complete the reassembly of the valve. Always clean and protect sealing surfaces from damage.

Mark parts as necessary to allow them to be returned to the same position and orientation as removed. The tailpiece, for instance, shall be returned to the same end of the valve from which it was removed. The seal assembly shall also be returned to the same tailpiece and in the same orientation from which it was removed.

1. Isolate the valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, shut off all pressure lines to the power actuator, release pressure from the actuator, and disconnect the pressure lines from the actuator. Use lockout/tagout procedures to be sure that the above measures stay in effect while working on the equipment.
2. Remove line bolting, remove the valve from the pipeline, and clean all valve surfaces. Place the actuator/valve assembly on a flat working surface.

3. Mark parts as necessary to allow them to be returned to the same position during re-assembly.
4. Refer to the appropriate actuator instruction manual for information on removal. Loosen the actuator mounting screws, bolts, or nuts while properly supporting the actuator then separate the actuator and mounting bracket from the valve. When valve maintenance is complete, refer to the Mounting Actuator procedure in this manual to reinstall the actuator on the valve.
5. Provide a clean soft working surface to protect the tailpiece-flange serrated surface. Lift the valve and place it on either tailpiece flange face. Be sure the valve is in a stable, upright position before releasing the hoist connection.

Note

If the packing is in good condition, it is possible to remove and replace the seal assembly without removing the packing box assembly. However, the packing box assembly must be removed to remove the ball (key 3) from the valve body.

6. Remove the packing box housing socket head cap screws (key 10).
 - a. If necessary, two packing box housing cap screws can be used as jack bolts to assist with separating the packing box housing assembly from the valve.
 - b. Remove the two plastic plugs (key 39) from the packing box housing and install two packing box housing cap screws until contact with the body occurs. Alternately and evenly, turn each fastener clockwise until the packing box housing assembly is adequately separated from the valve body. Remove the packing box housing assembly from the valve body. The packing box housing assembly includes all packing parts, drive shaft (key 4), O-ring seal (key 14), drive shaft bushing (key 8), and thrust washer (key 9). The two straight pins (key 7) may stay attached to the packing box.
 - c. If necessary, use a punch and drive each straight pin towards the valve side of the packing box to remove.
7. If it is desired to separate the packing box assembly parts, loosen or remove the packing components and slide the shaft down and out the valve side of the packing box. Inspect the drive shaft bushing (key 8) and the thrust washer (key 9). If necessary, replace worn components.
8. Remove the heavy hex nuts (key 21) from the studs, if applicable, remove base brackets (key 25), and lift the upper tailpiece from the body. If studs (key 19 and 20) are removed from the valve body, mark installed locations of long studs (key 20) in valve body.

NOTICE

While lifting the tailpiece (key 2) from the valve body, check to see if the seal (key 5) is lifting with the tailpiece. If so, use caution in case the seal falls out and protect the ball's spherical surface. An additional strap can be employed to ensure the seal stays in place.

9. Turn the tailpiece assembly over so the seal is facing up, and place it on a clean soft surface to protect the flange serrated surface. Note the tailpiece O-ring (key 13).
10. Lift the seal out of the tailpiece. Note the seal O-ring and back up ring (keys 15 and 16) and the multitude of springs (key 18). Ensure all springs and the bearing plate dowel pins (key 22) are accounted for. Clean and protect all sealing surfaces.

⚠ WARNING

When lifting the ball, ensure the bearing plates (key 11) are secure on the ball trunnions to prevent parts from falling which may cause personal injury or property damage.

Note

Refer to figure 6 and note the NPS6 CL150 construction is different than the balance of the DSV1000 product line in that it lacks bearing plates and the ball design does not have male trunnions. Specific to the NPS6 CL150, ball removal also requires removal of the follower trunnion (key 42) and fasteners (key 43).

11. Turn the ball (key 3) to the closed position. Use an approved lifting sling through the ball bore to lift the ball out of the valve body. Lift the ball and set it on a clean soft surface.
12. Remove the two bearing plates (key 11) and thrust washers (key 17) from the ball. Inspect the lined bushing (key 12) in each bearing plate and the thrust washers. If necessary, replace worn components.
13. Evenly loosen the heavy hex nuts (key 21) from the studs, if applicable, remove base brackets (key 25), and lift the body (key 1) from the lower tailpiece (key 2).
14. Lift the seal out of the lower tailpiece. Note the seal O-ring and back up ring (keys 15 and 16) and the multitude of springs (key 18). Ensure all springs and the lower bearing plate dowel pins (key 22) are accounted for. Clean and protect all sealing surfaces.

Valve Assembly

Be sure to replace valve parts in the same position and orientation from which they were removed. Use the following steps to reassemble the valve.

Note

Clean and protect all sealing surfaces from damage while installing parts. Lubricate components when necessary as an aid for installation and to help protect sealing surfaces.

Refer to figures 4, 5, and 6 to identify the DSV1000 valve components by key number.

During assembly, visually inspect component surfaces that interface with an O-ring or seal for any damage that may prevent proper sealing.

1. Place both tailpieces (key 2), flange end down on a clean soft surface with the seal assembly cavity facing up. Use caution to protect the flange end serrated surfaces.
2. Lubricate the tailpiece counterbores where the seal will insert and inject lubricant into each of the spring holes. Install the seal springs (key 18).
3. On both seals (key 5), install the O-ring (key 15) and backup ring (key 16) in the correct orientation (see figure 5 and 6).
4. Lubricate the seal O-rings and insert the seal assembly into the tailpiece counterbores. Maintain axial alignment of the two components as the seal assembly is pushed into place.

5. Lubricate and install the O-rings (key 13) in both tailpieces.
 - a. For NPS 6 through NPS 12 constructions, one O-ring per tailpiece is required.
 - b. For NPS 14 through NPS 24 constructions, two O-rings per tailpiece are required.
6. Place the body (key 1) on an appropriate work surface.
7. If studs (keys 19 and 20) were removed from valve body during disassembly, apply anti-seize lubricant (key 47) to threaded stud holes. Apply anti-seize lubricant to the long studs (key 20), which are used to attach the base brackets (key 25). Install the long studs first in the stud hole locations marked during disassembly. (Note: Base brackets are not available for the NPS6 CL150 and NPS6 CL300 valve constructions.) Apply anti-seize compound to the balance of studs (key 19) and install in the body.
8. Lubricate the tailpiece O-ring gland of the body and lower the tailpiece into place, guiding the male O-ring gland of the tailpiece within the female gland of the body. Take special care to prevent pinching of the O-ring. The tailpiece must be oriented such that the bearing plate dowel pin holes are in alignment and parallel with the body shaft bore axis. Refer to figure 4 and note the tailpiece (key 2) orientation in relation to the body (key 1), bearing plates (key 11), and dowel pins (key 22).
9. Apply anti-seize lubricant compound to the face and threads of the heavy hex nuts (key 21). If applicable, place the base bracket (key 25) over the long studs. Install the heavy hex nuts on the studs by hand with the material identifier facing outwards. Use an appropriate torque device to apply the final torque specification (see table 3).
10. Lift and orient the assembly so the raised face of the tailpiece end connection flange is sitting on a clean, soft surface. Take special care to prevent damage to the raised face serrated surface. Install the bearing plate dowel pins (key 22) in the tailpiece. (Note: The dowel pins are not applicable to the NPS6 CL150, as this construction does not incorporate bearing plates.)
11. If necessary, install new bushings (key 12) in the bearing plates (key 11) by driving out the old and pressing in the new.

WARNING

When lifting the ball, ensure the bearing plates (key 11) are secure on the ball trunnions to prevent parts from falling which may cause personal injury or property damage.

12. Use an approved lifting sling through the ball bore to lift the ball (key 3).
 - a. Lubricate and install the thrust washers (key 17) and bearing plates on both ball trunnions.
 - b. Install the ball and bearing plate assembly into the body.
 - c. Guarantee the dowel pins (key 22) in the lower tailpiece have engaged the holes in the bearing plates and that the ball shaft interface geometry is aligned with the body shaft bore.
 - d. Note: Specific to the NPS 6 CL150 construction, lubricate and place the follower end thrust washer (key 17) in the follower end bore of the ball then lubricate and press in the follower end bushing (key 12) prior to installing the ball assembly into the body. See figure 6.
13. Insert the upper bearing plate dowel pins (key 22) into the intended holes and install the upper studs, tailpiece, base bracket, and heavy hex nuts per steps 7 through 10.
14. Insert the drive shaft (key 4) into the body shaft bore and engage the ball interface geometry. Slide the shaft thrust washer (key 9) into place.
15. Install the drive shaft bushing (key 8) in the packing box from the end that engages the body. Lubricate and install the O-ring (key 14) in the packing box housing.
16. After lubricating the body shaft bore and thrust washer (key 9), position the packing box housing assembly over the drive shaft and slide into place ensuring the O-ring (key 14) properly engages the body shaft bore. For DSV1000 constructions other than the NPS6 CL150, skip to step 18.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

DSV1000 Valve

June 2022

Instruction Manual

D104727X012

17. Specific to the DSV1000 NPS 6 CL150 construction, inject lubricant into the spring hole of the follower trunnion (key 42) and install the grounding spring (key 40) by pressing firmly into place (see figure 6).
 - a. Lubricate and install the O-ring (key 41) in the gland of the follower trunnion.
 - b. Lubricate the body follower bore and install the follower trunnion assembly.
 - c. Apply anti-seize lubricant to the socket head cap screws (key 43) and tighten in a star pattern to 81 N•m (60 ft•lbf).
18. Apply anti-seize lubricant to the packing box housing socket head cap screws (key 10). Thread in all fasteners, but do not tighten.
19. The packing box holes for the straight pins (key 7) were originally staked at the factory. Use a file to remove the deformed material at the top of each pin hole to allow the pin to slide by with minimal interference. Lubricate the straight pins (key 7) and drive each through the packing box housing and into the valve body. When properly installed and bottomed out, the pin top surface will be slightly below the packing box top surface. Stake all pins in place making sure the packing box housing material has been deformed within the bore to prevent the pins from disengaging.
20. Tighten the socket head cap screws (key 10) in a star pattern to the appropriate torque specification (see table 4). Reinstall the two plastic packing box plugs (key 39) into their respective jack bolt counterbores to prevent environmental ingress.
21. Install the packing components as detailed in the Packing Maintenance section of this manual.
22. Install the valve shaft key (key 29), flat washer (key 30) and hex head bolt (key 31). The purpose of the washer and hex bolt is to prevent the key from migrating axially out of the keyway in-service.

	600	5782	4264	247	182

1. Fasteners must be lubricated to achieve proper preload.

Actuator Mounting

Use the appropriate actuator instruction manual for mounting the actuator or changing the actuator position. Attach the actuator mounting bracket to the valve packing box and tighten the mounting bracket fasteners as detailed in table 5.

Table 5. Required Actuator Mounting Bracket-to-Valve Bolt Torque

VALVE SIZE, NPS	FASTENER SIZE INCH	GRADE 5/NCF3 ⁽¹⁾

16			
20			
24			

1. Fasteners must be lubricated to achieve proper preload

Determining Closed Position

1. To confirm proper actuator adjustment visually check the position of the ball.
2. Adjust the actuator linkage or travel stops as described in the actuator instruction manual so that at the end of stroke, the valve ball bore diameter in the full open (100%) position is in alignment and centered within the upstream and downstream valve seal inside diameters. The actuator linkage or travel stops should be adjusted so that the full closed (0%) valve position is precisely 90 degrees from the visually verified 100% open position.
3. For reference, two parallel lines are machined on the actuator mounting end of the valve drive shaft (key 4). The lines represent the orientation of the valve ball bore. The ball is in the closed position when the two lines are perpendicular to the pipeline bore.

Parts Ordering

A serial number is assigned to each valve and stamped on the nameplate. Always refer to the valve serial number when corresponding with your [Emerson sales office](#) regarding spare parts or technical information. When ordering replacement parts, also specify the part name and desired material.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Figure 1. Fisher DVI Desuperheater Venturi Inline

W5365-1

Introduction

Scope of Manual

This instruction manual includes installation and operation information for the Fisher DVI desuperheater venturi inline.

Do not install, operate, or maintain a DVI desuperheater without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

The DVI desuperheater venturi inline (figure 1) offers efficient desuperheating in steam pipelines of NPS 24 and less. It is particularly designed for rugged service conditions and can maintain final temperatures to within 6 to 8°C (10 to 15°F) of saturation. By utilizing a compact design and unique flow path, the desuperheater provides even distribution of spraywater with good turndown for a fixed orifice desuperheater. It is easily installed between any two ASME flanges up to CL1500 and NPS 24. The simple design of the desuperheater allows for virtually maintenance-free operation.

Table 1. Specifications

Steam Line Sizes NPS 1 through 24 Steam Line Connection Sizes Designed for water connection with NPS 1 through 24 ■ CL150, ■ 300, ■ 600, ■ 900, and ■ 1500 raised-face and ring type joint flanges Spraywater Connection Sizes ■ NPS 1/2, ■ 3/4, ■ 1, and ■ 2 ■ CL150, ■ 300, ■ 600, ■ 900, and ■ 1500 raised-face and ring type joint flanges	Maximum Inlet Pressures⁽¹⁾ Consistent with applicable CL150, 300, 600, 900, or 1500 pressure-temperature ratings per ASME B16.34 Inherent Rangeability⁽²⁾ Up to 10:1 Spraywater Pressure Required 3.5 to 35 bar (50 to 500 psi) greater than steam line pressure -- depending on nozzle design Minimum Steam Velocity 6.1 m/s (20 feet per second) -- depending on conditions
---	---

1. Do not exceed the pressure or temperature limits in this instruction manual, nor any applicable code or standard limitations.

2. Ratio of maximum to minimum controllable C_v .

Figure 2. Detail of Fisher DVI Desuperheater

Principle of Operation

The operation of the DVI desuperheater is quite simple. Spraywater flow is throttled by a control valve that responds to the signal generated by the temperature control loop. The spraywater enters the desuperheater water tube and then continues into the distribution chamber (see figure 2). As the chamber fills, the spraywater is forced into the injection orifices. As the flow area is reduced, the spraywater accelerates to the injection point. The accelerated flow results in a fine spray for efficient and rapid vaporization.

At the same time, the steam flow is entering the desuperheater venturi. The reduction in flow area continues until the point of water injection. This results in a higher velocity and turbulent steam flow, thus improving the mixing of the spraywater with the steam and increasing overall system turndown.

Installation

WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Use bypass valves or completely shut off the process to isolate the line from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
- If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

WARNING

Personal injury or equipment damage caused by sudden release of pressure may result if the desuperheater is installed where service conditions could exceed the limits given in table 1 or on the nameplate. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

CAUTION

When ordered, the desuperheater configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and fluid conditions. Do not apply any other conditions to the desuperheater without first contacting your [Emerson sales office](#) or Local Business Partner.

1. Mount the DVI desuperheater between two flanges with gaskets and bolt the desuperheater to the pipe in accordance with standard piping practice.
2. Clean and flush out the cooling water line before connection to the desuperheater. Use only clean sources of cooling water. Use of clean water decreases wear and prevents clogging of the desuperheater by solid particles.

Note

Installation of a strainer and isolating valve on the water line leading to the desuperheater is recommended. Failure to do so may result in clogging of the desuperheater by solid particles, thus hampering temperature control of the steam. Please consult the factory for the minimum diameter of the nozzles and recommended strainer size to assure debris will not disrupt the flow by blocking the nozzles.

3. A straight run of pipe is required downstream of the desuperheater to ensure complete vaporization of the cooling water. Consult the desuperheater sizing sheet for installation recommendations including the exact straight pipe distance required.

Figure 3. Typical Control Loop with Fisher DVI Desuperheater

B2318-1

4. A temperature sensor should be mounted in accordance with the manufacturer's instructions. The recommended distance from the desuperheater to the temperature sensor changes with the velocity and percentage of spraywater required. Consult the desuperheater sizing sheet for installation recommendations including the exact distance required before the temperature sensor.
5. Allow no branching out from the steam line, to divide the steam flow, between the temperature sensor and the desuperheater.

A typical control loop is illustrated in figure 3. A temperature sensor generates a signal (pneumatic or digital) through a transmitter. This signal is transmitted to the positioner on the spraywater control valve. The positioner output signal is piped to the actuator, which strokes the spraywater control valve governing the amount of spraywater flow.

Operating Instructions

Verification of Control Instrumentation

1. Connect the appropriate signal lines to the temperature transmitter, indicating control station, and valve positioner in accordance with the instrumentation manufacturer's instructions.

2. Switch the controller to manual control.
3. This instruction manual assumes a pneumatic signal of 0.2 to 1.0 bar (3 to 15 psig). If 0.4 to 2.0 bar (6 to 30 psig) or another range is used, adjust the instrument signal referenced in the following steps accordingly. Adjust the instrument signal to 0.2 bar (3 psig). Check that the water valve is completely closed. Adjust the positioner, if necessary.
4. Now adjust the instrument signal to 1.0 bar (15 psig). Check that the control valve opens to its full travel. Adjust the positioner to correct the range and re-zero if needed, by referring to step 3.
5. Thereafter, check that the controller is responding so that rising steam temperature gives an increasing instrument signal.
6. Adjust the instrument signal to 0.6 bar (9 psig).
7. Open the water supply.
8. Observe the downstream steam temperature.
9. Increase the instrument signal to 0.8 bar (11 psig). Check that the steam temperature decreases.
10. Adjust the instrument signal to 0.5 bar (7 psig) and check that the steam temperature rises.

Note

If the temperature does not fall when the instrument signal is increased, the cause may be that either the water valve has not been opened or that the steam temperature is close to saturation. If the latter is the case, set the instrument signal to 0.3 bar (4 psig) [water valve slightly open] and increase the signal to 0.4 bar (6 psig). Check if the temperature decreases.

11. When satisfactory coordination between the instrument signal and steam temperature is reached, adjust the controller in accordance with the manufacturer's instructions.
12. Switch the controller to "automatic" for automatic positioning.

Note

For more detailed calibration information, refer to the instrument manufacturer's operating instructions.

Maintenance Instructions

WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
 - Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
 - Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator for the spraywater control valve. Be sure the actuator cannot suddenly open the valve.
 - Completely shut off the process to isolate the DVI desuperheater from process pressure. Relieve process pressure on both sides of the desuperheater. Drain the process media from the desuperheater.
 - Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
 - Check with your process or safety engineer for any additional measures that must be taken to protect against process media.
-

Figure 4. Fisher DVI Desuperheater with Nozzle Cross Section

B2710

Servicing

Although the DVI desuperheater is a simple design requiring very little maintenance, in the event that the spray nozzles become clogged by debris, it may be necessary to service the unit. Prior to removal of the unit from the line, ensure that the necessary gaskets and spare nozzles (if applicable) are available for rebuild if turnaround time for the repair is critical. Review the drawing and specification sheet for clarification. If in doubt as to the construction, advise your [Emerson sales office](#) or Local Business Partner of the serial number and model number and ask for further clarification.

⚠ WARNING

Residual system pressure may be released during the following steps if the system was improperly isolated or vented. Use extreme care to prevent personal injury while loosening any fasteners in the pressure boundary.

Ensure that the weight of the unit is sufficiently supported to avoid personal injury.

1. Slowly loosen the flange stud bolts retaining the DVI desuperheater in line taking care to ensure that there is no residual pressure and that the weight of the unit is sufficiently supported to avoid personal injury. Normally the lower flange bolts will be left loosely in place during removal of the desuperheater from the line unless the location or design requires their complete removal.
2. Remove the DVI desuperheater from the line.
3. Inspect the desuperheater for cuts on the flange mating facing and repair if needed. If there is damage on the gasket surfaces that is too large for field repair, the unit may require replacement.
4. Inspect the nozzles or spray orifices. If the desuperheater has drilled holes for water injection, ream out the holes with a small drill bit or welding rod to clear all obstructions. If the desuperheater has a screwed in nozzle(s) (key 5, figure 4), cut the tack weld(s) and unscrew the nozzle(s).
5. Thoroughly flush the DVI desuperheater after cleaning. For desuperheaters using screwed in nozzles, it is recommended that the nozzles be replaced if the unit has required cleaning.
6. After cleaning the unit including all gasket surfaces, screw in the new nozzles (key 5), if applicable, and tack weld the new nozzles in place with ER309 or similar weld rod taking care not to damage any gasket surface or other nozzles.

7. When reinstalling the unit in line, take care to center the desuperheater between the steam line flanges as evenly as possible. This will help avoid leakage as well as making sure that the steam flow is not disrupted by not having the desuperheater installed evenly in the piping. Tighten the steam line flanges in accordance with good piping practice.
8. After installing the DVI desuperheater in the steam line, reconnect the water line flange connection.
9. After ensuring that the desuperheater is properly reinstalled in the pipeline, the unit may be returned to service. The desuperheater should be monitored as the unit is brought on line to ensure that there are no leaks in the connections.

Troubleshooting

The following guide (table 2) is a basic first line troubleshooting guide. Contact your [Emerson sales office](#) or Local Business Partner for assistance if you are unable to resolve your field operation problem.

Table 2. Troubleshooting Guide

Problem	Possible Solution
Temperature setpoint is not reached	Check water source availability and pressure
Temperature setpoint is not reached	Check nozzle(s) for plugging
Temperature setpoint is not reached	Make sure that steam saturation pressure is not above setpoint
Temperature setpoint is not reached	Check to ensure full actuator stroke is reached
Temperature is below setpoint	Check temperature control loop - reset
Temperature is below setpoint	Check nozzle for fouling/poor spray pattern - clean/replace
Temperature is below setpoint	Check temperature sensor location - relocate per guidelines
Temperature oscillates around setpoint	Tune control system parameters
Temperature oscillates around setpoint	Temperature setpoint may be too close to saturation
Water in steam line	Check that steam traps are functioning properly
Water in steam line when steam line isolated	Check for leakage of spraywater control valve
Water in steam line	Review piping configuration for downstream tees and elbows

Parts Ordering

Each DVI desuperheater is assigned a serial number that can be found on the DVI desuperheater body or on a tag attached to the water pipe. Refer to the serial number when contacting your [Emerson sales office](#) or Local Business Partner for technical assistance. When ordering a replacement nozzle, refer to the serial number and key number. The key numbers in figure 4 can be used to help in part identification.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts List

Note

For part numbers not shown, contact your [Emerson sales office](#) or Local Business Partner.

Key	Description

Section 1: Introduction

1.1 Scope of the Manual

If the actuator has a RPU-100 installed refer to easy-Drive RPU-100 Instruction Manual (D104551X012).

WARNING

This instruction manual provides installation, maintenance and parts information for the easy-Drive 200L. Do not install, operate or maintain an easy-Drive 200L without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

1.2 Description

The easy-Drive 200L is a compact, rugged electric actuator designed primarily for high-pressure throttling applications. This actuator is ideal for use on pressure and flow control applications.

Figure 1. Fisher easy-Drive 200L

X1520-1

Table 1. Specifications

Available Actuator Configurations	Average Thrust
Positioning	2446 N / 550 lbf
Power Requirements	Nominal Stroke Speed ⁽¹⁾
11 to 30 V DC, minimum 4 A power supply required (fuse to 5 A)	3.9 mm/s / 0.15 in./s at 24 V DC 2.2 mm/s / 0.09 in./s at 12 V DC

1. 10% variation can be expected, based on temperature and pressure of application.	

1.3 Specifications

Table 1 lists specifications for the easy-Drive 200L. Some of the specifications for a given actuator as it originally comes from the factory are stamped on a nameplate located on the lower actuator enclosure.

1.4 Education Services

Emerson Education Services
 Phone: 800-338-8158
 Email: education@emerson.com
emerson.com/en/final-control/services/valve-training

Section 2: Installation

WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage caused by bursting of pressure-retaining parts or by uncontrolled process fluid, be certain the service conditions do not exceed the limits shown on the valve nameplate and in Table 1. Use pressure-relieving devices required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

WARNING

For explosion-proof applications, ensure the actuator cover is properly bolted before applying power to the actuator. Personal injury or property damage may result from fire or explosion if power is applied to the actuator with the cover removed in a hazardous area.

For explosion-proof applications, install rigid metal conduit and a conduit seal no more than 457 mm / 18 in. from the actuator. Personal injury or property damage may result from explosion if the seal is not installed.

Select wiring and/or cable glands that are rated for the environment of use (such as hazardous area, ingress protection and temperature). Failure to use properly rated wiring and/or cable glands can result in personal injury or property damage from fire or explosion.

Wiring connections must be in accordance with local, regional and national codes for any given hazardous area approval. Failure to follow the local, regional and national codes could result in personal injury or property damage from fire or explosion.

WARNING

Avoid personal injury or property damage caused by possible actuator failure. The use of a rigidly-mounted support on the actuator casing may cause additional stress on the actuator leading to premature wear and/or failure of the actuator components.

1. The easy-Drive 200L can be installed in any position, but normally the actuator is vertical above the valve. Install the valve per the manufacturer's guidelines and per any applicable local, regional and national piping codes.
2. For explosion-proof applications, install rigid metal conduit and seal no more than 457 mm / 18 in. from the actuator.
3. Unused conduit ports must be sealed with an explosion-proof port plug.

NOTE

Plastic conduit ports provided by factory are to be removed prior to operation and replaced with an explosion-proof port plug.

2.1 Special Instructions for “Safe Use” and Installations in Hazardous Locations

WARNING

To avoid static discharge from the enclosure, do not rub or clean the enclosure with solvents. To do so could result in an explosion. Clean with a mild detergent and water only.

The enclosure is non-conducting and may generate an ignition-capable level of electrostatic charges under certain extreme conditions. The user should ensure that the equipment is not installed in a location where it may be subjected to external conditions (such as high-pressure steam) which might cause a buildup of electrostatic charges on non-conducting surfaces. Additionally, cleaning of the equipment shall only be done with a damp cloth.

To avoid damage to the enclosure, when screws are fully tightened into blind holes in enclosure walls, with no washer fitted, at least one full thread shall remain free at the base of the hole.

2.2 Actuator Mounting

The following procedure describes how to mount an easy-Drive 200L actuator.

The actuator is shipped with the stem in the ideal coupling position; 6% off the lower actuator stop.

NOTE

Do not stroke the actuator prior to coupling the unit to the valve.

To reposition the actuator to the ideal coupling position calibrate the actuator as valve type “Stop-to-Stop”. Ensure the actuator is able to travel making contact with its internal stops. Once calibration is complete command the valve to 6% open.

User designed and manufactured Mounting Kit and Stem Coupler will be needed to complete this procedure.

WARNING

To avoid personal injury or property damage, keep hands and tools out of the actuator stem travel path when moving the actuator stem in the following steps.

1. Supply a method of supporting the weight of the valve and actuator during assembly.
2. Push the valve stem down away from the actuator to the closed position for push-down-to-close valves.
3. Mount the easy-Drive 200L to the mounting kit designed and supplied by the user.
 - a. Utilizing the wrench flats on the actuator yoke tighten the actuator yoke locknut to 205 N•m / 151 lb•ft.
4. Lift or hoist the actuator and mounting assembly onto the valve and mate the mounting kit securely to the valve following the valve manufacturer's guidelines.

NOTE

The valve stem must be fully in the down position.

5. Make the stem connection between the actuator and valve stems.
 - a. When installing the user-supplied stem connector the actuator stem's threads should engage the threads of the stem connector by a distance equal to or greater than the diameter of the actuator stem.

NOTICE

Incomplete engagement of the actuator stem in the stem connector can result in stripped threads or improper operation. Be sure that the length of each stem clamped in the stem connector is equal to or greater than one diameter of that stem. Damage to threads on either stem or in the stem connector can cause the parts to be replaced prematurely. Do not attempt to remove the stem connector when force is applied to the stem.

6. Configure the actuator to the appropriate mode using the easy-Drive configurator tool. See Valve Type Configuration section of this manual.
7. Calibrate the actuator. See Calibration Instructions section of this manual.

2.3 Startup Overview

Figure 2. Flowchart

Figure 3. Fisher easy-Drive 200L Wiring Diagram

Power Requirements

Ensure a stable DC power source is available, maintaining less than 5% ripple and sufficiently surge protected for the application. A 4 amp (minimum) power supply is required.

Wiring Instructions

1. Observe local wiring requirements for hazardous location usage.
2. Conduit seals within 450 mm / 18 in. of the enclosure port are required for explosion-proof installation.
3. 18 AWG / 0.52 mm² to 12 AWG / 3.31 mm² wire size required.
4. Fuse system to 5 A.
5. Connect enclosure and analog signal shields.
6. Ensure power is turned off before connecting the wires.

Power

1. Connect 12 or 24 V DC reference to: –
2. Connect 12 or 24 V DC positive to: +
3. Be sure to tighten terminals sufficiently to ensure solid mechanical connection.

Figure 4. Wiring - Analog Input

Figure 5. Wiring - Dual Dry Contact

Figure 6. Wiring - Single Dry Contact

Figure 7. Wiring - Modbus Input

Figure 8. Wiring - Auxiliary Digital I/O Set to Input (40080=0)

Figure 9. Wiring - Auxiliary Digital I/O Set to Output (40080=1)

2.4 Configuration

The easy-Drive 200L must be configured prior to operation.

All configuration within the actuator is done by setting values in Modbus registers. Configuration software, providing a visual interface to the registers, is available through your Emerson sales office or at www.fisher.com/easydrive. Control and monitoring can be done using any Modbus master (flow computer, PLC, PC).

See Appendix A for a full map of Modbus registers and their functions.

Control Method Configuration

There are two functional configurations available for the easy-Drive electric actuator: On/Off and Positioning.

All available input signals are shown in Table 2.

Table 2. All Available Input Signals

CONFIGURATION	ON/OFF			POSITIONING	
	Control Source	Modbus	Local		Modbus
	Input Signal	Modbus	Dual Dry Contact	Single Dry Contact	Modbus
					4 to 20 mA (default)

2.5 Modbus Setup

Use of a serial or USB to RS-485 device is required to connect to the actuator. Refer to manufacturer's requirements for installation. The easy-Drive 200L Modbus factory defaults are Address 1, 9600 baud, even parity, 1 stop bit, MSB.

When a connection has been achieved, the actuator may be configured as required for the application.

Figure 10. Fisher easy-Drive Configuration Software

Connecting Using the Fisher easy-Drive Configuration Software

The Fisher easy-Drive configuration software allows configuration and diagnosing of the Fisher easy-Drive electric actuator with a graphical interface. Connect a PC to the actuator using a USB or serial device to RS-485 converter using the wiring instructions above. The USB or serial device will be visible in the drop menu under Serial Port Settings. Baud rate and parity should be set to the Modbus settings of the actuator. Default actuator settings are address 1, 9600 baud, even parity, 1 stop bit, MSB. Press the AUTO button in the upper left corner to connect to the valve.

Use the Fisher easy-Drive configuration software (Figure 10) to make the desired changes or register values may be changed to allow different functionality.

Valve Type Configuration

- Valve Type
 - 0.5" Fixed
 - 0.62" Fixed
 - 0.75" Fixed
 - Stop-to-Stop

Figure 11. Fisher easy-Drive Configuration Software

Fixed travel settings will set the fixed travel from the valve seat (push down to close) up, i.e., 0.50" Fixed, will set the full range of travel at 0.5 in. from the seat.

Stop-to-stop setting will set the travel using hard stops that define the full range (max 0.75 in.).

Initial Setup

The control method selection determines the control signal to which the valve will respond. Only the control signal selected will result in movement of the valve; all others will be ignored.

- Control Methods
 - Dual Contact On/Off
 - Single Contact On/Off
 - Modbus On/Off
 - Modbus Positioning
 - 4 to 20 mA Positioning
 - 4 to 20 mA Level

When using the easy-Drive Configuration Tool, clicking on the "Control Method" box will create a drop down menu as shown. Select the desired control source; the selection will turn yellow. A box with Pending Changes will appear showing all changes. Press "APPLY" to confirm the change(s).

Figure 12. Fisher easy-Drive Configuration Software

Calibration Instructions

⚠ WARNING

To avoid personal injury or property damage, be aware that the valve will move during the calibration cycle.

Span Calibration

It will be necessary to perform a span calibration. A span calibration is accomplished by the following method:

1. Ensure the process and valve are in a safe state – the valve may move during this operation.
2. Press the “CALIBRATE SPAN” button to initiate the span calibration. The software will show a progress bar during the calibration and display “Valve Span Calibrated” when complete.

NOTE

Should actual travel not equal the expected travel you will receive a span calibration failure alert. See Figure 13. Ensure valve type is selected correctly. It may be necessary to re-couple the valve actuator assembly.

Figure 13. Fisher easy-Drive Configuration Software

Span Calibration without the Use of Modbus

1. Turn power to the actuator off.
2. Wait for 10 seconds to ensure all circuits have discharged.
3. Return power to the actuator and use the appropriate calibration method for your control signal. Calibration sequence must be done within 15 seconds of power being switched on.
4. For positioning operation using 4 to 20 mA:
 - a. Apply a 4 mA signal between pins 4 to 20 mA - and 4 to 20 mA +. If Span is currently uncalibrated, valve plug will not move at this time.
 - b. Apply a 20 mA signal between pins 4 to 20 mA - and 4 to 20 mA +. If Span is currently uncalibrated, valve plug will not move at this time.
 - c. Apply a 4 mA signal between pins 4 to 20 mA - and 4 to 20 mA + – valve plug will move to the upper stop, immediately followed by moving to the lower, closed position.
 - d. If calibration of the analog input is desired to improve positional accuracy, an optional operation is listed in the next section titled Analog Input Calibration.
5. For On/Off operation using dual input dry contact:
 - a. Close the contact to create a short between pins COMMON and CLOSE. If Span is currently uncalibrated, valve plug will not move at this time.
 - b. Close the contact to create a short between pins COMMON and OPEN. If Span is currently uncalibrated, valve plug will not move at this time.
 - c. Close the contact to create a short between pins COMMON and CLOSE – valve plug will move to the upper, open position and then to the lower, closed position.

6. For On/Off operation using single dry contact:
 - a. Open the contact to create an open circuit between pins COMMON and OPEN. If Span is currently uncalibrated, valve plug will not move at this time.
 - b. Close the contact to create a short between pins COMMON and OPEN. If Span is currently uncalibrated, valve plug will not move at this time.
 - c. Open the contact to create an open circuit between pins COMMON and OPEN – valve plug will move to the upper, open position and then to the lower, closed position.
7. The unit is now calibrated.

Analog Input Calibration

For valves using 4 to 20 mA as a control source, several options are available to customize control of the actuator. Use a 4 to 20 mA signal generator to provide the desired signal. It is possible to calibrate the 4 to 20 mA signal in reverse acting or split-ranging with the method below with at least 4 mA of signal difference between the close and open values. The example shows a valve being changed from normal to reverse acting during the calibration process.

1. With the Control Method set to 4 to 20 Positioning or 4 to 20 mA Level, enter the Calibration screen and the 4 to 20 mA Signal Calibration window will be visible.
2. Click the CALIBRATE CLOSE & OPEN VALUES button. A separate window will open to guide through the process.
3. Set the 4 to 20 mA signal to the desired value for when the valve is to be closed.
4. Enter this value into the Calibrated mA Signal text box and press Next.

Figure 14. Fisher easy-Drive Configuration Software

5. Set the 4 to 20 mA signal to the desired value for when the valve is to be open.
6. Enter this value into the Commanded mA Signal text box and press Next.

Figure 15. Fisher easy-Drive Configuration Software

7. If the Close and Open values are as expected, press Confirm to accept these values. If not, press Cancel to restart the process.

NOTE

The value of the 4 to 20 mA signal must have at least 4 mA difference between the close and open signals. A differential less than that amount will cause the actuator to reject the calibration and use the previous values.

Should the entered values vary more than 10% from the expected 4 to 20 mA values, the actuator will accept the calibration and a notification displaying "Questionable Analog Calibration" will result.

Figure 16. Fisher easy-Drive Configuration Software

Operational Verification

WARNING

To avoid personal injury or property damage, be aware that the valve will move and respond to an input signal during start up.

1. Before turning on power to the unit, be sure that a closed signal is being commanded to the unit.
 - Single Dry Contact: contact is open.
 - Dual Dry Contact: contact closed across pins COMMON and CLOSE.
 - Analog Input: signal = 4 mA.
 - Modbus: position demand = 0.
2. Turn on power to the unit.
3. Apply a change in position demand to ensure unit responds properly.
 - Single Dry Contact:
 - Closed contact between pins COMMON and OPEN will open the valve.
 - Dual dry contact: Closed contact between pins COMMON and OPEN will open the valve. Closed contact between pins COMMON and CLOSE will close the valve.
 - Analog Input: valve will respond to proportional demand.
 - Modbus: valve will respond to positional demand in register 40001. 0 = fully closed and 1000 = fully open.
4. If the valve does not respond as expected, proceed to Troubleshooting guide.
5. Check conduit ports.
 - Conduit seal must be in place within 450 mm / 18 in. of the enclosure.
 - Unused conduit ports must be sealed with an explosion-proof port plug.
6. Replace the cover and tighten all 8 bolts to 20 N•m / 15 ft•lbs.

Section 3: Troubleshooting

1. Unit does not move.
 - a. Green heartbeat LED will pulse near Modbus terminals when power is present. Verify the 12 V DC to 24 V DC is present on the power terminals as shown on the cover.
 - b. Verify all wires are firmly attached on both ends.
 - c. Verify the wires are connected to the correct terminals - see Wiring in the manual.
 - d. Verify the configured control method matches control signal.
2. Unit does not respond to 4 to 20 mA signal.
 - a. Green heartbeat LED will pulse near Modbus terminals when power is present. Verify the 12 V DC to 24 V DC is present on the power terminals as shown on the cover.
 - b. Verify all wires are firmly attached on both ends.
 - c. Verify the wires are connected to the correct terminals - see Wiring in the manual.
 - d. Verify the configured control method matches control signal.
 - e. Check the value of the analog input in register 40026. If this register shows 0, the 4 to 20 mA may be wired backwards. Swap wire and attempt again.
3. Diagnostics show a Motor Stall - Travel Deviation Fault.
 - a. If the actuator can not move to its commanded position, the actuator will stop, without damage and issue a Motor Stall - Travel Deviation Fault warning. When the command signal changes outside of the deadband (Modbus register 40053), it will attempt to move again.

Section 4: Maintenance

The frequency of inspection and maintenance depends on the severity of the service conditions.

WARNING

Avoid personal injury from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Back plug away from seat to relieve spring compression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

WARNING

For explosion-proof applications, ensure the actuator cover is properly bolted before applying power to the actuator. Personal injury or property damage may result from fire or explosion if power is applied to the actuator with the cover removed in a hazardous area.

For explosion-proof applications, install rigid metal conduit and a conduit seal no more than 457 mm / 18 in. from the actuator. Personal injury or property damage may result from explosion if the seal is not installed.

Select wiring and/or cable glands that are rated for the environment of use (such as hazardous area, ingress protection and temperature). Failure to use properly rated wiring and/or cable glands can result in personal injury or property damage from fire or explosion.

Wiring connections must be in accordance with local, regional and national codes for any given hazardous area approval. Failure to follow the local, regional and national codes could result in personal injury or property damage from fire or explosion.

4.1 Disassembly

1. Follow valve manufacturer's warnings and instructions for isolating and releasing line pressure prior to disassembling the valve.
2. Move the actuator off the seat before disassembling the valve and actuator.

NOTICE

The following steps are intended to prevent damage to the valve during the removal of the yoke and actuator.

3. For Positioning Actuators:
 - Command the valve to anywhere between 10% and 20% travel.
 - Disconnect power and signal.
 - Proceed to step 4.For On/Off Actuators:
 - Command the valve to open or close and cut the power when the valve is at midstroke.
 - Disconnect power and signal.
 - Proceed to step 4.
4. Remove actuator and mounting kit from the valve body.

Assembly

1. Connect actuator and mounting kit to valve body.
2. Replace the top of the explosion proof enclosure (key 60) and tighten cap screws (key 64) to 20 N•m / 15 lbf•ft.

Section 5: Parts

5.1 Parts Ordering

Each easy-Drive 200L actuator is assigned a serial number, which can be found on the nameplate. Refer to the number when contacting your [Emerson sales office](#) for assistance or when ordering replacement parts.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher actuator, because they may void your warranty, might adversely affect the performance of the actuator and could cause personal injury and property damage.

NOTE

Previous generation gearboxes may not be compatible with the easy-Drive 200L. For additional information please consult your [Emerson sales office](#).

5.2 Parts Kits

Table 3. Kit and Part Number

Kit	Part Number
Board Replacement Kit (On/Off is default)	GE83055X012
Board Replacement Kit + Positioning License Dongle	GE83126X012
Motor/Gearbox Assembly	GK10613X012
Motor/Gearbox/Board Assembly (On/Off is default)	GK16046X012
Motor/Gearbox/Board Assembly + Positioning License Dongle	GK16047X012
Replacement Kit - Belleville Springs	GK15266X012
Replacement Kit - Drivetrain	GK15328X012
Positioning License Dongle (1 License)	GE83574X012
Positioning License Dongle (5 License)	GE83574X022

5.3 Parts List

NOTE

For part numbers not shown, contact your [Emerson sales office](#).

Table 4. Parts List

Key	Description	Key	Description
16	Stem	62	Screw cap, Hex Hd
18	O-ring	63	Washer, plain
20	Nut, Hex, Locking	64	Screw cap, Hex Hd
25	O-ring	65	Retaining washer

Appendix A: Modbus

A.1 Register Summary

Table A-1. easy-Drive 200L Modbus Map

Type ⁽¹⁾	Name	MB Register	Default	R/W	Values	Notes
uint16	Modbus position command (100=10.0%)	40001	0	R/W	0 to 1000	Modbus command value with one implied decimal place (1000=100.0%). R/W at all times but only used in Modbus control mode. In on/off mode 0 to 499 will result in a move to 0% and 500 to 1000 will result in a move to 100%.
uint16	Digital output	40002	0	R/W	0, 1	0=no voltage supplied to terminals, 1=voltage supplied to terminals (Only used when output setup is set for Remote controlled)
uint16	Reset error codes	40003	0	R/W	0, 1	Value of 1 will clear faults. Will automatically set back to 0.
uint16	RESERVED	40004	---	---	---	---
uint16	RESERVED	40005	---	---	---	---
uint16	RESERVED	40006	---	---	---	---
uint16	RESERVED	40007	---	---	---	---
uint16	RESERVED	40008	---	---	---	---
uint16	RESERVED	40009	---	---	---	---
uint16	Actual position (100=10.0%)	40010	0	R	0 to 1000	Present position of the actuator relative to span with 1 implied decimal place (1000=100.0%). Valid for all control modes.
uint16	Commanded position (100=10.0%)	40011	0	R	0 to 1000	Present position command of the actuator relative to span (1000=100.0%). Valid for all control modes.
uint16	Diagnostic Flags	40012	0	R	0 to 65535	Bit flags - see chart
uint6	Digital status	40013	0	R	0 to 1	0=no connection between terminals, 1=connection between terminals (Status of digital input or output)
uint32	Total Running Time (min)	40014, 40015	0	R	4294967296	Total number of minutes the actuator has been powered on since time has been reset
uint32	Total Open Time (min)	40016, 40017	0	R	4294967296	Total number of minutes the actuator has been at 100% of travel since time has been reset
uint32	Total Closed Time (min)	40018, 40019	0	R	4294967296	Total number of minutes the actuator has been at 0% of travel since time has been reset
uint32	Number of Closed (cycle count)	40020, 40021	0	R	4294967296	Total number of close cycles the actuator has performed since reset. One open/close cycle counts as 1.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

easy-Drive 200L

Instruction Manual

June 2026

D104331X012

Table A-1. easy-Drive 200L Modbus Map (continued)

Type ⁽¹⁾	Name	MB Register	Default	R/W	Values	Notes
uint16	Loss of signal position (100=10.0%)	40050	0	R/W	0 to 1001	Position to which valve plug will be driven upon loss of signal. Loss of signal is based upon the active control mode. 0 to 1000=0-100.0% with 1 implied decimal point. In on/off mode 0 to 499 will result in movement to 0% while 500 to 1000 will result in movement to 100%. A value of 1001 in any control mode is the setting for "lock-in-last."
uint16	Modbus timeout(s)	40051	60	R/W	0 to 65535	Time without a valid Modbus message is seen (to any address) before "loss of signal" motion is engaged when in Modbus control mode. Only active in Modbus control mode. 0=disabled
uint16	Dual contact timeout(s)	40052	60	R/W	0 to 3600	Time without a digital signal being low (contact made) from either digital input as viewed by voltage level on the digital input terminals. If neither contact has been made (pulled input low) within the timeout period, the valve plug will be moved to the loss-of-signal position. Only active in the local, on-off, dual contact mode. 0=disabled
uint16	Deadband (10=1.0%)	40053	5	R/W	0 to 250	Minimum percentage signal change to elicit a movement response based upon end position of last movement. For example, if the previous command resulted in the actuator moving to 31.2% of travel and deadband is set to 100 (10.0%), setpoint must command valve to 21.2% or 41.2% before valve will move to new position. Default is set to minimize signal dithering.
uint16	Low travel cutoff position (100=10.0%)	40054	50	R/W	0 to 999	Analog input command, in percent with one implied decimal (50=5.0%), below this value will result in the valve plug moving to the closed position. Active in both local and Modbus control modes.
uint16	Analog on/off close position (100=10.0%)	40055	400	R/W	0 to 999	When the valve is in 4 to 20 mA on/off mode, this value is the point at which the valve will close. It must be set to a smaller value than the analog on/off open position. Percentage position value with one implied decimal (400=40.0%).
uint16	Analog on/off open position (100=10.0%)	40056	500	R/W	1 to 1000	When the valve is in 4 to 20 mA on/off mode, this value is the point at which the valve will open. It must be set to a larger value than the analog on/off close position. Percentage position value with one implied decimal (500=50.0%).
uint16	Analog Close Value	40057	40	R	31 to 220	The analog value, in mA with one implied decimal (40=4.0 mA), that defines the closed position.

1. uint is defined as unsigned integer uint16 – unsigned 16-bit variable, can take value 0 to 65535. uint32 – unsigned 32-bit variable, can take value 0 to 4294967295. (Reserved) – registers used for development use only. † - 32-bit register contains data that spans two registers – reads and write of data needs to be performed within the same Modbus command function to ensure coherency of data.						

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Table A-2. Diagnostic Fault Flags

Hex Value	Bit Mask	Description	Value	Bit	Definition
0x8000	1000 0000 0000 0000	Fault in N.V. Memory – system has restored default settings	32768	15	A memory fault has occurred and the actuator has been restored to factory defaults. Contact your Emerson sales office .
0x8000	1000 0000 0000 0000	Fault in N.V. Memory – system has restored default settings	32768	15	A memory fault has occurred and the actuator has been restored to factory defaults. Contact your Emerson sales office .
0x4000	0100 0000 0000 0000	Motor Assembly Stall - Travel Deviation	16384	14	The actuator is unable to move to the commanded position and has stopped. Follow troubleshooting guide in Help section to remedy.
0x2000	0010 0000 0000 0000	Discrete Input override mode active	8192	13	The digital input has detected a closed contact and the actuator has moved to its safe position. Check switch input device status.
0x1000	0001 0000 0000 0000	System or Watchdog fault	4096	12	The actuator has experienced a fatal error and shut down. Contact your Emerson sales office .
0x0800	0000 1000 0000 0000	Analog Input calibration value not in expected range	2048	11	The analog values entered do not match the analog signal level. Check analog signal value and value entered.
0x0400	0000 0100 0000 0000	Valve travel distance calibration not in legal range	1024	10	The valve travel distance is outside the acceptable range. Confirm valve type and that no obstructions are present.
0x0200	0000 0010 0000 0000	Analog Input span calibration not in legal range	512	9	The analog values for open and close are less than 4 mA and previous values have been maintained. Calibrate analog input with differential >4 mA.
0x0100	0000 0001 0000 0000		256	8	- - -
0x0080	0000 0000 1000 0000	Valve was shutdown while moving	128	7	Actuator was powered down during a move and actual position may vary from commanded. Recalibrate the valve span.
0x0040	0000 0000 0100 0000	Valve span calibrated (informational)	64	6	Span has been calibrated and actuator is ready.
0x0020	0000 0000 0010 0000	Valve position controller active (informational)	32	5	Actuator is active and ready.
0x0010	0000 0000 0001 0000	Loss of signal active	16	4	Control signal not present. Signal is <3 mA, timeout period exceeded (40051 or 40052).

FISHER™

Fisher™ easy-Drive™ 200L Quick Start Guide

Mounting and travel configuration for your Fisher easy-Drive 200L actuator.

Before You Begin

Do not install, operate, or maintain a 200L actuator without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this quick start guide, including all safety cautions and warnings. Refer to the Fisher easy-Drive 200L Instruction Manual ([D104331X012](#)) for product specifications, custom setup information, maintenance procedures, and installation in hazardous locations. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

WARNING

To avoid personal injury or property damage, keep hands and tools out of the actuator stem travel path. The actuator stem will move during calibration and positioning steps.

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Note

Refer to easy-Drive 200L Instruction Manual ([D104331X012](#)) for wiring, Modbus setup and connecting the Configurator to an easy-Drive actuator as this will be needed to configure and calibrate the 200L.

Ensure Actuator Stem is in the Proper Position Prior to Mounting and Coupling

Your 200L actuator has internal hard stops to limit maximum travel within the actuator. A new actuator will be shipped from the factory at 6% off the lower internal hard stop, which is the recommended mounting position.

Note

If you are mounting a new actuator that has never been positioned and is still in its recommended mounting position of 6% of maximum travel, you can begin at step 5.

To set the stand-alone 200L actuator to the recommended mounting position of 6% of maximum travel, follow steps 1-4:

Step 1. Ensure use of a stand-alone 200L (must be actuator only, no valve body).

X1520-1

Step 2. Using the Fisher easy-Drive Configurator, select the "System" tab and then "Advanced Settings." Select the valve type "Stop-to-Stop" from the drop-down options and click "Apply."

Step 3. Perform Span Calibration from Calibration tab.

Step 4. Position actuator to 6% travel.

Note

Stop-to-Stop is used for positioning the actuator to 6% off the lower travel stop. Select proper valve type and travel after mounting the 200L to the valve body.

Mount the Actuator to the Valve Body and Couple the Stems

Note

User supplied mounting bracket and stem coupler will be needed to complete this procedure.

- Step 5. Supply a method of supporting the weight of the valve and actuator during assembly.
- Step 6. Push the valve stem down away from the actuator to the valves closed position for push down to close valves.
- Step 7. Mount the to the mounting bracket supplied by the user. Tighten the actuator locknut to 205 N•m (151lb•ft).
- Step 8. Lift or hoist the actuator and mounting bracket onto the valve and mate the mounting bracket securely to the valve following the valve manufacturer's instructions.
- Step 9. Make the stem connection between the actuator and valve stems. When installing the user-supplied stem connector, be sure the actuator stem threads engage the threads of the stem connector by a distance equal to or greater than the diameter of the actuator stem.

Refer to the easy-Drive 200L bulletin ([D104361X012](#)) for complete mounting specifications.

Select Proper Valve Type

- Step 10. Refer to valve manufacturer documentation to determine maximum valve travel. (Manufacturer specifications may vary.)

- Step 11. In the Configurator, navigate to the Calibration tab.

- Step 12. Click on the "Valve Type" and select the appropriate value that matches desired travel of the valve body for your application and is within manufacturer valve travel limits. Then click "Apply" to save the selection.

Note

Stop-to-Stop valve type selection should be avoided unless the valve is specifically designed with its own internal up and down hard stops within the valve body. Fixed travel settings are recommended and will set the travel from the valve seat (push down to close) up to a pre-defined amount of travel, e.g. '0.75" Fixed' setting, will set the full range of travel at 19 mm (0.75 inches) from the seat.

Calibrate Travel of the Actuator to the Valve Assembly

Step 13. Ensure the process and valve are in a safe state – the valve will move during the calibration steps.

Step 14. Navigate to the Calibration tab of the Configurator

Step 15. Press the “Calibrate Span” button to initiate the span calibration. The software will show a progress bar during the calibration and display “Valve Span Calibrated” when complete.

Step 16. Verify valve is closed when commanded to 0%.

Step 17. Verify full desired travel is achieved when commanded to 100% by confirming “Actual Position” in the Configurator is 100%.

Note

If actuator cannot achieve desired travel, review steps 5-12 to ensure all steps were followed, validate proper Configurator selections were made, and confirm the stems were properly coupled.

The valve/actuator assembly is now ready to be put into operation. If the 200L is not operating properly contact your [Emerson sales office](#).

Introduction

Scope of Manual

This instruction manual provides installation, maintenance, and parts information for the easy-Drive 200R. Do not install, operate, or maintain an easy-Drive 200R without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The easy-Drive 200R electric rotary actuators are used on rotary-shaft valve bodies for throttling or on-off applications. The 200R has an ISO 5211 mating interface that allows installation to non-Fisher valves. Style F mounting is available for coupling with Fisher rotary valves. This actuator is ideal for use on pressure and flow control applications for Fisher Vee-Ball NPS 1-6, HPBV NPS 2-4 and non-Fisher 90° rotary valves with 9 mm, 11 mm, 14 mm, or 19 mm square shaft connections, and 5/8-inch or 3/4-inch splined shaft connections. In applications that require a known loss of power position, an RPU-100 can be used to drive the easy-Drive actuator open or closed. Consult the easy-Drive RPU-100 Instruction Manual ([D104551X012](#)).

Table 1. Specifications

Material Temperature Capabilities⁽¹⁾ Electric Actuator Assembly: -40 to 70°C (-40 to 158°F)	Torque⁽⁵⁾ Rated: 124 N • m (1100 in • lbf)
Available Actuator Configurations⁽⁴⁾ Positioning	Nominal Stroke Speed⁽²⁾ 9° per second at 24 VDC
Compatible Fisher Valve Types and Sizes See tables 2 and 3	Hazardous Area Approvals CSA (C/US): Explosion-Proof Class I, Division 1, Groups C and D, T6, Ex db IIB T6, Class I, Zone 1, AEx db IIB T6 ATEX Flameproof - Gas: ⚠ II 2 G, Ex db IIB T6 Gb IECEx Flameproof - Gas: Ex db IIB T6 Gb
Power Requirements 11-30 VDC, minimum 2.7 amp power supply required (fuse to 5 amps)	Enclosure Rating Type 4X and IP66
Maximum Current Draw ■ 2.3 amps	Duty Cycle 50% maximum
Idle Current Draw ■ 15 mA at 24 VDC ■ 25 mA at 12 VDC	Enclosure Material Cast aluminum alloy with powder coat paint
Conduit Connections Two 3/4 NPT connections	Approximate Weight: 17.7 kg (39 lbs)
Travel⁽³⁾ Rated: 1/4 turn, 90°	

1. The temperature limits in the referenced tables and any applicable code or standard limitations should not be exceeded.

2. Variation can be expected, based on temperature and pressure of application.

3. Actuator is capable of 14° of over-travel (104° of total travel) for travel stop adjustment and valve zeroing.

4. Not compatible for use with valve assemblies that include a handwheel or manual actuator.

5. Not intended for applications where process conditions could produce torque beyond the rated torque.

Table 2. Compatible Fisher Valve Types and Sizes for Square Shaft Connection

VALVE TYPE	VALVE SIZE, NPS	SQUARE SHAFT CONNECTION SIZE (mm)
V150, V150E, V200, and V300	1	9
	1-1/2 and 2	11
	3 and 4	14
	6	19
8580	2	9
	6	19
8580 and 8590	3	11
	4	14

Table 3. Compatible Fisher Valve Types and Sizes for Splined Shaft Connection (Retro-fit Only)⁽¹⁾

VALVE TYPE	VALVE SIZE, NPS	SPLINE SHAFT CONNECTION SIZE (Inch)
V150, V150E, V200, and V300	1-1/2 and 2	5/8
	3 and 4	3/4
8580 and 8590	3	5/8
	4	3/4

1. Mounting bracket not supplied with splined shaft adaptor.

Specifications

Table 1 lists specifications for the easy-Drive 200R. Some of the specifications for a given actuator as it originally comes from the factory are stamped on a nameplate located on the lower actuator enclosure.

Security

NOTICE

Physical security is an important part of any security program and is fundamental to protecting your system.

Unauthorized personnel may potentially cause significant damage to and/or misconfiguration of end users' equipment. This could be intentional or unintentional and must be protected against by restricting access to unauthorized personnel in your facility.

- If unsecured, any device in the field is vulnerable to a physical attack; safety and security procedures must include mitigation by physical security controls.
- The easy-Drive actuator has optional Configurator software for configuration and data viewing. When the Configurator software is used, it must run on devices that are configured according to local security policies.
- Ensure that operation personnel are trained both on local security policies and the secure operation of the easy-Drive actuator.
- Operate the device within a controlled and secured physical environment.
- Operate the easy-Drive actuator and Configurator software within a controlled and secured network environment.
- Apply security patches and updates as they are released.
- Report security incidents and potential product vulnerabilities.
(https://go.emersonautomation.com/reportvulnerability_en)
- Follow local disposal policy for securely disposing of an unneeded device.

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage caused by bursting of pressure-retaining parts or by uncontrolled process fluid, be certain the service conditions do not exceed the limits shown on the valve nameplate and in table 1. Use pressure-relieving devices required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

⚠ WARNING

For explosion-proof applications, ensure the actuator cover is properly bolted before applying power to the actuator. Personal injury or property damage may result from fire or explosion if power is applied to the actuator with the cover removed in a hazardous area. Do not remove cover(s) or make live connections unless the area is known to be non-hazardous.

For explosion-proof applications, install rigid metal conduit and a conduit seal no more than 457 mm (18 in) from the actuator. Personal injury or property damage may result from explosion if the seal is not installed.

Select wiring and/or cable glands that are rated for the environment of use (such as hazardous area, ingress protection, and temperature). Failure to use properly rated wiring and/or cable glands can result in personal injury or property damage from fire or explosion.

Wiring connections must be in accordance with local, regional, and national codes for any given hazardous area approval. Failure to follow the local, regional, and national codes could result in personal injury or property damage from fire or explosion.

⚠ WARNING

Avoid personal injury or property damage caused by possible actuator failure. The use of a rigidly-mounted support on the actuator casing may cause additional stress on the actuator leading to premature wear and/or failure of the actuator components.

1. The easy-Drive 200R can be installed in any position. Install the valve per the manufacturer's guidelines and per any applicable local, regional, and national piping codes.
2. For explosion-proof applications, install rigid metal conduit and seal no more than 457 mm (18 in) from the actuator.
3. Plastic conduit ports provided by factory are to be removed prior to operation and replaced with an explosion-proof port plug.

Special Instructions for “Safe Use” and Installations in Hazardous Locations

⚠ WARNING

To avoid static discharge from the enclosure, do not rub or clean the enclosure with solvents. To do so could result in an explosion. Clean with a mild detergent and water only.

The enclosure is non-conducting and may generate an ignition-capable level of electrostatic charges under certain extreme conditions. The user should ensure that the equipment is not installed in a location where it may be subjected to external conditions (such as high-pressure steam) which might cause a build-up of electrostatic charges on non-conducting surfaces. Additionally, cleaning of the equipment shall only be done with a damp cloth.

To avoid damage to the enclosure, when screws are fully tightened into blind holes in enclosure walls, with no washer fitted, at least one full thread shall remain free at the base of the hole.

Flame proof joints are not intended to be repaired. To ensure safe use in hazardous locations, do not attempt to repair the upper enclosure (key 3), lower enclosure (key 2) or output shaft assembly (key 5). Contact your [Emerson sales office](#) for more information.

Actuator Mounting

The following procedure describes how to mount an easy-Drive 200R actuator.

Standalone actuators will be shipped with the shaft adaptor at the configured loss of signal position.

User designed and manufactured Mounting Kit and Stem Coupler will be needed to complete this procedure.

⚠ WARNING

Avoid personal injury from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

⚠ WARNING

To avoid personal injury and equipment damage from moving parts, keep fingers and tools clear while stroking the actuator in the following steps.

NOTICE

To avoid damage to the 200R actuator, do not install on a valve assembly that includes a handwheel or manual actuator.

1. Supply a method of supporting the weight of the valve and actuator during assembly.
2. Manually rotate the valve shaft to the loss of signal position.
3. Mount the easy-Drive 200R to the mounting kit designed and supplied by the user.
4. Lift or hoist the actuator and mounting assembly onto the valve and mate the mounting kit securely to the valve following the valve manufacturer's guidelines.
5. Make the shaft connection between the actuator coupler and valve shaft.
 - a. When installing the user-supplied shaft connector the actuator shaft coupler should fully engage the valve shaft by a distance equal to or greater than the diameter of the actuator stem.

NOTICE

Be sure that the output shaft adaptor on the actuator and valve shaft are completely engaged. Do not attempt to remove the shaft adaptor when force is applied to the shaft.

6. Configure the actuator to the appropriate mode using the easy-Drive configurator tool. See Valve Type Configuration section of this manual.
7. Externally adjustable travel stops are used to limit the degree of rotation at both ends of the actuator stroke to calibrate valve to the actuator.
8. Calibrate the actuator. See Calibration Instructions section of this manual.

Figure 2. Fisher easy-Drive 200R

MOTOR AND GEAR CASE ASSEMBLY

**MOTOR AND GEAR CASE ASSEMBLY
INCLUDING GEN2 CONTROL BOARD
AND RPU-100**

Figure 3. Fisher easy-Drive 200R Wiring Diagram

Power Requirements

Ensure a stable DC power source is available, maintaining less than 5% ripple and sufficiently surge protected for the application. A 2.7A (minimum) power supply is required, fused to 5A. 12 VDC or 24 VDC is typical.

NOTICE

Misconfiguration of the valve type when powering the control board could result in damage to the valve or actuator. Ensure proper configuration and decommissioning are performed when installing, removing, or configuring a control board.

Wiring Instructions

1. Observe local wiring requirements for hazardous location usage.
2. Ensure power is turned off before connecting the wires.
3. Conduit seals within 450 mm (18 inches) of the enclosure port are required for explosion-proof installation.
4. 18 AWG (0.52 mm²) to 12 AWG (3.31 mm²) wire size required.
5. Fuse system to 5A.
6. Connect enclosure and analog signal shields.

Power

1. Connect 12 or 24 VDC reference to: –
2. Connect 12 or 24 VDC positive to: +
3. Be sure to tighten terminals sufficiently to ensure solid mechanical connection.

Figure 4. Wiring - Analog Input

Figure 5. Wiring - Dual Dry Contact

Figure 6. Wiring - Single Dry Contact

Figure 7. Wiring - Modbus Input

Figure 8. Wiring - Auxiliary Digital I/O set to input (40080=0)

Figure 9. Wiring - Auxiliary Digital I/O set to output

Configuration

The easy-Drive 200R must be configured prior to operation.

All configuration within the actuator is done by setting values in Modbus registers. Configuration software, providing a visual interface to the registers, is available through your Emerson sales office or at www.emerson.com/en-us/catalog/fisher-200R. Control and monitoring can be done using any Modbus master (flow computer, PLC, PC).

See Appendix A for a full map of Modbus registers and their functions.

Control Method Configuration

There are two functional configurations available for the easy-Drive electric actuator: On/Off and Positioning.

All available input signals are shown in table 4.

Table 4. All Available Input Signals

CONFIGURATION	ON/OFF			POSITIONING	
Control Source	Modbus	Local		Modbus	Local
Input Signal	Modbus	Dual Dry Contact (default)	Single Dry Contact	Modbus	4-20 mA (default)

Modbus Setup

Use of a serial or USB to RS-485 device is required to connect to the actuator. Refer to manufacturer's requirements for installation. The easy-Drive 200R Modbus factory defaults are Address 1, 9600 baud, even parity, 1 stop bit, MSB.

When a connection has been achieved, the actuator may be configured as required for the application.

Figure 10. Fisher easy-Drive Configuration Software

Connecting Using the Fisher easy-Drive Configuration Software

The Fisher easy-Drive Configurator software allows configuration and diagnosing of the Fisher easy-Drive electric actuator with a graphical interface. Connect a PC to the actuator using a serial or USB to RS-485 device using the wiring instructions above. The USB or serial device will be visible in the drop menu under Serial Port in the Manual Computer Connection settings. Address baud rate, parity, stop bits, and byte order should be set to the Modbus settings of the actuator. See Modbus Setup above for default actuator settings. Press the AUTO button in the upper left corner to attempt to scan for and enable from the Preferences in the upper right.

Use the Fisher easy-Drive configuration software (figure 10) to make the desired changes, or register values may be changed to allow different functionality.

Valve Type Configuration

- Valve Type
 - Rotary: CW (clockwise to close)
 - Rotary: CCW (counterclockwise to close)

Figure 11. Fisher easy-Drive Configuration Software

The easy-Drive 200R limits travel using hard stops that define the full range (max 104° rotation). Adjustable Travel Stops are provided to allow for adjustments to travel to meet the application requirements, and for valve alignment/calibration. See Actuator Mounting Section for more information on configuring the adjustable travel stops.

Initial Setup

The control method selection determines the control signal to which the valve will respond. Only the control signal selected will result in movement of the valve; all others will be ignored.

- Control Methods
 - Dual Contact On/Off
 - Dual Contact Stepped Control
 - Single Contact On/Off
 - Modbus On/Off
 - Modbus Positioning
 - 4-20mA Positioning
 - 4-20mA Level
 - 4-20mA Virtual Stops

When using the easy-Drive Configuration Tool, clicking on the “Control Method” box will create a drop down menu as shown. Select the desired control source; the selection will turn yellow. A box with Pending Changes will appear showing all changes. Press “APPLY” to confirm the change(s).

Figure 12. Fisher easy-Drive Configuration Software

Calibration Instructions

⚠ WARNING

To avoid personal injury or property damage, be aware that the valve will move during the calibration cycle.

NOTICE

A mismatch between the Configurator and valve type may cause damage to the actuator.

Span Calibration

It will be necessary to perform a span calibration. A span calibration is accomplished by the following method:

Note

If the actuator is equipped with a RPU-100, the RPU-100 must be disabled via the Disable switch prior to powering off the actuator.

1. Ensure the process and valve are in a safe state – the valve may move during this operation.
2. Press the “CALIBRATE SPAN” button to initiate the span calibration. The software will show a progress bar during the calibration and display “Valve Span Calibrated” when complete.

Note

Should actual travel not equal the expected travel you will receive a span calibration failure alert. See figure 13. Ensure valve type is selected correctly. It may be necessary to re-couple the valve actuator assembly.

Figure 13. Fisher easy-Drive Configuration Software

Span Calibration without the use of Modbus

1. Turn power to the actuator off.
2. Wait for 10 seconds to ensure all circuits have discharged.
3. Return power to the actuator and use the appropriate calibration method for your control signal. Calibration sequence must be done within 15 seconds of power being switched on.
4. For positioning operation using direct acting 4-20 mA:
 - a. Apply a fully closed signal between pins 4-20 mA - and 4-20 mA +. If Span is currently uncalibrated, valve ball/disk will not move at this time.
 - b. Apply a fully open signal between pins 4-20 mA - and 4-20 mA +. If Span is currently uncalibrated, valve ball/disk will not move at this time.
 - c. Apply a fully closed signal between pins 4-20 mA - and 4-20 mA + – valve ball/disk will move its fully opened position, followed by moving to its closed position.
 - d. If calibration of the analog input is desired to improve positional accuracy, an optional operation is listed in the next section titled Analog Input Calibration.

5. For On/Off operation using dual-input dry contact:

- Close the contact to create a short between pins COMMON and CLOSE. If Span is currently uncalibrated, valve ball/disk will not move at this time.
- Close the contact to create a short between pins COMMON and OPEN. If Span is currently uncalibrated, valve ball/disk will not move at this time.
- Close the contact to create a short between pins COMMON and CLOSE – valve ball/disk will move to its fully opened position, followed after a delay by moving to its closed position.

6. For On/Off operation using single dry contact:

- Open the contact to create an open circuit between pins COMMON and OPEN. If Span is currently uncalibrated, valve ball/disk will not move at this time.
- Close the contact to create a short between pins COMMON and OPEN. If Span is currently uncalibrated, valve ball/disk will not move at this time.
- Open the contact to create an open circuit between pins COMMON and OPEN – valve plug will move to its fully opened position, followed after a delay by moving to its closed position.

7. The unit is now calibrated.

Analog Input Calibration

For valves using 4-20 mA as a control source, several options are available to customize control of the actuator. Use a 4-20 mA signal generator to provide the desired signal. It is possible to calibrate the 4-20 mA signal in reverse acting or split-ranging with the method below with at least 4 mA of signal difference between the close and open values. The example shows a valve being changed from normal to reverse acting during the calibration process.

- With the Control Method set to 4-20 Positioning or 4-20 mA Level, enter the Calibration screen and the 4-20 mA Signal Calibration window will be visible.
- Click the CALIBRATE CLOSE & OPEN VALUES button. A separate window will open to guide through the process.
- Set the 4-20 mA signal to the desired value for when the valve is to be closed.
- Enter this value into the Calibrated mA Signal text box and press Next.

Figure 14. Fisher easy-Drive Configuration Software

5. Set the 4-20 mA signal to the desired value for when the valve is to be open.
6. Enter this value into the Commanded mA Signal text box and press Next.

Figure 15. Fisher easy-Drive Configuration Software

7. If the Close and Open values are as expected, press Confirm to accept these values. If not, press Cancel to restart the process.

Note

The value of the 4-20 mA signal must have at least 4 mA difference between the close and open signals. A differential less than that amount will cause the actuator to reject the calibration and use the previous values.

Should the entered values vary more than 10% from the expected 4-20 mA values; the actuator will accept the calibration and a Notification displaying "Questionable Analog Calibration" will result.

Figure 16. Fisher easy-Drive Configuration Software

Operational Verification

⚠ WARNING

To avoid personal injury or property damage, be aware that the valve will move and respond to an input signal during start up.

1. Before turning on power to the unit, be sure that a closed signal is being commanded to the unit.
 - Single Dry-Contact: contact is open.
 - Dual Dry Contact: Contact closed across pins COMMON and CLOSE.
 - Analog Input: signal = 4 mA.
 - Modbus: position demand = 0.
2. Turn on power to the unit.
3. Apply a change in position demand to ensure unit responds properly.
 - Single Dry-Contact:
 - Closed contact between pins COMMON and OPEN will open the valve.
 - Dual dry contact: Closed contact between pins COMMON and OPEN will open the valve. Closed contact between pins COMMON and CLOSE will close the valve.
 - Analog Input: valve will respond to proportional demand.
 - Modbus: valve will respond to positional demand in register 40001. 0 = fully closed and 1000 = fully open.
4. If the valve does not respond as expected, proceed to Troubleshooting guide of this instruction manual.
5. Check conduit ports
 - Conduit seal must be in place within 450 mm (18 in) of the enclosure.
 - Unused conduit ports must be sealed with an explosion-proof port plug.
6. Replace the cover and tighten all 10 bolts to 40.7 N•m (30 ft•lbs).

Troubleshooting

1. Unit does not move.
 - a. Green heartbeat LED will pulse near Modbus terminals when power is present. Verify the 12VDC to 24VDC is present on the power terminals as shown on the cover.
 - b. Verify all wires are firmly attached on both ends, screw terminals are fully screwed down and wire gauge is sufficient for length of wiring.
 - c. Verify the wires are connected to the correct terminals - see Wiring in the manual.
 - d. Verify the configured control method matches control signal.
 - e. Verify the configured valve type matches the mounted valve.

2. Unit does not respond to 4-20 mA signal
 - a. Green heartbeat LED will pulse near Modbus terminals when power is present. Verify the 12VDC to 24VDC is present on the power terminals as shown on the cover.
 - b. Verify all wires are firmly attached on both ends.
 - c. Verify the wires are connected to the correct terminals - see Wiring in the manual.
 - d. Verify the configured control method matches control signal.
 - e. Check the analog input control value. If the value is 0, the 4-20 mA may be wired backwards. Swap wire and attempt again.
3. Unit does not respond to Modbus signal.
 - a. Green heartbeat LED will pulse near Modbus terminals when power is present. Verify the 12VDC to 24VDC is present on the power terminals as shown on the cover.
 - b. Verify all wires are firmly attached on both ends.
 - c. Verify the wires are connected to the correct terminals. See Wiring section of this instruction manual.
 - d. Verify the configured control method matches control signal.
 - e. Verify multiple Modbus devices are not using the same Modbus address.
4. Unit does not communicate with easy-Drive Configurator software.
 - a. Ensure appropriate drivers are installed for RS-485 modem.
 - b. Verify multiple Modbus devices are not using the same Modbus address.
 - c. Ensure RS-45 modem is functional and compatible.
5. Diagnostics show a Motor Stall - Travel Deviation Fault.
 - a. If the actuator can not move to its commanded position, the actuator will stop, without damage, and issue a Motor Stall - Travel Deviation Fault warning. When the command signal changes outside of the deadband (Modbus register 40053), it will attempt to move again.

Maintenance

The frequency of inspection and maintenance depends on the severity of the service conditions.

⚠ WARNING

Avoid personal injury from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Back plug away from seat to relieve spring compression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

⚠ WARNING

For explosion-proof applications, ensure the actuator cover is properly bolted before applying power to the actuator. Personal injury or property damage may result from fire or explosion if power is applied to the actuator with the cover removed in a hazardous area.

For explosion-proof applications, install rigid metal conduit and a conduit seal no more than 457 mm (18 in) from the actuator. Personal injury or property damage may result from explosion if the seal is not installed.

Select wiring and/or cable glands that are rated for the environment of use (such as hazardous area, ingress protection, and temperature). Failure to use properly rated wiring and/or cable glands can result in personal injury or property damage from fire or explosion.

Wiring connections must be in accordance with local, regional, and national codes for any given hazardous area approval. Failure to follow the local, regional, and national codes could result in personal injury or property damage from fire or explosion.

Disassembly

1. Follow valve manufacturer's warnings and instructions for isolating and releasing line pressure prior to disassembling the valve.

NOTICE

The following steps are intended to prevent damage to the valve during the removal of the yoke and actuator.

Note

If the actuator is equipped with a RPU-100, the RPU-100 must be disabled via the Disable switch prior to powering off the actuator.

2. Remove any positioning licenses to a license dongle if you wish to use them on a different device.
3. Perform a Restore to Defaults operation on the control board if the control board is to be used on a different actuator.

Figure 17. Fisher easy-Drive Configuration Defaults

4. Remove actuator and mounting kit from the valve body.

Assembly

1. Connect actuator and mounting bracket to valve body.
2. Replace the top of the explosion proof enclosure (key 3) and tighten cap screws (key 32) to 40.7 N • m (30 lbf • ft).

Parts Ordering

Each easy-Drive 200R actuator is assigned a serial number, which can be found on the nameplate. Refer to the number when contacting your [Emerson sales office](#) for assistance or when ordering replacement parts.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher actuator, because they may void your warranty, might adversely affect the performance of the actuator, and could cause personal injury and property damage.

Parts Kits

KIT NAME	PART NUMBER
Board Replacement Kit (On/Off is default)	GE83055X012
Board Replacement Kit + Positioning License Dongle	GE83126X012
Motor/Gearbox Assembly	GE84237X012

Figure 21. Fisher easy-Drive 200R Mounting Positions

**POSITION 1
(PREFERRED)**

POSITION 2

POSITION 3

POSITION 4

Actuator Mounting Configuration (Figure 21)

Position 1 is preferred for both right or left hand mounted options. This has the conduit ports facing down below the centerline of the valve body, and the 210.1 mm (8.72 in) dimension of the actuator above the centerline of the valve, in either configuration. A vertical mounted orientation may be used if desired but may not be recommended for the trim wear of the intended valve assembly.

Note

Refer to the Instruction manual of the valve body to determine which position the valve can be oriented for optimal performance and life of trim parts.

Appendix A - Modbus

A.1 Register Summary

Table 5. easy-Drive 200R Modbus Map

Type ⁽¹⁾	Name	MB Register	Default	R/W	Values	Notes
uint16	Modbus position command (100=10.0%)	40001	0	R/W	0-1000	Modbus command value with one implied decimal place (1000=100.0%). R/W at all times but only used in Modbus control mode. In on/off mode 0-499 will result in a move to 0% and 500-1000 will result in a move to 100%.
uint16	Digital output	40002	0	R/W	0,1	0=no voltage supplied to terminals, 1=voltage supplied to terminals (Only used when output setup is set for Remote controlled)
uint16	Reset error codes	40003	0	R/W	0,1	Value of 1 will clear faults. Will automatically set back to 0.
uint16	RESERVED	40004				
uint16	RESERVED	40005				
uint16	RESERVED	40006				
uint16	RESERVED	40007				
uint16	RESERVED	40008				
uint16	RESERVED	40009				
uint16	Actual position (100=10.0%)	40010	0	R	0-1000	Present position of the actuator relative to span with 1 implied decimal place (1000=100.0%). Valid for all control modes.
uint16	Commanded position (100=10.0%)	40011	0	R	0-1000	Present position command of the actuator relative to span (1000=100.0%). Valid for all control modes.
uint16	Diagnostic Flags	40012	0	R	0-65535	Bit flags - see Table 6
uint16	Digital status	40013	0	R	0 - 1	0=no connection between terminals, 1=connection between terminals (Status of digital input or output)
uint32	Total Running Time (min)	40014, 40015	0	R	4,294,967,296	Total number of minutes the actuator has been powered on since time has been reset
uint32	Total Open Time (min)	40016, 40017	0	R	4,294,967,296	Total number of minutes the actuator has been at 100% of travel since time has been reset
uint32	Total Closed Time (min)	40018, 40019	0	R	4,294,967,296	Total number of minutes the actuator has been at 0% of travel since time has been reset
uint32	Number of Closed (Cycle count)	40020, 40021	0	R	4,294,967,296	Total number of close cycles the actuator has performed. One open/close cycle counts as 1.
uint32	Number of Power Cycles	40022, 40023	0	R	4,294,967,296	Total number of times the actuator has been powered on.
uint32	Number of Movements	40024, 40025	0	R	4,294,967,296	Total number of movements the actuator has performed. Move must be at least 5% of rated travel for cycle to increment.
uint16	Analog input control value	40026	0	R	0-2400	Value of the analog signal in mA with 2 implied decimals. In analog control mode, this is the command value and is subject to the analog settings in registers 40046 to 40059. Always active but a slower refresh rate when unit is not in analog control mode.
uint16	Incoming voltage	40027	0	R	0-350	Diagnostic register - value of incoming voltage with 1 implied decimal. Future plans are to have this available in a historian type register.
uint16	Latch Open State	40028	0	R	0 - 1	Normally open latch state
uint16	Latch Close State	40029	0	R	0 - 1	Normally closed latch state
uint16	Dual Contact Stepped Status	40030		R	0-10	Current status of Dual Contact Stepped Control. 0=Closed, 1=At first position, 2=At second position, 3=At third position, 4-7=RESERVED, 8=Override close, 9=Override open, 10=At Loss of Signal/Power Position

uint16	RESERVED	40039				
uint16	Test Register - 16 bit	40040	45964	R	45964	Fixed register to test correct reading of 16 bit registers - Hex=B38C, Binary=1011001110001100
uint32	Test Register - 32 bit	40041, 40042	3,012,341,331	R	3,012,341,331	Fixed register to test correct reading of 32 bit registers - Hex=B38C AE53, Binary=1011001110001100 1010111001010011
uint16	Span calibration	40043	0	R/W	0,1	Value of 1 will initiate span calibration. Will automatically set back to 0.
uint16	RESERVED	40044				
uint16	RESERVED	40045				
uint16	RESERVED	40046				
uint16	RESERVED	40047				
uint16	RESERVED	40048				
uint16	RESERVED	40049				
uint16	Loss of signal position (100=10.0%)	40050	0	R/W	0-1001	Position to which valve plug will be driven upon loss of signal. Loss of signal is based upon the active control mode. 0-1000=0-100.0% with 1 implied decimal point. In on/off mode 0-499 will result in movement to 0% while 500-1000 will result in movement to 100%. A value of 1001 in any control mode is the setting for "lock-in-last".
uint16	Modbus timeout (s)	40051	60	R/W	0-65535	Time without a valid Modbus message is seen (to any address) before "loss of signal" motion is engaged when in Modbus control mode. Only active in Modbus control mode. 0=disabled
uint16	Dual contact timeout (s)	40052	60	R/W	0-3600	Time without a digital signal being low (contact made) from either digital input as viewed by voltage level on the digital input terminals. If neither contact has been made (pulled input low) within the timeout period, the valve plug will be moved to the loss-of-signal position. Only active in the local, on-off, dual contact mode. 0=disabled.
uint16	Deadband (10=1.0%)	40053	5	R/W	0-250	Minimum percentage signal change to elicit a movement response based upon end position of last movement. For example, if the previous command resulted in the actuator moving to 31.2% of travel and deadband is set to 100 (10.0%), setpoint must command valve to 21.2% or 41.2% before valve will move to new position. Default is set to minimize signal dithering.
uint16	Low travel cutoff position (100=10.0%)	40054	50	R/W	0-999	Analog input command below this value will result in the valve plug moving to the closed position. Always active in Modbus and 4-20mA Positioning control modes, active in 4-20mA Virtual Stop Positioning if Lower Virtual Hard Stop is disabled (0).

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

easy-Drive 200R

April 2024

Instruction Manual

D104742X012

Table 5. easy-Drive 200R Modbus Map (cont.)

Type	Name	MB Register	Default	R/W	Values	Notes
uint16	Digital I/O input setup	40082	0	R/W	0,1	Valid only when Digital I/O selection is set to Input (0) - 0=Reference only (status appears in 40013 and does nothing else), 1=Override (status appears in 40013 and valve plug is moved to safe position noted in register 40050)
uint16	Dual Contact Stepped Position 1	40083	1000	R/W	0-1001	When dual contact is Open, the actuator will first move to this position. It will remain at this position for the number of seconds specified in Dual Contact Stepped Time at Position 1, or until dual contact is closed. If Position is 1001, this position is disabled and the next position will be considered.
uint16	Dual Contact Stepped Position 2	40084	1001	R/W	0-1001	When dual contact is Open, the actuator will move to this position following position 1. It will remain at this position for the number of seconds specified in Dual Contact Stepped Time at Position 2, or until dual contact is closed. If Position is 1001, this position is disabled and the next position will be considered.
uint16	Dual Contact Stepped Position 3	40085	1001	R/W	0-1001	When dual contact is Open, the actuator will move to this position following position 2. It will remain at this position until dual contact is closed. If Position is 1001, this position is disabled and the actuator will close upon reaching this position.
uint16	Dual Contact Stepped Time at Position 1	40086	6001	R/W	1-60001	The time in seconds to remain at Dual Contact Stepped Position 1 before moving to Dual Contact Stepped Position 2. If time is 60001, this position will be held until dual contact is closed.
uint16	Dual Contact Stepped Time at Position 2	40087	6001	R/W	1-60001	The time in seconds to remain at Dual Contact Stepped Position 2 before moving to Dual Contact Stepped Position 3. If time is 60001, this position will be held until dual contact is closed.
uint16	Dual Contact Stepped Override	40088	0	R/W	0-2	If configured to a non-zero value (Off), the actuator will move to the position specified regardless of the Dual Contact Stepped Control Status. Options are 0=Off, 1=Close, 2=Open. This does not take precedence over loss of signal/power positioning.

Table 5. easy-Drive 200R Modbus Map (cont.)

Type	Name	MB Register	Default	R/W	Values	Notes
uint32	Motor test date	40134, 40135	0	R/W*	0-4,294,967,296	Seconds since January 1, 2000, Motor Supplier Test Date
uint32	System completion date	40136, 40137	0	R/W*	0-4,294,967,296	Seconds since January 1, 2000, Final Assembly Test Date

1. uint is defined as unsigned integer
 uint16 – unsigned 16 bit variable, can take value 0-65535.
 uint32 – unsigned 32 bit variable, can take value 0-4294967295.
 (Reserved) – registers used for development use only.

† - 32bit register contains data that spans two registers – reads and write of data needs to be performed within the same Modbus command function to ensure coherency of data.

Table 6. Diagnostic Fault Flags

Hex Value	Bit Mask	Description	Value	Bit	Definition
0x8000	1000 0000 0000 0000	Fault in N.V. Memory – system has restored default settings	32768	15	A memory fault has occurred and the actuator has been restored to factory defaults. Contact your Emerson sales office .
0x4000	0100 0000 0000 0000	Motor Assembly Stall - Travel Deviation	16384	14	The actuator is unable to move to the commanded position and has stopped. Follow troubleshooting guide in Help section to remedy.
0x2000	0010 0000 0000 0000	Discrete Input override mode active	8192	13	The digital input has detected a closed contact and the actuator has moved to its safe position. Check switch input device status.
0x1000	0001 0000 0000 0000	System or Watchdog fault	4096	12	The actuator has experienced a fatal error and shut down. Contact your Emerson sales office.
0x0800	0000 1000 0000 0000	Analog Input calibration value not in expected range	2048	11	The analog values entered do not match the analog signal level. Check analog signal value and value entered.
0x0400	0000 0100 0000 0000	Valve travel distance calibration not in legal range	1024	10	The valve travel distance is outside the acceptable range. Confirm valve type and that no obstructions are present.
0x0200	0000 0010 0000 0000	Analog Input span calibration not in legal range	512	9	The analog values for open and close are less than 4 mA and previous values have been maintained. Calibrate analog input with differential >4 mA.
0x0100	0000 0001 0000 0000		256	8	
0x0080	0000 0000 1000 0000	Valve was shutdown while moving	128	7	Actuator was powered down during a move and actual position may vary from commanded. Recalibrate the valve span.
0x0040	0000 0000 0100 0000	Valve span calibrated (informational)	64	6	Span has been calibrated and actuator is ready.
0x0020	0000 0000 0010 0000	Valve position controller active (informational)	32	5	Actuator is active and ready.
0x0010	0000 0000 0001 0000	Loss of signal active	16	4	Control signal not present. Signal is <3 mA, timeout period exceeded (40051 or 40052).
0x0008	0000 0000 0000 1000		8	3	
0x0004	0000 0000 0000 0100	Modbus command has been sent (starts a calibrated system)	4	2	The actuator is successfully moving the valve.
0x0002	0000 0000 0000 0010	Analog input initialized (system has seen input >3 mA/1 V)	2	1	4-20 mA analog input has a valid signal present.
0x0001	0000 0000 0000 0001	Start delay active (within 15 second calibration window)	1	0	Span calibration using physical inputs allowed during startup.

Introduction

Scope of Manual

This instruction manual provides product information including installation for the Fisher easy-Drive RPU-100. For Fisher easy-Drive actuators refer to the appropriate easy-Drive actuator instruction manual. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Description

The easy-Drive RPU-100 is a reserve power unit designed to provide backup power to the easy-Drive actuator upon loss of incoming power. The RPU-100 provides enough power to the actuator to allow the actuator to drive the valve to the pre-defined loss of power or loss of signal position. The RPU-100 can be ordered with a new easy-Drive assembly or be retrofit into existing easy-Drive units that have the Gen2 control board.

Related Documents

This section lists other documents containing information related to the easy-Drive RPU-100. These documents include:

- Fisher easy-Drive 200L Instruction Manual ([D104331X012](#))
- Fisher easy-Drive 200R Instruction Manual ([D104742X012](#))
- Fisher D3 Valve with Gen 2 easy-Drive Actuator Instruction Manual ([D104161X012](#))
- Fisher D4 Valve with Gen 2 easy-Drive Actuator Instruction Manual ([D104188X012](#))

Product Operation

The easy-Drive RPU-100 will begin charging once valid power ($\geq 11\text{VDC}$) is received. Once the RPU-100 is charged, it will pass power through to the easy-Drive actuator. Upon loss of power the RPU-100 will interrupt the control signals commanding the actuator to move to the defined loss of power/signal position. The RPU-100 will provide power to the actuator for 120 seconds to ensure enough time to complete move and then power down.

The easy-Drive RPU-100 will determine when it is sufficiently charged. Charge time will depend on the application and/or power used to perform a back up. A minimum charge time is enforced.

Product Interfaces

Enable / Disable Switch

The switch enables or disables the functionality of the RPU. When the switch is in the “disable” position the RPU-100 will continue to pass line power through to the actuator and charge but will not provide backup capability upon loss of power.

Figure 2. Fisher easy-Drive RPU-100 Switch

easy-Drive User Interface

The easy-Drive configurator is available on the Emerson [easy-Drive](#) product website or [Fisher.com](#).

Figure 4. Fisher easy-Drive Configuration Software

Loss Detect

The loss detect is a user defined time the RPU-100 will wait to verify loss of power before performing a backup operation. This time is configurable between 0.05 and 3.00 seconds. The default is 0.250 seconds.

Status Output

The status output is a discrete output that indicates the overall status of the RPU-100. If the output is on, (connection made) this indicates the RPU-100 is operational. If the output is off, additional information can be found in the Modbus diagnostic fault flags register.

See the Mounting section of this manual for wiring details.

Installation

⚠ WARNING

Avoid personal injury from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- For linear actuator, back plug away from seat to relieve spring compression.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve. If an RPU-100 is already installed, move the switch to the disable position to prevent movement of the valve by the RPU-100.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

⚠ WARNING

- For explosion-proof applications, ensure the actuator cover is properly bolted before applying power to the actuator. Personal injury or property damage may result from fire or explosion if power is applied to the actuator with the cover removed in a hazardous area.
- For explosion-proof applications, install rigid metal conduit and a conduit seal no more than 457 mm (18 in) from the actuator. Personal injury or property damage may result from explosion if the seal is not installed.
- Select wiring and/or cable glands that are rated for the environment of use (such as hazardous area, ingress protection, and temperature). Failure to use properly rated wiring and/or cable glands can result in personal injury or property damage from fire or explosion.
- Wiring connections must be in accordance with local, regional, and national codes for any given hazardous area approval. Failure to follow the local, regional, and national codes could result in personal injury or property damage from fire or explosion.
- To avoid exposure hazard or release of toxic gases, DO NOT disassemble, subject to heat above 100°C (212°F), or incinerate the RPU-100.

Note

End user must ensure a power supply voltage of 11-30VDC after retrofitting an easy-Drive electric actuator with the RPU-100 to maintain the actuator's CSA hazardous area approval.

Product Security

It is the end-user's responsibility to provide a secure facility with limits to operating equipment.

Facility cyber security practices should include keeping the Fisher easy-Drive Configurator up to date.

Mounting

The RPU-100 is mounted using the motor/gearbox bolts and the provided mounting bracket.

Figure 5. Fisher easy-Drive RPU-100 Mounting

1. For linear easy-Drive — Loosen all four motor housing bolts, removing the three bolts as shown below.
 - For rotary easy-Drive — 3 mounting bolts are provided with the RPU-100 when ordered for the 200R.
2. Position the bracket on the motor/gearbox.

Figure 6.

LINEAR

ROTARY

3. For linear easy-Drive — Use the motor housing bolts removed in step one to secure the mounting bracket in place. Note the washers will not be used with the bolts with the mounting bracket.

- For rotary easy-Drive — Use the 3 mounting bolts provided to secure the mounting bracket in place.

Figure 7.

LINEAR

ROTARY

4. For linear easy-Drive — Tighten all 4 motor bolts to 15 ft•lbs (20 N•m) using a criss-cross pattern while tightening the bolts.

- For rotary easy-Drive — Tighten all 3 bolts to 15 ft•lbs (20 N•m).

5. The RPU-100 will sit down on the mounting bracket then slide toward the motor to lock into place.

Figure 8.

LINEAR

ROTARY

6. For linear and rotary easy -Drive — Once the RPU-100 is locked in place install the two mounting screws to finish securing the unit.

Figure 9.

7. Use the provided wiring harness to connect the RPU-100 to the easy-Drive control board. Tighten all terminals to ensure solid mechanical connection. Ensure the red wire is connected to the 12/24 VDC + Power.
8. After wiring connections have been completed, install easy-Drive actuator upper enclosure per the applicable actuator instruction manual.
9. Use the easy-Drive configurator to configure the RPU-100 after installation.

Figure 10.

Wiring

Power Requirements

Ensure a stable DC power source is available, maintaining less than 5% ripple and sufficiently surge protected for the application. A 4 amp (minimum) power supply is required.

Wiring Instructions

1. Ensure power is turned off before connecting the wires.
2. Observe local wiring requirements for hazardous location usage.
3. Conduit seals within 450 mm (18 inches) of the enclosure port are required.
4. 18 AWG (0.52mm²) to 12 AWG (3.31mm²) wire size required.
5. Fuse system to 5A.
6. Connect enclosure and analog signal shields.
7. Be sure to tighten terminals sufficiently to ensure solid mechanical connection.

Replacement

⚠ WARNING

- Refer to the **WARNINGS** at the beginning of the **Installation** section in this instruction manual.
- To avoid exposure hazard or release of toxic gases, do not disassemble, subject to heat above 100°C (212°F), or incinerate the RPU-100.

Note

Proper disposal of used reserve power unit, which contains acetonitrile, is required. Disposal should be done in accordance with applicable federal, state, and local rules and regulations.

Removal

Refer to figures 5 through 10.

1. Remove the easy-Drive actuator upper enclosure per the applicable actuator instruction manual.
2. Disable RPU-100 by moving switch on reserve power unit to 'disable' position.
3. Disconnect power from the RPU-100.
4. Disconnect wiring harness from the RPU-100.
5. Remove the two mounting screws securing the RPU-100 to the actuator.
6. Slide RPU-100 to remove from mounting bracket.

Installation

Refer to Mounting section, steps 5 through 9, for installation of new RPU-100 reserve power unit. The existing wiring harness can be used to connect to the new RPU-100.

Parts Ordering

The RPU-100 can be ordered as a part to be installed into existing easy-Drive electric actuators. Contact your [Emerson sales office](#) for assistance or when ordering replacement parts.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher actuator, because they may void your warranty, might adversely affect the performance of the actuator, and could cause personal injury and property damage.

uint16	Reset statistics	44149	0	R/W	0 - 1	Value of 1 will clear all statistic registers (44011 - 44017). Will automatically set back to 0.

1. uint is defined as Unsigned Integer
uint16 – unsigned 16 bit variable, can take value 0-65535.
uint32 – unsigned 32 bit variable, can take value 0-4294967295.
(Reserved) – registers used for development use only.

R/W* - writable in manufacturing.
† - 32bit register contains data that spans two registers – reads and write of data needs to be performed within the same Modbus command function to ensure coherency of data.

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for NPS 1 through 8 Fisher ED valves, and NPS 1 through 6 EAD valves, through CL600 ratings. Refer to separate manuals for instructions covering the actuator and accessories.

Do not install, operate, or maintain ED or EAD valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Table 1. Specifications
End Connection Styles
Cast Iron Valves

Flanged: CL125 flat-face or 250 raised-face flanges per ASME B16.1

Steel and Stainless Steel Valves

Flanged: CL150, 300, and 600 raised-face or ring-type joint flanges per ASME B16.5

Screwed or Socket Welding: All available ASME B16.11 schedules that are consistent with CL600 per ASME B16.34

Butt welding: NPS 1 through 8

Schedules 40 or 80 consistent with ASME B16.25

Maximum Inlet Pressure⁽¹⁾
Cast Iron Valves

Flanged: Consistent with CL125B or 250B pressure-temperature ratings per ASME B16.1

Steel and Stainless Steel Valves

Flanged: Consistent with CL150, 300, and 600⁽²⁾ pressure-temperature ratings per ASME B16.34

Screwed or Welding: Consistent with CL600 pressure-temperature ratings per ASME B16.34

Shutoff Classifications per ANSI/FCI 70-2 and IEC 60534-4

Standard: Class II

Optional: Class III--For valves with graphite piston ring and 3.4375 inch or larger port diameter; Class IV--For valves with multiple graphite piston rings and 4.375 inch or larger port diameter

C-seal trim: High-temperature, Class V.
See table 2

Flow Characteristics

Standard Cages: ■ Linear, ■ quick opening, or ■ equal percentage

Whisper Trim™ and WhisperFlo™ Cages: Linear

Flow Directions

Linear, Quick Opening, or Equal Percentage Cage:
Normally down

Whisper Trim and WhisperFlo Cages: Always up

Approximate Weights

NPS 1 & 1-1/4 valves: 14 kg (30 lb)

NPS 1-1/2 valves: 20 kg (45 lb)

NPS 2 valves: 30 kg (67 lb)

NPS 2-1/2 valves: 45 kg (100 lb)

NPS 3 valves: 57 kg (125 lb)

NPS 4 valves: 77 kg (170 lb)

NPS 6 valves: 159 kg (350 lb)

NPS 8 valves: 408 kg (900 lb)

1. The pressure/temperature limits in this manual and any applicable standard or code limitation for valve should not be exceeded.

2. Certain bonnet bolting material selections may require a CL600 easy-e valve assembly to be derated. Contact your [Emerson sales office](#).

Description

These single-port valves have cage guiding, quick-change trim, and balanced push-down-to-close valve plug action. Valve configurations are as follows:

ED--Globe-style valve (figure 1) with metal-to-metal seating for all general applications over a wide variety of pressure drops and temperatures.

EAD--Angle version of ED, used to facilitate piping or in applications where a self-draining valve is required.

C-seal trim is available for ED valves, CL150, 300, and 600, in NPS 2-1/2, 3, 4, 6, and 8. C-seal trim is available for EAD valves, CL150, 300, and 600, in NPS 3, 4, and 6.

With C-seal trim, a balanced valve can achieve high-temperature, Class V shutoff. Because the C-seal plug seal is formed from metal (N07718 nickel alloy) rather than an elastomer, a valve equipped with the C-seal trim can be applied in processes with a fluid temperature of up to 593°C (1100°F), provided other material limits are not exceeded.

Specifications

Typical specifications for these valves are shown in table 1.

Educational Services

For information on available courses for Fisher ED and EAD valves, as well as a variety of other products, contact:

emerson.com/fishervalvetraining

Installation

WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Since some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

1. Before installing the valve, inspect the valve and associated equipment for any damage and any foreign material.
2. Make certain the valve body interior is clean, that pipelines are free of foreign material, and that the valve is oriented so that pipeline flow is in the same direction as the arrow on the side of the valve.
3. The control valve assembly may be installed in any orientation unless limited by seismic criteria. However, the normal method is with the actuator vertical above the valve. Other positions may result in uneven valve plug and cage wear, and improper operation. With some valves, the actuator may also need to be supported when it is not vertical. For more information, consult your Emerson sales office.
4. Use accepted piping and welding practices when installing the valve in the line. For flanged valves, use a suitable gasket between the valve and pipeline flanges.

CAUTION

Depending on valve body materials used, post weld heat treating may be required. If so, damage to internal elastomeric and plastic parts, as well as internal metal parts is possible. Shrink-fit pieces and threaded connections may also loosen. In

general, if post weld heat treating is to be performed, all trim parts should be removed. Contact your [Emerson sales office](#) for additional information.

5. With a leak-off bonnet construction, remove the pipe plugs (keys 14 and 16, figure 18) to hook up the leak-off piping. If continuous operation is required during inspection or maintenance, install a three-valve bypass around the control valve assembly.
6. If the actuator and valve are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.

Table 2. Additional Shutoff Classification

Valve	Valve Size, NPS	Port Diameter, Inches	Cage Style	Leakage Class
ED (CL150-600)	2-1/2	2.875	Equal Percentage, Linear, Whisper I, Cavitrol™ III, 1 stage	V (for port diameters from 2.875 through 8-inch with optional C-seal trim)
	3	3.4375		
	3	2.875	Cavitrol III, 2 stage	
	4	2.875		
	4	4.375	Equal Percentage, Linear, Whisper I, Cavitrol III, 1 stage	
	6	5.375	Whisper III (A3, B3, D3, D3), Cavitrol III, 2 stage	
		7	Equal Percentage, Linear, Whisper I, Cavitrol III, 1 stage	
	8	7	Cavitrol III, 2 stage	
		8	Equal Percentage, Linear, Whisper I, Cavitrol III, 1 stage	

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some readjustment to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Valves with ENVIRO-SEAL live-loaded packing or HIGH-SEAL live-loaded packing will not require this initial re-adjustment. See the Fisher instruction manuals, ENVIRO-SEAL Packing System for Sliding-Stem Valves or HIGH-SEAL Live-Loaded Packing System (as appropriate), for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the Parts Kit sub-section near the end of this manual.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing lubrication, packing maintenance, trim maintenance, and ENVIRO-SEAL bellows seal bonnet replacement. All maintenance operations may be performed with the valve in the line.

⚠ WARNING

Avoid personal injury or property damage from sudden release of process pressure or bursting of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.

- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the pneumatic actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Note

Whenever a gasket seal is disturbed by removing or shifting gasketed parts, install a new gasket during reassembly. This ensures a good gasket seal because the used gasket may not seal properly.

Packing Lubrication

Note

ENVIRO-SEAL or HIGH-SEAL packing does not require lubrication.

WARNING

To avoid personal injury or property damage resulting from fire or explosion, do not lubricate packing used in oxygen service or in processes with temperatures over 260°C (500°F).

If a lubricator or lubricator/isolating valve (figure 2) is provided for PTFE/composition or other packings that require lubrication, it will be installed in place of the pipe plug (key 14, figure 18). Use a good quality silicon-based lubricant. Do not lubricate packing used in oxygen service or in processes with temperatures over 260°C (500°F). To operate the lubricator, simply turn the cap screw clockwise to force the lubricant into the packing box. The lubricator/isolating valve operates the same way except open the isolating valve before turning the cap screw and then close the isolating valve after lubrication is completed.

Packing Maintenance

Note

For valves with ENVIRO-SEAL packing, see the Fisher instruction manual, ENVIRO-SEAL Packing System for Sliding-Stem Valves, [D101642X012](#), for packing instructions.

For valves with HIGH-SEAL packing, see the Fisher instruction manual, HIGH-SEAL Live-Loaded Packing System, [D101453X012](#), for packing instructions.

Key numbers refer to figure 3 for PTFE V-ring packing and to figure 4 for PTFE/composition packing, unless otherwise indicated.

Figure 2. Lubricator and Lubricator/Isolating Valve (optional)

For spring-loaded single PTFE V-ring packing, the spring (key 8, figure 3) maintains a sealing force on the packing. If leakage is noted around the packing follower (key 13, figure 3), check to be sure the shoulder on the packing follower is touching the bonnet. If the shoulder is not touching the bonnet, tighten the packing flange nuts (key 5, figure 18) until the shoulder is against the bonnet. If leakage cannot be stopped in this manner, proceed to the Replacing Packing procedure.

If there is undesirable packing leakage with other than spring-loaded packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts.

If the packing is relatively new and tight on the stem, and if tightening the packing flange nuts does not stop the leakage, the valve stem may be worn or nicked so that a seal cannot be made. The surface finish of a new valve stem is critical for making a good packing seal. If the leakage comes from the outside diameter of the packing, the leakage may be caused by nicks or scratches around the packing box wall. If performing any of the following procedures, inspect the valve stem and packing box wall for nicks and scratches.

Replacing Packing

⚠ WARNING

Refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut off all pressure lines to the power actuator, and release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Disconnect the operating lines from the actuator and any leak-off piping from the bonnet. Disconnect the stem connector, then remove the actuator from the valve by unscrewing the yoke locknut (key 15, figure 18) or the hex nuts (key 26, figure 18).

Figure 3. PTFE V-Ring Packing Arrangements for Plain or Extension Bonnets

Table 3. Body-to-Bonnet Bolt Torque Guidelines

Valve Size, NPS		Bolt Torques ^(1, 3)			
ED	EAD	SA193-B7		SA193-B8M ⁽²⁾	
		N•m	Lbf•ft	N•m	Lbf•ft
1-1/4 or less	1	129	95	64	47
1-1/2, 1-1/2 x 1, 2, or 2 x 1	2 or 2 x 1	96	71	45	33
2-1/2 or 2-1/2 x 1-1/2	3 or 3 x 1-1/2	129	95	64	47
3, 3 x 2, or 3 x 2-1/2	4 or 4 x 2	169	125	88	65
4, 4 x 2-1/2, or 4 x 3	6 or 6 x 2-1/2	271	200	156	115
6	---	549	405	366	270
8	---	746	550	529	390

1. Determined from laboratory tests.
2. SA193-B8M annealed.
3. For other materials, contact your [Emerson sales office](#) for torque values.

3. Loosen the packing flange nuts (key 5, figure 18) so that the packing is not tight on the valve stem. Remove any travel indicator parts and stem locknuts from the valve stem threads.

⚠ WARNING

To avoid personal injury or property damage caused by uncontrolled movement of the bonnet, loosen the bonnet by following the instructions in the next step. Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet.

Note

The following step also provides additional assurance that the valve body fluid pressure has been relieved.

CAUTION

Avoid damaging the seating surface caused by the valve plug and stem assembly dropping from the bonnet (key 1, figure 18) after being lifted part way out. When lifting the bonnet, temporarily install a valve stem locknut on the valve stem. This locknut will prevent the valve plug and stem assembly from dropping out of the bonnet.

If the cage starts to lift with the bonnet, tap it with a plastic mallet, or other soft material, to be sure it stays in the valve.

4. Hex nuts (key 16, figure 19, 20, or 21) or cap screws (not shown) attach the bonnet (key 1, figure 18) to the valve body (key 1, figure 19, 20, or 21). Loosen these nuts or cap screws approximately 3 mm (1/8 inch). Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and valve. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, remove the nuts or cap screws completely and carefully lift the bonnet off the valve.
5. Remove the locknut and separate the valve plug and stem from the bonnet. Set the parts on a protective surface to prevent damage to gasket or seating surfaces.
6. Remove the bonnet gasket (key 10, figure 19, 20, or 21) and cover the opening in the valve to protect the gasket surface and prevent foreign material from getting into the valve body cavity.
7. Remove the packing flange nuts, packing flange, upper wiper, and packing follower (keys 5, 3, 12, and 13, figure 18). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall. Clean the packing box and the metal packing parts.
8. Inspect the valve stem threads and packing box surfaces for any sharp edges which might cut the packing. Scratches or burrs could cause packing box leakage or damage to the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts by following the appropriate steps in the Trim Maintenance procedure.
9. Remove the cover protecting the valve body cavity and install a new bonnet gasket (key 10, figure 19 through 21), making sure the gasket seating surfaces are clean and smooth. Place the valve plug and stem into the valve body, making sure it is properly centered on the seat ring. Then slide the bonnet over the stem and onto the stud bolts (key 16, figure 19, 20, or 21) or onto the valve body cavity if cap screws (not shown) will be used instead.

Figure 4. PTFE/Composition Packing Arrangements for Plain or Extension Bonnets

Note

Proper performance of the bolting procedures in step 10 compresses the spiral wound gasket (key 12, figure 19 or 20) or load ring (key 26, figure 21) enough to both load and seal the seat ring gasket (key 13, figure 19, 20, or 21). It also compresses the outer edge of the bonnet gasket (key 10, figure 19 through 21) enough to seal the body-to-bonnet joint.

The bolting procedures in step 10 include--but are not limited to--ensuring that bolting threads are clean, and evenly tightening the cap screws, or the nuts onto the studs, in a crisscross pattern. Tightening one cap screw or nut may loosen an adjacent cap screw or nut. Repeat the crisscross tightening pattern several times until each cap screw or nut is tight and the body-to-bonnet seal is made.

10. Install bolting, using accepted bolting procedures during tightening, so that the body-to-bonnet joint will withstand test pressures and application service conditions. Use the bolt torques in table 3 as guidelines.
11. Install new packing and the metal packing box parts according to the appropriate arrangement in figure 3, 4, or 5. Place a smooth-edged pipe over the valve stem and gently tap each soft packing part into the packing box.
12. Slide the packing follower, upper wiper, and packing flange (keys 13, 12, and 3, figure 18) into position. Lubricate the packing flange studs (key 4, figure 18) and the faces of the packing flange nuts (key 5, figure 18). Install the packing flange nuts.
13. For spring-loaded PTFE V-ring packing, tighten the packing flange nuts until the shoulder on the packing follower (key 13, figure 18) contacts the bonnet.

For graphite packing, tighten the packing flange nuts to the maximum recommended torque shown in table 4. Then, loosen the packing flange nuts, and retighten them to the recommended minimum torque shown in table 4.

For other packing types, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in table 4. Then, tighten the remaining flange nut until the packing flange is level and at a 90-degree angle to the valve stem.

For ENVIRO-SEAL or HIGH-SEAL live-loaded packing, refer to the note at the beginning of Packing Maintenance.

14. Mount the actuator on the valve assembly and reconnect the actuator and valve stem according to the procedure in the appropriate actuator instruction manual.

Figure 5. Graphite Ribbon/Filament Packing for Plain or Extension Bonnets

Trim Maintenance

⚠ WARNING

Observe the warning at the start of the Maintenance section.

For C-seal construction, see the appropriate C-seal sections in this instruction manual.

Except where indicated, key numbers in this section are referenced in figure 19 for standard NPS 1 through 6 constructions, figure 20 for Whisper Trim III cage detail, figure 21 for the NPS 8 ED valve, and figures 22 and 23 for WhisperFlo trim. Some valve plug constructions require three piston rings (key 6).

Disassembly

1. Remove the actuator and the bonnet according to steps 1 through 5 of the Replacing Packing procedure in the Maintenance section.

⚠ WARNING

Avoid personal injury or property damage from valve or packing leakage.

The graphite piston rings in an ED or EAD valve are brittle and in two pieces. Use care to avoid damage to the piston rings caused by dropping or rough handling.

Any damage to the gasket sealing surfaces could cause the valve to leak. The surface finish of the valve stem (key 7) is critical for making a good packing seal. The inside surface of the cage or cage/baffle assembly (key 3), or cage retainer (key 31), is critical for smooth operation of the valve plug and for making a seal with the piston rings (key 6). The seating surfaces of the valve plug (key 2) and seat ring (key 9) are critical for proper shutoff. Protect these parts accordingly while disassembling the trim.

2. Remove the packing flange nuts, packing flange, upper wiper, and packing follower (keys 5, 3, 12, and 13, figure 18). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall. Clean the packing box and the metal packing parts.
3. Inspect the valve stem threads and packing box surfaces for any sharp edges which might cut the packing. Scratches or burrs could cause packing box leakage or damage to the new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts.

Table 4. Recommended Torque for Packing Flange Nuts

VALVE STEM DIAMETER		PRESSURE RATING	GRAPHITE TYPE PACKING				PTFE TYPE PACKING			
			Minimum Torque		Maximum Torque		Minimum Torque		Maximum Torque	
mm	Inches		N•m	Lbf•in	N•m	Lbf•in	N•m	Lbf•in	N•m	Lbf•in
9.5	3/8	CL125, 150	3	27	5	40	1	13	2	19
		CL250, 300	4	36	6	53	2	17	3	26
		CL600	6	49	8	73	3	23	4	35
12.7	1/2	CL125, 150	5	44	8	66	2	21	4	31
		CL250, 300	7	59	10	88	3	28	5	42
		CL600	9	81	14	122	4	39	7	58
19.1	3/4	CL125, 150	11	99	17	149	5	47	8	70
		CL250, 300	15	133	23	199	7	64	11	95
		CL600	21	182	31	274	10	87	15	131
25.4	1	CL300	26	226	38	339	12	108	18	162
		CL600	35	310	53	466	17	149	25	223
31.8	1-1/4	CL300	36	318	54	477	17	152	26	228
		CL600	49	437	74	655	24	209	36	314

- Remove the load ring (key 26) from an NPS 8 ED valve, or the cage adaptor (key 4) from any restricted-trim valve through NPS 4, and wrap it for protection.
- On an NPS 6 ED valve with a Whisper Trim III cage or WhisperFlo trim, remove the bonnet spacer (key 32) and bonnet gasket (key 10) on top of the spacer. Then on any construction with a cage retainer (key 31), remove the cage retainer and its associated gaskets. A Whisper Trim III and WhisperFlo cage retainer has two 3/8 inch-16 UNC tappings in which screws or bolts can be installed for lifting.
- Remove the cage or cage/baffle assembly (key 3) and the associated gaskets (keys 10, 11, and 12), and shim (key 51 for the ED valve, key 27 for the EAD valve). If the cage is stuck in the valve, use a rubber mallet to strike the exposed portion of the cage at several points around its circumference.
- Remove the seat ring or liner (key 9), seat ring gasket (key 13), and the seat ring adaptor (key 5) and adaptor gasket (key 14) where used in a restricted-trim seat ring construction.
- Inspect parts for wear or damage which would prevent proper operation of the valve. Replace or repair trim parts according to the following procedure for Lapping Metal Seats or other valve plug maintenance procedures as appropriate.

Lapping Metal Seats

CAUTION

To avoid damaging the ENVIRO-SEAL bellows seal bonnet assembly, do not attempt to lap the metal seating surfaces. The design of the assembly prevents rotation of the stem and any forced lapping rotation will damage internal components of the ENVIRO-SEAL Bellows Seal bonnet.

With metal-seat constructions, seating surfaces of the valve plug and seat ring or liner (keys 2 and 9, figure 19, 20, or 21) can be lapped for improved shutoff. (Deep nicks should be machined out rather than ground out.) Use a good quality lapping compound of a mixture of 280 to 600-grit. Apply compound to the bottom of the valve plug.

Assemble the valve to the extent that the cage and the cage retainer and bonnet spacer (if used) are in place and the bonnet is bolted to the valve. A simple handle can be made from a piece of strap iron locked to the valve plug stem with nuts. Rotate the handle alternately in each direction to lap the seats. After lapping, remove the bonnet and clean the seat surfaces. Completely assemble as described in the Assembly portion of the Trim Maintenance procedure and test the valve for shutoff. Repeat the lapping procedure if leakage is still excessive.

Valve Plug Maintenance

Except where indicated, key numbers in this section are referenced in figure 19 for standard NPS 1 through 6 constructions, figure 20 for Whisper Trim III detail, figure 21 for the NPS 8 ED valve, and figures 22 and 23 for WhisperFlo trim. Some valve plug constructions require three piston rings (key 6).

CAUTION

To avoid the piston ring (key 6) not sealing properly, be careful not to scratch the surfaces of the ring groove in the valve plug or any of the surfaces of the replacement ring.

1. With the valve plug (key 2) removed according to the Disassembly portion of the Trim Maintenance procedure, proceed as appropriate:

For the carbon-filled PTFE piston ring, The ring is split in one place. If there is visible damage, spread the ring slightly and remove it from the groove in the valve plug.

To install a carbon-filled PTFE piston ring, Spread the ring apart slightly at the split and install it over the stem and into the groove in the valve plug. The open side must face along the stem, depending on flow directions, as shown in view A of figure 19.

For the graphite piston ring, The ring can be easily removed since it is in two pieces. A new graphite piston ring is furnished as a complete ring. Use a vise with smooth or taped jaws to break this replacement ring into halves. Place the new ring in the vise so that the jaws will compress the ring into an oval. Slowly compress the ring until it snaps on both sides. If one side snaps first, do not try to tear or cut the other side. Instead, keep compressing the ring until the other side snaps. Be sure to match the broken ends when installing the ring in the valve plug groove.

CAUTION

Never reuse an old stem or adaptor with a new valve plug. Using an old stem or adaptor with a new plug requires drilling a new pin hole in the stem (or adaptor in case an ENVIRO-SEAL bellows seal bonnet is being used). This drilling weakens the stem or adaptor and may cause failure in service. However, a used valve plug may be reused with a new stem or adaptor.

Note

For plain bonnets and style 1 extension bonnets, the valve plug (key 2), valve stem (key 7), and pin (key 8) are available completely assembled. Refer to the Key 2, 7, and 8 Valve Plug and Stem Assembly tables in the Parts List.

2. To replace the valve stem (key 7), drive out the pin (key 8). Unscrew the valve plug from the stem or adaptor.
3. To replace the adaptor (key 24, figure 18) on ENVIRO-SEAL bellows seal bonnets, place the plug stem assembly and valve plug in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out the pin (key 36, figure 18). Reverse the plug stem assembly and valve plug in the soft-jaw chuck or vise. Grip the flat areas on the valve stem just below the threads for the actuator/stem connection. Unscrew the valve plug/adaptor assembly (key 24, figure 18) from the valve stem assembly (key 20, figure 18).
4. Screw the new stem or adaptor into the valve plug. Tighten to the torque value given in table 5. Refer to table 5 to select the proper drill size. Drill through the stem or adaptor, using the hole in the valve plug as a guide. Remove any chips or burrs and drive in a new pin to lock the assembly.
5. For ENVIRO-SEAL bellows seal bonnets, grip the flats of the stem extending out of the top of the bellows shroud with a soft-jaw chuck or other type of vise. Screw the valve plug/adaptor assembly onto the valve stem. Tighten as

necessary to align the pin hole in the stem with one of the holes in the adaptor. Secure the adaptor to the stem with a new pin.

Assembly

Except where indicated, key numbers are referenced in figure 19 for standard NPS 1 through 6 constructions, figure 20 for Whisper Trim III detail, figure 21 for the NPS 8 ED valve, and figures 22 and 23 for WhisperFlo trim.

Table 5. Valve Stem Connection Torque and Pin Replacement

VALVE STEM CONNECTION (VSC)		TORQUE, MINIMUM TO MAXIMUM		DRILL SIZE, INCH
mm	Inch	N•m	Lbf•ft	
9.5	3/8	40 to 47	25 to 35	3/32
12.7	1/2	81 to 115	60 to 85	1/8
19.1	3/4	237 to 339	175 to 250	3/16
25.4	1	420 to 481	310 to 355	1/4
31.8	1-1/4	827 to 908	610 to 670	1/4

1. With a restricted-trim seat ring construction, install the adaptor gasket (key 14) and seat ring adaptor (key 5).
2. Install the seat ring gasket (key 13), seat ring or liner (key 9).
3. Install the cage or cage/baffle assembly (key 3). Any rotational orientation of the cage or assembly with respect to the valve is acceptable. A Whisper Trim III cage designated by level A3, B3, or C3 may be installed with either end up. The level D3 cage/baffle assembly, however, must be installed with the hole pattern end next to the seat ring. If a cage retainer (key 31) is to be used, place it on top of the cage.
4. Slide the valve plug (key 2) and stem assembly, or valve plug and ENVIRO-SEAL bellows seal assembly, into the cage until the piston ring(s) is level with the top of the cage (key 3) or cage retainer (key 31).
5. Installing piston rings (key 6):
 - a. For valve plugs with a single piston ring: Make sure the piston ring is evenly engaged into the entrance chamfer at the top of the cage or cage retainer ring. Carefully press the piston ring into the cage or cage retainer ring.
 - b. For valve plugs with multiple piston rings: As each piston ring is slid into the cage, make sure the ring is evenly engaged in the entrance chamfer at the top of the cage or cage retainer. Also, make sure to offset the fracture in the rings to minimize leakage. Carefully press each piston ring into the cage or cage retainer ring.
6. Place the gaskets (keys 12, 11 or 14 if used, and 10) and the shim (key 27 or 51) if used, on top of the cage or cage retainer. If there is a cage adaptor (key 4) or a bonnet spacer (key 32), set it on the cage or cage retainer gaskets and place another flat sheet gasket (key 10) on top of the adaptor or spacer. If there is only a cage retainer, place another flat sheet gasket on the retainer.
7. With an NPS 8 ED valve, install the load ring (key 26).
8. Mount the bonnet on the valve and complete assembly according to steps 10 through 14 of the Replacing Packing procedure. Be sure to observe the note prior to step 10.

Retrofit: Installing C-seal Trim

Note

Additional actuator thrust is required for a valve with C-seal trim. When installing C-seal trim in an existing valve, contact your [Emerson sales office](#) for assistance in determining new actuator thrust requirements.

Assemble the new valve plug/retainer assembly (with C-seal plug seal) using the following instructions:

CAUTION

To avoid leakage when the valve is returned to service, use appropriate methods and materials to protect all sealing surfaces of the new trim parts while assembling the individual parts and during installation in the valve body.

1. Apply a suitable high-temperature lubricant to the inside diameter of the C-seal plug seal. Also, lubricate the outside diameter of the valve plug where the C-seal plug seal must be pressed into the proper sealing position (figure 6).
2. Orient the C-seal plug seal for correct sealing action based on the process fluid flow direction through the valve.
 - The open interior of the C-seal plug seal must face up in a valve with flow-up construction (figure 6).
 - The open interior of the C-seal plug seal must face down in a valve with flow-down construction (figure 6).

Figure 6. Fisher ED with C-seal Trim

Note

An installation tool must be used to properly position the C-seal plug seal on the valve plug. A tool is available as a Fisher spare part or a tool could be manufactured following the dimensions given in figure 7.

3. Place the C-seal plug seal over the top of the valve plug and press the C-seal plug seal onto the plug using the C-seal installation tool. Carefully press the C-seal plug seal onto the plug until the installation tool contacts the horizontal reference surface of the valve plug (figure 8).
4. Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the C-seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.

5. Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place (figure 9) to secure the C-seal retainer.
6. Install the new plug/retainer assembly with C-seal plug seal on the new stem following the appropriate instructions in the Trim Replacement section of this manual.
7. Install piston rings by following instructions in the Trim Replacement section of this manual.
8. Remove the existing valve actuator and bonnet following the appropriate instructions in the Replacing Packing section of this manual.

CAUTION

Do not remove the existing valve stem from the valve plug unless you are planning to replace the valve stem.

Never reuse an old valve stem with a new plug or reinstall a valve stem after it has been removed. Replacing a valve stem requires drilling a new pin hole in the stem. This drilling weakens the stem and may cause failure in service. However, a used valve plug may be reused with a new valve stem.

9. Remove the existing valve stem and plug, cage, and seat ring from the valve body following the appropriate instructions in the Trim Removal section of this manual.
10. Replace all gaskets according to appropriate instructions in the Trim Replacement section of this manual.
11. Install the new seat ring, cage, valve plug/retainer assembly, and stem into the valve body and completely reassemble the valve package following the appropriate instructions in the Trim Replacement section of this manual.

CAUTION

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the C-seal plug seal and contact the seat ring. You can correctly seat the valve plug by applying the full actuator load. This force will adequately drive the valve plug to the seat ring, thus giving the C-seal plug seal a predetermined permanent set. Once this is done, the plug/retainer assembly, the cage, and the seat ring become a matched set.

With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

Replacement of Installed C-seal Trim

Trim Removal (C-seal Constructions)

1. Remove the valve actuator and bonnet following the appropriate instructions in the Replacing Packing section of this manual.

CAUTION

To avoid leakage when the valve is returned to service, use appropriate methods and materials to protect all sealing surfaces of the trim parts during maintenance.

Use caution when removing piston ring(s) and C-seal plug seal to avoid scratching any sealing surface.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

ED Valve
February 2020

Figure 7. C-seal Plug Seal Installation Tool

Figure 8. Installing the C-seal Plug Seal Using the Installation Tool

NOTE:
PRESS INSTALLATION TOOL OVER VALVE PLUG
UNTIL THE TOOL CONTACTS THE HORIZONTAL
REFERENCE SURFACE OF THE VALVE PLUG.

Figure 9. Stake the Threads of the C-seal Retainer

CAUTION

Do not remove the valve stem from the plug/retainer assembly unless you are planning to replace the valve stem. Never reuse an old valve stem with a new plug or reinstall a valve stem after it has been removed. Replacing a valve stem requires drilling a new pin hole in the stem. This drilling weakens the stem and may cause failure in service. However, a used valve plug may be reused with a new valve stem.

Figure 10. Lower (Valve Plug to Seat Ring) and Upper (C-seal Plug Seal to Cage) Seating Surfaces

A6780

NOTE:

1 UPPER SEATING SURFACE IS THE AREA OF CONTACT BETWEEN THE C-seal METAL PLUG SEAL AND THE CAGE.

Figure 11. Example of Machining the Lower (Valve Plug to Seat Ring) and Upper (C-seal Plug Seal to Cage) Seating Surfaces

NOTE:

- 1 REMOVAL OF 0.254 mm (0.010 inch) FROM THE VALVE PLUG
PLUS 2 REMOVAL OF 0.254 mm (0.010 inch) FROM THE SEAT RING
MUST EQUAL 3 REMOVAL OF 0.508 mm (0.020 inch) FROM THE
UPPER SEATING SURFACE IN THE CAGE
4. THESE VALUES ARE FOR EXAMPLE ONLY. REMOVE ONLY THE
MINIMUM AMOUNT OF MATERIAL REQUIRED TO REFURBISH THE SEATS.

A6781 / IL

mm (inch)

- Remove the plug/retainer assembly (with C-seal plug seal), cage, and seat ring from the valve body following the appropriate instructions in the Trim Removal section of this manual.
- Locate the staked thread on top of the valve plug (figure 9). The staked thread secures the retainer. Use a drill with a 1/8 inch bit to drill out the staked area of the thread. Drill approximately 3 mm (1/8 inch) into the metal to remove the staking.
- Locate the break between sections of the piston ring(s). Using an appropriate tool such as a flat-blade screwdriver, carefully pry out the piston ring(s) from the groove(s) in the C-seal retainer.

5. After removing the piston ring(s), locate the 1/4-inch diameter hole in the groove. In a retainer with two piston ring grooves, the hole will be found in the upper groove.
6. Select an appropriate tool such as a punch and place the tip of the tool into the hole with the body of the tool held tangent to the outside diameter of the retainer. Strike the tool with a hammer to rotate the retainer and free it from the valve plug. Remove the retainer from the plug.
7. Use an appropriate tool such as a flat-blade screwdriver to pry the C-seal plug seal off the plug. Use caution to avoid scratches or other damage to the sealing surfaces where the C-seal plug seal makes contact with the valve plug (figure 10).
8. Inspect the lower seating surface where the valve plug contacts the seat ring for wear or damage which would prevent proper operation of the valve. Also, inspect the upper seating surface inside the cage where the C-seal plug seal contacts the cage, and inspect the sealing surface where the C-seal plug seal makes contact with the plug (figure 10).
9. Replace or repair trim parts according to the following procedure for Lapping Metal Seats, Remachining Metal Seats, or other valve plug maintenance procedures as appropriate.

Lapping Metal Seats (C-seal Constructions)

Before installing a new C-seal plug seal, lap the lower seating surface (valve plug to seat ring, figure 10) following appropriate procedures in the Lapping Metal Seats section of this manual.

Remachining Metal Seats (C-seal Constructions)

See figure 11. A valve plug with a C-seal metal plug seal features two seating surfaces. One seating surface is found where the valve plug contacts the seat ring. The second seating surface is found where the C-seal plug seal contacts the upper seating surface in the cage. If you machine the seats on the seat ring and/or plug, you must machine an equal dimension from the seating area in the cage.

CAUTION

If metal is removed from the seat ring and plug and a corresponding amount is not removed from the cage seating area, the C-seal plug seal will be crushed as the valve closes and the C-seal retainer will strike the seating area of the cage, preventing the valve from closing.

Trim Replacement (C-seal Constructions)

1. Apply a suitable high-temperature lubricant to the inside diameter of the C-seal plug seal. Also, lubricate the outside diameter of the valve plug where the C-seal plug seal must be pressed into the proper sealing position (figure 6).
2. Orient the C-seal plug seal for correct sealing action based on the process fluid flow direction through the valve.
 - The open interior of the C-seal plug seal must face up in a valve with flow-up construction (figure 6).
 - The open interior of the C-seal plug seal must face down in a valve with flow-down construction (figure 6).

Note

An installation tool must be used to properly position the C-seal plug seal on the valve plug. A tool is available as a Fisher spare part or a tool could be manufactured following the dimensions given in figure 7.

3. Place the C-seal plug seal over the top of the valve plug and press it onto the plug using the installation tool. Carefully press the C-seal plug seal onto the plug until the installation tool contacts the horizontal reference surface of the valve plug (figure 8).

4. Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the C-seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
5. Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place (figure 9) to secure the C-seal retainer.
6. Replace the piston ring(s) following instructions in the Trim Replacement section of this manual.
7. Return the seat ring, cage, plug/retainer assembly, and stem to the valve body and completely reassemble the valve package following the appropriate instructions in the Trim Replacement section of this manual.

CAUTION

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the C-seal plug seal and contact the seat ring. You can correctly seat the valve plug by applying the full actuator load. This force will adequately drive the valve plug to the seat ring, thus giving the C-seal plug seal a predetermined permanent set. Once this is done, the plug/retainer assembly, the cage, and the seat ring become a matched set.

With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

ENVIRO-SEAL Bellows Seal Bonnet

Replacing a Plain or Extension Bonnet with an ENVIRO-SEAL Bellows Seal Bonnet (Stem/Bellows Assembly)

1. Remove the actuator and bonnet according to steps 1 through 5 of the Replacing Packing procedure in the Maintenance section.
2. Lift out the cage.
3. Remove and discard the existing bonnet gasket. Cover the valve body opening to protect sealing surfaces and to prevent foreign material from entering the valve body cavity.

Note

The ENVIRO-SEAL stem/bellows assembly for easy-e valves is available only with a threaded and drilled plug/adaptor/stem connection. The existing valve plug can be reused with the new stem/bellows assembly or a new plug can be installed.

4. Inspect the existing valve plug. If the plug is in good condition, it can be reused with the new ENVIRO-SEAL stem/bellows assembly. To remove the existing valve plug from the stem, first, place the existing plug stem assembly in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out or drill out the pin (key 8).
5. Then, reverse the plug stem assembly in the soft-jaw chuck or vise. Grip the valve stem in an appropriate place and unscrew the existing plug from the valve stem.

CAUTION

When installing a valve plug on the ENVIRO-SEAL stem/bellows assembly, the valve stem must not be rotated. Damage to the bellows may result.

Do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

Note

The ENVIRO-SEAL stem/bellows assembly has a one-piece stem.

6. To attach the valve plug to the stem of the new ENVIRO-SEAL stem/bellows assembly, it is necessary to first attach the plug to the adaptor (key 24). Locate the adaptor. Notice that a hole has not been drilled in the threads where the plug screws onto the adaptor. Secure the valve plug in a soft-jaw chuck or other type of vise. Do not grip the plug on any seating surface. Position the plug in the chuck or vise for easy threading of the adaptor. Thread the adaptor into the valve plug and tighten to the appropriate torque value.
7. Select the proper size of drill bit and drill through the adaptor using the hole in the valve plug as a guide. Remove any metal chips or burrs and drive in a new pin (key 8, figures 19, 20, and 21) to lock the plug/adaptor assembly together.
8. Attach the plug/adaptor assembly to the ENVIRO-SEAL stem/bellows assembly by first securing the stem/bellows assembly in a soft-jaw chuck or other type of vise so that the jaws of the chuck or vise grip the flats of the stem extending out of the top of the bellows shroud. Screw the valve plug/adaptor assembly onto the valve stem. Tighten the plug/adaptor assembly until it is snug. Then turn the plug/adaptor assembly to the next pin hole in the valve stem. Drive in new pin (key 36, figure 18) to lock the assembly.
9. Inspect the seat ring (key 9). Replace, if necessary.

Table 6. Recommended Torque for ENVIRO-SEAL Bellows Seal Bonnet Packing Flange Nuts

VALVE SIZE, NPS	VALVE STEM DIAMETER THROUGH PACKING	MINIMUM TORQUE		MAXIMUM TORQUE	
		N•m	Lbf•in	N•m	Lbf•in
1/2 - 2	1/2	2	22	4	33
3 - 8	1	5	44	8	67

10. Place a new gasket (key 10) into the valve body in place of the bonnet gasket. Install the new stem/bellows assembly with valve plug/adaptor by placing it into the valve body on top of the new bellows gasket.
11. Place a new gasket (key 22) over the stem/bellows assembly. Place the new ENVIRO-SEAL bonnet over the stem/bellows assembly.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) immediately if a discrepancy between actual parts and approved parts is suspected.

12. Properly lubricate the bonnet stud bolts. Install and tighten the bonnet hex nuts to the proper torque.
13. Install the new packing and the metal packing box parts according to the appropriate arrangement in figure 12 or 13.

Figure 12. PTFE Packing Arrangement for Use in ENVIRO-SEAL Bellows Seal Bonnets

14. Install the packing flange. Properly lubricate the packing flange stud bolts and the faces of the packing flange nuts.

For **graphite packing**, tighten the packing flange nuts to the maximum recommended torque shown in table 6. Then, loosen the packing flange nuts, and retighten them to the recommended minimum torque shown in table 6.

For **other packing types**, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in table 6. Then, tighten the remaining flange nut until the packing flange is level and at a 90-degree angle to the valve stem.

15. Install the travel indicator parts and stem locknuts; mount the actuator on the valve body according to the procedure in the appropriate actuator instruction manual.

Replacement of an Installed ENVIRO-SEAL Bellows Seal Bonnet (Stem/Bellows Assembly)

1. Remove the actuator and bonnet according to steps 1 through 5 of the Replacing Packing procedure of the Maintenance section.
2. Lift out the cage. Remove and discard the existing bonnet gasket and bellows gasket. Cover the valve body opening to protect sealing surfaces and to prevent foreign material from entering the valve body cavity.

Note

The ENVIRO-SEAL stem/bellows assembly for easy-e valves is available only with a threaded and pinned plug/adaptor/stem connection. The existing valve plug can be reused with the new stem/bellows assembly or a new plug can be installed. If the existing valve plug is reused, and the adaptor is in good condition, it may be reused also. However, never reuse an old adaptor with a new valve plug. Using an old adaptor with a new valve plug requires drilling a new pin hole in the adaptor. This drilling weakens the adaptor and may cause failure in service. However, a used valve plug may be reused with a new adaptor.

Figure 13. Double Graphite Ribbon/Filament Arrangements for Use in ENVIRO-SEAL Bellows Seal Bonnets

A5887

NOTES:

- 1 > 0.102 mm (0.004 INCH) THICK SACRIFICIAL ZINC WASHERS;
USE ONLY ONE BELOW EACH GRAPHITE RIBBON RING.

3. Inspect the existing valve plug and adaptor. If they are in good condition, they can be reused with the new stem/bellows assembly and they do not need to be separated.

CAUTION

When removing/installing a valve plug on the ENVIRO-SEAL stem/bellows assembly, the valve stem must not be rotated. Damage to the bellows may result.

Do not grip the bellows shroud or other parts of the stem/bellows assembly. Grip only the flat areas on the stem where it extends out of the top of the bellows shroud.

Note

The ENVIRO-SEAL stem/bellows assembly has a one-piece stem.

4. If the valve plug and adaptor are not in good condition and must be replaced, the valve plug/adaptor assembly must first be removed from the stem/bellows assembly and then the valve plug removed from the adaptor. First, place the stem/bellows assembly and valve plug in a soft-jaw chuck or other type of vise so that the jaws grip a portion of the valve plug that is not a seating surface. Drive out or drill out the pin (key 8, figure 19, 20, or 21). Drive out the pin (key 36, figure 18).
5. Then, reverse the stem/bellows and plug/adaptor assembly in the soft-jaw chuck or vise. Grip the flat areas on the valve stem just below the threads for the actuator/stem connection. Unscrew the plug/adaptor assembly from the stem/bellows assembly. Unscrew the valve plug from the adaptor.
6. To attach either the existing or a new valve plug to the stem of the new ENVIRO-SEAL stem/bellows assembly, first attach the plug to the adaptor (if the valve plug was removed from the adaptor) as follows:
 - a. Locate the adaptor. Notice that a hole has not been drilled in the new adaptor threads where the plug screws onto the adaptor.
 - b. Secure the valve plug in a soft-jaw chuck or other type of vise. Do not grip the plug on any seating surface. Position the plug in the chuck or vise for easy threading of the adaptor.
 - c. Thread the adaptor into the valve plug and tighten to the appropriate torque value.
7. Complete the installation by following steps 7 through 15 of the ENVIRO-SEAL Bellows Seal Bonnet installation instructions given above.

Purging the ENVIRO-SEAL Bellows Seal Bonnet

The ENVIRO-SEAL bellows seal bonnet has been designed so that it can be purged or leak tested. Refer to figure 18 for an illustration of an ENVIRO-SEAL bellows seal bonnet. Perform the following steps for purging or leak testing.

1. Remove the two diametrically opposed pipe plugs (key 16).
2. Connect a purging fluid to one of the pipe plug connections.
3. Install appropriate piping or tubing in the other pipe plug connection to pipe away the purging fluid or to make a connection to an analyzer for leak testing.
4. When purging or leak testing has been completed, remove the piping or tubing and reinstall the pipe plugs (key 16).

Parts Ordering

Each valve body-bonnet assembly is assigned a serial number which can be found on the valve. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance. When ordering replacement parts, refer to the serial number and to the 11-character part number for each part required from the following Parts Kit or Parts List information.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

ENVIRO-SEAL Packing Retrofit Kits

Retrofit kits include parts to convert valves with existing standard bonnets to the ENVIRO-SEAL packing box construction. Refer to figure 15 for key numbers for PTFE packing, figure 16 for key numbers for Graphite ULF packing, and figure 17 for key numbers for duplex packing. PTFE kits include keys 200, 201, 211, 212, 214, 215, 217, 218, tag, and cable tie. Graphite ULF kits include keys 200, 201, 207, 208, 209, 210, 211, 212, 214, 216, 217, tag, and cable tie. Duplex kits include keys 200, 201, 207, 209, 211, 212, 214, 215, 216, 217, tag, and cable tie.

Stems and packing box constructions that do not meet Fisher stem finish specifications, dimensional tolerances, and design specifications, may adversely alter the performance of this packing kit.

For part numbers of individual components, refer to instruction manual ENVIRO-SEAL Packing System for Sliding-Stem Valves, [D101642X012](#).

ENVIRO-SEAL Packing Retrofit Kits

ENVIRO-SEAL Packing Repair Kits

Repair kits include parts to replace the "soft" packing materials in valves that already have ENVIRO-SEAL packing arrangements installed or in valves that have been upgraded with ENVIRO-SEAL retrofit kits. Refer to figure 15 for key numbers for PTFE packing, figure 16 for key numbers for Graphite ULF packing, and figure 17 for key numbers for duplex packing. PTFE repair kits include keys 214, 215, and 218. Graphite ULF repair kits include keys 207, 208, 209, 210, and 214. Duplex repair kits include keys 207, 209, 214, and 215.

Stems and packing box constructions that do not meet Fisher stem finish specifications, dimensional tolerances, and design specifications, may adversely alter the performance of this packing kit.

For part numbers of individual components, refer to instruction manual ENVIRO-SEAL Packing System for Sliding-Stem Valves, [D101642X012](#).

Figure 1. Reverse Acting easy-e Valve with Actuator

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for NPS 1 through 4 EDR and ETR valves (see figure 1). The valves are available in CL150 through 600 ratings.

The valves are also available with full-size and restricted-trim designs. Refer to separate manuals for instructions covering the actuator and accessories.

Do not install, operate, or maintain an EDR or ETR valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Description

The EDR and ETR are single-port, globe-style valves that feature cage guiding, a balanced plug design, and push-down-to-open valve plug action. The valve constructions are available with metal-to-metal or metal-to-composition seats. These constructions permit access to the internal trim parts through the bottom flange without removing the actuator from the valve.

Table 1. Specifications

Available Valve Constructions

See table 2

End Connection Styles

Cast Iron Valves

Flanged: CL125 flat-face or 250 raised-face flanges per ASME B16.1

Steel and Stainless Steel Valves

Flanged: CL150, 300, and 600 raised-face or ring-type joint flanges per ASME B16.5

Screwed or Socket Welding: All available ASME B16.11 schedules that are consistent with CL600 per ASME B16.34

Buttwelding: Consistent with ASME B16.25

Maximum Inlet Pressure⁽¹⁾

Cast Iron Valves

Flanged: Consistent with CL125B or 250B pressure-temperature ratings per ASME B16.1

Steel and Stainless Steel Valves

Flanged: Consistent with CL150, 300, and 600⁽²⁾ pressure-temperature ratings per ASME B16.34

Screwed or Welding: Consistent with CL600 pressure-temperature ratings per ASME B16.34

Shutoff Classification

EDR: ANSI/FCI 70-2 and IEC 60534-4 Class II (standard); Class III for valves with a graphite piston ring and 78 mm (3.4375 inch) or larger port diameter

ETR: Standard air test (0.05 mL/minute/psid/inch of port diameter) using air at service pressure drop or 3.5 bar (50 psi), whichever is lower; or ANSI/FCI 70-2 and IEC 60534-4 Class V (optional) with PTFE seats; Class IV or V (optional) with metal seats

Flow Characteristics

Linear (all cages), quick-opening, or equal percentage

Flow Directions

Linear, Quick Opening, or Equal Percentage Cage: Normally up,
Whisper Trim™ I Cage: Always down

Approximate Weights

VALVE SIZE, NPS	WEIGHT	
	kg	Pounds
1 & 1-1/4	14	30
1-1/2	20	45
2	39	67
2-1/2	45	100
3	54	125
4	77	170

1. The pressure/temperature limits in this manual and any applicable standard or code limitation for the valve should not be exceeded.

2. Certain bonnet bolting material selections may require a CL600 easy-e valve assembly to be derated. Contact your [Emerson sales office](#) or Local Business Partner.

Installation

⚠ WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations.

To avoid personal injury or property damage resulting from the sudden release of pressure, do not install the valve assembly where service conditions could exceed the limits given on the valve and actuator nameplates. Use pressure-relieving devices as required by accepted industry, local, state, or Federal codes, and good engineering practices. Check with your process or safety engineer for any other hazards that may be present from exposure to process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

The valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Because some body/trim material combinations are limited in their pressure drop and temperature range capabilities, do not exceed these conditions without first contacting your [Emerson sales office](#) or Local Business Partner.

Inspect the valve and pipelines to ensure they are not damaged, are clean, and free of foreign material.

1. Before installing the valve, inspect the valve and associated equipment for any damage and any foreign material.
2. Make certain the valve body interior is clean, that pipelines are free of foreign material, and that the valve is oriented so that pipeline flow is in the same direction as the arrow (see figure 2) on the side of the valve.
3. The control valve assembly can be installed in any orientation unless limited by seismic criteria. However, the normal method is with the actuator vertical above the valve body (see figure 2). Other positions may result in uneven valve plug and cage wear, and improper operation. With some valves, the actuator may also need to be supported when it is not vertical. For more information, consult your Emerson sales office or Local Business Partner.
4. Use accepted piping and welding practices when installing the valve in the line. If a post-weld heat treatment process is to be applied to the valve end connections, and the valve has composition or elastomer trim parts, remove the trim to avoid damage to the soft parts.

CAUTION

Depending on valve body materials used, post weld heat treating may be required. If so, damage to internal elastomeric and plastic parts, as well as internal metal parts is possible. Shrunk-fit pieces and threaded connections may loosen. In general, if post weld heat treating is to be performed, all trim parts should be removed. Contact your Emerson sales office or Local Business Partner for additional information.

5. If continuous operation is required during inspection or maintenance, install a three-valve bypass around the control valve assembly.
6. If the actuator and valve are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual and also see figure 2.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however some readjustment will be required to meet specific service conditions.

Maintenance

WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for trim maintenance, packing maintenance, and packing lubrication. All maintenance operations may be performed with the valve installed in the pipeline.

Note

If the valve has ENVIRO-SEAL™ live-loaded packing installed (figure 8, 9, or 10), see the Fisher instruction manual entitled ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)) for packing instructions.

Trim Maintenance

Disassembly

Note

Whenever a gasket seal is disturbed by removing or shifting gasketed parts, install a new gasket upon reassembly. This is necessary to ensure a good gasket seal.

Key number locations are shown in figure 11 or 12 unless otherwise indicated.

Figure 3. Valve Plug Assembly

ETR USES A SEAL RING (KEY 24) AND A BACKUP RING (KEY 25) (SEE FIGURE 11).

CAUTION

Take care when removing the bottom flange (key 31) in the following procedure, to prevent possible product damage from parts unexpectedly falling out of the valve body.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment. When removing the bottom flange (key 31), be careful that the cage and other parts are not damaged by unexpectedly falling out of the valve body. Remove the nuts (key 16) or cap screws from the bottom flange.
2. Removing the valve plug from the valve body, the valve plug can be removed independently of the valve stem by removing the cotter pin and castle nut (keys 30 and 8). Then, slide the valve plug out of the cage (see figure 3).
 - Disconnect the stem connector, and loosen the packing flange nuts (see figure 2).
 - Move the valve stem away from the actuator stem allowing room to remove the indicator disk and stem locknuts. Remove the parts indicated.
 - Remove the valve plug by pulling the valve plug/stem assembly through the packing and out of the bottom of the bonnet.
 - If the valve plug is to be re-used but the stem needs to be replaced, drive the pin (key 8) out of the plug/stem assembly and unscrew the valve stem.

CAUTION

Take care during disassembly in the following procedure, to prevent possible damage to sealing surfaces.

- Remove the seat ring (key 9), gaskets (keys 10, 11, 12, and 13), and any remaining parts if they did not come out with the valve plug. If the seat ring (key 9) is stuck in the valve body, strike the outside of the valve body at the seat ring line with a rubber hammer while pulling down on the seat ring. Carefully remove the seat ring without damaging sealing surfaces.

If necessary, machine or grind metal seats before installing the piston ring/seal ring or packing, or refer to the Lapping Metal Seats procedure in this section.

CAUTION

The pressure balancing holes in the valve plug are necessary for the proper and safe operation of the valve. Inspect the balancing holes every time the valve is disassembled for service. Any build-up, blockage, or clogging of the balance holes should be removed.

Lapping Metal Seats

A certain amount of leakage should be expected with metal-to-metal seating in any valve body. If the leakage becomes excessive, however, the condition of the seating surfaces of the valve plug and seat ring can be improved by lapping. (Deep nicks should be machined out rather than ground out.) Use a good quality lapping compound of a mixture of 280 to 600-grit.

Assemble the valve to the extent that the seat ring (key 9), cage (key 3), cage adaptor (key 4, if used), and bonnet are in place. Also, remove the piston ring or seal ring from the valve plug (if used).

- Insert the valve stem (key 7) into the bonnet and thread the plug (key 2) onto the end of the stem. Make a simple handle from a piece of strap iron; lock it to the valve with the stem locknuts.
- Apply the lapping compound to the seating surfaces. Rotate the handle alternately in each direction to lap the seats. After lapping the seats, remove the valve plug and stem, then clean all parts. Repeat the lapping procedure if necessary.

Trim Assembly

Carefully clean all gasket surfaces. Use new gaskets during reassembly of the valve.

Table 3. Valve Body-to-Flange Nut Torques⁽³⁾

VALVE SIZE, NPS	TORQUES ⁽¹⁾			
	SA193-B7		SA193-B8M ⁽²⁾	
	N•m	Lbf•ft	N•m	Lbf•ft
1 and 1-1/4	129	95	64	47
1-1/2, 1-1/2 x 1, 2, or 2 x 1	96	71	45	33
2-1/2, 2-1/2 x 1-1/2, or 3 x 1-1/2	129	95	64	47
3, 3 x 2, 3 x 2-1/2, or 4 x 2	169	125	88	65
4, 4 x 2-1/2, or 4 x 3	271	200	156	115
1. Determined from laboratory tests. 2. SA193-B8M annealed. 3. For other materials, contact your Emerson sales office or Local Business Partner.				

Replacing the Seal or Piston Ring

CAUTION

Be careful not to scratch the surface of the ring groove in the valve plug (key 2), or the new ring may not seal properly.

- For EDR, if the piston ring (key 6) is visibly damaged, remove the ring and replace it with a new part. Refer to the Parts List at the end of this manual for a replacement part.
- For ETR, if the seal ring and backup ring (keys 24 and 25) are visibly damaged, remove the rings by prying or cutting them from the groove. Be careful not to scratch valve plug surfaces. Refer to the Parts List at the end of this manual for replacement parts.

Assembling the Valve Plug and Stem

1. For EDR and ETR, perform the following steps:

- Insert the stem (key 7) into the plug (key 2, figure 3) and thread the castle nut (key 8) onto the end of the stem and hand tighten.

CAUTION

To prevent possible product damage, take care that the stem and plug are not damaged during the following tightening procedure.

- When tightening the castle nut with a wrench, line up the hole in the end of the stem with a slot in the castle nut. Ensure that the stem and plug are not damaged during the tightening procedure.
- Insert the cotter pin (key 30) and lock it in place.

Installing the Piston Rings or Backup Ring/Seal Rings

1. For EDR: When using a carbon-filled PTFE piston ring, spread the ring apart slightly at the split, start one end of the split into the groove in the valve plug. Work the ring around the valve plug inserting the ring into the groove in the valve plug.

The replacement graphite piston rings will arrive in one piece. Use a vise with smooth or tapered jaws to break the replacement piston ring into two halves. Place the new ring in the vise so that the jaws compress the ring into an oval. Compress the ring slowly until the ring snaps on both sides. If one side snaps first, do not try to tear or cut the other side. Instead, keep compressing the ring until the other side snaps. The piston ring can also be fractured by scoring and snapping over a hard surface such as a table edge. Sawing or cutting the ring is not recommended.

2. For ETR: Apply a lubricant to both backup and seal rings (keys 25 and 24). Place the backup ring over the stem (key 7) and into the groove in the valve plug (key 3). Slowly and gently stretch the seal ring over the valve plug and work it into the groove. Stretching the ring over the valve plug can cause it to appear too large for the groove, but it will contract to its original size when inserted into the cage.

CAUTION

When installing the EDR or ETR valve plug into the cage, make sure the piston or seal ring is evenly engaged in the entrance chamfer of the cage to avoid damage to the ring.

Note

Use the preceding procedures to assemble the valve plug and stem before installing the parts into the valve body. Insert the valve plug into the cage (figure 3), then stack the parts as recommended in steps below.

Installing the Parts into the Valve Body

1. Stack the valve trim parts using figures 11 and 12 to determine the sequence of parts.
2. Lubricate the stud bolts (key 15) before installing the valve trim into the valve body. (Note: For ease of installing trim parts, remove all packing parts from the packing box before installing the trim parts.)
3. When inserting the stack of trim parts into the valve body, carefully align the parts in the recess of the valve body.
4. Slide the bottom flange onto the stud bolts (key 15). Secure the bottom flange (key 31) in place on the valve body with the hex nuts (key 16). Tighten the hex nuts to the torque value shown in table 3.
5. Torque the nuts in a criss-cross pattern. Repeat the pattern until all nuts are torqued to the value indicated in table 3.
6. Refer to the Packing Maintenance procedures below.

Packing Maintenance

This procedure covers PTFE V-ring, graphite ribbon/filament, and PTFE composition packing rings. Key numbers refer to figure 5 for PTFE V-ring packing and PTFE/composition packing, unless otherwise indicated.

Note

If the valve has ENVIRO-SEAL live-loaded packing installed (figure 8, 9, or 10), see the Fisher instruction manual entitled ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)) for packing instructions.

For all except spring-loaded packing, if the packing is relatively new and tight on the stem, and if tightening the packing flange nuts does not stop the leakage, it is possible that the valve stem is worn or nicked so that a seal cannot be made. If the leakage comes from the outside diameter of the packing follower, it is possible that the leakage is caused by nicks or scratches around the inside of the packing box wall.

For spring-loaded single PTFE V-ring packing, the spring (key 8) maintains a sealing force on the packing. If leakage is noted around the packing follower (key 13), check to be sure the shoulder on the packing follower is touching the bonnet. If the shoulder is not touching the bonnet, tighten the packing flange nuts (key 5, figure 4) until the shoulder is against the bonnet. If leakage cannot be stopped in this manner, proceed to the Removing Packing and Installing Packing procedures below.

Removing Packing

WARNING

Refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

The packing may have been removed in earlier steps, or during trim maintenance procedures. Use the following steps, when necessary, to remove packing and associated assemblies.

Key number locations for packing parts are shown in figures 5 and 6. For valve parts and the live loaded packing system, refer to figures 8 through 10 (in the Parts List section), for key number locations.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve. If using a power actuator, also shut off all pressure lines to the power

actuator and release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.

2. Exhaust all actuator pressure, disconnect the operating lines from the actuator, and disconnect any leakoff piping from the actuator. Relieve any actuator precompression from the stem connector. (If necessary, refer to the appropriate actuator instruction manual for warnings, cautions, and disassembly procedures.)
3. When removing the bottom flange (key 31), be careful that the cage and other parts are not damaged by unexpectedly falling out of the valve body. Remove the nuts (key 16) or cap screws from the bottom flange.
4. To remove the packing for maintenance, disconnect the stem connector (see figure 2). Remove the yoke locknut, and lift the actuator off the valve.
5. Remove the packing flange nuts (key 5, figure 4), packing flange (key 15), upper wiper (key 12), and packing follower (key 13). If maintaining the packing while the valve stem is in place, ensure that the valve stem surface is not scratched or marred while working with the packing.

Table 4. Recommended Torque for Packing Flange Nuts

VALVE STEM DIAMETER		PRESSURE RATING	GRAPHITE PACKING				PTFE PACKING			
			Minimum Torque		Maximum Torque		Minimum Torque		Maximum Torque

		CL600	20	180	30	264	10	90	15	132

Figure 4. Bonnet Assembly

10A6681-A

NOTE:

1

REFER TO FIGURE 5 OR 6 FOR PACKING ARRANGEMENTS.

CAUTION

To prevent possible product damage, avoid scratching the packing box walls when removing old packing parts. Also inspect valve stem threads and packing box surfaces for sharp edges which may damage packing.

6. Avoid scratching the packing box walls when removing the old packing parts. Clean the packing box (see figure 4), and clean, inspect, or replace metal packing parts. Generally, the metal packing parts are not part of the packing kits listed in the Parts List section, and they must be ordered individually.
7. Inspect the valve stem threads and packing box surfaces for any sharp edges which might cut the packing. Scratches or burrs on the stem surfaces can cause packing box leakage or damage to new packing. If the surface condition cannot be improved by light sanding, replace the damaged parts by following the appropriate steps in the Trim Maintenance procedure.

Note

If the control valve assembly was purchased for an application where the service temperatures are under 232°C (450°F), the bonnet may be unscrewed from the valve body. Where temperatures are greater than 232°C (450°F), the bonnet is seal welded to the valve body.

CAUTION

To prevent possible product damage, set the bonnet on a protective surface in the following procedure.

8. If necessary, remove the bonnet assembly from the valve by unscrewing it. Some applications require seal welding the bonnet to the valve body, and the bonnet should not be removed. Set the bonnet on a protective surface to prevent damage to the bonnet gasket surface.

Figure 5. Packing Arrangements

NOTES:

1 REFER TO THE VALVE SERIAL NUMBER AND THE PARTS ORDERING SECTION FOR THE SPACER AND OTHER METAL PARTS.

TYPICAL SINGLE ARRANGEMENTS

TYPICAL DOUBLE ARRANGEMENTS

B2359

Figure 6. Packing Arrangements

Installing Packing

If the trim is removed, refer to Trim Maintenance procedures, and install the trim (including the valve stem) before installing the packing. If necessary, use the Lapping Metal Seats procedures before installing packing. Key number locations are shown in figure 5 or 6 unless otherwise indicated.

CAUTION

To prevent possible product damage, take care when installing the bonnet over the valve stem in the following procedure.

1. If the bonnet has been removed from the valve body, install the replacement bonnet (see figure 4). Carefully slide the bonnet over the valve stem without damaging the stem surfaces.
2. Refer to figure 5 or 6 for the sequence of parts to make up the appropriate packing set for your application. Arrange the packing parts in sequence before installing them into the packing box.
3. For split-ring packing, alternate the positions of the splits to avoid creating a leak path. Place a smooth-edged pipe over the valve stem and gently tap each soft packing ring into the packing box. Be sure that air is not trapped between adjacent soft parts.
4. Install the packing follower (key 13), packing flange (key 3), and upper wiper (key 12, if required). Install the packing flange nuts (key 5).
5. Refer to actuator installation procedures in the actuator instruction manual, and the installation procedures in the manual when mounting and connecting the actuator to the valve. If lubrication is required, refer to the Packing Lubrication section below.
6. For spring-loaded PTFE V-ring packing, tighten the packing flange nuts until the shoulder on the packing follower (key 13, figure 4) contacts the bonnet.

For **graphite packing**, tighten the packing flange nuts to the maximum recommended torque shown in table 4. Then, loosen the packing flange nuts, and retighten them to the recommended minimum torque shown in table 4.

For **other packing types**, tighten the packing flange nuts alternately in small equal increments until one of the nuts reaches the minimum recommended torque shown in table 4. Then, tighten the remaining flange nuts until the packing flange is level and at a 90-degree angle to the valve stem.

Note

If the valve has ENVIRO-SEAL live-loaded packing installed (figure 8, 9, or 10), see the Fisher instruction manual entitled ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)) for packing instructions.

Packing Lubrication

⚠ WARNING

To avoid personal injury or property damage resulting from fire or explosion, do not lubricate packing used in oxygen service or in processes with temperatures over 260°C (500°F).

Packing used in oxygen service or in processes with temperatures over 260°C (500°F) should not be lubricated. If a lubricator or lubricator/isolating valve (see figure 7) is required for the packing, install the lubricator or lubricator/isolating valve into the threaded hole in the side of the bonnet (see figure 7). Use a good quality silicon-base lubricant.

To operate the lubricator, simply turn the cap screw clockwise to force the lubricant into the packing box. The lubricator/isolating valve operates the same way except the isolating valve must first be opened and then closed after lubrication is completed.

Parts Ordering

Each body-bonnet assembly is assigned a serial number which can be found on the valve body. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Refer to the serial number when contacting your [Emerson sales office](#) or Local Business Partner for technical assistance. When ordering replacement parts, refer to the serial number and to the eleven-character part number for each part required from the following parts kit or parts list information.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Packing Kits

Standard Packing Repair Kits (Non Live-Loaded)

Standard Packing Repair Kits (non live-loaded)

Stem Diameter, mm (Inches) Yoke Boss Diameter, mm (Inches)	9.5 (3/8) 54 (2-1/8)	12.7 (1/2) 71 (2-13/16)	19.1 (3/4) 90 (3-9/16)

ENVIRO-SEAL Packing Retrofit Kits

Retrofit kits include parts to convert valves with existing standard bonnets to the ENVIRO-SEAL packing box construction. Refer to figure 8 for key numbers for PTFE packing, to figure 9 for key numbers for graphite packing, and to figure 10 for key numbers for duplex packing. PTFE kits include keys 200, 201, 211, 212, 214, 215, 216, 217, 218, tag, and cable tie. Graphite kits include keys 200, 201, 207, 208, 209, 210, 211, 212, 214, 217, tag, and cable tie. Duplex kits include keys 200, 201, 207, 209, 211, 212, 214, 215, 216, 217, tag, and cable tie.

Stems and packing box constructions that do not meet Fisher stem finish specifications, dimensional tolerances, and design specifications, may adversely alter the performance of this packing kit.

For part numbers of individual components in the ENVIRO-SEAL packing kits, refer to instruction manual ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)).

ENVIRO-SEAL Packing Repair Kits

Repair kits include parts to replace the “soft” packing materials in valves that already have ENVIRO-SEAL packing arrangements installed or in valves that have been upgraded with ENVIRO-SEAL retrofit kits. Refer to figure 8 for key numbers for PTFE packing, to figure 9 for key numbers for graphite packing, and to figure 10 for key numbers for duplex packing. PTFE repair kits include keys 214, 215, and 218. Graphite repair kits include keys 207, 208, 209, 210, and 214. Duplex repair kits include keys 207, 209, 214, and 215.

Stems and packing box constructions that do not meet Fisher stem finish specifications, dimensional tolerances, and design specifications, may adversely alter the performance of this packing kit.

For part numbers of individual components in the ENVIRO-SEAL packing kits, refer to instruction manual ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)).

Figure 1. Fisher EH Series Control Valve with 667 Actuator

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts ordering information for NPS 8 through 14 Fisher EHD and EHT sliding-stem globe-style control valves. Refer to separate manuals for instructions covering the actuator, positioner, and accessories.

Do not install, operate, or maintain an EH valve without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

EH Valves NPS 8 through 14

June 2017

Instruction Manual

D100392X012

Table 1. Specifications

End Connection Styles⁽¹⁾ Buttwelding: All available ASME B16.25 schedules that are compatible with ASME B16.34 pressure/temperature ratings Flanged Ends: CL1500 or 2500 ■ raised-face (RF) or ■ ring-type joint (RTJ) flanges per ASME B16.5 Shutoff Classifications See table 2 Bore seal trim: High-temperature, Class V. See table 3 Flow Characteristic Standard Cages: ■ Linear, ■ equal percentage, or ■ modified equal percentage ⁽²⁾	Whisper Trim™ III Cages: ■ Linear or ■ modified characteristics available upon request Flow Direction Normally flow down (in through the cage windows and out through the seat ring) for all cage styles except for applications using either a Whisper Trim III cage or a diverter cone plug, both of which are flow up only Additional Specifications For specifications such as materials, valve plug travels, and port, yoke boss, and stem diameters, see the Parts List section Approximate Weights See table 4
--	---

1. The pressure or temperature limits in this manual and any applicable standard limitations should not be exceeded.

2. Valves using an equal percentage cage may be travelled an additional 13 mm (0.5 inch) if desired to obtain additional capacity; flow characteristic becomes modified equal percentage.

Table 2. Shutoff Classifications⁽¹⁾

Valve Design	ANSI/FCI LEAKAGE CLASS
EHD	III—Standard
	IV—Optional
EHT	IV—Standard
	V—Optional
EHT w/ PEEK ⁽²⁾ Anti-Extrusion Rings	V to 316°C (600°F)

1. Per ANSI/FCI 70-2 and IEC 60534-4
2. Poly Ether Ether Ketone

Description

The EHD and EHT valves, shown in figure 1, are large, sliding-stem, high-pressure, globe-style valves. These valves have metal seats, cage guiding, and push-down-to-close valve plug action.

The EHD and EHT valves feature balanced valve plugs. To provide a seal between the valve plug and cage, the EHD valve plug has piston rings; the EHT valve plug has a pressure-assisted seal ring.

Bore seal trim is available for EHD valves, CL1500, NPS 8 and 10 and CL2500, NPS 8, 10, 12, and 14.

With Bore seal trim, a balanced valve can achieve high-temperature, Class V shutoff. Because the Bore seal plug seal is formed from metal (N07718 nickel alloy) rather than an elastomer, a valve equipped with the Bore seal trim can be applied in processes with a fluid temperature of up to 593°C (1100°F), provided other material limits are not exceeded.

Specifications

Specifications for the EHD and EHT valves are shown in table 1.

Educational Services

14	3400	7300	---	---	3400	7600	---	---

Installation

WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage resulting from the sudden release of pressure, do not install the valve assembly where service conditions could exceed the limits given in this manual or on the appropriate nameplates. Use pressure-relieving devices as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

The valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop, and controlled fluid conditions. Because some body/trim material combinations are limited in their pressure drop and temperature range capabilities, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#) or Local Business Partner.

If hoisting the valve, use a nylon sling to protect the painted surfaces. Carefully position the sling to prevent damage to the actuator tubing or any accessories. Also, take precautions to prevent personnel from being injured in case the hoist or rigging slips unexpectedly. Refer to table 4 for valve assembly weights and the appropriate actuator instruction manual for actuator assembly weights. Be sure to use adequately sized hoists and chains or slings to handle the valve and actuator assembly.

1. Before installing the valve, inspect it to ensure that the valve body cavity is free of foreign material.
2. Clean out all pipelines to remove scale, welding slag, and other foreign materials before installing the valve.

Note

If installing a valve with small internal flow passages, such as with Whisper Trim III or Cavitrol™ III cages, consider installing an upstream strainer to prevent the lodging of particles in these passages. This is especially important if the pipeline cannot be thoroughly cleaned or if the flowing medium is not clean.

3. Install the control valve with the valve body in a horizontal pipeline and the actuator vertical above the valve. Other orientations may result in shortened trim life and difficulty with field maintenance. Flow through the valve body must be in the direction indicated by the flow arrow (key 15, figure 12 or 14) on the valve body.

CAUTION

Depending on valve body materials used, post-weld heat treating might be needed. Post-weld heat treatment can damage internal elastomeric, plastic, and metal parts. Shrink-fit pieces and threaded connections might also loosen. In general, if post-weld heat treating is needed, remove all trim parts. Contact your Emerson sales office or Local Business Partner for additional information.

4. Use accepted piping and welding practices when installing the valve in the line. For flanged valve bodies, use suitable gaskets between the valve body flanges and pipeline flanges.
5. Install a three-valve bypass around the control valve if continuous operation is required during maintenance.
6. If the actuator and valve are shipped separately, see the Actuator Mounting procedure.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however some readjustment will be required to meet specific service conditions.

7. If the valve was shipped without packing installed in the packing box, install the packing prior to putting the valve into service. Refer to instructions given in the Packing Maintenance section of this manual.

Principle of Operation

Key numbers referenced in this section are shown in figure 12 for the EHD valve and in figure 14 for the EHT valve.

EHD and EHT valves are balanced designs. When they are opening or closing, pressure registers on top of the valve plug (key 3) through the registration holes in the plug. The force of the pressure on top of the plug balances the force of the pressure on the bottom of the plug to reduce the actuator force required.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing lubrication and maintenance, trim maintenance, and lapping of metal seats. All maintenance operations can be performed with the valve in the line.

WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

WARNING

Refer to table 4 for valve assembly weights and the appropriate actuator instruction manual for actuator assembly weights. Due to the size and weight of the valve and actuator assembly, be sure adequately sized hoists and chains or slings are used to handle it. Also, take proper precautions to prevent personnel from being injured if the hoist or rigging slips unexpectedly.

Note

Whenever a gasket seal is disturbed by removing or shifting gasketed parts, install a new gasket upon reassembly. This is necessary to ensure a good gasket seal.

8. After all maintenance is complete, refer to the Trim Replacement procedure to assemble the valve body.

Note

If the valve has ENVIRO-SEAL™ live-loaded packing installed, see the Fisher instruction manual titled ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)) for packing instructions.

If the valve has HIGH-SEAL live-loaded packing installed, see the Fisher instruction manual titled HIGH-SEAL Live-Loaded Packing System ([D101453X012](#)) for instructions.

Figure 2. Lubricator and Lubricator/Isolating Valve

Packing Lubrication

⚠ WARNING

To avoid personal injury or property damage resulting from fire or explosion, do not lubricate packing used in oxygen service or in processes with temperatures over 260°C (500°F).

CAUTION

Do not lubricate graphite packing. Graphite packing is self-lubricated. Additional lubrication may result in slip-stick movement of the valve.

Note

ENVIRO-SEAL or HIGH-SEAL packing does not require lubrication.

A lubricator or lubricator/isolating valve (figure 2) is recommended for PTFE-impregnated composition packing. The lubricator or lubricator/isolating valve is installed in place of the pipe plug in the bonnet. Use a good quality silicon-base lubricant. Do not lubricate packing used in oxygen service or in processes with temperatures over 260°C (500°F). To operate the lubricator, turn the cap screw clockwise to force lubricant into the packing box. The lubricator/isolating valve operates the same way except open the isolating valve before turning the cap screw and then close the isolating valve after lubrication is completed.

Packing Maintenance

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require readjustment to meet specific service conditions.

Valves with ENVIRO-SEAL live-loaded packing or HIGH-SEAL live-loaded packing installed probably will not require this initial re-adjustment. See the Fisher instruction manuals titled ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)) or HIGH-SEAL Live-Loaded Packing System ([D101453X012](#)) (as appropriate) for packing instructions. To convert an existing packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the parts kit sub-section near the end of this manual. Figure 10 shows typical ENVIRO-SEAL packing systems.

For spring-loaded PTFE V-ring packing (figure 4), the spring maintains a sealing force on the packing. If leakage is noted around the packing follower (key 13, figure 11), check to be sure the shoulder on the packing follower is touching the bonnet (key 1, figure 11). If the shoulder is not touching the bonnet, tighten the packing flange nuts (key 5, figure 11) until the shoulder on the packing follower is against the bonnet. If the packing leakage is still excessive, replace the packing by following the Replacing Packing procedure.

If packing leakage is undesirable with other than spring-loaded PTFE V-ring packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts (key 5, figure 11) to at least the minimum recommended torque in table 5. However, do not exceed the maximum recommended torque in table 5 or excessive friction may result.

Table 5. Recommended Packing Flange Nut Torques

STEM DIAMETER		VALVE RATING	N•m		Lbf•ft	
mm	Inches		Min	Max	Min	Max
31.8	1-1/4	CL1500	68	102	50	75
		CL2500	81	122	60	90
50.8	2	CL1500	98	146	72	108
		CL2500	115	170	85	125

If the packing is relatively new and tight on the stem, and if tightening the packing flange nuts does not stop the leakage, the valve stem may be worn or nicked so that a seal cannot be made. The surface finish of a new stem is critical for making a good packing seal. If the leakage comes from the outside diameter of the packing, the leakage may be caused by nicks or scratches around the packing box wall. While replacing the packing according to the Replacing Packing procedure, inspect the stem and packing box wall for nicks or scratches.

Replacing Packing

⚠ WARNING

Refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

Key numbers referred to in this procedure are shown in figure 11 unless otherwise indicated.

1. Remove the stem connector cap screws shown in figure 3, and separate the two halves of the stem connector. Then exhaust all actuator pressure, if any was applied, and disconnect the actuator supply and any leakoff piping.
2. Remove the hex nuts (key 26) and remove the actuator from the bonnet (key 1). Loosen the packing flange nuts (key 5) so that the packing (key 6, or 7 and 9, figure 4) is not tight on the valve plug stem (key 4, figure 12 or 14). Remove any travel indicator disk and stem locknuts from the valve plug stem threads.

⚠ WARNING

Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet. To avoid personal injury or property damage caused by uncontrolled movement of the bonnet, loosen the bonnet by following the instructions in the next step.

Figure 3. Actuator Mounting

Note

The following step also provides additional assurance that the valve fluid pressure has been relieved.

3. Hex nuts (key 14, figures 12 and 14) attach the bonnet to the valve body. Loosen these nuts approximately 3 mm (1/8 inch). Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and valve body. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, proceed with the bonnet removal in step 5.

⚠ WARNING

If the cage sticks to the bonnet, proceed carefully with bonnet removal until the cage windows are accessible. Do not extend hands or arms through the windows at this point as a sudden separation of bonnet and cage will cause personal

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D100392X012

EH Valves NPS 8 through 14

June 2017

injury. Use a stick or other device to thread a rope or sling through the windows. Use this rigging to secure the cage to the bonnet or hoist to prevent damage or injury should the cage suddenly separate from the bonnet.

CAUTION

When lifting the bonnet (key 1), be sure that the valve plug and stem assembly (keys 3 and 4, figure 12 or 14) remains on the seat ring (key 6, figure 12 or 14). This avoids damage to the seating surfaces as a result of the assembly dropping from the bonnet after being lifted part way out. The parts are also easier to handle separately.

4. Remove the hex nuts (key 14, figure 12 or 14) and washers (key 29 and 33, figure 12, 13, or 14). Carefully lift the bonnet off the valve plug stem. If the valve plug assembly starts to lift with the bonnet, use a brass or similar hammer to tap the end of the stem and tap it back down. Set the bonnet on a protective surface to prevent damage to the bonnet gasket surface.

CAUTION

Use care to avoid damaging gasket sealing surfaces.

EHD piston rings (key 8) are brittle and in two halves. Use care to avoid damage to the piston rings caused by dropping or rough handling.

5. Lift the plug assembly (keys 3 and 4, figure 12 or 14) out of the valve body.
6. To remove the cage (key 2, figure 12 or 14), if it remained in the valve body, install eyebolts or similar devices into the 1/2 inch 13-UNC tapped holes in the top of the cage. Using the eyebolts, carefully lift the cage out of the valve body. Remove the top and bottom cage gaskets (key 11, figure 12 or 14). Carefully remove any residual silver or tin from the gasket surfaces.
7. Cover the opening in the valve body to protect the gasket surface and to prevent foreign material from getting into the valve body cavity.

Table 6. Body-to-Bonnet Bolting Torques

VALVE SIZE NPS	VALVE RATING	B7, B16, BD, 660 STUDS		B8, B8M STUDS	
		N•m	lbf•ft	N•m	lbf•ft
8, 10	CL1500	2710	2000	2035	1500
	CL2500	4070	3000	3050	2250
12, 14	CL1500	8130	6000	6100	4500
	CL2500	5830	4300	4370	3225

8. Remove the packing flange nuts, packing flange, upper wiper and packing follower. Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall. Clean the packing box and these metal packing parts shown in the figure 4 arrangements: packing box ring, spring, lantern ring, washer if used, and packing follower (keys 11, 8, 10, and 13).
9. Inspect the valve plug stem threads for any sharp edges that might cut the packing. Use a whetstone or emery cloth to smooth the threads if necessary.
10. Remove the protective covering from the valve body cavity, and install the cage using new cage gaskets (key 11, figure 12 or 14).
11. Install the plug and stem assembly. Be sure the seal ring or piston rings are installed correctly as described under Trim Replacement.

Figure 4. Packing Arrangements

NOTES:

- ① 0.102 mm (0.004 INCH) THICK SACRIFICIAL ZINC WASHERS. USE ONLY ONE BELOW EACH GRAPHITE LAMINATE RING.

- ② HAS THE APPEARANCE OF FLAT WASHERS PRESSED TOGETHER.
③ HAS THE APPEARANCE OF A WOVEN OR BRAIDED RING.

C0634-1

12. Slide the bonnet over the stem and onto the bonnet studs (key 13, figure 12 or 14).

Note

Proper performance of the bolting procedures in step 13 compresses the cage gaskets (key 11, figure 12 or 14) enough to seal the body-to-bonnet joint.

The prelubricated hex nuts (key 14, figure 12 or 14) referred to in step 13 can be identified by a black film coating on the nut threads.

The proper bolting procedures in step 13 include, but are not limited to, ensuring that the bonnet stud threads are clean, Belleville washers (if present) are installed in the correct orientation, and that the hex nuts are evenly tightened to the specified torque values.

CAUTION

Failure to comply with good bonnet-to-body bolting practices and the torque values shown in table 6 may result in cage crushing, cage diameter reduction, and/or bonnet deformation. Do not use cheater bars or slug wrenches for this procedure.

Hot torquing is not recommended; it may result in damage to valve components.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) or Local Business Partner immediately if a discrepancy between actual parts and approved parts is suspected.

13. Lubricate the stud threads and the faces of the hex nuts (key 14, figure 12 or 14) with anti-seize lubricant (not necessary if new factory prelubricated hex nuts are used). Replace the flat washers (key 29, figure 12 or 14) and Belleville washers (key 33, figure 13), if included with the valve body assembly. Belleville washers must be installed so that the concave side is facing towards the valve body or flat washer. Replace the hex nuts and torque the nuts in a crisscross pattern to no more than 1/4 of the nominal torque value specified in table 6. When all nuts are tightened to that torque value, increase the torque by 1/4 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.
14. Install new packing and the metal packing box parts according to the appropriate arrangement in figure 4. Slip a smooth-edged pipe over the valve stem, and gently tamp each soft packing part into the packing box.
15. Slide the packing follower, wiper, and packing flange into position. Lubricate the packing flange studs (key 4) and the faces of the packing flange nuts (key 5) and then install the packing flange nuts.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

EH Valves NPS 8 through 14

June 2017

Instruction Manual

D100392X012

For spring-loaded PTFE V-ring packing: Tighten the packing flange nuts until the shoulder on the packing follower (key 13) contacts the bonnet (key 1).

For other kinds of packing, except ENVIRO-SEAL and HIGH-SEAL: Tighten the packing flange nuts to the maximum recommended torque shown in table 5. Then, loosen the packing flange nuts and retighten them to the recommended minimum torque in table 5.

For ENVIRO-SEAL and HIGH-SEAL packing: See the Fisher instruction manuals titled ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)) or HIGH-SEAL Live-Loaded Packing System ([D101453X012](#)) (as appropriate) for packing instructions.

Table 7. Seat Ring and Seat Ring Cap Screw Lubricants and Recommended Torque for Seat Ring Cap Screws

LUBRICANT	VALVE SIZE, NPS	VALVE RATING	RECOMMENDED TORQUE			
			Spiral Wound Gasket Construction		O-Ring Construction or Constructions for Sour Gas Service	
			N•m	lbf•ft	N•m	lbf•ft
Lithium Grease or Anti-Seize Lubricant	8, 10	CL1500	61	45	41	30
		CL2500	95	70	61	45
	12, 14	CL1500	95	70	61	45
		CL2500	95	70	61	45
Dry Film Lubricant	8, 10	CL1500	47	35	34	25
		CL2500	75	55	47	35
	12, 14	CL1500	75	55	47	35
		CL2500	75	55	47	35

16. Mount the actuator on the valve body assembly, and reconnect the actuator and valve plug stem according to the Actuator Mounting procedure. After the control valve is returned to service, retighten the hex nuts (key 14, figure 12 or 14) to the torque recommended in table 6.

Trim Removal

WARNING

Refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

For Bore seal construction, see the appropriate Bore seal sections in this instruction manual.

Key numbers referenced in this procedure are shown in figure 12 for the EHD valve and figure 14 for the EHT valve except where indicated.

1. Remove the actuator and bonnet by following steps 1 through 9 of the Replacing Packing procedure.
2. To remove the seat ring (key 6), remove the cap screws (key 7). Install eyebolts or similar devices in the 5/8 inch 11-UNC tapped holes (9/16 inch 12-UNC for an NPS 8 or 10 CL1500 valve). Use the eyebolts to carefully lift the seat ring out of the valve body. If the seat ring is to be reused, exercise care to protect the gasket surfaces on the bottom of the seat ring.
3. Remove the spiral wound seat ring gasket or O-ring (key 12).
4. Refer to the following appropriate valve plug maintenance procedure or to the Lapping Seats procedure.

EHD and EHT Valve Plug Maintenance

Key numbers used in this procedure are shown in figure 12 for the EHD valve and in figure 14 for the EHT valve.

1. With the valve plug (key 3) removed per the Trim Removal procedure, proceed as appropriate:

For the EHD valve, the piston rings (key 8) are each in two sections; remove the sections from the grooves in the valve plug.

For all EHT valves, work the retaining ring (key 10) off the valve plug with a screwdriver. Carefully slide the backup ring and seal ring (keys 9 and 8) off the valve plug. Additionally, for the EHT valve with Whisper Trim Level D cage, remove the two sections of the piston ring (key 30, figure 14).

2. To replace the valve plug stem (key 4), drive out the pin (key 5) and unscrew the stem from the valve plug (key 3).

CAUTION

Never reuse an old stem with a new valve plug. Using an old stem with a new plug requires drilling a new pin hole in the stem. This weakens the stem and may cause the stem to fail in service. If a new valve plug is required, always order a valve plug, stem, and pin as an assembly. Specify the correct part number of each of the three parts but state that the parts are being ordered as an assembly.

A used valve plug may be reused with a new stem.

3. Thread the new stem into the valve plug until the stem wedges tightly at the end of the thread. Using the valve plug pin hole as a guide, drill the pin hole through the stem. Use a 1/4 inch drill for 31.8 mm (1-1/4 inch) stems and a 3/8 inch drill for 50.8 mm (2-inch) stems.
4. Drive in the pin to lock the assembly.
5. If seat lapping is necessary, complete the Lapping Seats procedure before installing the EHD piston rings or the EHT seal ring. Piston ring and seal ring installation instructions and valve body-to-bonnet reassembly instructions are presented in the Trim Replacement procedure.

Lapping Seats

Key numbers referenced in this procedure are shown in figure 12 for the EHD valve and in figure 14 for the EHT valve.

A certain amount of leakage should be expected with metal-to-metal seating in any valve. If the leakage becomes excessive, however, the condition of the seating surfaces of the valve plug (key 3) and seat ring (key 6) can be improved by lapping. (Deep nicks should be machined out rather than ground out.) Use a good quality lapping compound with a mixture that contains 280 to 600 grit. Apply the compound to the bottom of the valve plug.

Use the following procedure to lap the seating surfaces.

1. For all designs, install the seat ring gasket or O-ring (key 12), seat ring (key 6), seat ring cap screws (key 7), lower cage gasket (key 12), cage (key 2), and upper cage gasket (key 12) into the valve body per the instructions in the Trim Replacement procedure.
2. Install the assembled valve plug and stem (keys 3 and 4)--without piston rings or seal ring (key 8)-- into the cage.
3. For all seating surfaces, install the bonnet (key 1, figure 11) over the valve stem and secure the bonnet with four of the hex nuts (key 14).
4. Attach a handle, such as a piece of strap iron secured by stem locknuts, to the valve plug stem. Rotate the handle alternately in each direction to lap the seats.

Note

In order to preserve the effects of lapping, do not change either the position of the seat ring in the valve body cavity or the position of the cage on the seat ring after lapping the seating surfaces. If possible, clean the parts without disturbing their positions. If the parts must be removed for cleaning, return them to the original positions.

5. After lapping, again disassemble as necessary, clean the seating surfaces, reassemble, and test for shutoff. Repeat the lapping procedure if necessary.

Trim Replacement

After all trim maintenance has been completed, reassemble the valve by following the numbered steps below. Be certain that all gasketed surfaces are clean. Key numbers referenced in this procedure are shown in figure 12 for the EHD valve and in figure 14 for the EHT valve.

CAUTION

Thoroughly clean the seat ring (key 6), the seat ring cap screws (key 7), and the cap screw threads in the valve body with a good-quality degreaser. Unless the valve is to be used for oxygen service, thoroughly lubricate the cap screw threads and the underside of the cap screw heads with one of the lubricants (or equivalent) shown in table 7.

Failure to lubricate as described may cause galling and improper seat ring gasket or O-ring (key 12) loading which may result in leakage.

⚠ WARNING

If the control valve is to be used for oxygen service, use the lubrication procedure above, but substitute a lubricant that has been approved for oxygen service. Use of unapproved lubricants creates a fire or explosion hazard.

1. Install either the seat ring gasket or the O-ring (key 12). Place the O-ring in the O-ring groove in the seat ring before installing the seat ring in the valve body. Install the seat ring (key 6) and secure it with the seat ring cap screws (key 7). Torque the hex socket head cap screws in a criss-cross pattern with no more than 20 N•m (15 lbf•ft) of torque. When all are tightened to 20 N•m (15 lbf•ft), increase the torque 20 N•m (15 lbf•ft) without exceeding the torque value specified in table 7, and repeat the crisscross pattern. Repeat until all cap screws are tightened to the torque value specified in table 7. Repeat the final torque and if any cap screw still turns, tighten every cap screw again.
2. Install one of the cage gaskets (key 11) between the valve body and cage (key 2), and install the cage.
3. If the cage used has multiple sizes of windows, attempt to orient the largest window toward the valve body web (a shelf-like projection of the casting into the flow cavity). As an alternate reference, orient the largest window toward the process outlet for a flow-down and toward the process inlet for a flow-up valve.
4. Inspect the valve plug stem threads for any sharp edges that might cut the packing. Use a whetstone or emery cloth to smooth the threads if necessary.
5. To install the piston rings or seal ring (key 8), proceed as appropriate:

For an EHD valve, if installing a new piston ring, the replacement piston ring will arrive in one piece. Use a vise with smooth or taped jaws to break this replacement piston ring into halves. Place the new ring in the vise so that the jaws compress the ring into an oval. Slowly compress the ring until the ring snaps on both sides. If one side snaps first, do not try to tear or cut the other side. Instead, keep compressing until the other side snaps.

Remove any protective tape or covering from the valve plug and stem assembly, and set it on a protective surface. Then place the piston ring in the piston ring groove with the fractured ends matched.

For an EHT valve, install the seal ring (key 8) onto the valve plug (key 3). Install the ring with the open side facing the seat ring end of the valve plug for a flow-down application (view B of figure 14) or with the open side facing the valve stem end of the valve plug for a flow-up application. Slide the backup ring (key 9) onto the valve plug. Secure with the retaining ring (key 10). For an EHT valve with a Whisper Trim Level D cage, install the piston ring (key 30, figure 14) using the procedure given in the EHD instructions immediately preceding this paragraph.

6. Install the valve plug into the cage.
7. Install the other cage gasket (key 11) between the cage and the bonnet.

CAUTION

Failure to comply with good bonnet-to-body bolting practices and the torque values shown in table 6 may result in cage crushing, cage diameter reduction, and/or bonnet deformation. Cheater bars or slug wrenches should not be used for this procedure.

Hot torquing is not recommended; it may result in damage to valve components.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) or Local Business Partner immediately if a discrepancy between actual parts and approved parts is suspected.

8. Install the bonnet over the valve stem and onto the valve body. Lubricate the threads of the studs (key 13) and the faces of the hex nuts (key 14) with anti-seize lubricant (key 24). Secure the bonnet with hex nuts (key 14) and washers (key 29). Torque the nuts in a crisscross pattern to no more than 1/4 of the nominal torque value specified in table 6. When all nuts are tightened to that torque value, increase the torque by 1/4 of the specified torque value and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Repeat the final torque value and if any nut still turns, tighten every nut again.
9. Install new packing and the metal packing box parts according to the appropriate arrangement in figure 4. Slip a smooth-edged pipe over the valve stem, and gently tamp each soft packing part into the packing box.
10. Slide the packing follower, wiper, and packing flange into position. Lubricate the packing flange studs (key 4) and the faces of the packing flange nuts (key 5) and then install the packing flange nuts.

For spring-loaded PTFE V-ring packing: Tighten the packing flange nuts until the shoulder on the packing follower (key 13) contacts the bonnet (key 1).

For other kinds of packing, except ENVIRO-SEAL and HIGH-SEAL: Tighten the packing flange nuts to the maximum recommended torque shown in table 5. Then, loosen the packing flange nuts and retighten them to the recommended minimum torque in table 5.

For ENVIRO-SEAL and HIGH-SEAL packing: See the Fisher instruction manuals titled ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)) or HIGH-SEAL Live-Loaded Packing System ([D101453X012](#)) (as appropriate) for packing instructions.

11. Mount the actuator by following the Actuator Mounting procedure. Check for packing leakage as the valve is being put into service. Retorque the packing flange nuts as required (see table 5). Then, retighten the hex nuts (key 14) to the torque shown in table 6.

Figure 5. Fisher EHD with Bore Seal Trim

Retrofit: Installing Bore Seal Trim

Note

Additional actuator thrust is required for a valve with Bore Seal trim. When installing Bore Seal trim in an existing valve, contact your [Emerson sales office](#) or Local Business Partner for assistance in determining new actuator thrust requirements.

Assemble the new valve plug/retainer assembly (with Bore Seal plug seal) using the following instructions:

CAUTION

To avoid leakage when the valve is returned to service, use appropriate methods and materials to protect all sealing surfaces of the new trim parts while assembling the individual parts and during installation in the valve body.

1. Apply a suitable high-temperature lubricant to the inside diameter of the Bore Seal plug seal. Also, lubricate the outside diameter of the valve plug where the Bore Seal plug seal must be pressed into the proper sealing position (figure 5).
2. Orient the Bore Seal plug seal for correct sealing action based on the process fluid flow direction through the valve.
 - The open interior of the Bore Seal plug seal must face up in a valve with flow-up construction (figure 5).
 - The open interior of the Bore Seal plug seal must face down in a valve with flow-down construction (figure 5).
3. Place the Bore Seal plug seal over the top of the valve plug. The retainer will help guide the Bore Seal down onto the plug (figure 5). Do not force the Bore Seal over the plug. For flow down constructions, skip to step 5.
4. An installation tool (see table 8) must be inserted into the Bore Seal prior to using the retainer to guide it down the plug.
5. Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the Bore Seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench. For flow down constructions, skip to step 7.
6. Remove the retainer and then the installation tool. Place the Bore Seal retainer back onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
7. Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place (figure 7) to secure the Bore Seal retainer.
8. Install the new plug/retainer assembly with Bore Seal plug seal on the new stem following the appropriate instructions in the Trim Replacement section of this manual.
9. Install piston rings by following instructions in the Trim Replacement section of this manual.
10. Remove the existing valve actuator and bonnet following the appropriate instructions in the Replacing Packing section of this manual.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

EH Valves NPS 8 through 14

June 2017

Instruction Manual

D100392X012

Figure 6. Bore Seal Installation Tool

GE22109-A

Table 8. Bore Seal Installation Tool Dimensions

VALVE PORT SIZE, INCH	Dimensions, Inches (See Figure 6)								Tool Part Number
	A	B	C	D	E	F	G	H	
5.375	5.49	5.07	5.17-5.19	5.39-5.37	0.10	0.10	0.32	R.06	GE22109X012
7.00	7.11	6.69	6.79-6.81	7.01-6.99	0.09	0.10	0.32	R.06	GE18264X012
10.00	10.12	9.7	9.80-9.82	10.02-10.00	0.10	0.10	0.32	R.06	GE17914X012

CAUTION

Do not remove the existing valve stem from the valve plug unless you are planning to replace the valve stem.

Never reuse an old valve stem with a new plug or reinstall a valve stem after it has been removed. Replacing a valve stem requires drilling a new pin hole in the stem. This drilling weakens the stem and may cause failure in service. However, a used valve plug may be reused with a new valve stem.

- Remove the existing valve stem and plug, cage, and seat ring from the valve body following the appropriate instructions in the Trim Removal section of this manual.
- Replace all gaskets according to appropriate instructions in the Trim Replacement section of this manual.
- Install the new seat ring, cage, valve plug/retainer assembly, and stem into the valve body and completely reassemble the valve package following the appropriate instructions in the Trim Replacement section of this manual.

CAUTION

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the Bore Seal plug seal and contact the seat ring. You can correctly seat the valve plug by using the same force calculated for full load when sizing your actuator. With no pressure drop across the valve, this force will adequately drive the valve plug to the seat ring, thus giving the Bore Seal plug seal a predetermined permanent set. Once this is done, the plug/retainer assembly, the cage, and the seat ring become a matched set.

With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

Replacement of Installed Bore Seal Trim

Trim Removal (Bore Seal Constructions)

1. Remove the valve actuator and bonnet following the appropriate instructions in the Replacing Packing section of this manual.

CAUTION

To avoid leakage when the valve is returned to service, use appropriate methods and materials to protect all sealing surfaces of the trim parts during maintenance.

Use caution when removing piston ring(s) and the Bore Seal plug seal to avoid scratching any sealing surface.

CAUTION

Do not remove the valve stem from the plug/retainer assembly unless you are planning to replace the valve stem.

Never reuse an old valve stem with a new plug or reinstall a valve stem after it has been removed. Replacing a valve stem requires drilling a new pin hole in the stem. This drilling weakens the stem and may cause failure in service. However, a used valve plug may be reused with a new valve stem.

2. Remove the plug/retainer assembly (with Bore Seal plug seal), cage, and seat ring from the valve body following the appropriate instructions in the Trim Removal section of this manual.
3. Locate the staked thread on top of the valve plug (figure 7). The staked thread secures the retainer. Use a drill with a 1/8 inch bit to drill out the staked area of the thread. Drill approximately 1/8 inch into the metal to remove the staking.
4. Locate the break between sections of the piston ring(s). Using an appropriate tool such as a flat-blade screwdriver, carefully pry out the piston ring(s) from the groove(s) in the Bore Seal retainer.
5. After removing the piston ring(s), locate the 1/4-inch diameter hole in the groove. In a retainer with two piston ring grooves, the hole will be found in the upper groove.
6. Select an appropriate tool such as a punch and place the tip of the tool into the hole with the body of the tool held tangent to the outside diameter of the retainer. Strike the tool with a hammer to rotate the retainer and free it from the valve plug. Remove the retainer from the plug.

Figure 7. Stake the Threads of the Bore Seal Retainer

Figure 8. Installing the Bore Seal Plug Seal Using the Installation Tool

NOTE: PRESS THE INSTALLATION TOOL OVER THE VALVE PLUG UNTIL THE TOOL CONTACTS THE HORIZONTAL REFERENCE SURFACE OF THE VALVE PLUG.

7. Use an appropriate tool such as a flat-blade screwdriver to pry the Bore Seal plug seal off the plug. Use caution to avoid scratches or other damage to the sealing surfaces where the Bore Seal plug seal makes contact with the valve plug (figure 9).
8. Inspect the lower seating surface where the valve plug contacts the seat ring for wear or damage which would prevent proper operation of the valve. Also, inspect the upper seating surface inside the cage where the Bore Seal plug seal contacts the cage, and inspect the sealing surface where the Bore Seal plug seal makes contact with the plug (figure 9).
9. Replace or repair trim parts according to the following procedure for lapping metal seats, remachining metal seats, or other valve plug maintenance procedures as appropriate.

Lapping Metal Seats (Bore Seal Constructions)

Before installing a new Bore Seal plug seal, lap the lower seating surface (valve plug to seat ring, figure 9) following appropriate procedures in the Lapping Seats section of this manual.

Remachining Metal Seats (Bore Seal Constructions)

A valve plug with a Bore Seal metal plug seal features two seating surfaces. One seating surface is found where the valve plug contacts the seat ring. The second seating surface is found where the Bore Seal plug seal contacts the upper seating surface in the cage. The cage does not require any machining, even when the plug and / or seat ring have been machined.

Trim Replacement (Bore Seal Constructions)

1. Apply a suitable high-temperature lubricant to the inside diameter of the Bore Seal plug seal. Also, lubricate the outside diameter of the valve plug where the Bore Seal plug seal must be pressed into the proper sealing position (figure 5).
2. Orient the Bore Seal plug seal for correct sealing action based on the process fluid flow direction through the valve.

- The open interior of the Bore Seal plug seal must face up in a valve with flow-up construction (figure 5).
- The open interior of the Bore Seal plug seal must face down in a valve with flow-down construction (figure 5).

Figure 9. Lower (Valve Plug to Seat Ring) and Upper (Bore Seal Plug Seal to Cage) Seating Surfaces

- Place the Bore Seal plug seal over the top of the valve plug. The retainer will help guide the Bore Seal down onto the plug. Do not force the Bore Seal over the plug. For flow down constructions, skip to step 5.
- An installation tool (see table 8) must be inserted into the Bore Seal prior to using the retainer to guide it down the plug.
- Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the Bore Seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench. For flow down constructions, skip to step 7.
- Remove the retainer and then the installation tool. Place the Bore Seal retainer back onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
- Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place (figure 7) to secure the Bore Seal retainer.
- Replace the piston ring(s) following instructions in the Trim Replacement section of this manual.
- Return the seat ring, cage, plug/retainer assembly, and stem to the valve body and completely reassemble the valve package following the appropriate instructions in the Trim Replacement section of this manual.

CAUTION

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the Bore Seal plug seal and contact the seat ring. You can correctly seat the valve plug by using the same force calculated for full load when sizing your actuator. With no pressure drop across the valve, this force will adequately drive the valve plug to the seat ring, thus giving the Bore Seal plug seal a predetermined permanent set. Once this is done, the plug/retainer assembly, the cage, and the seat ring become a matched set.

With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

Actuator Mounting

The following procedure assumes that the valve and actuator are fully assembled, but with the actuator removed from the valve. Unless otherwise identified, the parts involved in making up the actuator-valve stem connection are shown in figure 3.

CAUTION

Never use a wrench or pliers on the valve plug stem and never turn the valve plug stem while the valve plug assembly is seated. A damaged stem could cut the packing and allow leakage. Turning the plug while seated could damage the seats allowing leakage at shutoff.

1. Turn the stem locknuts onto the valve stem.
2. Move the valve plug to the closed position.
3. Place the actuator on the bonnet and secure with the hex nuts (key 26, figure 11). Connect supply pressure to the actuator.
4. Make sure the actuator stem is fully retracted. With a properly assembled direct-acting spring-return actuator, spring compression forces the actuator stem to the fully retracted position. A double-acting piston actuator or a reverse-acting spring-return actuator requires air pressure (or a side-mounted handwheel) to stroke the actuator stem to the fully retracted position.
5. Extend the actuator stem a distance equal to the travel (as specified on the nameplate).
6. Attach both halves of the stem connector, making sure the connector fully engages both the actuator threads and valve plug stem threads. Install the cap screws in the stem connector, but tighten them only slightly at this time.
7. Stroke the valve to the fully open position. The travel indicator should show the valve to be wide open. If it does not, loosen the screws that hold the travel indicator scale, and shift the scale to the required position.
8. Stroke the valve to the closed position. The travel indicator should show the valve to be closed.
9. If travel is not correct, lift the valve plug assembly (key 3, figure 12 or 14) off its seat approximately 6.4 mm (1/4 inch) and screw the valve plug stem into or out of the stem connector as follows. To lengthen travel, turn the valve plug stem into the stem connector slightly. To shorten travel, turn the valve plug stem out of the stem connector slightly. (Turning it out too far will limit the stroke.)
10. After adjusting the stem connection so that the actuator will properly stroke the valve plug assembly, tighten the cap screws in the stem connector, tightening the one opposite the anti-rotation groove first. Then lock the stem locknuts against the stem connector.

Parts Ordering

Each valve is assigned a serial number, which can be found on the valve body. This same number also appears on the actuator nameplate when the valve is shipped from the factory as part of a control valve assembly. Refer to the number when contacting your [Emerson sales office](#) or Local Business Partner for technical assistance or when ordering replacement parts.

When ordering replacement parts, also be sure to include the 11-character part number for each part required from the following parts list.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts Kits

ENVIRO-SEAL Packing Retrofit Kits

Retrofit kits include parts to convert existing packing to the ENVIRO-SEAL packing system. PTFE kits include keys 200, 201, 211, 212, 214, 215, 217, 218, tag, and cable tie. Graphite kits include keys 200, 201, 207, 208, 209, 210, 211, 212, 214, 216, 217, tag, and cable tie. Duplex kits include keys 200, 201, 207, 209, 211, 212, 214, 215, 216, 217, tag, and cable tie. Stems and packing box constructions that do not meet Emerson stem finish specifications, dimensional tolerances, and design specifications, may adversely alter the performance of the packing kit.

		Double PTFE	Graphite ULF	Duplex
31.8 (1-1/4)	127 (5, 5H)	RPACKXRT052	RPACKXRT302	RPACKXRT252

ENVIRO-SEAL Packing Repair Kits

Repair kits include parts to replace the “soft” packing materials in valves that already have ENVIRO-SEAL packing arrangements installed or in valves that have been upgraded with ENVIRO-SEAL retrofit kits. PTFE repair kits include keys 214, 215, and 218. Graphite repair kits include keys 207, 208, 209, 210, and 214. Duplex repair kits include keys 207, 209, 214, and 215.

Introduction

Scope of Manual

This instruction manual includes installation, maintenance, and parts information for the Fisher EHD, EHS, and EHT control valves in NPS 1-1/2 x 1 through NPS 8x6. Refer to separate manuals for instructions covering the actuator, positioner, ENVIRO-SEAL™ packing, HIGH-SEAL packing, and accessories.

Do not install, operate, or maintain EHD, EHS, or EHT valves without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Unless otherwise noted, all NACE references are to NACE MR0175-2002.

End Connection Styles Buttwelding: All available ASME B16.25 schedules that are compatible with ASME B16.34 pressure/temperature ratings Flanged: CL2500 ■ ring-type joint (RTJ) or ■ raised-face (RF) flanges according to ASME B16.5 Socket Welding: Consistent with ASME B16.11 Maximum Inlet Pressure⁽¹⁾ Buttwelding: Consistent with CL2500 pressure-temperature ratings per ASME B16.34 Flanged: Consistent with CL2500 pressure-temperature ratings per ASME B16.34 Socket Welding: Consistent with CL2500 pressure-temperature ratings per ASME B16.34 Shutoff Classifications See table 2 C-seal trim: High-temperature, Class V. See table 3 TSO (Tight Shutoff) trim: See tables 4 and 5	Flow Characteristic Standard Cage: ■ Equal percentage, ■ modified equal percentage⁽²⁾, ■ or linear Cavitrol™ III or Whisper Trim™ III Cage: Linear Flow Direction EHD or EHT: Flow down, except with either a Whisper Trim III cage or a valve plug with diverter cone, both of which are flow up EHS: Flow up, except flow down with Cavitrol III cage Approximate Weights (Valve Body and Bonnet Assemblies) See table 6 Additional Specifications For specifications such as materials, valve plug travels, and port, yoke boss, and stem diameters, see the Parts List section
--	---

1. The pressure or temperature limits in this manual and any applicable standard limitations should not be exceeded.

2. Modified equal percentage characteristic is equal-percentage for the first 90% of travel, then quick-opening for additional capacity.

Table 2. Shutoff Classifications per ANSI/FCI 70-2 and IEC 60534-4

Valve	Valve Size, NPS	ANSI/FCI Leakage Class
EHD	3x2	II
	3, 4x3, 4, 6x4	II—Standard
		III—Optional ⁽¹⁾
	6, 8x6	III—Standard
		IV—Optional ⁽¹⁾
EHS w/Cavitrol III, or EHT w/Cavitrol III	All	V ⁽¹⁾
EHS, EHT, EHS w/Micro-Form or EHS w/Micro Flute	All	IV—Standard
		V—Optional ⁽¹⁾
EHT w/ PEEK Anti-Extrusion Rings	3 to 6	V to 600°F (316°C)

1. O-ring seat ring construction recommended for this shutoff classification; for temperatures below 232°C (450°F) only.

Description

The EHD, EHS, and EHT high-pressure globe valves (figure 1) have metal seats, cage guiding, and push-down-to-close valve plug action. The EHD and EHT valves use balanced valve plugs.

The EHS valve uses an unbalanced valve plug. To provide a seal between the cage and a balanced valve plug, the EHD valve plug uses piston rings; the EHT valve plug uses a pressure-assisted seal ring. A Whisper Trim cage can be used with an EHD, EHS, or EHT valve plug. A Cavitrol III cage can be used with an EHS or EHT valve plug.

C-seal trim is available for EHD valves, CL2500, in sizes 4, 6, 6x4, and 8x6.

With C-seal trim, a balanced valve can achieve high-temperature, Class V shutoff. Because the C-seal plug seal is formed from metal (N07718 nickel alloy) rather than an elastomer, a valve equipped with the C-seal trim can be

Installation

WARNING

Always wear protective gloves, clothing, and eyewear when performing any installation operations to avoid personal injury.

To avoid personal injury or property damage resulting from the sudden release of pressure, do not install the valve assembly where service conditions could exceed the limits given in this manual or on the appropriate nameplates. Use pressure-relieving devices as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

CAUTION

Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. The valve configuration and construction materials meet particular pressure, temperature, pressure drop, and controlled fluid conditions specified in the customer's order. Because some body/trim material combinations are limited in their pressure drop and temperature range capabilities (especially due to differences in thermal expansion rates), do not apply any other conditions to the valve without first contacting your [Emerson sales office](#) or Local Business Partner.

CAUTION

If hoisting the valve, use a nylon sling to protect the painted surfaces. Carefully position the sling to prevent damage to the tubing or any accessories. Use adequately sized hoists and chains or slings to handle the valve and take precautions to prevent personnel from being injured in case the hoist or rigging slips unexpectedly. Refer to table 6 for valve assembly weights.

WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however some readjustment will be required to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

1. Before installing the valve, inspect it to ensure that the valve body cavity is free of foreign material.
2. Clean out all pipelines to remove scale, welding slag, and other foreign materials before installing the valve.

Note

If the valve being installed has small internal flow passages, such as with Whisper Trim III or Cavitrol III cages, consideration should be given to installing an upstream strainer to prevent the lodging of particles in these passages. This is especially important if the pipeline cannot be thoroughly cleaned or if the flowing medium is not clean.

3. The control valve must be installed with the actuator vertical above the valve body for proper operation. Flow through the valve must be in the direction indicated by the flow arrow (key 15, figure 18, 19, or 20) on the valve body.
4. Use accepted piping and welding practices when installing the valve in the line. For welding end valve bodies, completely disassemble the valve removing all trim parts before welding the valve body in the line. For flanged valve bodies, use suitable gaskets between the valve body flanges and pipeline flanges.

Figure 2. Lubricator and Lubricator/Isolating Valve

CAUTION

Depending on valve body materials used, post-weld heat treating might be needed. Post-weld heat treatment can damage internal elastomeric, plastic, and metal parts. Shrunk-fit pieces and threaded connections might loosen.

If post-weld heat treating is needed, remove all trim parts to avoid any damage to internal elastomeric, plastic, and metal parts. Contact your [Emerson sales office](#) or Local Business Partner for additional information.

5. Install a three-valve bypass around the valve if continuous operation is required during maintenance.
6. If the actuator and valve body are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.
7. If the valve was shipped without packing installed in the packing box, install the packing before putting the valve into service. Refer to instructions given in the Packing Maintenance procedure.

Valves with ENVIRO-SEAL live-loaded packing or HIGH-SEAL Heavy-Duty live-loaded packing will not require this initial re-adjustment. See the Fisher instruction manuals titled ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)) or HIGH-SEAL Live-Loaded Packing System ([D101453X012](#)) (as appropriate) for packing instructions. If you wish to convert your present packing arrangement to ENVIRO-SEAL packing, refer to the retrofit kits listed in the parts kit sub-section near the end of this manual.

Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing lubrication, packing maintenance, adding packing rings, replacing packing, trim removal, valve plug maintenance, lapping seats, and trim replacement. All maintenance operations can be performed with the valve in the line.

⚠ WARNING

Avoid personal injury from sudden release of process pressure. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

1. Includes intermediate class ratings.

Note

Whenever a gasket seal is disturbed by removing or shifting gasketed parts, a new gasket should be installed upon reassembly. This is necessary to ensure a good gasket seal.

Note

If the valve has ENVIRO-SEAL live-loaded packing installed (figure 3), see the Fisher instruction manual entitled ENVIRO-SEAL Packing System for Sliding-Stem Valves ([D101642X012](#)) for packing instructions.

If the valve has HIGH-SEAL heavy-duty live-loaded packing installed, see Fisher instruction manual entitled HIGH-SEAL Live-Loaded Packing System ([D101453X012](#)) for packing instructions.

⚠ WARNING

Personal injury could result from packing leakage. Valve packing was tightened prior to shipment; however some readjustment will be required to meet specific service conditions. Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

Packing Lubrication

CAUTION

Do not lubricate graphite packing. Graphite packing is self-lubricated. Additional lubrication may result in slip-stick movement of the valve.

⚠ WARNING

To avoid personal injury or property damage resulting from fire or explosion, do not lubricate packing used in oxygen service or in processes with temperatures over 260°C (500°F).

A lubricator or lubricator/isolating valve (figure 2) is recommended for PTFE-composition packing. The lubricator or lubricator/isolating valve is installed in place of the pipe plug (key 14, figure 16). It is recommended that a good quality silicon-base lubricant be used. To operate the lubricator, simply turn the cap screw clockwise to force lubricant into the packing box. The lubricator/isolating valve operates the same way except the isolating valve must first be opened and then closed after lubrication is completed.

Packing Maintenance

If there is undesirable packing leakage in spring-loaded PTFE V-ring packing (figure 4), tighten the packing flange nuts (key 5, figure 16) until the shoulder on the packing follower (key 13, figure 16) contacts the bonnet (key 1, figure 16). If leakage continues, replace the packing by following the numbered steps presented in the Replacing Packing procedure.

CAUTION

When tightening packing flange nuts, do not exceed the maximum recommended torque in table 7 or excessive friction may result, resulting in keeping the valve from stroking fully and not attaining proper seat load.

If there is undesirable packing leakage with other than spring-loaded PTFE V-ring packing, first try to limit the leakage and establish a stem seal by tightening the packing flange nuts (key 5, figure 16) to at least the minimum recommended torque in table 7. However, do not exceed the maximum recommended torque in table 7 or excessive friction may result. If leakage continues, replace the packing by following the numbered steps presented in the Replacing Packing procedure.

If the packing is relatively new and tight on the valve plug stem, and if tightening the packing flange nuts does not stop the leakage, it is possible that the stem is worn or nicked so that a seal cannot be made. The surface finish of a stem is critical for making a good packing seal. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches around the packing box wall. While replacing the packing according to the Replacing Packing procedure, inspect the valve plug stem and packing box wall for nicks or scratches.

Replacing Packing

Key numbers referred to in this procedure are shown in figure 16 unless otherwise indicated.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body, and drain the process media from both sides of the valve.

Remove the cap screws in the stem connector, and separate the two halves of the stem connector. Then exhaust all actuator pressure, if any was applied, and disconnect the actuator supply and any leakoff piping.

2. Remove either the yoke locknut (key 15) or the hex nuts (key 26), and remove the actuator from the bonnet (key 1).
3. Loosen the packing flange nuts (key 5) so that the packing is not tight on the valve plug stem (key 4, figure 18, 19, or 20). Remove any travel indicator disk and stem locknuts from the valve plug stem threads.

1. For other materials, contact your [Emerson sales office](#) or Local Business Partner for torques.

CAUTION

When lifting the bonnet (key 1), be sure that the valve plug and stem assembly (keys 3 and 4, figure 18, 19, or 20) remains on the seat ring (key 6, figure 18, 19, or 20). This avoids damage to the seating surfaces as a result of the assembly dropping from the bonnet after being lifted part way out. The parts are also easier to handle separately.

Use care to avoid damaging gasket sealing surfaces.

The EHD piston rings (key 8, figure 18) are brittle and in two halves. Avoid damaging the piston rings by dropping or rough handling.

⚠ WARNING

If the cage adheres to the bonnet as the bonnet is lifted, secure the cage to the bonnet so that it will not cause personal injury or equipment damage should it fall unexpectedly.

4. Unscrew the hex nuts (key 14, figure 18, 19, or 20) and carefully lift the bonnet off the valve stem. If present, remove the Belleville washers (key 33, figure 17) and flat washers (key 29, figure 18, 19, 17, or 20). If the valve plug and stem assembly starts to lift with the bonnet, use a brass or lead hammer on the end of the stem and tap it back down. Set the bonnet on a cardboard or wooden surface to prevent damage to the bonnet gasket surface.
5. Remove the valve plug (key 3, figure 18, 19, or 20), the cage (key 2, figure 18, 19, or 20), and the top and bottom cage gaskets (key 11, figure 18, 19, or 20).

Typical HIGH-SEAL ULF Packing System

Typical ENVIRO-SEAL Packing System
with PTFE Packing

Typical ENVIRO-SEAL Packing System
with Graphite ULF Packing

Typical ENVIRO-SEAL Packing System
with Duplex Packing

Figure 4. Packing Arrangements

CAUTION

All residual gasket material must be removed from the cage gasket surfaces. If the gasket surfaces are scored or damaged during this process, smooth them by hand sanding with 360 grit paper using long, sweeping strokes. Failure to remove all residual gasket material and/or burrs from the gasket surfaces will result in leakage.

6. Clean all gasket surfaces with a good quality degreaser. Remove all residual tin or silver from all gasket surfaces.
7. Cover the opening in the valve body to protect the gasket surface and to prevent foreign material from getting into the valve body cavity.
8. Remove the packing flange nuts (key 5), packing flange (key 3), upper wiper (key 12), and packing follower (key 13, figures 4 and 16). Carefully push out all the remaining packing parts from the valve side of the bonnet using a

rounded rod or other tool that will not scratch the packing box wall. For extension bonnets, also remove the baffle (key 2) and retaining ring (key 35).

9. Clean the packing box and the following metal packing parts: packing follower (key 13), packing box ring (key 11), spring or lantern ring (key 8, figures 4 and 16), and, for single arrangements of PTFE V-ring packing only, special washer (key 10, figures 4 and 16).
10. Inspect the valve stem threads for any sharp edges that might cut the packing. A whetstone or emery cloth may be used to smooth the threads if necessary.
11. Remove the protective covering from the valve body cavity. Using new top and bottom cage gaskets (key 11, figure 18, 19, or 20), place the cage into the valve body. Be sure the cage lugs are engaged in the corresponding recesses of the seat ring retainer. Turn the cage clockwise until the lugs contact the seat ring retainer. Install the plug, then slide the bonnet over the stem and onto the studs (key 13, figure 18, 19, or 20).

Note

The prelubricated hex nuts (key 14, figure 18, 19, or 20) referred to in step 12 can be identified by a black film coating on the nut threads.

The proper bolting procedures in step 12 include--but are not limited to--ensuring that the bonnet stud threads are clean, Belleville washers (if present) are installed in the correct orientation, and that the hex nuts are evenly tightened to the specified torque values.

CAUTION

Failure to comply with good bonnet-to-body bolting practices and the torque values shown in table 8 may result in cage crushing, cage diameter reduction, and/or bonnet deformation. Cheater bars or slug wrenches should not be used for this procedure.

Hot torquing is not recommended.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) or Local Business Partner immediately if a discrepancy between actual parts and approved parts is suspected.

12. Lubricate the stud threads and the faces of the hex nuts (key 14, figure 18, 19, or 20) with anti-seize lubricant (not necessary if new factory prelubricated hex nuts are used). Replace the flat washers (key 29, figure 18, 19, 17, or 20) if present. If the valve assembly includes Belleville washers (key 33, figure 17) install these onto the studs (key 14, figure 17) with the concave side facing towards the valve body. Replace the hex nuts but do not tighten them. Torque the nuts in a crisscross pattern to no more than one fourth of the nominal torque value specified in table 8.

When all nuts are tightened to that torque value, increase the torque by one fourth of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.

Figure 5. Installing Graphite Ribbon/Filament Packing Rings One at a Time

Note

If graphite ribbon/filament packing rings are used, special procedures must be observed to prevent entrapping air between the rings. Add the rings one at a time without forcing them below the chamfer of the packing box entrance chamber. As each successive ring is added, the stack should not be pushed down more than the thickness of the added ring (figure 5).

13. Install new packing and the metal packing box parts according to the appropriate arrangement in figure 4. If desired, packing parts may be pre-lubricated with a silicon base grease for easier installation. Slip a smooth-edged pipe over the valve stem, and gently tamp each soft packing part into the packing box, being sure that air is not trapped between adjacent soft parts. For a valve with extension bonnet, also install the baffle and retaining rings (keys 2 and 35).

14. Slide the packing follower, wiper, and packing flange into position. Lubricate the packing flange studs (key 4) and the faces of the packing flange nuts (key 5). Replace the packing flange nuts.

For spring-loaded PTFE V-ring packing, tighten the packing flange nuts until the shoulder on the packing follower (key 13) contacts the bonnet.

For other packing types, tighten the packing flange nuts to the maximum recommended torque shown in table 7. Then, loosen the packing flange nuts, and retighten them to the recommended minimum torque shown in table 7.

For ENVIRO-SEAL or HIGH-SEAL live-loaded packing, refer to the note at the beginning of the Maintenance section.

15. Mount the actuator on the valve body assembly, and reconnect the actuator and valve plug stems according to the procedures in the appropriate actuator instruction manual.

Trim Removal

For C-seal construction, see the appropriate C-seal sections in this instruction manual.

Trim removal and replacement requires the use of a seat ring retainer tool (key 25). If specifically ordered, a tool is supplied with a valve; but, the tool can also be ordered separately by referencing the tool part number in the Parts List. If desired, a tool can also be machined for a valve of specific size and valve class using the dimensions shown in figure 9. Machine the tool from a material listed in figure 9 or from a material with a yield strength of at least 827 MPa (120,000 psi). Using a tool of lower strength material may result in damage to the seat ring retainer or valve body threads.

Key numbers referenced in this procedure are shown in figure 18 for the EHD valve, figure 19 for the EHS valve, and figure 20 for the EHT valve except where indicated.

1. Remove the actuator and bonnet by following steps 1 through 4 of the Replacing Packing procedure. Observe all warnings and cautions.
2. Lift the valve stem and attached valve plug out of the valve body. If the valve plug is to be reused, tape or otherwise protect the valve plug stem and the valve plug seating surface to prevent scratches.
3. Lift out the cage (key 2) and the top and bottom cage gaskets (key 11). For a valve with Cavitrol III two-or three-stage cage, also remove the O-ring (key 26, figure 21) that fits between the cage and the seat ring (key 6).

Constructions other than TSO trim

1. Use the seat ring retainer tool (figure 9) to remove the seat ring retainer (key 7) as follows:
 - a. Insert the tool into the valve body. Be certain the tool lugs are engaged in the corresponding recesses in the retainer.
 - b. Use a power torque wrench or driver having torque capabilities equal to or greater than those shown in table 9. Connect the torque wrench to an extension if necessary. The tool or extension must snugly fit the square hole in the seat ring retainer tool. Refer to figure 9 for square hole sizes.
 - c. Insert the tool or extension into the square hole in the seat ring retainer tool.
 - d. Use the bonnet studs (key 13) to prevent a power torque wrench from rotating.

CAUTION

Hold the torque wrench or driver at right angles to the seat ring retainer when applying torque. Tilting the tool or extension while applying torque may cause the lugs on the seat ring retainer tool to suddenly disengage from the recesses in the retainer, damaging the retainer and seat ring.

- e. Unscrew and remove the seat ring retainer.
2. Remove the seat ring (key 6) and the seat ring gasket or O-ring (key 12).
 3. Refer to the Valve Plug Maintenance procedure or to the Lapping Seats procedure.

TSO Trim

Refer to figure 7.

1. Remove the retainer, backup ring, anti-extrusion rings, and piston ring.
2. Remove the set screws that lock the outer plug to the inner plug.
3. Using a strap wrench or similar tool, unscrew the outer plug from the inner plug. Do not damage the outer plug guide surfaces.
4. Remove the protected soft seat seal (see figure 5).
5. Inspect the parts for damage and replace if needed.
6. Refer to the Valve Plug Maintenance procedure or to the Lapping Seats procedure.

Figure 6. Detail of Protected Soft Seat

A7088

Figure 7. Typical Balanced TSO Trim

A7096

Valve Plug Maintenance

Key numbers used in this procedure are shown in figure 18 for the EHD valve, in figure 19 for the EHS valve, and in figure 20 for the EHT valve.

1. With the valve plug (key 3) removed according to the Trim Removal procedure, proceed as appropriate:

For the EHD valve, the piston rings (key 8) are each in two sections; remove the sections from the grooves in the valve plug.

For the EHS valve, proceed to step 2.

For the EHT valve, work the retaining ring (key 10) off the valve plug with a screwdriver. Carefully slide the backup ring and seal ring (keys 9 and 8) off the valve plug. For an NPS 6 valve with a level D Whisper Trim III cage, also remove the piston ring (key 30) from the grooves in the valve plug.

2. To replace the valve plug stem (key 4), drive out the pin (key 5), and unscrew the stem from the valve plug.

CAUTION

Never reuse an old stem with a new valve plug or reinstall a valve stem after it has been removed. Using an old stem with a new plug requires drilling a new pin hole in the stem. This weakens the stem and may cause the stem to fail in service. If a new valve plug is required, always order a valve plug, stem, and pin as an assembly. Specify the correct part number of each of the three parts, but state that the parts are being ordered as an assembly.

A used valve plug may be reused with a new stem. An exception is the Cavitrol III plug/stem assembly which must be ordered and replaced as a unit.

3. Thread the new stem into the valve plug and tighten it to the appropriate torque value given in table 10. Using the valve plug pin hole as a guide, drill the pin hole through the stem. Refer to table 10 for drill sizes.
4. Drive in the pin to lock the assembly.
5. If it is necessary to lap the seating surfaces, complete the Lapping Seats procedure before installing the EHD piston rings or the EHT seal ring. The Trim Replacement procedure provides piston ring and seal ring installation instructions and valve reassembly instructions.

Lapping Seats

Key numbers referenced in this procedure are shown in figure 18 for the EHD valve, in figure 19 for the EHS valve, and in figure 20 for the EHT valve unless otherwise indicated.

Seating surfaces of the valve plug (key 3) and the seat ring (key 6) can be lapped for improved shutoff. Use a good quality lapping compound with a mixture that contains 280 to 600 grit. Apply the compound to the bottom of the valve plug. Use the following procedure to lap the seating surfaces.

1. Install the following parts according to the instructions presented in the Trim Replacement procedure: seat ring gasket or O-ring (key 12), seat ring (key 6), seat ring retainer (key 7), cage (key 2), cage gaskets (key 11), and if used, the O-ring (key 26, figure 21).
2. Proceed as appropriate:

For an EHD or EHT valve, install the valve plug and stem assembly (keys 3 and 4)—without piston rings or seal ring (keys 8 and 30)—into the cage.

For an EHS valve, install the valve plug and stem assembly (keys 3 and 4) into the cage.

3. Install the bonnet (key 1, figure 16) over the valve stem, and secure the bonnet with four of the hex nuts (key 14).
4. Attach a handle, such as a piece of strap iron secured by stem locknuts, to the valve stem. Rotate the handle alternately in each direction to lap the seats.

Note

To preserve the effects of lapping, do not change either the position of the seat ring in the valve body cavity or the position of the cage on the seat ring after lapping the seating surfaces. If possible, clean the parts without disturbing their positions. If the parts must be removed for cleaning, return them to the original positions.

5. After lapping, again disassemble as necessary, clean the seating surfaces, reassemble, and test for shutoff. Repeat the lapping procedure if necessary.

Trim Replacement

After all trim maintenance has been completed, reassemble the valve by following the numbered steps below. Be certain that all gasketed surfaces have been well cleaned. Key numbers referenced in this procedure are shown in figure 18 for the EHD valve, in figure 19 for the EHS valve, and in figure 20 for the EHT valve.

Figure 8. Trim Surfaces Requiring Lubrication

A3583

1 LUBRICATION REQUIRED

CAUTION

Thoroughly clean the seat ring (key 6), seat ring retainer (key 7), and the retainer threads in the valve body with a good-quality degreaser. Also clean all cage gasket surfaces. All residual gasket material must be removed from the cage gasket surfaces and, in gasketed seat ring constructions, from the serrated valve body and seat ring gasket surfaces. If the serrations are scored or damaged during this process, smooth them by hand sanding with 360 grit paper using long, sweeping strokes. Failure to remove all residual gasket material and/or burrs from the seat ring, cage, and valve body gasket surfaces will result in leakage.

Thoroughly lubricate the surfaces indicated in figure 8 with the appropriate lubricant shown in table 11. Be certain to lubricate the mating surfaces of both parts involved (i.e., lubricate the threads on the seat ring retainer and the threads in the valve body; lubricate the mating surfaces of the seat ring retainer and seat ring).

Failure to lubricate as described may cause galling and improper gasket or O-ring (key 12) loading that may result in leakage.

Table 11. Seat Ring and Seat Ring Retainer Lubricants

VALVE BODY MATERIAL	SEAT RING MATERIAL	LUBRICANT
WCC, WC9, C5, or LCC steel	S41600 (416 stainless steel)	Lithium grease, dry film lubricant, or anti-seize lubricant
	R30006 (Alloy 6)	Anti-seize lubricant
CF8M (316 stainless steel)	R30006	Dry film lubricant or anti-seize lubricant

1. For gasketed seat ring constructions, install the seat ring gasket (key 12) into the valve body. For O-ring seat ring constructions, install the O-ring (key 12) into the groove on the underside of the seat ring (key 6). Install the seat ring (key 6). Screw in the seat ring retainer (key 7). Use the seat ring retainer tool (figure 9) to tighten the seat ring retainer as follows:

- Insert the tool into the valve body. Be certain the tool lugs are engaged in the corresponding recesses in the retainer.

- b. Use a power torque wrench or driver having torque capabilities equal to or greater than those shown in table 9. Connect the torque tool to an extension if necessary. The tool or extension must snugly fit the square hole in the seat ring retainer tool. Refer to figure 9 for square hole sizes.
- c. Insert the tool or extension into the square hole in the seat ring retainer tool.
- d. Use the stud bolts (key 13) to prevent a power torque wrench from rotating.

CAUTION

Hold the torque wrench at right angles to the seat ring retainer when applying torque. Tilting the tool and extension while applying torque may cause the lugs on the seat ring retainer tool to suddenly disengage from the recesses in the retainer, damaging the retainer and seat ring.

- e. Tighten the seat ring retainer to the torque shown in table 9.

Note

Some cages have one large window and several small windows. In step 2, install a cage that has different size windows so that the largest window faces toward the process outlet for a flow-down and toward the process inlet for a flow-up valve. Though it may not be possible to align the large window directly opposite the inlet or outlet, orient the window in the appropriate direction as much as possible. Incorrect orientation of cage windows causes a reduction of capacity.

2. Proceed as appropriate:

For a valve with a Cavitrol III cage, slide the O-ring (key 26, figure 21) over the seat ring (key 6) and against the shoulder in the outer diameter of the seat ring. Install the lower gasket (key 11) between the valve body and cage (key 2), and install the cage. Be certain the lugs on the bottom of the cage engage the corresponding slots in the seat ring retainer.

For all other valves, install the lower gasket (key 11) between the valve body and cage (key 2), and install the cage. Be certain the lugs on the bottom of the cage engage the corresponding slots in the seat ring retainer.

Note

Rotate the cage clockwise by hand as much as possible once the cage lugs engage the slots in the seat ring retainer. Failure to do so may result in leakage at the seat ring to valve body seal.

Constructions other than TSO trim

1. To install the piston rings and seal rings (keys 8 and 30), proceed as appropriate:

For an EHD valve (figure 18), if it is necessary to install new piston rings, the replacement piston rings will arrive in one piece. Use a vise with smooth or taped jaws to break a replacement piston ring into halves. Place the new ring in the vise so that the jaws compress the ring into an oval. Compress the ring slowly until the ring snaps on both sides. If one side snaps first, do not try to tear or cut the other side. Instead, keep compressing until the other side snaps. The piston ring can also be fractured by scoring and snapping over a hard surface such as a table edge. Sawing or cutting is not recommended.

Remove any protective tape or covering from the valve plug and stem assembly, and set it on a protective surface. Then, place the piston ring in the piston ring groove with the fractured ends matched.

For an EHT valve (figure 20), install the seal ring (key 8) onto the valve plug (key 3). Install the ring with the open side facing the seat ring end of the valve plug for flow-down applications (view A of figure 20) or with the open side facing the valve plug stem end of the valve plug for flow-up applications. Slide the backup ring (key 9) onto the valve plug. Secure with the retaining ring (key 10). For an NPS 6 valve with a level D Whisper Trim III cage, reinstall the piston ring (key 30) following the instructions given in the paragraph immediately preceding.

2. Install the valve plug into the cage.

TSO Trim

Refer to figure 7.

1. Thread the outer plug onto the inner plug until the parts seat metal to metal, using a strap wrench or similar tool that will not damage the outer plug guide surfaces.
2. Mark the top of the inner plug and outer plug with alignment marks in the assembled position.
3. Disassemble the outer plug from the inner plug and install the seal over the inner plug, so that the seal rests below the threaded area.
4. Thread the outer plug onto the inner plug and tighten with a strap wrench or similar tool until the alignment marks line up. This will ensure that the plug parts are metal to metal and the seal is compressed properly. Do not damage the outer plug guide surfaces.
5. Install set screws centering the inner plug in the outer plug and torque to 11 N•m (8 lbf•ft).
6. Assemble the piston ring, anti-extrusion rings, backup ring, and retainer.

All Constructions

1. Install the top cage gasket (key 11) on the cage.
2. Install the bonnet over the valve stem and onto the valve body.

Note

The prelubricated hex nuts (key 14, figure 18, 19, or 20) referred to in step 3 can be identified by a black film coating on the nut threads.

The proper bolting procedures in step 3 include--but are not limited to--ensuring that the bonnet stud threads are clean, Belleville washers (if present) are installed in the correct orientation, and that the hex nuts are evenly tightened to the specified torque values.

CAUTION

Failure to comply with good bonnet-to-body bolting practices and the torque values shown in table 8 may result in cage crushing, cage diameter reduction, and/or bonnet deformation. Cheater bars or slug wrenches should not be used for this procedure.

Hot torquing is not recommended.

Note

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) or Local Business Partner immediately if a discrepancy between actual parts and approved parts is suspected.

3. Lubricate the stud threads and the faces of the hex nuts (key 14, figure 18, 19, or 20) with anti-seize lubricant (not necessary if new factory prelubricated hex nuts are used). Replace the flat washers (key 29, figure 18, 19, 17, or 20) if present. If the valve assembly includes Belleville washers (key 33, figure 17) install these onto the studs (key 14, figure 17) with the concave side facing towards the valve body. Replace the hex nuts but do not tighten them. Torque the nuts in a crisscross pattern to no more than one fourth of the nominal torque value specified in table 8. When all nuts are tightened to that torque value, increase the torque by one fourth of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.
4. Install new packing and packing box parts per steps 13 and 14 of the Replacing Packing procedure. Be certain to observe the note given prior to step 13 of that procedure.
5. Mount the actuator by following the procedures in the actuator instruction manual. Check for packing leakage as the valve is being put into service. Retorque the packing flange nuts as required (see table 7).

Retrofit: Installing C-seal Trim

Note

Additional actuator thrust is required for a valve with C-seal trim. When installing C-seal trim in an existing valve, contact your [Emerson sales office](#) or Local Business Partner for assistance in determining new actuator thrust requirements.

Figure 10. Fisher EHD with C-seal Trim

3781047-A

Assemble the new valve plug/retainer assembly (with C-seal plug seal) using the following instructions:

CAUTION

To avoid leakage when the valve is returned to service, use appropriate methods and materials to protect all sealing surfaces of the new trim parts while assembling the individual parts and during installation in the valve body.

1. Apply a suitable high-temperature lubricant to the inside diameter of the C-seal plug seal. Also, lubricate the outside diameter of the valve plug where the C-seal plug seal must be pressed into the proper sealing position (figure 10).
2. Orient the C-seal plug seal for correct sealing action based on the process fluid flow direction through the valve.
 - The open interior of the C-seal plug seal must face up in a valve with flow-up construction (figure 10).
 - The open interior of the C-seal plug seal must face down in a valve with flow-down construction (figure 10).

Note

An installation tool must be used to properly position the C-seal plug seal on the valve plug. A tool is available as a spare part from your [Emerson sales office](#) or Local Business Partner or a tool could be manufactured following the dimensions given in figure 11.

3. Place the C-seal plug seal over the top of the valve plug and press the C-seal plug seal onto the plug using the C-seal installation tool. Carefully press the C-seal plug seal onto the plug until the installation tool contacts the horizontal reference surface of the valve plug (figure 12).
4. Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the C-seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
5. Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place (figure 13) to secure the C-seal retainer.
6. Install the new plug/retainer assembly with C-seal plug seal on the new stem following the appropriate instructions in the Trim Replacement section of this manual.
7. Install piston rings by following instructions in the Trim Replacement section of this manual.
8. Remove the existing valve actuator and bonnet following the appropriate instructions in the Replacing Packing section of this manual.

CAUTION

Do not remove the existing valve stem from the valve plug unless you are planning to replace the valve stem.

Never reuse an old valve stem with a new plug or reinstall a valve stem after it has been removed. Replacing a valve stem requires drilling a new pin hole in the stem. This drilling weakens the stem and may cause failure in service.

However, a used valve plug may be reused with a new valve stem. An exception is the Cavitrol III plug/stem assembly which must be ordered and replaced as a unit.

9. Remove the existing valve stem and plug, cage, and seat ring from the valve body following the appropriate instructions in the Trim Removal section of this manual.
10. Replace all gaskets according to appropriate instructions in the Trim Replacement section of this manual.

Figure 11. C-seal Plug Seal Installation Tool

11. Install the new seat ring, cage, valve plug/retainer assembly, and stem into the valve body and completely reassemble the valve package following the appropriate instructions in the Trim Replacement section of this manual.

CAUTION

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the C-seal plug seal and contact the seat ring. You can correctly seat the valve plug by using the same force calculated for full load when sizing your actuator. With no pressure drop through the valve, this force will adequately drive the valve plug to the seat ring, thus giving the C-seal plug seal a predetermined permanent set. Once this is done, the plug/retainer assembly, the cage, and the seat ring become a matched set.

12. With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

Replacement of Installed C-seal Trim

Trim Removal (C-seal Constructions)

1. Remove the valve actuator and bonnet following the appropriate instructions in the Replacing Packing section of this manual.

CAUTION

To avoid leakage when the valve is returned to service, use appropriate methods and materials to protect all sealing surfaces of the trim parts during maintenance.

Use caution when removing piston ring(s) and C-seal plug seal to avoid scratching any sealing surface.

CAUTION

Do not remove the valve stem from the plug/retainer assembly unless you are planning to replace the valve stem.

Never reuse an old valve stem with a new plug or reinstall a valve stem after it has been removed. Replacing a valve stem requires drilling a new pin hole in the stem. This drilling weakens the stem and may cause failure in service.

However, a used valve plug may be reused with a new valve stem. An exception is the Cavitrol III plug/stem assembly which must be ordered and replaced as a unit.

2. Remove the plug/retainer assembly (with C-seal plug seal), cage, and seat ring from the valve body following the appropriate instructions in the Trim Removal section of this manual.
3. Locate the staked thread on top of the valve plug (figure 13). The staked thread secures the retainer. Use a drill with a 1/8-inch bit to drill out the staked area of the thread. Drill approximately 1/8-inch into the metal to remove the staking.
4. Locate the break between sections of the piston ring(s). Using an appropriate tool such as a flat-blade screwdriver, carefully pry out the piston ring(s) from the groove(s) in the C-seal retainer.
5. After removing the piston ring(s), locate the 1/4-inch diameter hole in the groove. In a retainer with two piston ring grooves, the hole will be found in the upper groove.

Figure 12. Installing the C-seal Plug Seal Using the Installation Tool

NOTE:
PRESS INSTALLATION TOOL OVER VALVE PLUG UNTIL THE TOOL CONTACTS THE HORIZONTAL REFERENCE SURFACE OF THE VALVE PLUG.

A6778

Figure 13. Stake the Threads of the C-seal Retainer

A6779

6. Select an appropriate tool such as a punch and place the tip of the tool into the hole with the body of the tool held tangent to the outside diameter of the retainer. Strike the tool with a hammer to rotate the retainer and free it from the valve plug. Remove the retainer from the plug.
7. Use an appropriate tool such as a flat-blade screwdriver to pry the C-seal plug seal off the plug. Use caution to avoid scratches or other damage to the sealing surfaces where the C-seal plug seal makes contact with the valve plug (figure 14).
8. Inspect the lower seating surface where the valve plug contacts the seat ring for wear or damage which would prevent proper operation of the valve. Also, inspect the upper seating surface inside the cage where the C-seal plug

seal contacts the cage, and inspect the sealing surface where the C-seal plug seal makes contact with the plug (figure 14).

9. Replace or repair trim parts according to the following procedure for lapping metal seats, remachining metal seats, or other valve plug maintenance procedures as appropriate.

Lapping Metal Seats (C-seal Constructions)

Before installing a new C-seal plug seal, lap the lower seating surface (valve plug to seat ring, figure 14) following appropriate procedures in the Lapping Seats section of this manual.

Remachining Metal Seats (C-seal Constructions)

See figure 15. A valve plug with a C-seal metal plug seal features two seating surfaces. One seating surface is found where the valve plug contacts the seat ring. The second seating surface is found where the C-seal plug seal contacts the upper seating surface in the cage. If you machine the seats on the seat ring and/or plug, you must machine an equal dimension from the seating area in the cage.

Figure 14. Lower (Valve Plug to Seat Ring) and Upper (C-seal Plug Seal to Cage) Seating Surfaces

A6780

NOTE:

1 UPPER SEATING SURFACE IS THE AREA OF CONTACT BETWEEN THE C-seal METAL PLUG SEAL AND THE CAGE.

CAUTION

If metal is removed from the seat ring and plug and a corresponding amount is not removed from the cage seating area, the C-seal plug seal will be crushed as the valve closes and the C-seal retainer will strike the seating area of the cage, preventing the valve from closing.

Trim Replacement (C-seal Constructions)

1. Apply a suitable high-temperature lubricant to the inside diameter of the C-seal plug seal. Also, lubricate the outside diameter of the valve plug where the C-seal plug seal must be pressed into the proper sealing position (figure 10).
2. Orient the C-seal plug seal for correct sealing action based on the process fluid flow direction through the valve.
 - The open interior of the C-seal plug seal must face up in a valve with flow-up construction (figure 10).
 - The open interior of the C-seal plug seal must face down in a valve with flow-down construction (figure 10).

Note

An installation tool must be used to properly position the C-seal plug seal on the valve plug. A tool is available as a spare part from your [Emerson sales office](#) or Local Business Partner or a tool could be manufactured following the dimensions given in figure 11.

3. Place the C-seal plug seal over the top of the valve plug and press it onto the plug using the installation tool. Carefully press the C-seal plug seal onto the plug until the installation tool contacts the horizontal reference surface of the valve plug (figure 12).
4. Apply a suitable high-temperature lubricant to the threads on the plug. Then, place the C-seal retainer onto the plug and tighten the retainer using an appropriate tool such as a strap wrench.
5. Using an appropriate tool such as a center punch, stake the threads on top of the plug in one place (figure 13) to secure the C-seal retainer.
6. Replace the piston ring(s) following instructions in the Trim Replacement section of this manual.
7. Return the seat ring, cage, plug/retainer assembly, and stem to the valve body and completely reassemble the valve package following the appropriate instructions in the Trim Replacement section of this manual.

CAUTION

To avoid excessive leakage and seat erosion, the valve plug must be initially seated with sufficient force to overcome the resistance of the C-seal plug seal and contact the seat ring. You can correctly seat the valve plug by using the same force calculated for full load when sizing your actuator. With no pressure drop through the valve, this force will adequately drive the valve plug to the seat ring, thus giving the C-seal plug seal a predetermined permanent set. Once this is done, the plug/retainer assembly, the cage, and the seat ring become a matched set.

8. With full actuator force applied and the valve plug fully seated, align the actuator travel indicator scale with the lower end of valve travel. Refer to the appropriate actuator instruction manual for information on this procedure.

Figure 15. Example of Machining the Lower (Valve Plug to Seat Ring) and Upper (C-seal Plug Seal to Cage) Seating Surfaces

Parts Ordering

Each body-bonnet assembly is assigned a serial number, which can be found on the valve body. This same number also appears on the actuator nameplate when the valve body is shipped from the factory as part of a control valve assembly. Refer to the number when contacting your [Emerson sales office](#) or Local Business Partner for technical assistance or when ordering replacement parts.

When ordering replacement parts, also be sure to include the 11-character part number for each part required from the following parts list.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Bonnet Assembly (figure 16)

Key	Description
1	Bonnet If you need a bonnet as a replacement part, order by valve size and stem diameter, serial number, and desired material.
2	Baffle, for use with extension bonnet only
3	Packing Flange
4	Packing Flange Stud (2 req'd)
5	Packing Flange Nut (2 req'd)
6*	Packing Set or Arrangement
7*	Packing Ring, low chloride graphite
8	Packing Spring, 316 stainless steel
8	Lantern Ring, 316 stainless steel
10	Special Washer, 316 stainless steel
11*	Packing Box Ring, 316 stainless steel
12*	Upper Wiper, felt
13	Packing Follower, 316 stainless steel
14	Pipe Plug
14	Lubricator
14	Lubricator/Isolating Valve
15	Yoke Locknut
25	Actuator Mounting Stud (8 req'd)
26	Hex Nut (8 req'd)
35	Retaining Ring, for use with extension bonnet only

Valve Body (figures 18-21)

1	Valve Body, order by valve size, serial number, and desired material
2*	Cage
3*	Valve Plug
4*	Valve Plug Stem
5*	Pin
6*	Seat Ring
7*	Seat Ring Retainer

Key	Description
8*	Piston Ring or Seal Ring
9*	Backup Ring
10*	Retaining Ring
10*	Retaining Ring (for EHT valve body only)
11*	Cage Gasket (2 req'd)
12*	Seat Ring O-Ring or Gasket
13	Bonnet Stud (8 req'd)
14	Hex Nut (8 req'd)
15	Flow Arrow
16	Drive Screw (4 req'd)
24	Anti-seize Lubricant
25	Seat Ring Retainer Tool (see figure 9) 416 stainless steel
26*	O-Ring (for valve with Cavitrol III trim only), ethylene/propylene
27	Nameplate
28	Nameplate Wire
29	Bonnet Washer
29	Flat Washer (8 req'd)
30*	Piston Ring (for EHT with Level D Whisper Trim III cage only)
33	Belleville Washer, N07718 (8 req'd)
63*	Anti-Extrusion Ring

C-seal Trim (figure 10)

2*	Cage
3*	Valve Plug/Retainer
4*	Valve Plug Stem, S20910
6*	Seat Ring
8*	Piston Ring, graphite (2 req'd)
64*	C-seal, N07718

TSO Trim (figure 7)

2*	Cage
4*	Seat Ring
5*	Plug/Stem Assembly
8*	Seal Ring
63*	Anti-Extrusion Ring
9*	Back Up Ring
10*	Retaining Ring

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual includes installation, maintenance and parts information for Fisher EHU Urea valves. Refer to separate manuals for instructions covering the actuator, positioner and accessories.

WARNING

Do not install, operate or maintain EHU Series valves without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

Figure 1. EHU Valve with Optional Bonnet for Top Entry

Table 1. Specifications

End Connection Styles and Ratings ^(1,2)	Shutoff Classifications
■ Lens Ring Flanges, ■ Flanged Ends: Ring-Type Joint (RTJ) or Raised-Face (RF) flanges according to ASME B16.5 and ■ EN flanges according to EN1092-1 As specified for the application. Valves can be rated in accordance with various ASME B16 or EN 1092 rating classifications.	Shutoff Classifications per ANSI/FCI 70-2 and IEC 60534-4 Metal Seat ■ CL IV (Standard) ■ CL V (Optional)
Flow Characteristic	Flow Direction
Standard Plug: ■ Equal percentage, ■ Linear or ■ Quick Open	Flow Up or Flow Down depending on application and installation
Approximate Weights (Valve Body and Bonnet Assemblies)	Additional Specifications
See order information for weight.	For specifications such as materials, valve plug travels and port, yoke boss and stem diameters, see the Parts List section.
1. The pressure or temperature limits in this manual and any applicable standard limitations should not be exceeded. 2. Consult your Emerson sales office for additional options.	

1.2 Description

The Fisher EHU Series valve is specially designed for severe service applications in urea plants. These plants containing urea, ammonium carbamate and ammonia applications demand highly engineered valves in specialty alloys to provide long life in service. The EHU is engineered with specific features to provide long life and quick serviceability in the full range of applications found in urea synthesis processes. The EHU valve body, optional bonnet and trim are available in several austenitic, super-austenitic and super-duplex stainless steels that are common in urea plants and are specified by some process licensors. Combined with a special urea service version of the industry-leading Fisher ENVIRO-SEAL™ live-loaded, low emissions packing, the EHU valve provides a design with maximum corrosion-resistance, friendly maintenance and protection against packing leaks.

1.3 Specifications

Specifications for the EHU valves are shown in Tables 1 and 2.

2-1/4	4340	3200
1. For other lubricants or bolting materials, contact your Emerson sales office for torques.		

Section 2: Installation

WARNING

Always wear protective gloves, clothing and eyewear when performing any installation operations to avoid personal injury.

Personal injury or equipment damage caused by sudden release of pressure may result if the valve assembly is installed where service conditions could exceed the limits given in Table 1 or on the appropriate nameplates. To avoid such injury or damage, provide a relief valve for over-pressure protection as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the **WARNING** at the beginning of the Maintenance section in this instruction manual.

WARNING

Some bonnet flanges have a tapped hole that was used to handle the bonnet during manufacture. Do not use this tapped hole to lift the valve assembly or personal injury may result.

WARNING

When ordered, the valve configuration and construction materials were selected to meet particular pressure, temperature, pressure drop and controlled fluid conditions indicated when the valve was ordered. Responsibility for the safety of process media and compatibility of valve materials with process media rests solely with the purchaser and end-user. Because some body/trim material combinations are limited in their pressure drop and temperature ranges, do not apply any other conditions to the valve without first contacting your [Emerson sales office](#).

NOTICE

To avoid product damage, inspect the valve before installation for any damage or any foreign material that may have collected in the valve body. Also remove any pipe scale, welding slag or other foreign material from the pipeline.

1. Before installing the valve, inspect it to ensure that the valve body cavity is free of foreign material.
2. Clean out all pipelines to remove scale, welding slag and other foreign materials before installing the valve.
3. Flow through the valve must be in the direction indicated by the flow arrow, which is stamped on or attached to the valve body.

4. Use accepted piping and welding practices when installing the valve in the pipeline. For flanged valve bodies, use a suitable gasket between the body and pipeline flanges.
5. Install a three-valve bypass around the valve if continuous operation is required during maintenance.
6. If the actuator and valve body are shipped separately, refer to the actuator mounting procedure in the appropriate actuator instruction manual.
7. If the valve body was shipped without packing installed in the packing box, install the packing before putting the valve body into service. Refer to instructions given in the Packing Maintenance procedure.

WARNING

Personal injury could result from packing leakage. Valve packing was tightened before shipment; however, the packing might require some re-adjustment to meet specific service conditions.

Valves with ENVIRO-SEAL live-loaded packing will not require this initial re-adjustment. See the instruction manuals titled ENVIRO-SEAL Packing System for Sliding-Stem Valves (D101642X012) for packing instructions.

2.1 Lifting Valve Assembly

WARNING

Failure to follow these lifting guidelines and accepted lifting and rigging practices could result in property damage and personal injury or death.

All lifting and rigging must be completed in accordance with federal/national/provincial, state and local regulations and applicable lifting and rigging equipment standards. Only personnel trained in proper lifting and rigging practices shall perform valve/actuator assembly lifting, rigging and installation. Because each lift will be unique, the method of lifting the valve assembly, the correct location for attaching and lifting the valve assembly and what the valve assembly will do when lifted shall be considered for each lift.

Lifting and rigging equipment used to lift, install or remove a valve assembly or component must be properly selected and sized for the weight and configuration of the valve assembly or component being lifted. The weight of the complete valve assembly, including attached accessories, must be taken in consideration for this purpose. The lifting and rigging equipment must be properly maintained and inspected for damage before each use.

If the valve is supplied with an actuator or handwheel, do not use the actuator or handwheel to lift the complete valve assembly. Lifting lugs attached to the actuator must not be used to lift the complete valve assembly unless clearly marked as being rated to support the complete valve assembly weight.

Lifting lugs or other lifting equipment attached to the valve or actuator must never be used to lift or support the weight of attached piping.

NOTICE

Care must be taken when lifting the valve/actuator assembly to ensure all accessories and tubing are not damaged in the process. Accessories and tubing may need to be removed prior to lifting to prevent damage and properly reinstalled before use. Protect valve flange faces, butt weld ends and other connection surfaces from damage during lifting.

Remove the valve/actuator assembly from its shipping container with appropriate lifting and rigging equipment for the valve/actuator assembly weight and configuration to be lifted. The valve and bonnet assembly weight is provided in the order information. Consult the appropriate actuator and valve accessory instruction manuals for the weight of each additional component, then determine the total weight of the complete valve assembly. The location of the valve/actuator assemblies center of gravity must be considered during lifting, installation and removal. Additional slings or other lifting equipment, such as a load leveler, may be necessary to prevent toppling of the equipment during lifting or to rotate the valve assembly into a different orientation for installation.

If the valve body includes attached lifting lugs, use all the lugs provided to lift the complete valve assembly. If lifting lugs are not provided on the valve body, lift the valve assembly with lifting straps secured around the valve body flanges, valve body neck and/or bonnet neck area.

Section 3: Maintenance

Valve parts are subject to normal wear and must be inspected and replaced as necessary. Inspection and maintenance frequency depends on the severity of service conditions. This section includes instructions for packing lubrication, packing maintenance and trim maintenance. All maintenance operations may be performed with the valve in the line.

** WARNING**

Avoid personal injury or damage to property from sudden release of pressure or uncontrolled process fluid. Before starting disassembly:

- **Do not remove the actuator from the valve while the valve is still pressurized.**
- **Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.**
- **Disconnect any operating lines providing air pressure, electric power or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.**
- **Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.**
- **Vent the power actuator loading pressure and relieve any actuator spring precompression.**
- **Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.**
- **The valve packing box may contain process fluids that are pressurized, even when the valve has been removed from the pipeline. Process fluids may spray out under pressure when removing the packing hardware or packing rings or when loosening the packing box pipe plug.**
- **Check with your process or safety engineer for any additional measures that must be taken to protect against process media.**

NOTE

The EHU Series valve may use spiral-wound gaskets which are crushed to provide their seal. A spiral-wound gasket should never be reused. Whenever a gasket seal is disturbed by removing or shifting gasketed parts, a new gasket must be installed upon reassembly. This is necessary to ensure a good gasket seal, since the used gasket will not seal properly.

NOTICE

The spiral-wound gaskets are of special design. Failure to use Fisher replacement parts may result in valve damage.

3.1 Packing Lubrication

NOTE

To avoid lubricants breaking down at elevated temperatures, do not lubricate packing used in processes with temperatures over 260°C / 500°F.

3.2 Packing Maintenance

If there is undesirable packing leakage in the Urea Grade ENVIROSEAL packing as shown in Figure 2, ensure that the proper tightening technique has been followed per the ENVIROSEAL instruction manual ([D101642X012](#)).

If the packing is relatively new and tight on the valve plug stem and if tightening the packing flange nuts does not stop the leakage, it is possible that the stem is worn or nicked so that a seal cannot be made. The surface finish of a new stem is critical for making a good packing seal. If the leakage comes from the outside diameter of the packing, it is possible that the leakage is caused by nicks or scratches around the packing box wall. While replacing the packing according to the Replacing Packing procedure, inspect the valve plug stem and packing box wall for nicks or scratches.

Figure 2. Live-Loaded Packing

Replacing Packing

For bottom entry constructions, see the appropriate bottom entry sections in this manual.
For top entry constructions, see the appropriate top entry sections in this manual.

WARNING

Refer to the WARNING at the beginning of the Maintenance section in this instruction manual.

Bottom Entry Constructions

Key numbers referred to in this procedure are shown in Figure 2 unless otherwise indicated.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Remove the cap screws in the stem connector and separate the two halves of the stem connector. Then exhaust all actuator pressure, if any was applied and disconnect the actuator supply and any leakoff piping.
3. Remove valve assembly from piping.
4. Remove yoke hex nuts (key 23) and remove the actuator from the valve body (key 1).
5. Hex nuts (key 4) attach the spool to the valve body. Loosen these nuts or cap screws approximately 3 mm / 1/8 in. Then loosen the body-to-spool gasketed joint by either rocking the spool or prying between the bonnet and valve body. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, proceed to the next step.
6. Unscrew the hex nuts (key 4) and carefully lift the spool off the studs. Set the spool on a cardboard or wooden surface to prevent damage to the spool gasket surface.
7. Remove the seat ring (key 3) using the provided lift holes. Inspect the seat ring and body sealing surfaces for damage.
8. Loosen the packing flange nuts (key 19) so that the packing (keys 14 and 17, Figure 2) is not tight on the valve plug stem (key 7). Remove any travel indicator disk and stem locknuts from the valve plug stem threads.
9. Lift the valve stem/plug (key 7) out of the valve body. If the valve plug is to be reused, tape or otherwise protect the valve plug/stem and the valve plug seating surface to prevent scratches.
10. Remove the packing flange nuts (key 19), packing flange (key 18) and packing follower (key 21). Carefully push out all the remaining packing parts from the valve side of the packing box using a rounded rod or other tool that will not scratch the packing box wall.
11. Clean the packing box and the following metal packing parts: packing follower (key 21) and lantern ring (key 15).
12. Inspect the valve stem threads for any sharp edges that might cut the packing. A whetstone or emery cloth may be used to smooth the threads, if necessary.
13. Install the plug. Install the seat ring then slide the spool onto the studs (key 5).
14. Lubricate the stud threads, the faces of the hex nuts (key 4) and washer face with anti-seize lubricant (not necessary if new factory prelubricated hex nuts are used). Replace the hex nuts and tighten them finger-tight. Stroke the valve several times to center the trim. Torque the nuts in a crisscross pattern to no more than 1/8 of the nominal torque value specified in the order documents.

When all nuts are tightened to that torque value, increase the torque by 1/8 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.

NOTE

When installing packing rings, prevent entrapping air between the rings. Add the rings one at a time without forcing them below the chamfer of the packing box entrance chamber. As each successive ring is added, the stack should not be pushed down more than the thickness of the added ring (Figure 2).

15. Use Figure 2 to ensure that the packing parts are installed in the correct order.
16. Install the spring pack assembly (key 21), with the attached springs, onto the stem.
17. Install the packing flange (key 18) and packing box nuts (key 20). Hand tighten them.
18. For Urea Grade ENVIRO-SEAL live-loaded packing, refer to the ENVIRO-SEAL IM (D101642X012) for tightening instructions. Follow the PTFE/Duplex packing instructions.
19. Mount the actuator on the valve body assembly and reconnect the actuator and valve plug stems according to the procedures in the appropriate actuator instruction manual.
20. Reinstall valve assembly in line.

Top Entry Constructions

Key numbers referred to in this procedure are shown in Figure 2 unless otherwise indicated.

1. Isolate the control valve from the line pressure, release pressure from both sides of the valve body and drain the process media from both sides of the valve. If using a power actuator, also shut-off all pressure lines to the power actuator, release all pressure from the actuator. Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
2. Remove the cap screws in the stem connector and separate the two halves of the stem connector. Then exhaust all actuator pressure, if any was applied and disconnect the actuator supply and any leakoff piping.
3. Remove yoke hex nuts (key 23) and remove the actuator from the bonnet (key 8).
4. Loosen the packing flange nuts (key 19) so that the packing (keys 14 and 17, Figure 2) is not tight on the valve plug stem (key 7). Remove any travel indicator disk and stem locknuts from the valve plug stem threads.

NOTICE

When lifting the bonnet (key 8), be sure that the valve plug/stem (key 7) remains on the seat ring (key 3). This avoids damage to the seating surfaces as a result of the assembly dropping from the bonnet after being lifted part way out. The parts are also easier to handle separately.

Use care to avoid damaging gasket sealing surfaces.

**WARNING**

To avoid personal injury or property damage caused by uncontrolled movement of the bonnet, loosen the bonnet by following the instructions in the next step. Do not remove a stuck bonnet by pulling on it with equipment that can stretch or store energy in any other manner. The sudden release of stored energy can cause uncontrolled movement of the bonnet.

NOTE

The following step also provides additional assurance that the valve body fluid pressure has been relieved.

5. Hex nuts (key 12) attach the bonnet to the valve body. Loosen these nuts or cap screws approximately 3 mm / 1/8 in. Then loosen the body-to-bonnet gasketed joint by either rocking the bonnet or prying between the bonnet and valve body. Work the prying tool around the bonnet until the bonnet loosens. If no fluid leaks from the joint, proceed to the next step.
6. Unscrew the hex nuts (key 12) and carefully lift the bonnet off the valve stem. If the valve plug and stem assembly starts to lift with the bonnet, use a dead blow hammer on the end of the stem and tap it back down. Set the bonnet on a cardboard or wooden surface to prevent damage to the bonnet gasket surface.
7. Remove the valve plug (key 7) and bonnet gasket (key 9).

NOTE

Inspect the bonnet and body gasket surface. This surface must be in good condition, with all foreign material removed. Scratches or burrs that run across the serrations are not permitted under any conditions, since they will prevent the gaskets from sealing properly.

8. Clean body to bonnet gasket surface. Clean in the same direction as the surface serrations, not across them.
9. Cover the opening in the valve body to protect the gasket surface and to prevent foreign material from getting into the valve body cavity.
10. Remove the packing flange nuts (key 19), packing flange (key 18) and packing follower (key 21). Carefully push out all the remaining packing parts from the valve side of the bonnet using a rounded rod or other tool that will not scratch the packing box wall.
11. Clean the packing box and the following metal packing parts: packing follower (key 21) and lantern ring (key 15).
12. Inspect the valve stem threads for any sharp edges that might cut the packing. A whetstone or emery cloth may be used to smooth the threads, if necessary.
13. Remove the protective covering from the valve body cavity and install the bonnet gasket (key 9). Install the plug, then slide the bonnet over the stem and onto the studs (key 10).

NOTE

The prelubricated hex nuts (key 12) referred to in step 14 can be identified by a black film coating on the nut threads. The proper bolting procedures in step 14 include—but are not limited to—ensuring that the bonnet stud threads are clean and that the hex nuts are evenly tightened to the specified torque values.

⚠ WARNING

Personal injury or damage to equipment could occur if improper stud and nut materials or parts are used. Do not operate or assemble this product with stud(s) and nut(s) that are not approved by Emerson/Fisher engineering and/or listed on the serial card provided with this product. Use of unapproved materials and parts could lead to stresses exceeding the design or code limits intended for this particular service. Install studs with the material grade and manufacturer's identification mark visible. Contact your [Emerson sales office](#) immediately if a discrepancy between actual parts and approved parts is suspected.

NOTICE

Failure to follow the bonnet-to-body bolting procedures in step 14 and the torque values shown in Table 2 may result in damage to the valve.

NOTE

Stud(s) and nut(s) should be installed such that the manufacturer's trademark and material grade marking is visible, allowing easy comparison to the materials selected and documented in the Emerson/Fisher serial card provided with this product.

14. Lubricate the stud threads, the faces of the hex nuts (key 12) and washer face with anti-seize lubricant (not necessary if new factory prelubricated hex nuts are used). Replace the hex nuts and tighten them finger-tight. Stroke the valve several times to center the trim. Torque the nuts in a crisscross pattern to no more than 1/8 of the nominal torque value specified in Table 2.

When all nuts are tightened to that torque value, increase the torque by 1/8 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.

NOTE

When installing packing rings, prevent entrapping air between the rings. Add the rings one at a time without forcing them below the chamfer of the packing box entrance chamber. As each successive ring is added, the stack should not be pushed down more than the thickness of the added ring (Figure 2).

15. Use Figure 2 to ensure that the packing parts are installed in the correct order.
16. Install the spring pack assembly (key 21), with the attached springs, onto the stem.
17. Install the packing flange (key 18) and packing box nuts (key 20). Hand tighten them.
18. For Urea Grade ENVIRO-SEAL live-loaded packing, refer to the ENVIRO-SEAL IM (D101642X012) for tightening instructions. Follow the PTFE/Duplex packing instructions.
19. Mount the actuator on the valve body assembly and reconnect the actuator and valve plug stems according to the procedures in the appropriate actuator instruction manual.

3.3 Valve Plug Replacement

WARNING

Observe the warning at the start of the Maintenance section.

This procedure describes how the valve plug can be removed and replaced. Be certain that all gasketed surfaces have been well cleaned. Key numbers referenced in this procedure are shown in Figure 3 except where indicated.

Bottom Entry Constructions

1. Remove the actuator, spool, seat and plug/stem by following steps 1 through 8 of the bottom entry replacing packing procedure. Observe all warning and notice messages.
2. With the new plug/stem, follow steps 11 and 12 of the bottom entry replacing packing procedure.

Top Entry Constructions

1. Remove the actuator and bonnet by following steps 1 through 7 of the top entry replacing packing procedure. Observe all warning and notice messages.
2. With the new plug/stem, follow steps 12 and 13 of the top entry replacing packing procedure.

3.4 Seat Replacement

WARNING

Observe the warning at the start of the Maintenance section.

Bottom Entry Constructions

This procedure describes how the valve seat ring can be removed and replaced. Be certain that all gasketed and sealing surfaces have been well cleaned. Key numbers referenced in this procedure are shown in Figure 3 except where indicated.

1. Remove the actuator, spool and seat by following steps 1 through 6 of the replacing packing procedure. Observe all warning and notice messages.

NOTICE

The seat ring lifting holes are provided for ease of disassembly. To prevent damage to the seat lifting hole, fully engage the threaded rod into the cage hole, but do not overtighten the hoist rod. It only needs to be hand tight.

2. Take new seat ring and follow steps 12 through 13 of the bottom entry packing maintenance.

Top Entry Constructions

This procedure describes how the valve seat ring can be removed and replaced. Be certain that all gasketed and sealing surfaces have been well cleaned. Key numbers referenced in this procedure are shown in Figure 3 except where indicated.

1. Remove the actuator and bonnet by following steps 1 through 7 of the replacing packing procedure. Observe all warning and notice messages.
2. Hex nuts (key 4) attach the spool to the valve body. Loosen these nuts or cap screws approximately 3 mm / 1/8 in. If no fluid leaks from the joint, proceed to the next step.
3. Unscrew the hex nuts (key 4) and carefully lift the spool off the studs. Set the spool on a cardboard or wooden surface to prevent damage to the spool gasket surface.
4. Remove the seat ring using the provided lift holes. Inspect the seat ring and body sealing surfaces for damage.

NOTICE

The seat ring lifting holes are provided for ease of disassembly. To prevent damage to the seat lifting hole, fully engage the threaded rod into the cage hole, but do not overtighten the hoist rod. It only needs to be hand tight.

5. Take new seat ring and install into the body. Place the spool over the studs (key 5).
6. Lubricate the stud threads, the faces of the hex nuts (key 4) and washer face with anti-seize lubricant (not necessary if new factory prelubricated hex nuts are used). Replace the hex nuts and tighten them finger-tight. Stroke the valve several times to center the trim. Torque the nuts in a crisscross pattern to no more than 1/8 of the nominal torque value specified in order documents.

When all nuts are tightened to that torque value, increase the torque by 1/8 of the specified nominal torque and repeat the crisscross pattern. Repeat this procedure until all nuts are tightened to the specified nominal value. Apply the final torque value again and, if any nut still turns, tighten every nut again.

Section 4: Parts

4.1 Parts Ordering

Each body-bonnet assembly is assigned a serial number, which can be found on the valve body. This same number also appears on the actuator nameplate when the valve body is shipped from the factory as part of a control valve assembly. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance or when ordering replacement parts.

WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve and could cause personal injury and property damage.

Figure 3. NPS 6 EHU Valve Assembly

4.2 Parts List

NOTE

Contact your [Emerson sales office](#) for Part Ordering information.

Key	Description	Key	Description
1	Valve body If you need a valve body as a replacement part, order by valve size, serial number and desired material.	13*	Guide bushing
2	Spool	14*	Lower packing set
3*	Seat ring	15*	Lantern ring
4*	Spool hex nut	16*	Anti-extrusion ring
5*	Spool stud	17*	Upper packing set
6*	Spool washer	18	Packing flange
7*	Plug/Stem	19	Packing nut
8	Bonnet ⁽¹⁾ If you need a bonnet as a replacement part, order by serial number and desired material.	20	Packing stud
9*	Bonnet gasket ⁽¹⁾	21	Spring pack assembly
10*	Bonnet stud ⁽¹⁾	22	Yoke stud
11*	Bonnet washer ⁽¹⁾	23	Yoke nut
12*	Bonnet nut ⁽¹⁾	---	---
*Recommended spare parts 1. These components are for top entry constructions only.

W9058-1

Introduction

Scope of Manual

This instruction manual includes installation and parts information for Fisher enhanced ENVIRO-SEAL live-loaded packing systems (see figure 1). These systems are available for Fisher rotary valves with 12.7 through 88.9 mm (1/2 through 3-1/2 inch) shaft diameters. The system can be used with many rotary valves, as shown in tables 1 and 3. Refer to appropriate valve and actuator instruction manuals for necessary information relating to the disassembly and assembly of the valve and actuator. Enhanced ENVIRO-SEAL packing systems utilize a Belleville (coned-disk) spring system.

Do not install, operate, or maintain the enhanced ENVIRO-SEAL packing systems, valve, actuator or accessories without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Enhanced ENVIRO-SEAL Packing Systems - Rotary Valves

February 2024

Instruction Manual

D101643X012

Table 1. Specifications

Applicable Valve Designs^(3,4) Fisher 8560 and 8532 eccentric disk control valves; A11 control valves; V150, V200 and V300 Vee-Ball™ control valves (Series B and Non-Series B ⁽¹⁾); V250 and V260 and BV500, CV500 and V500 eccentric plug rotary valves. Also see table 3.	Applicable Shaft Diameters See table 3 Pressures and Temperatures⁽²⁾ See table 2
1. Refer to Fisher Vee-Ball V150, V200, and V300 instruction manual, for distinctions between Series B and Non-Series B. 2. The pressure/temperature limits in this manual, in the valve literature, and any applicable code or standard limitation should not be exceeded. 3. Whenever 8532 is referenced, A31A and A31D can be applied. 4. Whenever 8560 is referenced, A41, 8510, 8510B can be applied.	

Table 2. Maximum Application Temperature and Pressure for 50 PPM Service

ENVIRO-SEAL PACKING MATERIAL	MAXIMUM APPLICATION TEMPERATURE		MAXIMUM APPLICATION PRESSURE
	°C	°F	
Single PTFE	232	450	Not Restricted ⁽¹⁾
Double PTFE ⁽²⁾	177	350	20.7 bar (300 Psi)
Graphite	316	600	Not Restricted ⁽¹⁾
1. For pressure ratings through CL600 of valves listed in this instruction manual. 2. These application conditions apply for double PTFE only in the valve types where double PTFE is available.			

Valve/Actuator Shaft Coupler

To install an enhanced ENVIRO-SEAL packing system on an A11 or 8532 valve with a non-standard, non-Fisher produced actuator may require a special valve/actuator shaft coupler.

Table 10 contains a list of valve/actuator combinations and part numbers for the new coupler. If you are considering installation of an enhanced ENVIRO-SEAL packing system in another existing valve/actuator package, check table 10 to see if a new coupler is required.

In some cases, coupler replacement is not required when retrofitting valve/actuator combinations. Table 11 contains a list of valve/actuator combinations that can use existing couplers.

Description

Fisher packing systems are offered with exceptional sealing capabilities that you can easily install in existing valves or that you can purchase with new valves. These systems help you conserve valuable process fluid. The external live-loading provides a constant load over the life of the packing material, which reduces the need for packing box adjustment and maintenance.

The system design, coupled with very smooth shaft finishes and spring-loading of the packing, provides longer service with lower maintenance than many other designs.

Installation

Use these instructions to install enhanced ENVIRO-SEAL packing in valves that have standard packing, or when inspecting or replacing ENVIRO-SEAL packing.

If you are changing the packing system material from standard graphite to ENVIRO-SEAL graphite or ENVIRO-SEAL PTFE packing, the packing friction for ENVIRO-SEAL packing will be lower than it was for the standard packing. Therefore, no change should be needed in actuator sizing.

If you are changing the packing system material from standard PTFE to ENVIRO-SEAL graphite or ENVIRO-SEAL PTFE packing, the packing friction will increase. Contact your [Emerson sales office](#) to determine if your existing actuator will be large enough.

WARNING

Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.

To avoid personal injury or property damage resulting from the sudden release of pressure, do not install the valve assembly where service conditions could exceed the limits given in this manual, the appropriate valve instruction manual, or the limits on the appropriate name plates. Use pressure relieving devices as required by government or accepted industry codes and good engineering practices.

Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

If installing into an existing application, also refer to the WARNING at the beginning of the Removing the Actuator section in this instruction manual.

Removing the Actuator

WARNING

Avoid personal injury from sudden release of process pressure or uncontrolled movement of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure on both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any additional measures that must be taken to protect against process media.

You must remove the actuator from the valve when you install enhanced ENVIRO-SEAL packing systems. To allow proper readjustment of the valve disk position, it is recommended that you remove the valve from the pipeline. Refer to appropriate valve and actuator instruction manuals.

⚠ WARNING

If a spring-return actuator is used, be sure the actuator spring is resting on its travel stop. If something is obstructing shaft rotation, it is possible that disconnecting the shaft connector will allow the spring to force the actuator to the end of its rotation, resulting in possible personal injury or property damage. Refer to the appropriate valve and actuator instruction manuals to remove the actuator.

Installing an enhanced ENVIRO-SEAL Packing System

Note

When installing an enhanced ENVIRO-SEAL packing system into an insulated valve, do not cover the packing springs with insulation.

Note

The valve shaft surface condition is critical in obtaining a good seal. If the valve shaft surface is scratched, nicked, or worn, replace the valve shaft before installing the enhanced ENVIRO-SEAL Packing System.

Refer to the appropriate valve instruction manual to replace the valve shaft.

Key number locations are shown in figures 2 and 4 for Vee-Ball, eccentric plug, 8560, and A41 valves, and in figures 3 and 5 for A11 and 8532 valves.

1. If you are installing an enhanced ENVIRO-SEAL packing system in an existing valve, remove existing packing nuts, packing flange, jam nuts, anti-blowout flange, packing follower, and any other external packing components from the valve body.

⚠ WARNING

To avoid personal injury from packing leakage, take care when removing the old packing parts from the packing box. Do not scratch, nick or dent the valve shaft surface or packing box wall.

2. For A11, 8532, 8580, 8590, and Control-Disk valves, remove the anti-blowout wire that surrounds the valve shaft.
3. For all valves, remove packing and all other internal components from the packing box.
4. Inspect the existing valve shaft. If necessary, replace the valve shaft. Refer to the appropriate valve instruction manual to replace the valve shaft.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D101643X012

Enhanced ENVIRO-SEAL Packing Systems - Rotary Valves

February 2024

Figure 2. Typical Enhanced ENVIRO-SEAL Rotary Packing Arrangements with PTFE Packing for Fisher Vee-Ball, Eccentric Plug, and 8560 Valves

NOTES:

- ① APPLY LUBRICANT
- ② THESE TWO SURFACES MUST REMAIN PARALLEL AS YOU ALTERNATELY AND EVENLY TIGHTEN THE PACKING NUTS (KEY 101)

Note

Enhanced ENVIRO-SEAL PTFE packing systems can be used in either vacuum or positive pressure service. It is not necessary to reverse ENVIRO-SEAL PTFE packing components in vacuum service.

Make sure that the Belleville springs are stacked properly and packing box parts are assembled in the correct order (see figure 6). Packing parts cannot function properly if the Belleville springs or other packing parts are not stacked correctly.

5. With the shaft in place in the valve, install the packing parts into the valve packing box.

Note

Be sure to install the packing rings in the sequence shown in figures 2 through 5.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Enhanced ENVIRO-SEAL Packing Systems - Rotary Valves

February 2024

Instruction Manual

D101643X012

- a. Place one of the packing box rings (key 107) into the packing box. Be sure the packing box ring is properly seated. This does not apply to NPS 3, 4 and 6 CL600 A11 valves.
- b. For PTFE packing, place an anti-extrusion washer (key 106) into the packing box and push it in until it rests next to the packing box ring (key 106 is not used with graphite packing).

Note

The graphite packing set has a carbon anti-extrusion ring on the top and bottom of the packing. These anti-extrusion rings are designed to have a slight interference fit on the shaft. The rings have a single fracture to allow the ring to be installed on the shaft. Additional fractures may develop while the valve is in service, however, these additional fractures will not affect the performance of the ENVIRO-SEAL packing.

- c. Place the packing set (key 105) into the packing box. Refer to figure 3 or 5 for the proper orientation of the packing set.
 - d. For PTFE packing, place another anti-extrusion washer (key 106) into the packing box after the packing set (key 106 is not used with graphite packing).
 - e. Place the second packing box ring (key 107) into the packing box.
 - f. Locate the new spring pack assembly (key 103). Remove the O-ring and packing springs from the packing follower. Use the packing follower to press the packing components into the packing box. Remove the packing follower.
6. For A11, 8532, 8580, 8590, and Control-Disk valves, install the anti-blowout wire (key 16) in the groove around the valve shaft.
 7. Slide the packing follower from the new spring pack assembly over the valve shaft and the anti-blowout wire until it rests against the packing box ring.
 8. For all valves, install the longer packing studs (key 100).
 9. For A11, 8532, 8580, 8590, and Control-Disk valves, install the new anti-blowout flange (key 10) over the valve shaft, packing studs, and packing follower. Secure the anti-blowout flange with the new jam nuts (key 17).
 10. For all valves, install the spring pack assembly (key 103 or 104) which includes the Belleville springs, packing follower, and O-ring arranged as shown in figures 2 through 6. (The O-ring is a non-functional part and is used to retain the packing springs during assembly.)

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D101643X012

Enhanced ENVIRO-SEAL Packing Systems - Rotary Valves

February 2024

Figure 3. Enhanced ENVIRO-SEAL PTFE Packing System for Fisher A11, 8532, 8580, 8590, and Control-Disk Valves

11. Install the packing flange (key 102) on the shaft, and install the packing nuts (key 101). Hand tighten them.

Note

In general, the following tightening procedure applies to all enhanced ENVIRO-SEAL packing systems—both sliding-stem and rotary.

NOTICE

Excessive force could cause valve body bushing displacement in Non-Series B Vee-Ball valves, allowing Vee-Ball misalignment, excessive seat leakage, or stalling of the actuator.

Note

Lubrication is required for the packing studs and nuts. Although it is important to properly lubricate the stud threads and internal nut threads, it is also important to properly lubricate the contacting face of the nut. See figures 2 through 5 and 7 for lubrication locations.

Figure 4. Typical Enhanced ENVIRO-SEAL Rotary Packing Arrangements with Graphite Packing for Fisher Vee-Ball, Eccentric Plug, and 8560 Valves

NOTES:

- 1 APPLY LUBRICANT
- 2 THESE TWO SURFACES MUST REMAIN PARALLEL AS YOU ALTERNATELY AND EVENLY TIGHTEN THE PACKING NUTS (KEY 101)
- 3 VALVE WITH SHAFTS LARGER THAN 38.1 mm (1-1/2 INCH) USE THREE GRAPHITE RINGS

Note the following definitions. You will need them for the next few steps. The **target load** is the point where the Belleville springs are designed for optimum performance, when they are compressed to 85% of their maximum deflection, or nearly flat. **Maximum deflection** is when the springs are 100% compressed, or completely flat.

12. You will obtain maximum benefit from your enhanced ENVIRO-SEAL packing system when you tighten the packing flange nuts and compress the Belleville springs to their “target load”.

To obtain the target load of 85% compression of maximum deflection, perform the following:

- Tighten the packing flange nuts alternately and evenly, keeping the packing flange parallel with the valve flange (see figure 7), until the Belleville springs are compressed 100% (or completely flat).

February 2024

NOTES:

- ① VALVES WITH SHAFTS LARGER THAN 38.1 mm (1-1/2 INCH) USE 3 GRAPHITE RINGS
- ② NOT USED ON VALVES LARGER THAN NPS 12
- ③ NOT USED ON A11 VALVES
- ④ NOT USED ON A11 CL600 NPS 3, 4, AND 6

Figure 6. Belleville Spring Stacking Order (See Table 3)

INCH
B2410-2

Figure 7. Enhanced ENVIRO-SEAL PTFE Packing System Detail

32B9116-B

NOTES:

- 1 APPLY LUBRICANT
- 2 THESE TWO SURFACES MUST REMAIN PARALLEL AS YOU ALTERNATELY AND EVENLY TIGHTEN THE PACKING NUTS.

Other Considerations

Note

The following check is only valid for rotary enhanced ENVIRO-SEAL packing systems and sliding-stem enhanced ENVIRO-SEAL or HIGH-SEAL packing systems.

When retrofitting an existing packing system or repacking a valve with enhanced ENVIRO-SEAL packing that has been in service, check the condition of the packing bore after you have removed the packing. An easy method for cleaning debris and minor imperfections from the bore is to use a brake cylinder hone attached to an electric drill. This method will do a good job of cleaning the packing bore without changing the dimension of the bore.

When you have completed this exercise, a good guideline to use in checking the condition of the packing bore is the 20/20 rule. If less than 20% of the surface area of the bore is pitted and if no pits are deeper than 0.010 inch, then your packing will work fine. This does not need to be an exact measurement; visual inspection is adequate. If the packing bore does not meet this criteria, however, you should replace the valve or have your Emerson service center repair it.

1. Shaft Diameter through the packing box.

Parts Ordering

Each valve assembly is assigned a serial number that can be found on the valve body. Refer to the serial number when contacting your [Emerson sales office](#) for technical assistance.

When ordering replacement parts, refer to the serial number and to the 11-character kit number for each kit required from the following list. Kits for valves with shaft sizes greater than 38.4 mm (1-1/2 inch) will not be available, however, ENVIRO-SEAL parts may be ordered separately. Consult your Emerson sales office for details.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Parts Kits

Retrofit Kits

Retrofit kits include all parts required for installation of the enhanced ENVIRO-SEAL packing system into existing rotary and high performance butterfly valves. Retrofit kits are available for single PTFE or graphite packing. See tables 5 through 7 for retrofit kit part numbers.

The 8510B has two packing boxes, one at the actuator end and one at the outboard end. Select a kit from each column of the following table.

Packing boxes in V500 and CV500 valve bodies may be deep drilled, (at one time standard on all CV500 and always available as an option). If the valve body being retrofitted has a deep packing box, use the longer packing box ring (key 107) from the original packing. Discard the 3 mm (1/8-inch) packing box ring from the retrofit kit. If a replacement packing box ring (long, key 107) is required, refer to the valve instruction manual for parts, or consult your Emerson sales office. Refer to figure 2, the view titled: Double PTFE Packing with Leakoff—Optional Deep Packing Box.

Note

1. Use the existing long packing box ring (key 107) that was furnished with the original valve when installing the retrofit kit in:

- V200 NPS 8 and 10 valves, or
 - V150 and V300 NPS 8, 10, and 12 valves
-

111	Tag	1
112	Cable	1

1. For use on Actuator end. The spring pack assembly is made up of the packing spring stack held in place by an O-ring on the packing follower.
 2. For use on Outboard end. The spring pack assembly is made up of the packing spring stack held in place by an O-ring on the packing follower.
 3. Not included in graphite packing kit.
 4. Only 1 req'd for NPS 18 CL300, NPS 20 CL150 and NPS 24 CL150. Two packing box rings required for 8560, 44.5 mm (1-3/4 inch) shaft. Not required on V150, V200 or V300 with 31.8 or 38.1 mm (1-1/4 or 1-1/2 inch) shafts.
 5. These are included in retrofit kits for 8532 and A11 valves.
 6. NPS 3 through 12 CL150 and NPS 3 through 8 CL300 for 8532; NPS 3 through 6 CL600, A11.
 7. NPS 14 through 24 CL150/300 for 8532; NPS 8 through 18 CL600, A11.

1. Shaft diameter: Diameter through the packing box. 2. For larger shaft sizes, consult your Emerson sales office .				

Repair Kits

PTFE repair kits include one packing set and two anti-extrusion washers. Graphite packing sets include two packing rings and two anti-extrusion rings. See table 8.

The 8510B has two packing boxes, one at the actuator end and one at the outboard end. A quantity of two of the appropriate kit is required to repair both ends.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

W5814-1*

Introduction

Scope of Manual

This instruction manual includes installation and parts information for Fisher ENVIRO-SEAL live-loaded packing systems (see figure 1). These systems are available for Fisher sliding-stem valves with 9.5, 12.7, 19.1, 25.4, 31.8, and 50.8 mm (3/8, 1/2, 3/4, 1, 1-1/4, and 2 inch) diameter stems. The system can be used with many sliding-stem valves as shown in the Applications section of the Specifications. Refer to appropriate valve and actuator instruction manuals for necessary information relating to the disassembly and assembly of the valve and actuator. ENVIRO-SEAL packing systems for sliding-stem valves utilize a Belleville (coned-disk) spring system in the pressure/temperature ranges shown in the specifications. For higher pressure/temperature ratings, refer to the HIGH-SEAL ULF Live-Loaded Packing System instruction manual, [D101453X012](#).

Do not install, operate, or maintain ENVIRO-SEAL live-loaded packing systems without being fully trained and qualified in valve, actuator, and accessory installation, operation, and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand, and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) or Local Business Partner before proceeding.

Table 1. Specifications

Applicable Product Types and Stem Diameters See tables 2 and 3 TÜV Certification TÜV has certified the stem sealing capabilities of ENVIRO-SEAL PTFE and Graphite ULF packing systems for sliding-stem valves with TA Luft emission control requirements. See figures 8 and 9 for copies of these certificates	Pressures and Temperatures⁽²⁾ See figure 2. Figure 2 applies only to ENVIRO-SEAL packing for 100 ppm service. Pressure and temperature ratings for non-environmental service are in the packing bulletins. See the appropriate valve instruction manual for additional pressure and temperature ratings.
1. For availability of ENVIRO-SEAL packing system with a specific valve, please contact your Emerson sales office or Local Business Partner. 2. The pressure/temperature limits in this manual, in the valve literature, and any applicable code or standard limitation, should not be exceeded.	

Figure 2. Applications Guidelines for 100 ppm Service

A6142-1

NOTE:

FOR MAXIMUM CYCLE LIFE, GRAPHITE ULF PACKING SHOULD BE USED IN SERVICES WHERE THE VAST MAJORITY OF THE VALVE CYCLES OCCUR AT TEMPERATURES OF 150°C (300°F) OR GREATER.

Description

ENVIRO-SEAL packing systems, with exceptional sealing capabilities, can be easily installed into your existing valves or can be purchased with new valves. These systems help seal your process to conserve valuable fluids, and protect the environment against the emission of hazardous or polluting liquids and gases. The external live-loading provides a constant load over the life of the packing material, which reduces your need for packing box adjustment and maintenance.

If the piping and valve are insulated, do not allow insulation to extend above the yoke boss surface, covering the ENVIRO-SEAL packing arrangement. Keep the ENVIRO-SEAL packing arrangement exposed to ambient air conditions.

Installation

ENVIRO-SEAL packing systems are designed for quality performance over extended periods. This longevity allows for packing maintenance to be performed as it should be, at regularly scheduled plant outages or turn-arounds.

Use these instructions to install ENVIRO-SEAL packing in valves that have standard packing or when inspecting or replacing ENVIRO-SEAL packing.

If you are changing the packing system material to a different material, such as PTFE to Graphite ULF, it is good practice to review actuator sizing, as packing friction will change. See tables 4, 5, and 6 for information on packing friction.

⚠ WARNING

Avoid personal injury from sudden release of process pressure or uncontrolled movement of parts. Before performing any maintenance operations:

- Do not remove the actuator from the valve while the valve is still pressurized.
- Always wear protective gloves, clothing, and eyewear when performing any maintenance operations to avoid personal injury.
- Disconnect any operating lines providing air pressure, electric power, or a control signal to the actuator. Be sure the actuator cannot suddenly open or close the valve.
- Use bypass valves or completely shut off the process to isolate the valve from process pressure. Relieve process pressure from both sides of the valve. Drain the process media from both sides of the valve.
- Vent the power actuator loading pressure and relieve any actuator spring precompression.
- Use lock-out procedures to be sure that the above measures stay in effect while you work on the equipment.
- The valve packing box may contain process fluids that are pressurized, *even when the valve has been removed from the pipeline*. Process fluids may spray out under pressure when removing the packing hardware or packing rings, or when loosening the packing box pipe plug.
- Check with your process or safety engineer for any other hazards that may be present from exposure to process media.

1. Contact your Emerson sales office for valves not listed.

If you are installing the system in a valve that is still connected to an actuator, remove the actuator from the valve to provide sufficient space to install the packing assembly. If a spring-return actuator is used, it is possible that disconnecting the stem connector will allow the spring to force the actuator to the end of its travel. Be sure the actuator spring is resting on its travel stop. Refer to the appropriate valve and actuator instruction manuals to remove the actuator.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

Instruction Manual

D101642X012

ENVIRO-SEAL Sliding-Stem Valves

July 2017

Remove old packing parts from the packing box by using the valve instruction manual procedures. Both the valve stem surface condition and the packing bore are critical in obtaining a good seal. If the valve stem surface is scratched, nicked, or worn, replace the valve stem before installing the ENVIRO-SEAL Packing System. Check the condition of the packing bore and clean or hone it out, as necessary. Refer to the appropriate valve instruction manual to replace the valve stem.

Figure 4. Belleville Spring Stacking Order

A6144

Table 4. Packing Friction with ENVIRO-SEAL PTFE Packing

VALVE STEM DIAMETER		PTFE PACKING	
mm	Inches	Newtons	Pounds (Force)
9.5	3/8	555	125
12.7	1/2	755	170
19.1	3/4	1110	250
25.4	1	1515	340
31.8	1-1/4	1890	425
50.8	2	3220	725

Table 5. Packing Friction with ENVIRO-SEAL Duplex Packing

VALVE STEM DIAMETER		DUPLEX PACKING	
mm	Inches	Newtons	Pounds (Force)
9.5	3/8	555	125
12.7	1/2	755	170
19.1	3/4	1110	250
25.4	1	1515	340
31.8	1-1/4	1890	425
50.8	2	3220	725

Table 6. Packing Friction with ENVIRO-SEAL Graphite ULF Packing

VALVE STEM DIAMETER		GRAPHITE ULF PACKING	
mm	Inches	Newtons	Pounds (Force)
9.5	3/8	935	210
12.7	1/2	1250	280
19.1	3/4	2350	530
25.4	1	3740	840
31.8	1-1/4	4800	1100
50.8	2	6000	1350

For key number locations refer to figures 5, 6, or 7. Then proceed as follows:

1. The original packing flange studs used for standard packing arrangements should be long enough to accommodate the retrofit kit parts. If you determine that the existing studs and nuts should be replaced however, due to their condition, replace them with the studs and nuts (keys 200 and 212) supplied in the retrofit kit.

FISHER VALVE & ACTUATOR INSTRUCTION MANUALS

ENVIRO-SEAL Sliding-Stem Valves

Instruction Manual

D101642X012

Table 7. Graphite ULF Packing Torque⁽¹⁾

STEM SIZE		TORQUE		
mm	Inch	N•m	lbf•in	lbf•ft
9.5	3/8	4.3	38	3.2
12.7	1/2	8.5	76	6.3
19.1	3/4	21	187	16
25.4	1	47	420	35
31.8	1-1/4	56	495	41

1. For A, DBQ, easy-e, EH, FB, HP, YD, and YS valves.

CAUTION

To prevent product damage caused by scratching or damaging the packing box wall, take care when removing the old packing parts from the packing box.

2. Carefully remove the old packing parts from the packing box. If the valve stem or packing box wall is scratched or damaged, it can cause excessive leakage. If the valve stem needs to be replaced, or any other valve part, refer to the appropriate valve instruction manual for replacement procedures. Complete all valve maintenance before installing the ENVIRO-SEAL packing system into the bonnet.

Note

ENVIRO-SEAL PTFE packing systems can be used in either vacuum or positive pressure service. It is not necessary to reverse ENVIRO-SEAL packing components in vacuum service.

Note

Ensure that the Belleville springs are stacked properly (see figure 4) and packing box parts are assembled in the correct order (see figures 5, 6, or 7). Packing parts cannot function properly if the Belleville springs or other packing parts are not stacked correctly.

3. Use figures 5, 6, or 7 to ensure that the packing parts and spring pack are assembled in the correct order. Install the ENVIRO-SEAL packing parts into the packing box.
4. Install the spring pack assembly (key 217), with the attached springs, onto the stem.
5. Install the packing flange (key 201) and packing box nuts (key 212). Hand tighten them.

Note

In general, the following tightening procedure applies to all ENVIRO-SEAL packing systems--both sliding-stem and rotary.

Note

Lubrication is required for the packing studs and nuts.

Although it is important to properly lubricate the stud threads and internal nut threads, it is also important to properly lubricate the contacting face of the nut. See figures 5, 6, or 7 for lubrication locations.

Tightening Procedures

1. You will obtain maximum benefit from your ENVIRO-SEAL packing system when you tighten the packing flange nuts and compress the Belleville springs to their “target load”. The target load is the point where the Belleville springs are designed for optimum performance, when they are compressed to 85% of their maximum deflection, or nearly flat. (Maximum deflection is when the springs are 100% compressed, or completely flat.)

To obtain the target load of 85% compression of maximum deflection, perform the following:

- Tighten the packing flange nuts alternately and evenly, keeping the packing flange parallel with the valve flange (see figure 3), until the Belleville springs are compressed 100% (or completely flat), as detected by a rapid increase in nut torque.
- For PTFE or Duplex packing, loosen each packing flange nut 1/2 turn (180° of rotation).
- For Graphite ULF packing, loosen each packing flange nut 1/4 turn (90° of rotation).

The “target load” of 85% compression has now been reached.

2. Refer to the appropriate valve and actuator instruction manuals when connecting the valve to the actuator. Under normal conditions, the packing nuts should not require retightening.

However, when servicing, if the springs do not remain at the target load of 85% compression, retighten the packing box nuts according to step 1 above.

3. The “springs flat” procedure described above in steps 1 and 2 of Tightening Procedures is the preferred method of adjusting ENVIRO-SEAL packing. However, for Graphite ULF packing, the torque values in table 7 can also be used as a guideline for 85% spring compression. These values are based on generous lubrication of the packing studs and nuts with anti-seize lubricant. Loosening of the packing flange nuts is not required when these torques are used.

Other Considerations

When retrofitting an existing packing system or repacking a valve with ENVIRO-SEAL packing that has been in service, check the condition of the packing bore after you have removed the packing. An easy method for cleaning debris and minor imperfections from the bore is to use a brake cylinder hone attached to an electric drill. This method will do a good job of cleaning the packing bore without changing the dimension of the bore.

When you have completed this exercise, a good guideline to use in checking the condition of the packing bore is the 20/20 rule. If less than 20% of the surface area of the bore is pitted and if there are no pits deeper than 0.020 inch, then your packing should work as designed. This does not need to be an exact measurement; visual inspection is adequate. If the packing bore does not meet this criteria, however, you should replace the bonnet.

Note

This check is only valid for rotary ENVIRO-SEAL packing systems and sliding-stem ENVIRO-SEAL or HIGH-SEAL packing systems.

Parts Ordering

Each valve assembly is assigned a serial number that can be found on the valve body. Refer to this serial number when contacting your [Emerson sales office](#) or Local Business Partner for technical assistance. When ordering replacement

parts, refer to this serial number and to the part description and part number from the following parts list. When ordering replacement parts, refer to the serial number and to the 11-character part number for each part required from the following parts list.

⚠ WARNING

Use only genuine Fisher replacement parts. Components that are not supplied by Emerson Automation Solutions should not, under any circumstances, be used in any Fisher valve, because they may void your warranty, might adversely affect the performance of the valve, and could cause personal injury and property damage.

Retrofit Kits

Stems and packing box constructions that do not meet Emerson stem finish specifications, dimensional tolerances, and design specifications, may adversely alter the performance of this packing kit.

easy-e, A, EH, HP, YD, and YS Retrofit Kits

Retrofit kits include parts to convert existing easy-e, A, EH, HP, YD, and YS valves to the ENVIRO-SEAL packing box construction. See table 3 for a complete listing of ENVIRO-SEAL packing systems for sliding-stem valves. PTFE kits include keys 200, 201, 211, 212, 214, 215, 217, 218, tag, and tie cable. Graphite ULF kits include keys 200, 201, 207, 208, 209, 210, 211, 212, 214, 216, 217, tag, and tie cable. Duplex kits include keys 200, 201, 207, 209, 211, 212, 214, 215, 216, 217, tag, and tie cable.

Fisher easy-e, A, EH, HP, YD, and YS Retrofit Kits

Repair Kits

Stems and packing box constructions that do not meet Emerson stem finish specifications, dimensional tolerances, and design specifications, may adversely alter the performance of this packing kit.

easy-e, A, EH, HP, YD, and YS Repair Kits

Repair kits include parts to replace the “soft” packing materials in valves that already have ENVIRO-SEAL packing arrangements installed or in valves that have been upgraded with ENVIRO-SEAL retrofit kits. PTFE repair kits include keys 214, 215, and 218. Graphite ULF repair kits include keys 207, 208, 209, 210, and 214. Duplex repair kits include keys 207, 209, 214, and 215.

to stem sealing with pre-boding system additional safety packing

This comparison is based on the requirements as described in
TA-Luft Section 5.2.6.4

The required tightness was achieved on a representative test specimen with nearly 1 000
cycles, 40 bar internal pressure and room temperatur.

Section 1: Introduction

1.1 Scope of the Manual

This instruction manual includes installation, maintenance and parts information for NPS 1/2 through 8 Fisher ES valves and NPS 1 through 6 EAS valves, through CL600 ratings. Refer to separate manuals for instructions covering the actuator and accessories.

WARNING

Do not install, operate or maintain an ES valve without being fully trained and qualified in valve, actuator and accessory installation, operation and maintenance. To avoid personal injury or property damage, it is important to carefully read, understand and follow all the contents of this manual, including all safety cautions and warnings. If you have any questions about these instructions, contact your [Emerson sales office](#) before proceeding.
