

DeltaV™ AgileOps

- Operations Management software for the industrial enterprise
- Monitor operational performance including alarm metrics and operator actions against industry standard KPIs
- Eliminate alarm floods and improve situational awareness of the operator
- Track the integrity of safety systems and operating windows at your facility
- Compatible with multiple control system platforms

Introduction

DeltaV™ AgileOps software provides consistency and reliability to the control system by keeping it optimally configured for the process state. AgileOps monitors the performance, loading and health of your system while providing a consistent reporting toolset across the enterprise. The software is scalable and modular to meet functionality and size requirements at any given site. Several features make up the AgileOps suite:

DeltaV AgileOps Performance Analytics – Monitor alarm and event metrics and track key performance indicators across the unit, site or enterprise with powerful dashboard capabilities and reports.

DeltaV AgileOps Database – A central repository for viewing, configuring, and managing all collected control system data, process boundaries, and alarm rationalization or design.

DeltaV AgileOps Dynamics – Allows the alarm configuration to change based on the operating state and process conditions of your facility which eliminates alarm floods and reduces the risk of missed alarms.

DeltaV AgileOps Alarm Shelving – Advanced alarm shelving capabilities to reduce stale and nuisance alarms, auto re-enable alarms as necessary, and minimize the number of alarms on the operator's alarm interface.

DeltaV AgileOps Safety Integrity – Monitor bypasses and interlocks to determine if your safety system is operating normally, operating in a degraded state, or if a safety function is active.

DeltaV AgileOps Operational Limits – Monitor key operational parameters to determine violations from normal condition and time in violation.

Benefits

- **One Solution Across the Enterprise** – Using the same approach and tools for tracking, KPI reporting, alarm rationalization, and state-based alarming, regardless of the control system, allows for a standardized solution to be implemented across multiple sites in your organization. This also reduces maintenance for upgrades and migrations.

- **Concurrently Monitor Software on Multiple Control Systems** – In addition to DeltaV, AgileOps is compatible with many control systems including Ovation™, OpenEnterprise™, Honeywell Experion® and TDC®, Siemens PCS7® and APACS, ABB 800xA, ABB Advant, DOW's MOD 5, Schneider Foxboro®, TIS/OMM, ClearSCADA/GeoSCADA, and Yokogawa Centum VP, thus delivering a complete solution for an entire site with one or multiple control system manufacturers. AgileOps also offers a generic connector for other systems not listed.
- **Compliant with Industry Standards** – AgileOps is compliant with ISA 18.2, EEMUA 191, IEC 62682, API RP1167, 49CFR192.631 and 49CFR195.446 standards and is designed to help you meet these standards when coupled with Emerson's alarm rationalization services.
- **Eliminate Alarm Floods and Improve Situational Awareness of the Operator** – Built-in transition management allows for easy and safe state transitions without generating alarm floods or missing critical alarms. AgileOps provides engineered shelving capabilities using advanced auto-shelving for dynamic management of those alarms that are not easily manageable with classic state-based alarm management methods.
- **Built-in Rationalization Work Processes** – The embedded work process provides a consistent and logical approach to both static and dynamic alarm rationalization by aggregating devices into systems. This allows devices to be logically grouped with unit operations with the ability to define operating states in order to simultaneously execute static and dynamic alarm management during rationalization. Auto synchronization between the control system and the AgileOps Database prevents stale data or conflicts when viewing the rationalization. Rationalized data can easily be audited or enforced against the data in the control system runtime.
- **Built-in Contention Management** – with AgileOps Dynamics, Alarm Shelving and Enforcement Reports allows users to choose which application has write priority over others when a common control system parameter is written to.
- **User Friendly Interface** – With AgileOps, there is no need for custom displays or programming for dynamic logic on the control system. Maintenance is drastically reduced with easy-to-use, standardized integration into the operator interface.
- **Track the Integrity of Safety Systems at your Facility** – Easily identify any safety system in a degraded state and resolve issues before the operation becomes unsafe with AgileOps Safety Integrity.
- **Track Inputs at your Facility** – Easily track any inputs to aggregate exceedance counts and activation duration metrics based on logical groupings relevant for the site or input function. AgileOps Operational Limits can be used to track the following kinds of inputs: safety shower activation, BPCS interlocks, bypass activations, gas monitor activation, abnormal controller modes, high or low tank levels, motor starts or stops, etc.
- **Out-of-the-box or Customizable Reports, as well as Multiple Data Egress Options** – In addition to standard reports included in AgileOps Performance Analytics, Safety Integrity and Operational Limits, users have the ability to create custom dashboards or reports. Data can be processed within AgileOps or consumed externally with a number of standard connectors and secure protocols.

Product Description

AgileOps provides modular and scalable platform-agnostic applications to provide a unified view of all control system settings and performance. With a direct connection to the control system, AgileOps collects live data and contextualizes it for consistent use in the applications that interact with the control system runtime. Event data that is collected from the control system is interpreted, contextualized, and the computed KPI metric results are transformed into consistent reports and dashboards (regardless of the control system) to better understand how your site is performing individually or compared to other sites within your organization.

DeltaV AgileOps Performance Analytics

AgileOps Performance Analytics allows the measurement, tracking and reporting of key performance indicators for events occurring in your facility. AgileOps reports alarm metrics as a result of data analysis which it automatically collects from one or more control systems. Metrics can be analyzed by the minute, hourly, daily, weekly, monthly or on a yearly basis. AgileOps is designed as an enterprise application that provides the necessary detailed information from local unit personnel up through complex-wide and cross-facility views for the enterprise.

DeltaV AgileOps Database

AgileOps provides the real-time capability to view the control system configuration, recommend and collaborate on design changes, implement changes in the control system, and audit the configuration versus the design. DeltaV AgileOps Database is an online database that monitors the control system for changes, detects new and deleted devices and alarms, and drives the work process for rationalizing alarms and control system settings. The system allows users to audit changes to alarms and keep detailed operator and engineer data about the alarm configuration. Based on the information provided, AgileOps will recommend the alarm priority based on the alarm priority matrix from your site's alarm philosophy. AgileOps can connect to multiple control systems to allow the user to view and manage alarm configuration in the same way across the site. With a consistent toolset and interface, the same processes can be used for alarm rationalization design and implementation for all control systems across a corporation.

DeltaV AgileOps Dynamics

AgileOps Dynamics allows the alarm configuration to change based on the operating state and process conditions of your facility. Built-in transition management ensures smooth and safe alarm transitions from one operating state to another, which effectively eliminates alarm floods during upset conditions and state changes. AgileOps automatically adjusts alarm settings, such as enabled, suppressed, or shelved, and can change alarm priority or trip point, based on operational state of the unit. This allows operators to focus on optimizing the facility operations rather than responding to unnecessary alarms. The integrated, user-friendly operator interface provides a simple drag and drop system, as well as a canvas, to allow rapid development of the state logic and easy updating when changes are needed. The logic can be built directly in the web interface or imported from Visio. Existing workspace logic can also be directly printed to PDF or exported to Visio. AgileOps Dynamics is presented in the operator interface, eliminating the need to build custom interfaces for the operator to interact or view the logic or state of the dynamics.

AgileOps Dynamic Logic Workspace for Detecting Changes in State.

DeltaV AgileOps Alarm Shelving

Manage malfunctioning alarms, stale alarms, or broken instrumentation with the AgileOps Alarm Shelving. With advanced alarm shelving capabilities, AgileOps can reduce nuisance alarms, auto re-enable alarms, and minimize the number of alarms on the summary at your facility. Engineered shelving techniques, such as auto-shelving, allow for management of alarms that are not easily incorporated into dynamic alarm suppression techniques. AgileOps Alarm Shelving works hand in hand with AgileOps Dynamics to help your site comply with applicable standards.

DeltaV AgileOps Safety Integrity

AgileOps Safety Integrity monitors the performance of a safety system to determine if that system is operating normally, operating in a degraded state, or if a safety function is active. The detection of whether a safety system is in a degraded state or if a safety function is active are defined as "cases". Each case contains selection logic built by the user to define what constitutes an activation trigger of the safety system or a degraded operating mode as well as individual contributors to an overall degraded mode of operation (such as active bypasses or bad inputs from field instruments). The results of this monitoring can then be viewed by users in reports presented in the AgileOps Performance Analytics.

AgileOps Safety Integrity Workspace.

DeltaV AgileOps Operational Limits

Monitor and track inputs in your control system with AgileOps Operational Limits. This allows users to track inputs (by user defined names), automatically aggregate them (by user defined named lists) and generate metrics when those inputs enter a specific state. AgileOps Operational Limits monitors inputs, using real-time data, to determine if it is active, and then tracks the counts and duration of activation. AgileOps will then automatically aggregate that metric based on the list the input is in. The results can be viewed via AgileOps Performance Analytics. These reports include data on individual raw events, metrics on individual inputs of lists, and metrics of the overall status of the aggregated lists.

Requirements

- Hardware Requirements
 - 2.20 GHz 8 Core Processors
 - 64 GB RAM (32 GB RAM if only the Performance Analytics feature is used)
 - 512 GB Hard Drive
- Software Requirements
 - Microsoft SQL Server 2019, 2022 or 2025 with Microsoft Server OS 2019, 2022 or 2025
- Web Browser (Microsoft Edge or Chrome)

Ordering Information

DeltaV AgileOps is licensed on a Flexible Subscription basis. Flexible Subscriptions can be used to access any AgileOps feature that is licensed on a Flexible Subscription basis, with each feature requiring its own subscription count. The Flexible Subscriptions are offered in one-year, three-year, and five-year terms. To purchase, extend, or expand a license, please contact your Emerson Sales Representative.

Product Support

AgileOps Product Support is delivered through Guardian™. Guardian is Emerson's digital platform for addressing the end-to-end lifecycle needs of automation & control software and asset performance management solutions. The Guardian digital experience enables users to quickly connect to product support; securely manage subscriptions; get intuitive views into system health; and explore additional software and services that propel performance.
